"Tit-Tat-To" is a solitaire game which introduces a new feature which will be used again in another set of number games. It is played with nine cards in sequence from ace to nine. They are to be placed in three rows of three cards each. Then, by changing their position they must be so disposed that the number of pips in each row, counting the cards horizontally, perpendicularly, and diagonally, will make the sum of fifteen each time.

As soon as the child masters the *figure symbols*, there is a variety of games and pastimes. We have the old game of *Lotto* which can be introduced quite early and will assist in the fixing of number symbols. Again, we have the *Fishpond*, *Parcheesi*, and a multitude of other games as offered by the toy stores.

Now, the Tit-Tat-To principle can be employed in the development of the *Magic Squares* and *Magic Triangles*. To work them out, the child should use counters, with the figures written or printed on; the number counters of a Lotto game will do very well. To illustrate:

A
B C
D E F

The figures from 1 to 6 should be so arranged that A plus B plus D = 9; A plus C plus F = 9; and likewise the third side, D plus E plus F = 9. This is one solution:

2
6 4
1 5 3

The same counters can be so arranged that the sum each time is 10, or 11, or 12. Again, a larger number of counters can be introduced, with larger sums. In the same way, "magic" squares are used; here is one example:

A B C
D E F
G H I

This is a so-called solid square, with a counter in the center; hollow squares omit this center counter. In the sample given, the numbers from 1 to 9 can be so arranged that they give 15 whichever way you add three numbers, vertically down any of the three columns, or horizontally, or diagonally. This is a solution:

4 9 2
3 5 7
8 1 6

These arrangements are a source of never-ending delight with children and develop in them facility of number combination which will stand them in good stead in many "practical" examples.

An example of a subtraction puzzle with counter is this:

Arrange nine counters as follows:

1 5 9
3 4 8
2 6 7

Now tell the child to move ONE counter from its present position to another pile, in order to make the sum of the counters in all the three piles the same. Of course, this is accomplished by moving the 9 from the third pile to the first.

The more of the *puzzle interest* of the child we can employ in teaching him number the more sustained will be his application, the more eager will he be to find the right solution. In fact, all problems or examples can arouse this puzzle interest when rightly presented. Every solution means a mastery over an obstacle, the conquest of a difficulty, the solution of a riddle.

Some of the special devices that may be used in this connection are the "Prestocard Multiplication Table" (Glen Ridge, N. J.), and the "Quiz Educational Toy" (Zestoy Mfg. Co., New York).

The following *drill charts* used by the author in many ways will assist greatly in fixing the decimal system of number relations in the mind of the child. Charts I and II are dealing with tens; the third chart, with hundreds, up to 10,000.

The arrangement of the charts is such that the relationship of numbers within the tens is readily grasped. The child should read each row separately at first, like this:
1 2 3 4 5 6 7 8 9 10;
then, the second row, the third, and so on. The next step would be to read the tens from the top line down to the bottom line:
10 20 30 40 50 60 70 80 90 100.
It will be well to call these first "tens", naming them "one ten", "two tens", etc., to "ten tens", so as to impress the decimal relationship; substituting the terms "twenty", "thirty", etc., only after this relationship is fully grasped.

The child will soon become interested in discovering further relations of tens, counting downward in the first compartment: 1, 11, 21, 31, etc. Also: 2, 12, 22, 32, etc., and so through the compartments. Further, he will discover that, going diagonally from the upper left corner to the lower right corner, he adds up by elevens (11 being the number given under 1): 1, 12, 23, 34, etc. Choosing the second number given below 1, viz. 21, he will find the corresponding sums by first taking the next number to the right of 21, viz. 22, and then following the same rule: going down two and one to the right, in the further operation: after 22, 43, then 64, 85; here we stop as this Chart I does not go beyond 100. But tacking on the corresponding columns of Chart II, we find 106, 127, 148, 169 and 190.

Parents and children will vie with each other in discovering more and more of

these games of addition. Chart III allows of the same illustration with hundreds, emphasizing the fundamental principles of the decimal system still further.

The Groszmann Drill Chart of Tens, I.

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50

171	172	173	174	175	176	177	178	179	180
181	182	183	184	185	186	187	188	189	190
191	192	193	194	195	196	197	198	199	200

The Groszmann Drill Chart of Hundreds

100	200	300	400	500	600	700	800	900	1000
1100	1200	1300	1400	1500	1600	1700	1800	1900	2000
2100	2200	2300	2400	2500	2600	2700	2800	2900	3000
3100	3200	3300	3400	3500	3600	3700	3800	3900	4000
4100	4200	4300	4400	4500	4600	4700	4800	4900	5000
5100	5200	5300	5400	5500	5600	5700	5800	5900	6000
6100	6200	6300	6400	6500	6600	6700	6800	6900	7000
7100	7200	7300	7400	7500	7600	7700	7800	7900	8000
8100	8200	8300	8400	8500	8600	8700	8800	8900	9000
9100	9200	9300	9400	9500	9600	9700	9800	9900	10000

Subtraction in this case is merely the reverse process, "counting backwards".

After exercising with the charts in full view of the child, the charts should be withdrawn, so that the child may test his ability to retain a mental picture of them. Rather than allow erroneous impressions to creep in, it will be well to show the charts again and again, until their image is firmly fixed upon the child's mind. Remember: this is not a *test*, but an *exercise*. It is of the utmost importance that the child should form and retain clear and correct mental images of these number relations.

The arrangement of the charts also allows their use in multiplication and division drills. For instance: 2x2=4; 2x3=6, etc. Also, 2x11=22; 2x21=42, etc. It will be seen that there is a geometrical relation of the figures representing these values. Children will delight in drawing pencil lines to mark these steps. For such exercises it is suggested that the charts be manifolded (hectographed or mimeographed) for individual use.

The difference between *prime numbers* and *composite numbers* can be studied at home by way of a game, using the so-called "sieve" of the famous Greek mathematician Eratosthenes, who lived several hundred years before Christ. Divisors and multiples can be discovered by using the same device. This is the sieve:

1	11	21	31	41	51	61	71	81	91
2	12	22	32	42	52	62	72	82	92
3	13	23	33	43	53	63	73	83	93
4	14	24	34	44	54	64	74	84	94
5	15	25	35	45	55	65	75	85	95
8	16	26	36	46	56	66	76	86	96
7	17	27	37	47	57	67	77	87	97
8	18	28	38	48	58	68	78	88	98
9	19	29	39	49	59	69	79	89	99
10	20	30	40	50	60	70	80	90	100

"This sieve," says Dr. Winifred Sackville Stoner who had used it in the training of her own daughter, "seems to amuse all children who like to mark out the composite numbers with red ink, and it impresses on their mind all prime numbers so that they recognize a Mr. Prime whenever they see him." It will be noticed that this "sieve" is similar to the Ten-Table of the author which can be used in various ways.

Mrs. Stoner, in her book, *Natural Education* (Bobbs Merrill), also describes the manner in which she taught her daughter *cancellation* as a short route and interesting game. With her permission we quote:

"In a box we place all sorts of numbers not exceeding two figures. These are to be our soldiers. Then we choose a name for ourselves, Wellington being a favorite with Winifred and Napoleon with me. We draw a line of battle and we are ready to begin. Winifred draws a number from the box. Suppose it is ten and that she has chosen the upper position above the line for her men. Then she puts 10 (in writing) above the line. I draw and get only two men, but I place them below the line ready for battle and feeling hopeful that my next draw will make my army larger than Winifred's. She draws and gets only two men, whom she places ready for action while I make my second draw and win five. Again Winifred draws and gains four. Now her line of battle is ten times two times four. I draw another two and my men stand two times five times two. At a glance you see that she has beaten me in number but we fight the battle to see how many of her men I can kill. My first battalion of two advances against her ten and is wiped out of existence though reducing the ten to five. Then she uses this five to kill my five but they die in battle. My two march against her two and both fall, but she has still four men remaining and so Wellington has won another Waterloo. This is how the battlefield is arranged:

5

10x2x1 Wellington's men =4

2x5x2 Napoleon's men =1

This is really a very interesting game for all children to play.

The only difficulty may be that the children will argue that Napoleon had not one, but no man left. That "cancellation" reduces the cancelled numbers to the value of one is one of those mathematical axioms which it is almost impossible to explain to children. Of course, 4 divided by 1 is still 4, and the children will have to be satisfied with this, just as we older ones will have to take Einstein's theory of relativity on faith. If the position of the forces had been reversed, so that ¼ had been the result, the explanation would perhaps be easier.

Fractions. When once the idea of fractions is understood, their manipulation is relatively easy. In common fractions, the only puzzling thing seems to be their multiplication and division. But it can be made plain in something like this manner:

Suppose the problem is to find ½ of ¾. Let the child understand ¾ means 3 *fourths*, that is to say three definite things. "*Fourths*" is really a denomination. As we would say, ½ of 3 apples is one and one-half apples, as ½ of three is one and one-half, so we have here ½ of 3 fourths = one and one-half fourths. Now we know that one-half of one-fourth is one-eighth; so we have as an answer, one-fourth and one-eighth. To express this in one quantity we remember that one-fourth = two-eighths; thus, by adding, we have ⅜ plus ⅛, or ⅜. Consequently ½ of ¾ is ⅜. Let the child fully understand each step. He will then joyfully appreciate the discovery that there is a short cut to the finding of the answer, namely, that we merely multiply. Thus:

$$\tfrac{1}{2} \text{ of } \tfrac{3}{4} = \frac{1\text{x}3}{2\text{x}4} = \frac{3}{8}$$

This is *multiplication of fractions*; the problem can also be written in this manner: ½x¾=⅜, or better: ¾x½=⅜, just as we would write ½ of ½ apple=¼ apple, or ½ apple x ½=¼ apple.

In *division of fractions*, we may argue in this form.

⅚÷⅙ means: how many times is ⅙ contained in ⅚; obviously 6 times.

This is the same as, with inverted divisor:

$$\frac{6\text{x}6}{6\text{x}1} = \frac{36}{6} = 6.$$

How many times is ⅔ contained in ¾?

The same as: ¾÷⅔. ¾=9/12; ⅔=8/12. 9/12 is contained in 8/12 one and one-eighth times, or 1⅛.

Short cut process:

$$\frac{3\text{x}3}{4\text{x}2} = \frac{9}{8} = 1\tfrac{1}{8},$$

by inverting the numerator and denominator of the divisor and multiplying.

Decimal Fractions. These can be most easily introduced through a previous manipulation of U. S. money. The division of the dollar into 100 cents forms the basis. There is not a child that will not at an early age become interested in money. The toy stores sell toy money in boxes, representing on card disks of corresponding sizes and with the denominations printed thereon, the various divisions of the dollar. For later exercises in buying and selling, in connection with store-keeping, such as has been elaborated by the "Model Store" movement (Educational Foundations, Brooklyn), it can be used to advantage. But young children are not interested in it; they want the real coins, and want to buy real things. They soon learn to manipulate pennies, nickels and dimes. Then they will understand the quarter, and that four quarters make one dollar. Out of practical experience in making change they will learn to master the rudiments of the decimal fraction idea, and will be more ready to transfer their knowl-

edge to decimal fractions in the abstract, or in application to other values. The same is true of *percentage*. Just as 25 cents are $^{25}/_{100}$ of a dollar, or a fourth (a quarter) of a dollar, the sum represents 25 per cent of the same amount. 10 cents is ten per cent, or 10%. And so on. The child will easily learn to add, subtract, multiply and divide decimal fractions. Indeed, he will find it much easier to manipulate them than the so-called common fractions, and will hope for the time when all our measures of length, distance, liquids and dry stuffs will be of the centigrade order.

The teaching of *time* is a slower process than one would imagine. But when the child has learned the divisions of circular objects, there will be an early opportunity to teach him at least the hours, and their main divisions. The recognition of minutes comes much later.

Area and *bulk* are best introduced through the kindergarten blocks and tablets. By arranging squares, especially if they have a definite size corresponding to the measuring standards in use (inches, feet), the first problems in area can be understood by the child. He will learn without diffculty that a one-inch square covers one square inch of surface; but if there is an area twice the length and twice the width, he needs four squares, in other words, that with a two-inch width and a two-inch length, he needs four one-inch squares to cover four square inches. And so on. He will also learn to appreciate *scale*, substituting feet of a real room for the inches of his drawing on the paper, and learning gradually the significance of map-drawing to a scale.

ARITHMETIC.—First Steps in Number Training.—Arithmetic in the first three grades is called "number work". It expresses in the simplest way the numbering sense or the counting instinct by which the child first gets hold of quantitive values in his environment. First year number work to the child is largely incidental, though the teacher must have definite aims and purposes. The simplest way to get number ideas is to count small groups of similar objects and find "how many" in a group. The mere rhythm of counting is pleasing to children, counting by 1's to 100; by 10's and 5's to 100; by 2's to 12 or 20; by 3's to 12 or 15; count backward by 1's and 10's. Children will have practical use for this knowledge in connection with games, songs, stories, manual work, and in the daily business of the schoolroom and the home. Through rhymes and jingles as in this *Ten Little Indians* song they have the concrete lesson, the physical exercise and the merry game all in a delightful combination.

One little, two little, three little Indians.
Four little, five little, six little Indians.
Seven little, eight little, nine little Indians.
Ten little Indian boys.

Ten little, nine little, eight little Indians.
Seven little, six little, five little Indians.
Four little, three little, two little Indians.
One little Indian boy.

Games in great varieties may be arranged that will bring into exercise this number sense and the delight of dramatization.

Reading and writing numbers may be taught the first year to one hundred and the second year to one thousand. Make practical use of numbers taught, as finding pages of books, numbers of houses, etc. The teacher must always study her class and suit her pace to theirs.

Teach various forms expressing number relations, as: Three and three are six. Six divided into twos are three twos. Three twos are six. Six less three are Three. Two threes are six. One-third of six is two. Six divided into threes are two threes. Two-thirds of six are four.

With the operation teach also the appropriate sign as +, —, =, ×, ÷.

Appropriate combinations for drill should be presented after the child has formed a concrete image of the number relation. He should see one-half and be able to think one-half before he is asked to repeat the statement that one-half of six is three.

Developing the Idea of Fractions.—Children easily grasp the idea of fractional parts, but the teacher should keep in mind the completeness of the fractional idea, as Professor David Eugene Smith in his monograph on the teaching of arithmetic has pointed out in the following illustration: "We should remember that a fraction, say ½, is commonly used in three distinct ways, and that it is our duty to see that little by little all these become familiar to the child. These ways are as follows: 1. ½ of a single object, the most natural idea of all, the breaking of an object into 2 equal parts. 2. ½ as large, as where a six-inch stick is ½ as long as a foot rule, not half of it, but half as long as it is. This is essentially the ratio notion, and it is necessary to the child's stock of knowledge, but it is not necessary to make it hard by talking about ratios at this time. 3. ½ of a group of objects, as in case of ½ of 10 children."

New Facts and Processes.—Whenever new facts and processes have to be learned they should be learned in comparison with known facts. The child should handle and measure and be the aid of drawing get graphic representation of mathematical relationships. Use different magnitudes. Do not neglect to follow up with abstract drill work. Drill, fix, learn. Abstract drill work may be made as interesting as concrete, for all the joy of the game element in education may be made to enter into it.

Seat Occupation for Number Work in Primary Grades.—Devices for making number work practical have been worked out in great abundance. Every resourceful teacher has devices of her own. A few have been gathered here as suggestions.

Make pasteboard rulers 4 inches long, a foot long. Mark off into inches. Later mark off into fractions of an inch. Use these rules in measuring many things. Compare lines, surfaces and solids, with similar lines, surfaces and solids, as: This line is three times as long as that line. This line is one-fourth as long as that line. This rectangle is one half that rectangle. Find lines and surfaces in the room, and compare. Teach the child to see many things through the one. Unless that which he sees aids him in interpreting something else his observation is of no use to him. Cut, fold, paste paper furniture according to directions. Paint flags or cut badges of paper for holidays.

Rule lines, squares, oblongs to dictation and scale, sheets for weather record, record sheets, score cards for games. In all construction children should make the necessary computation to get total lengths and beaths and effect of any allowances, *e. g.*, laps in making boxes, for cover of a box compared with the box itself.

Have children measure each other, measure the growth of twigs, make comparisons in weights and measures. Arithmetic of a very practical kind is found in nature study, manual training, and in sewing and cooking. Boys and girls in industrial courses must measure and weigh with accuracy and skill.

Construction work when properly taught affords the finest mental discipline. Let children work out their own knowledge and make them personally responsible for their own results. Encourage them to tell what they know in free conversation. Such free work is far more valuable than formal recitation.

Test-Book.—A text-book is usually placed in the hands of pupils as early as the second half of the third year. From this time on the teacher follows the outlined course of study. Each year she must see to it the class thoroughly reviews the essential features of the preceding year's work and that such forward steps as are marked out for her grade be intelligently taken. Each year the work involves more difficult combinations and more complicated processes. The exact groundwork to be covered grade by grade differs in different schools according to the course of study outlined by different boards of education, but everywhere the essentials of class work are the same.

Class Work.—Cultivate the habit of first grasping the conditions of a problem, what is given, what is required, the relations between the two, the solution. Dictate original problems. Call for restatements of facts and conditions. Let pupil state process without solving. Dictate work slowly and distinctly without repeating. Demand close and lively attention. Call for original problems to illustrate principles. Secure familiarity with arithmetical facts and accuracy and ease of language. Typical problems, from Professor Smith's *Monograph*, to which this article is already under great obligations, have been borrowed here to show the nature of original work that may be done in different grades.

Two Groups of Problems Give to a Third Year Class.—

Oral Exercise (without pencil and paper).

1. The coffee for our breakfast cost 6c the potatoes 4c, the meat 32c, and th bread 4c. How much did the bread an meat cost? How much did the food cost

2. The oatmeal for a breakfast cost 8 the milk 4c, the fruit 10c, the rolls and bu ter 5c, and the eggs 8c. How much d this food cost?

3. For a dinner the meat cost 30c, t vegetables 20c, the dessert 20c, the coff 15c, and the other food 15c. Find the to cost.

4. The meals for a small family c $1.70 on one day and $2.20 on another d How much did they cost for these two da

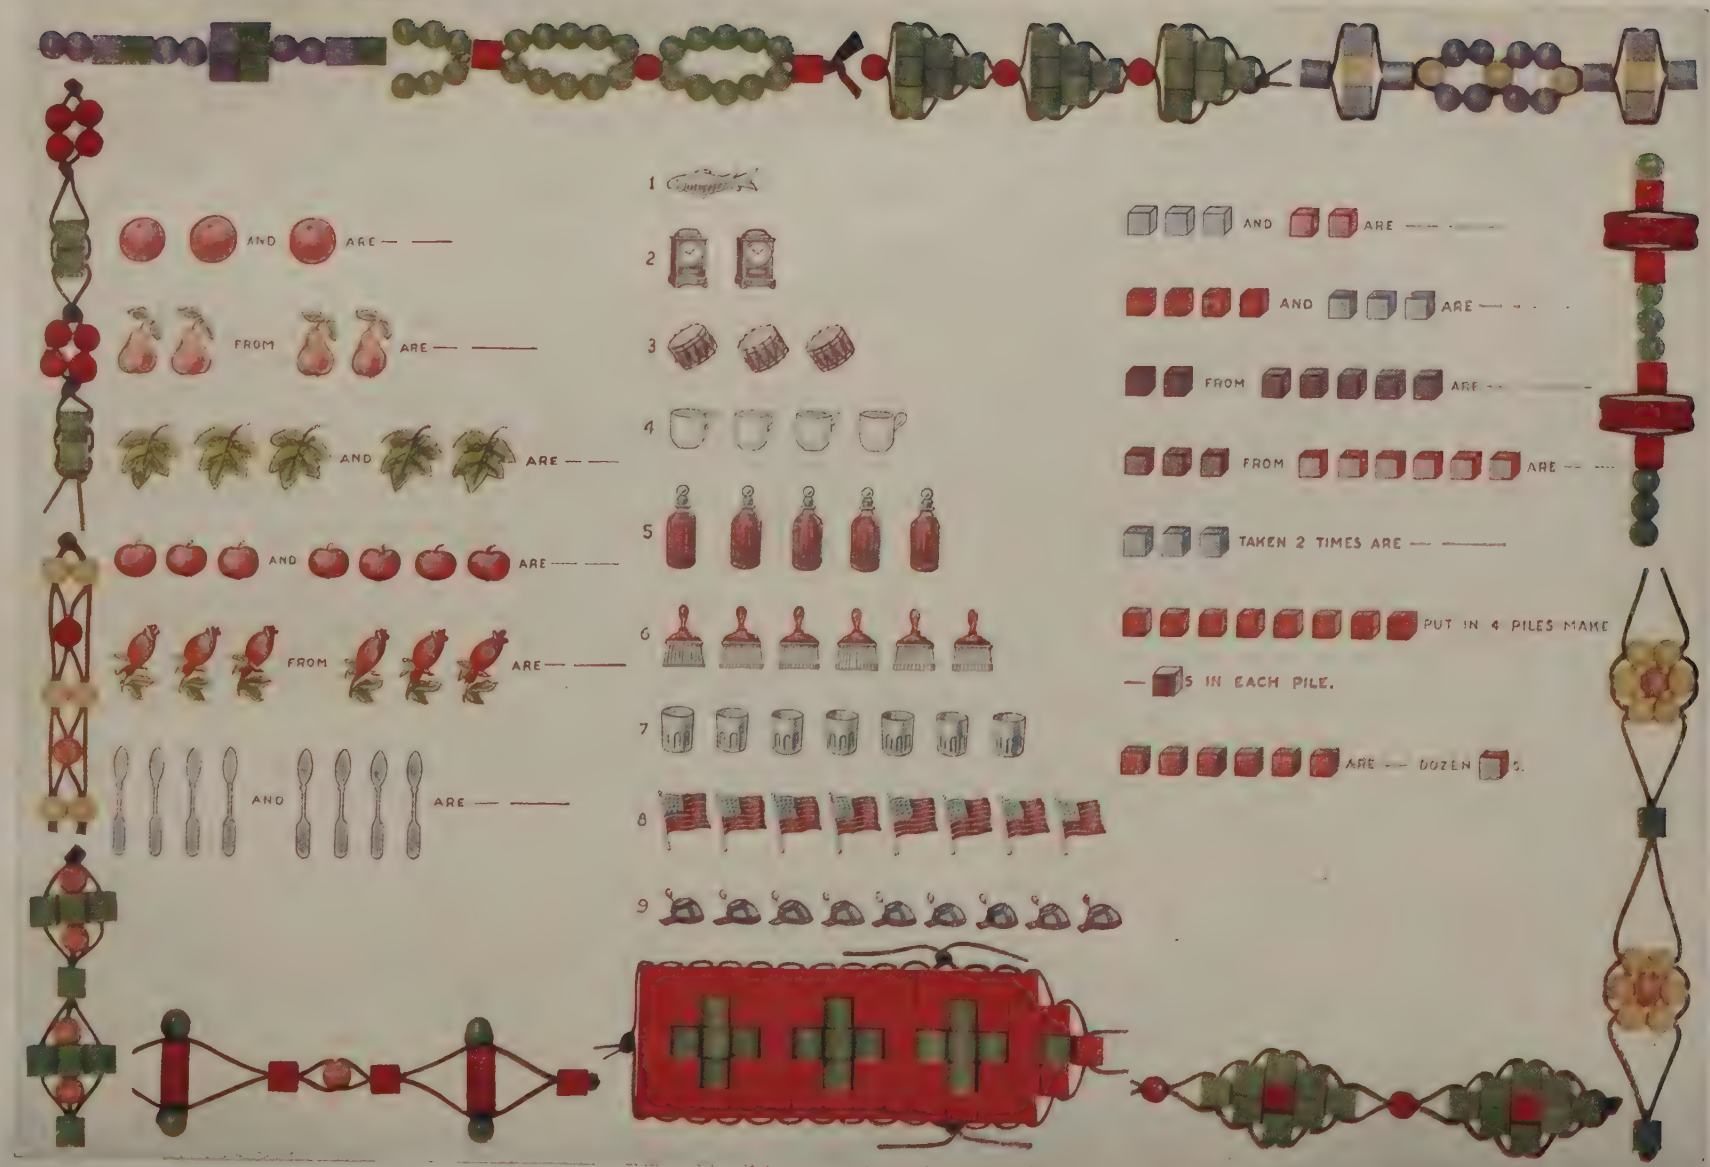
Written Exercise.—The toad is one of ma best friends. One toad will keep a gar of 800 sq. ft. free from harm insects.

1. At this rate, how many toads wo protect from insects a garden 80 ft. w and 100 ft. long?

2. The eggs of four toads were cour and found to be 7,547, 11,540, 7,927, 9,536. How many were there in all?

3. If one out of 50 hatched, how m hatched? (Divide all by 50.) If of these were destroyed by other anim how many survived?

4. If each of these survivors destroy sects that would cause $10 worth damage, how much are they all worth village?



Copyright, 1916, by the W. E. Richardson Company

OBJECTS AND DESIGNS FOR PRIMARY NUMBER AND BEAD WORK

Typical Problems for the Fourth or Fifth Grades.—1. Sarah's mother bought 4⅕ yds. of cloth for a coat, at $1.25 a yd. What did she pay for it?

2. She also bought 3½ yds. of lining at 50c a yd. and 4¼ yds. of braid at 20c a yd. How much did these cost?

3. She also bought 6 pearl buttons at $1.50 a dozen, and 2 spools of silk at 8c a spool. How much did these cost?

4. A dressmaker charged $5 for making the coat. What did the materials and making cost?

Typical Problems for the Sixth or Seventh Grades.—1. The following is, by weight, a good mixture of seed for a pasture: Kentucky blue grass 25%, white clover 12½%, perennial rye 28⅛%, red fescue ⅜%, redtop 25%. At 32 lbs. to the acre, how many pounds of each are used?

2. A farmer puts 5 acres into celery, setting out 20,000 to the acre. The yield being 1,500 doz. heads to the acre, what is the ratio of the plants matured to the others?

3. He pays $95 an acre for seed, fertilizer, labor, and other expenses, and sells the crop at 15c a dozen heads. What is his profit on the 5 acres?

An outline of the course in arithmetic in the eighth school year in Munich will show how the German schools are working out some practical ideas for girls who are soon to be the home makers. It is more complete than anything we have yet worked out in America.

The work for the year is as follows: 1. Simple domestic bookkeeping. 2. Calculation of the prices of foods, bought in large or in small quantities, together with the question of discounts. 3. Cost of meals for the home. 4. Daily, monthly, and yearly supplies for the kitchen.

Too much importance cannot be placed upon the nature of the original problems. They enliven class interest and give ample opportunity for correlation with other school subjects and with the livelier interests of the social environment. They should strain the powers of the child to think and compute, but they should not be too hard for him to master them independently. In every way problems should help the teacher to make school work practical.

Summary of Suggestions for the Teacher of Arithmetic.—1. There are a few things primarily essential in arithmetic that should be learned by every child. He should think in numbers as readily as he thinks in other subjects. He should be ready to execute his thought with quickness and precision.

2. Drill and repetition for accuracy and speed should be given day after day that the child may early master the mechanical difficulties of the subject, but drill should not become a lifeless mechanical repetition; it should be so varied as to produce thought and animation.

3. Such processes as addition, subtraction, multiplication, and division should be mastered early. Often much time is wasted in the upper grades learning facts and processes that should have been mastered in the lower grades when the child is passing through the stage in which this work can be done most easily.

4. The introduction of too many topics at a time should be avoided. The pupil should be required to meet but one difficulty at a time.

5. Begin with the concrete, then drill on number facts and processes. In the primary grades teach number facts for the most part in connection with the study of other subjects. Use material drawn from the number side of school experience and the simpler and more evident relation of home life. The continued use of any particular set of objects is tiresome and narrowing.

6. It is important to use objects freely whenever they assist in understanding number relations, but care should be taken not to fetter the mind with objects when it is ready for the abstract. Pass from observation to reasoning, from concrete to abstract, from facts to principles, from particular to general, and, very slowly, from the simple to the complex. The child passes through the stage of objects to that of representation of objects, to that of symbols. Noticeable progress begins when he can think of things not present to his senses.

7. In the intermediate grades emphasis should be laid upon the scientific aspects of the work, that is, rules and principles, in order to secure mastery of fundamental operations of numbers.

8. In the grammar grades considerable attention should be paid to the use of numbers in connection with the commercial and industrial activities of the community. Practical problems for all grades should be taken from industrial life.

9. In the working out of problems the child should be taught from the beginning to determine for himself the approximateness of results, appeal being made to the common sense check "Is this result reasonable?" "Does it agree with the conditions?"

10. Problems of graded difficulty should be given in all classes in order that even the weakest pupil may find enough that he can do to keep him trying. The exercise should bring in all the primary combinations of numbers and all the fundamental processes. The tendency to overuse a few combinations at the expense of others must be guarded against.

11. The teacher must exercise judgment as to the amount of written work. Oral expression should always precede written. In primary grades number work is largely given orally—good, clear, well worded expression. A little work well done is much better than a large amount of work over-hurried.

12. Insist upon neatness and a proper statement of steps taken.

13. Accuracy, facility, orderly arrangement, self-reliance, are cardinal virtues in number work.

14. In the assignment of work, assign some purely for drill and some purely to train the reasoning powers. If reasoning is difficult, mechanical processes should be simple.

15. Aim to obtain efficiency through the discipline of numbers. "The prime desideratum," it has been said, "is the ability to work accurately, with reasonable rapidity and with interest, and to know how to apply numbers to the ordinary affairs of life." There is moral value in the integrity of numbers that "cannot lie."

PRACTICAL HELPS IN ARITHMETIC

ADDITION AND SUBTRACTION

The following plan is suggested in teaching the combinations in addition and subtraction:—

1. Add **1** to every number up to **10**; later to **20**.
2. Subtract **1** from every number up to **10**; later to **20**.
3. Add

2	3	4	5	6	7	8	9	10
+2	+3	+4	+5	+6	+7	+8	+9	+10

Here the addends are equal and easily added. The figures should be placed as above and not 2+2, 3+3, etc., because the vertical form is the natural one which the child will use all through life. It does not look so formal and represents better what he really does with the objects.

4. Add

1	2	3	4	5	6	7	8	9
+2	+3	+4	+5	+6	+7	+8	+9	+10

Here one addend exceeds the other by **1**.

5. Subtract

2	3	4	5	6	7	8	9	10
−1	−2	−3	−4	−5	−6	−7	−8	−9

Here the minuend is **1** greater in each case.

6. Teach the parts of **10**.

5	2	3	4	9
+5	+8	+7	+6	+1

7. In adding **9** to numbers have the child think of **9** as **10**

thus $9 + 6 = 10 + 5$ and $9 + 8 = 10 + 7$

8. Teach the corresponding subtractions.
9. Add **8** to each number up to **10**.
10. Teach the corresponding subtractions.
11. Add **7**, **6**, and **5** to each number up to **10**.
12. Teach the corresponding subtractions.
13. Review and give combinations not taught above.

Note.—Objects should be grouped by tens and units, in showing numbers above **10**. The numbers written should represent objects counted.

The Forty-Five Facts of Addition

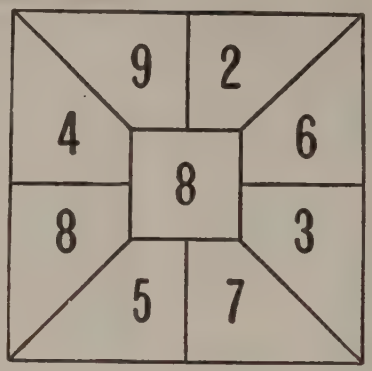
1	2	2	3	3	4	3	4	5
1	1	2	1	2	1	3	3	1
2	3	4	4	5	5	6	6	6
4	5	6	4	5	6	7	5	6
3	2	1	4	3	2	1	4	3
7	7	7	8	8	8	8	9	9
7	8	5	6	7	8	9	6	7
2	1	5	4	3	2	1	5	4
9	9	10	10	10	10	10	11	11
8	9	6	7	8	9	7	8	9
3	2	6	5	4	3	6	5	4
11	11	12	12	12	12	13	13	13
7	8	9	8	9	8	9	9	9
7	6	5	7	6	8	7	8	9
14	14	14	15	15	16	16	17	18

Note.—Be sure that the nine facts underscored are thoroughly learned. They give most trouble.

Drills in Addition

Draw on a sheet of paper a large square and a circle. Divide them like these. Put, say the figure 8, in the center with the other numbers around it.

Write any figure in the center where the 8 is. Then drill, by pointing to the figures around it, while the child names at once the sum of the center figure and the one pointed at.



Use exercises like this frequently, and give many problems, using the combinations with which you find the child has difficulty.

Exercises in which the child counts by 2's, by 3's, etc., to 100 are valuable.

Proving Addition

You may early teach how to prove an addition. There are a number of ways of doing this. Use the way the child's teacher uses. It is a good way.

One Way

Add the columns down. If the result is the same as when the columns were added up, the result is correct.

Second Way

Write the numbers in two groups. Find the sum of each group. Add the sums of the two groups. If the result is the same as when the numbers were added in one group, the result is correct.

Illustration of second way:—

273 }	——	273	
456 }		456	
		729	729
629 }	——	629	
384 }		384	
1742		1013	1013
			1742

The Accountant's Proof

This is a modification of the plan called *casting out the nines.*

Illustration

7926—24—6	
4356—18—9	
1824—15—6 +	} 31—4
9263—20—2	
7856—26—8	
31225—13—4	

Explanation

First add the columns in the regular way. Add each column horizontally, left to right. The results are 24, 18, 15, etc. Add these horizontally and you have 6, 9, 6, etc.

You have now reduced all to one column. Take the sum of this column. It is 31. This added horizontally is 4.

Add the sum 31225 horizontally until you have but one figure in it and you also have 4. This proves your answer correct.

Another Illustration

This illustrates where it is necessary to carry the horizontal additions a step further:—

986745—39—12—3	
726324—24— 6—6	
916348—31— 4—4 +	} 16—7
992973—39—12—3	
3622390—25— 7—7	

Note.—With some practice it will be necessary to write the last line of figures only.

Rapid Adding Exercises

When pupils have learned to add they quickly acquire skill by an occasional rapid adding exercise. A few minutes serves the purpose.

It may be made competitive by each pupil writing the numbers and at a given signal beginning the addition.

Slow and correct work is preferable to rapid work that is incorrect. Incorrect work is of no value here.

Civil Service Method of Adding

Employees under the civil service bureau, bank clerks, and others who perform additions while surrounded by people engaged in conversation, use the following method in their additions.

This method is safe because one can detect and change an error very quickly.

$5280	16
9760.50	21
349	19
4006.75	23
6522.89	18
132.12	24
	$26,051.26

The Banker's Method of Adding

This method is the same as that used by the civil service employees, with one change. In adding the columns the number carried is "added in" to each partial sum.

$5280	16
9760.50	22
349	21
4006.75	25
6522.89	20
132.12	26
	$26,051.26

The banker's method is an improvement on the civil service method as it does not require a second addition. The number to be carried is always in sight in the banker's method, being the tens figure of the last partial sum written. The sum can be written at once.

SUBTRACTION

The differences of all these combinations should be learned so thoroughly that the pupil will be able to name difference of any combination *on sight.* This will take time, but it is time well spent.

Use devices similar to those used in the drills on the addition table.

Give many problems for oral work. Let the pupil make many problems and give the difference in each case.

Combinations in Subtraction

1	2	3	4	5	6	7	8	9	10
−1	−1	−1	−1	−1	−1	−1	−1	−1	− 1
—	—	—	—	—	—	—	—	—	—

—	—	—	—	—	—	—	—	—	—
10	11	12	13	14	15	16	17	18	19	20
−10	−10	−10	−10	−10	−10	−10	−10	−10	−10	−10
—	—	—	—	—	—	—	—	—	—	—

The Computer's Method

In making change, the method below is nearly always used. Computers find it the more practical way. It gives greater rapidity and accuracy than the other method.

Many of the best teachers use it alone in teaching subtraction.

This plan is called the Austrian method by some.

Example

Find the difference between 725 and 432.

Work:

725	*Explanation*
432	Let the pupil imagine he is adding with the sum written above.
293	He inserts the missing figures to form the sum as he works, 3, 9, 2.
	He thinks of 2 and 3 as 5; 3 and 9 as 12; 5 and 2 as 7. He may talk it this way: 3 and 2, 5; 9 and 3, 12; 3 and 4, 7.

Use that method with these examples:—

	42,936	2034	7825	6243
	−17,245	−1456	−1504	−1428
	25,691	578	6321	4815

Note.—With practice the pupil will come to prefer this method and should be helped in its use. It is practical since conducive to both *rapidity* and *accuracy.*

Proofs of Subtraction

To prove a subtraction *add* the *subtrahend* to the *remainder*. The result will be the *minuend* if the work is correct.

Example	*Proof*
425 *minuend*	173
—173 *subtrahend*	252
252 *remainder*	425

425 is the same as the minuend, hence the work is correct.

Another Proof

Take the *remainder* from the *minuend*. If the work is correct the subtrahend will be left.

If in the last example given we write

425
—252

we get 173, which is the subtrahend used above, hence the work is correct.

Note.—Either proof may be used. Show the child why these two proofs are true. Use small numbers to do this like 7—2. Later use larger ones.

NUMBER STORIES IN MULTIPLICATION

Example

3 × 4 = —

Facts Given by Child

3 × 4 means 3 4's.
I count my blocks by fours—I take 1 four, another, another.
I find that 3 4's are 12.
3 × 4 = 12.

To the Teacher

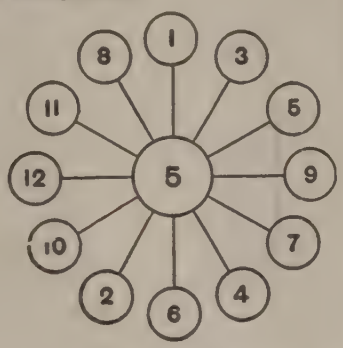
Now the child is ready to give a number story about 3 × 4.

Note.—If the pupil is in doubt about any part of the work in number stories, he should use objects, and then practice much without them.

Drills in Multiplication

The drill opposite is very good and effective, if a rapid answering exercise is made of it. Products should be given at once.

To vary it use squares.



Draw a diagram like this one and let the pupil fill in the squares with the proper products. Fix a time limit. Have results put in quickly.

1	2	3	4	5	6	7	8	9
2								
3								
4						28		
5								
6								
7					42			
8								
9								
10								

4 X 1 = 4
4 X 2 = 8
4 X 3 = 12

7 X 1 = 7
7 X 2 = 14
7 X 3 = 21

Make diagrams like these, and let the pupils fill them in.

In this work it is not intended that the pupil should at first learn "his tables" in order, the 2's first, then the 3's, then the 4's, etc. He remembers many of the facts of multiplication from his primary work in numbers. These drills are to complete and fix firmly in the pupil's mind the completed multiplication tables.

Proofs in Multiplication

The Multiplication	*The Proof*
42	25
×25	×42
210	50
84	100
1050	1050
123	475
×475	×123
615	1425
861	950
492	475
58,425	58,425

The proof consists merely in reversing the positions of the multiplicand and multiplier, and performing the multiplication in the usual way. If the product is the same in both cases the work is correct.

PRIMARY IDEAS OF DIVISION

In teaching the two ideas of division—division by measurement (division proper) and the fractional idea of division (partition)—proceed very slowly and see that each step is thoroughly understood.

The following suggestions may be useful:—

Division by Measurement

Use colored blocks or any other counters in illustrating the process.

Example

4)12

The teacher should ask the child, "How would you count this story?"

Facts Given by Child

12 = whole number of blocks.
4 = number in each part.
We want to know the number of parts.
We place the blocks so, 4 in each part:—

There are 3 parts.

Division by Partition

Make use of colored blocks or substitutes to show the process here.

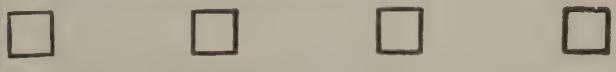
Example

¼ of 12 = 3

The teacher should ask the child, "How would you count this story?"

Facts Given by Child

12 = whole number of blocks.
4 = number of parts.
We want to know the number in each part.
We place the blocks so, as we know there are 4 parts:—



We have put one in each part.
Now we will put one in each part until the 12 blocks are gone:—

There are 3 in each part.

The Three Uses of Division

First Use Explained (Partition)

What is ¼ of 24 cents?

Here 24 cents is the sum of money to be divided. It is to be divided by 4. The result shows the size of each part.

Number of equal parts 4) 24c money to be divided.

6c size of each part.

Second Use Explained (Division by Measurement)

How many times is 8 cents contained in 32 cents?

Here 32 cents is the sum of money to be divided. The size of each part is 8 cents, and the result gives the number of equal parts.

Size of each part 8c) 32c money to be divided.

4 number of equal parts.

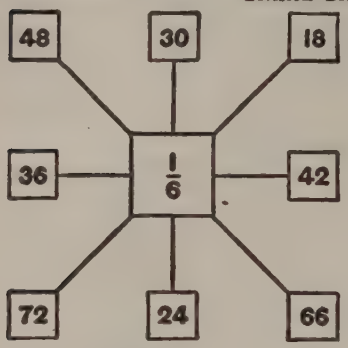
Third Use Explained (Ratio Idea)

There are 36 acres in one lot and 9 acres in another. The first lot is how many times as large as the second?

From division we know that 36 acres contains 9 acres 4 times. Then 36 acres is 4 times as large as 9 acres; or, 36 acres is to 9 acres as 4 acres is to 1 acre.

Note.—This on the ratio idea leaves the impression that the other work does not embrace the ratio principle. Any comparison of numbers embraces the ratio idea.

Division Drills



It is well to use drills of different kinds to help fix the facts of the division table in mind. At no time, at this stage, are you sure that the pupil remembers from one day to the next.

Diagram drills are given here as suggestive of what may be made use of. Use other numbers in order to get drill on the whole division table.

Be sure to make the drill work brisk and of short duration.

The Drill

The teacher points to any of the numbers in the small squares and the child answers simply the quotient number. Skip about rapidly. Draw the same diagram on the blackboard and frequently change the fraction in the center square.

The Drill

Allow no "thinking out" of results. The child should have the table at his tongue's end.

Change center fraction repeatedly.

The supreme test of his mental activity is to think quickly and tell correctly.

Proofs in Division

The best way to prove work in division is to multiply the quotient by the divisor and add the remainder, if there is one.

The result will equal the dividend if the work is correct.

Example

Divide 600,181 by 937.

Work

$640\frac{501}{937}$

937)600181
5622
3798
3748
501

Proof

640
937
4480
1920
5760
599680
501
600181

READING NUMBERS

When we spell a word, that is, when we read the letters in the word, we read from *left to right.*

To read a number we do the same thing for we read the figures from left to right.

325 is read "three hundred twenty-five."

The number is read differently if we wish to tell the *place* and *value* of a certain figure, for then we read the figures themselves from *right to left.* thus—

325 means 5 units, 2 tens, 3 hundreds.

Never use "AND" in reading whole numbers.

325 should never be read "three hundred and twenty-five," but "three hundred twenty-five."

Numbers between 100 and 1000 are read by naming the hundreds, tens, and units in succession. Thus—

192—one hundred ninety-two.
652—six hundred fifty-two.
207—two hundred seven.

Above 1000

Read 1,892,632.

Here the 2 represents 1's, or units of the *first order.*
the 3 represents 10's, or units of the *second order.*
the 6 represents 100's, or units of the *third order.*
the 2 represents 1000's, or units of the *fourth order.*
the 8 represents 100000's, or units of the *sixth order*, etc., etc.

The order of any figure is the number of its place, starting from the right.

In reading large numbers we arrange the orders into groups of three figures each.

We call each group a *period.* Commas are used to keep the periods separate.

Names of the Periods

units,	billions,	quintillions,	octillions,
thousands,	trillions,	sextillions,	nonillions,
millions,	quadrillions,	septillions,	decillions.

trillions	billions	millions	thousands	units
225,	902,	302,	472,	399.

FACTS ABOUT ROMAN NUMERALS

The following facts about the origin and development of Roman notation can be made very interesting, and will tend to fix the characters in one's mind—

At first one	was written	I,
two	was written	II,
three	was written	III,
four	was written	IIII,
five	was written	IIIII,
six	was written	IIIIII,
seven	was written	IIIIIII,
eight	was written	IIIIIIII,
nine	was written	IIIIIIIII.

It took too long to make ten marks, and too long to count them after they were made, so one mark with another across it was used to denote 10, thus **X.** The upper or first half of the **X**, or **V**, was used to show 5.

At first twenty	was written	XX,
thirty	was written	XXX,
forty	was written	XXXX,
ninety	was written	XXXXXXXXX.

It took too long to make the crosses and too long to count them in reading, so **C** was used to show 100. Half of the **C** or **L** was used to show 50. The **C** gradually became **C** in trying to make the **E** rapidly.

Write these where the child can see them plainly

I = 1	XX = 20	XXXIX = 39
II = 2	XXI = 21	XL = 40
III = 3	XXII = 22	XLI = 41
IV = 4	XXIII = 23	XLII = 42
V = 5	XXIV = 24	XLIII = 43
VI = 6	XXV = 25	XLIV = 44
VII = 7	XXVI = 26	XLV = 45
VIII = 8	XXVII = 27	XLVI = 46
IX = 9	XXVIII = 28	XLVII = 47
X = 10	XXIX = 29	XLVIII = 48
XI = 11	XXX = 30	XLIX = 49
XII = 12	XXXI = 31	L = 50
XIII = 13	XXXII = 32	LX = 60
XIV = 14	XXXIII = 33	LXX = 70
XV = 15	XXXIV = 34	LXXX = 80
XVI = 16	XXXV = 35	XC = 90
XVII = 17	XXXVI = 36	C = 100
XVIII = 18	XXXVII = 37	D = 500
XIX = 19	XXXVIII = 38	M = 1000

PRIME NUMBERS

Some numbers, like 3, 5, 11, etc., can only be divided by themselves and unity. As they cannot otherwise be factored, we call them *prime numbers.*

Prime Numbers from 1 to 1000

(*Use This Table for Reference*)

1	59	139	233	337	439	557	653	769	883
2	61	149	239	347	443	563	659	773	887
3	67	151	241	349	449	569	661	787	907

53	137	229	331	433	547	647	761	881	

SIMPLE MEASURES—For the Child to Learn Objectively

2 pints make 1 quart.
8 quarts make 1 peck.
4 pecks make 1 bushel.
7 days make 1 week.*
16 ounces make 1 pound.
12 inches make 1 foot.
3 feet make 1 yard.
12 things make 1 dozen.
5 cents make 1 nickel.
10 cents make 1 dime.

LONG MEASURE

Teach the child to estimate distances and then to verify every estimate by actual measurement.

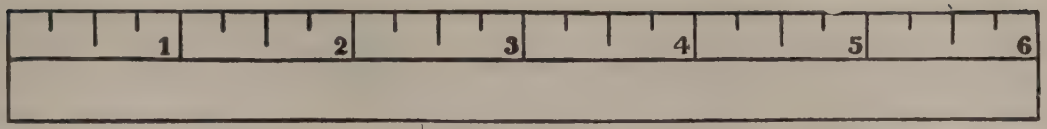
Teach half inches as well as inches.

For the Child to Do

1. Cut a strip of paper 12 inches long and 1 inch wide.
2. Mark the inches on it.
3. How many inches long is it?
4. What do you call a measure 12 inches long?
5. Draw a line 2 inches long, as near as you can, without using a ruler
6. Measure it with a ruler. Did you guess nearly right? Try again.
7. Measure this page. How long is it? How wide?
8. Draw a line on the ground 1 yard long.
9. ½ of a foot is how many inches?
10. 1 yard is how many inches? What is measured by the yard?

*Objectively so far as pointing it out on a calendar.

11. Ask your mother how many yards of cloth she needs for a dress.
12. What is measured by the foot?
13. How tall are you?



PRIMARY IDEAS OF TIME

Turn to the paragraph on Roman numerals and note the facts about them.
60 minutes make 1 hour.
12 hours make 1 half day.
24 hours make 1 day.

A new day begins at midnight and lasts until next midnight.

One hour after midnight is 1 o'clock, 2 hours after midnight is 2 o'clock, and so on, until 12 o'clock at noon.

At noon one-half the day has gone and we begin the afternoon, which is the last half of the day.
One hour after noon is 1 o'clock, 2 hours after is 2 o'clock, etc.

If a person says he was at a certain place at 2 o'clock, he must say forenoon or afternoon, so we will know which half of the day he means. If it was 2 o'clock in the morning he would write 2 a. m., and if 2 o'clock in the afternoon, 2 p. m.

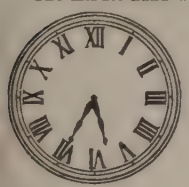
How to Teach a Child to Tell Time

First—Teach him to tell the hour hand from the minute hand.
Next—Teach him when he first looks at the dial, to find the hour hand and then notice which Roman numeral it is nearest. *This will tell about what time it is.*

Then—Find the minute hand. *The minute hand will tell exactly what time it is.*

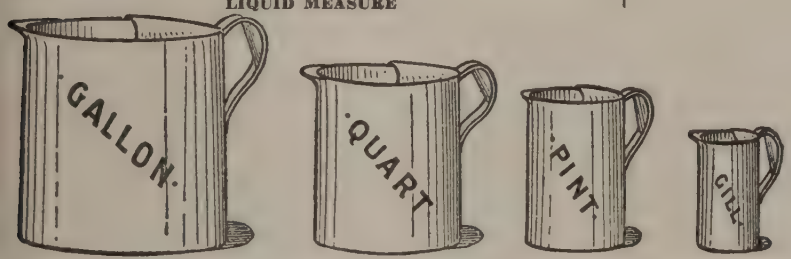
To Illustrate

Take this clock. The hour hand is near the Roman numeral II, which stands for 2. Tell the child it is somewhere near two o'clock.
The minute hand will tell *how near.*



It must always point to the XII before it is exactly the hour. If it is one numeral away from the XII, toward the left, it is 5 minutes of two. If it is two numerals away to the left, it is 10 minutes of two, etc. If it is one numeral away to the right, it is 5 minutes after two, etc. Proceed in this way and keep at it.

LIQUID MEASURE



If you have quart and pint measures allow the child to empty water from one to the other.

On teaching the table of liquid measure proceed in this manner—

Here is a gill cup. I am going to fill it to see how many gills make a pint. Now I have poured one gill; now two; now three; now four. Is the pint cup full? How many gills in a pint?

Let us prove what you say by pouring the water back. One gill; two gills; three; four. Were we right then?

Let us write what we have just said and proved—

4 gills = 1 pint.

Proceed in this way with the other measures, only let the child do more of the work for himself.

MONEY

Use actual coins in teaching money. Lessons on money should be given frequently after the first year of school life.

Begin by teaching the value of the cent and the nickel, then the dime, then the quarter, then the half-dollar, and then the dollar.

Make problems involving change. Develop the ability to make change rapidly. The child may have some money of his own and he should be taught the comparative values of the coins. The correct method of making change follows.

10 cents make 1 dime.
2 five-cent pieces make 1 dime.
100 cents make 1 dollar.
A quarter of a dollar = 25 cents.
A half-dollar = 50 cents.

$ means dollars and *c* means cents.
A 5-cent piece is called a nickel because it is made of nickel.
A cent piece is made of copper.
The other coins named are made of silver.

HOW TO MAKE CHANGE

First—Name the cost of goods.
Then—Add enough money to make even money.
Last—Add the large coin.

To Illustrate

I bought some cloth for 35c and gave the clerk 50c. Count my change.
How to count it—
35c for cloth
And 5c makes 40c (to make even money)
And 10c makes 50c.

To Illustrate

I buy suspenders for 32c and give the clerk $1. Count my change.
How to count it—
32c for suspenders
And 3c makes 35c
And 5c makes 40c
And 10c makes 50c
And 50c makes $1
} (to make even money)

Note.—Think of it in this way—32c, 35c, 40c, 50c, $1.

THE CALENDAR

Procure a calendar for the child to own.

A good way to make him familiar with the use of the days of the week and month, as found on a calendar, is to ask him to look up and tell on what day of the week the next Fourth of July will fall; Christmas; New Year; his birthday.

Have him distinguish between the day of the week and the day of the month.

1928 August 1928						
Sun.	Mon.	Tues.	Wed.	Thur.	Fri.	Sat.
First Quar. 1st 30th	Full Moon 9th	Last Quar. 17th	1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	New Moon 23d

7 days make 1 week.
30 days make 1 month.

	December

SQUARE MEASURE

How long is each side of the figure opposite?

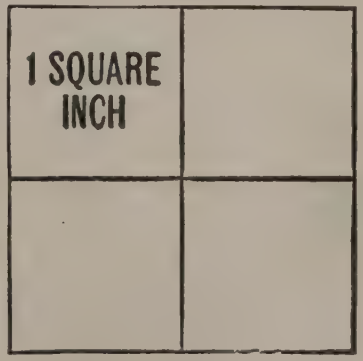
How many squares in the figure?

Because each square is one inch on each side, we call it a square inch.

How many square inches in the whole figure?

The number of squares is called the *area.*

4 square inches is the *area* of this figure.



Show by a drawing how many square inches in a figure 3 in. wide and 9 in long.

Its area is 27 square inches.

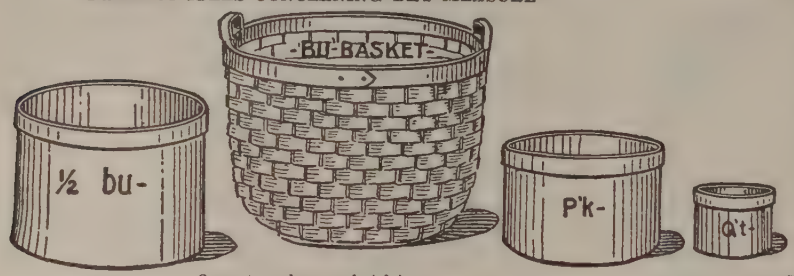
We need not always draw a figure to get the area.

You will notice that the *length times the width will give the number of squares in the figure.*

Find the area of a figure 9 in. long and 5 in. wide, without a drawing. What did you do? *Make a rule.*

Cut out a piece of paper 1 in. wide and 4 in. long. Cut it into square inches. Place the cut squares so as to form a large square. How long is it now? How wide? (*See section on weights and measures for advanced tables.*)

PRIMARY IDEAS CONCERNING DRY MEASURE



8 quarts make a peck (pk.).

4 pecks make a bushel (bu.).

Dry measure is sometimes used to measure dry articles. Formerly grains, vegetables, and fruits of all kinds were bought and sold by dry measure.

Don't teach the child, as most arithmetics say, that grains, fruits, and vegetables are bought and sold by the measured bushel. They are not.

The weight bushel, the case, and the box have come into common use for these articles.

Teach the names of the measures before you attempt to teach the number of one measure in another, etc.

SIMPLE FRACTIONS

A very good method of teaching the combinations in small fractions is by the use of paper or cardboard disks. (Children may call them circles.)

Cut out a large number of them, and, in order to avoid trouble later on, it might be better to have the disks all of one size—about 4 inches in diameter.

Teaching the Fraction $\frac{1}{2}$ with Disks

Say to the child:

I am going to cut this circle into two equal parts. What is this part called? What is this other part called? How many halves in the whole circle? One-half and one-half are what? One-half taken away from one leaves what? If I take a half *two times*, what do I get? How many halves in a whole?

Now I will write these—

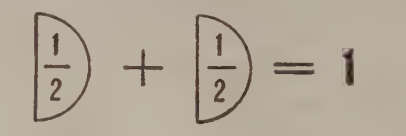
$\frac{1}{2} + \frac{1}{2} =$ 1 divided by $\frac{1}{2} =$

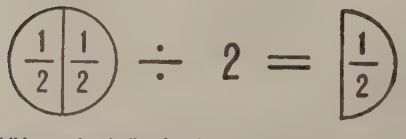
1 less $\frac{1}{2} =$ $1 + 2 =$

$2 \times \frac{1}{2} =$ $1 - \frac{1}{2} =$

Give me the answers and I will write them.

Drawings showing the "placing" of disks for number stories can be made by the child; as,





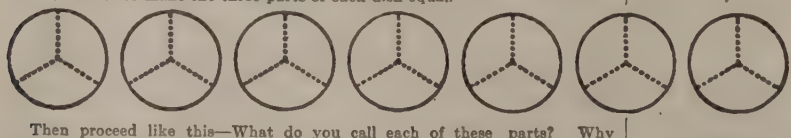
Ask the child to make similar drawings to tell about halves.

Proceed like this— How many halves in a pie? If a pie cost 10 cents, what will half a pie cost? Who can tell other stories about halves? etc.

Teach fourths along with halves.

Teaching the Fraction $\frac{1}{3}$ with Disks

Cut several disks into thirds. Have the child practice on cutting, so that he will be able to make the three parts of each disk equal.



Then proceed like this—What do you call each of these parts? Why are they called *thirds*? How many thirds in a circle? I am going to take a circle and cut it any way, so as to make three parts; do I call these unequal parts thirds? Why not? Let me write one-third on a piece of paper for you. (Write, ⅓.) Draw a circle for me. Instead of cutting it, draw lines where you would cut it to make thirds. Write one-third (⅓) on each third of a circle. I write this (⅓ + ⅓). Who can tell me what the answer is? Are two-thirds and two-thirds more than one? How much more? I have two-thirds of an apple and give Mary one-third, how much have I left? Who can give other story problems about thirds? Everybody try, etc.

Teach sixths along with thirds. Use disks, dots, marks, sticks, and inches to illustrate.

Remember that no advance should be made until each little part is understood.

Teaching the Fraction $\frac{1}{5}$ with Disks

Have fifths compared with fourths, thirds, and halves.

Be sure that the child sees that the number below the line shows the size of each part and the number above how many parts are taken.

Have the child illustrate every step with drawings. If at any time he cannot answer results at sight, let him show the work with disks.

Say to the child·

I am going to cut this circle into five equal parts. What is each part called? How many fifths in the whole circle? How many fifths here? (Show two-fifths.) One-fifth and one-fifth are how many fifths? One less two-fifths is what? If I take three-fifths, how many times one-fifth do I take? How many times one-fifth are left? Are two-fifths greater than one-third?

Give and ask for story problems and number stories telling about fifths.

Teach tenths along with fifths.

When twelfths are taught, show the relations between twelfths and sixths, fourths, thirds, and halves.

Equal Fractions in Different Forms

Have the child see how fractions may differ in form but still remain the same in value.

Begin with his knowledge of smaller fractions, as

$\frac{1}{2}$, $\frac{2}{4}$, $\frac{3}{6}$, $\frac{4}{8}$, and $\frac{5}{10}$ of an apple

Let him show by the use of drawings that fractions may have large or small terms but be equal in value.

Things for the Child to Do

Fill out the numerators in the following fractions and prove each by a drawing:—

1. $\frac{1}{4} = \frac{2}{8} = \frac{4}{16} = \frac{8}{32} = \frac{16}{64}$
2. $\frac{1}{5} = \frac{?}{10} = \frac{?}{15} = \frac{?}{20} = \frac{?}{30}$
3. $\frac{1}{8} = \frac{?}{16} = \frac{?}{24} = \frac{?}{32} = \frac{?}{40}$
4. $\frac{3}{4} = \frac{?}{8} = \frac{?}{12} = \frac{?}{16} = \frac{?}{24}$
5. $\frac{2}{5} = \frac{?}{10} = \frac{?}{15} = \frac{?}{20} = \frac{?}{40}$

PRINCIPLES OF FRACTIONS

1. A fraction's value is the quotient obtained by dividing the numerator by the denominator.

$\frac{6}{2} = 3$ 3 is the value of $\frac{6}{2}$

$\frac{2}{3} = \frac{2}{3}$ $\frac{2}{3}$ is the value of $\frac{2}{3}$

2. Multiplying the denominator of a fraction divides the fraction by that number.

$\frac{1}{2 \times 4} = \frac{1}{8}$ $\frac{3}{7 \times 3} = \frac{3}{21}$ $\frac{2}{3 \times 9} = \frac{2}{27}$

3. Dividing the denominator of a fraction multiplies the fraction by that number.

$\frac{3}{8 \div 4} = \frac{3}{2}$ $\frac{10}{9 \div 3} = \frac{10}{3}$ $\frac{3}{10 \div 5} = \frac{3}{2}$

4. Multiplying the numerator of a fraction multiplies the fraction by that number.

$\frac{2 \times 2}{3} = \frac{4}{3}$ $\frac{1 \times 8}{9} = \frac{8}{9}$ $\frac{5 \times 3}{8} = \frac{15}{8}$

5. Dividing the numerator of a fraction divides the fraction by that number.

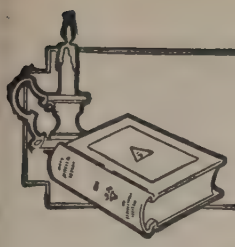
$\frac{4 \div 2}{7} = \frac{2}{7}$ $\frac{12 \div 12}{16} = \frac{1}{16}$ $\frac{3 \div 3}{7} = \frac{1}{7}$

6. Multiplying both numerator and denominator of a fraction by the same number does not change the value of the fraction.

$\frac{1 \times 3}{3 \times 3} = \frac{3}{9} = \frac{1}{3}$ $\frac{6 \times 2}{7 \times 2} = \frac{12}{14} = \frac{6}{7}$

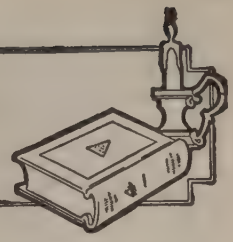
7. Dividing both numerator and denominator of a fraction by the same number does not change the value of the fraction.

$\frac{12 \div 3}{15 \div 3} = \frac{4}{5} = \frac{12}{15}$ $\frac{18 \div 9}{27 \div 9} = \frac{2}{3} = \frac{18}{27}$



Grammar School Arithmetic

George Morrell York, B.A.—Chester J. Terrill



APPLIED ARITHMETIC

In this section, arithmetic is presented in brief form for the aid of the busy student. Special emphasis is placed upon short methods and devices for checking results. Solutions of typical problems and tables are presented for review and aid in solving similar problems in business and school.

ADDITION

Addition is the process of combining numbers into a single equivalent number, called the sum, the amount or the total.

More than nine-tenths of the arithmetical work of a bookkeeper and business man consists in combining or adding numbers. To become successful as an accountant, cashier or clerk it is most essential that the ability to add be developed in a high degree. By constant drill one may become expert in adding units in rotation as follows:

(*A*)	(*B*)
4	42
8	24
2	36
6	72
7	81
27	255

In the above examples the worker simply runs up the columns taking one figure at a time as follows: 4 plus 8 equals 12, plus 2 equals 14, plus 6 equals 20, plus 7 equals 27, or the sum. The same operation would be carried out in the case of problem (*B*) with the exception of *after* obtaining the sum of the first column to the right to be 15, the worker puts the figure 5 under the column and adds the 1 to the next column to the left, making the sum of that column 25 and the total sum 255.

However, this method is slow and cumbersome and no one can hope to acquire great speed in addition who has to depend upon it.

Group Method.—In adding columns of figures it is advisable to group the numbers into totals as one proceeds up and down the columns. In the above problem (*A*): In adding 4, 8, 2, 6, and 7, think of each subtotal as follows: 12 (4 plus 8), 20 (2 plus 6 added to previous sub-total) and 27. The method rests on the ability to group two or more numbers together at a glance:

6 5 4 3 } equals 12
6 7 8 9 }
2 3 4 5 } equals 11
9 8 7 6 }

Thus in adding the following:

(*A*)	(*B*)	
8	3	(*A*) Read instantly the numbers in brackets as: 8, 9, 7, 8, and 7. When combining, read as follows: 8, 17, 24, 32, and 39.
5	5	
9	10 — 2	
2		
7	5	
7	4	
3	10 — 1	(*B*) Process is same as in (*A*) except that three are joined instead of two. Should be read as follows: 10, 20, 27.
8	2	
6		
2	7 — 2	
7	3	
39	27	

This may be carried to almost any extent; *e. g.*,

53 The worker should think in groups
27 of 10, as follows:
— 53, 63, 83, 80.
80

Some bookkeepers regularly add double columns after the above plan, or some variation of it. Thus in adding 56 and 67, he would think 50 plus 60 plus 6 plus 7.

All addition should be checked or tested by one of the following methods:

(*a*) Reverse addition; that is, adding down after adding up.

(*b*) After adding by consecutive numbers or group, check by adding in group by tens.

(*c*) Add the unit column and write the total to one side as in the following example:

3967	
8234	27
7987	32
4372	31
5976	26
30536	30536

The above is obtained by first adding the units' column and writing the sum, 26, to the right. Next add the tens' column and write the sum as shown above. The sums of the hundreds' and thousands' columns, 32 and 27, are written as shown. Beginning with the units' column and adding, the result agrees with that of the problem.

(*d*) Casting or counting out nines. This means add the digits in the number and whenever the sum equals or exceeds 9, discard 9, adding the remainder to succeeding digits.

426—3
824—5
936—0
1542—3
3728—2 check remainder.

Explanation: Take the first number, 426, the excess of the sum of the digits over nine is 3. Doing the same with the remaining digits and dividing by nine, we find the excess or final remainder. The sum of the digits in the sum, 3728, is then divided by nine and we find a remainder of 2. Adding the remainders to the right, the sum is 11. Dividing 11 by 9, we find a remainder of 2. If the final remainder equals the remainder of the sum, the sum may be presumed to be correct.

(*e*) Casting out elevens:

426—6 plus 4 minus 2 = 8
824—4 plus 8 minus 2 = 10
936—6 plus 9 minus 3 = 12
1542—2 plus 5—4— 1 = 2 32
3728—8 plus 7—3— 2 = 10

The sum of 8 plus 10 plus 12 plus 2 is 32, and 32 is two 11s' and 10 over.

Explanation: Find the sum of the digits in the odd places, beginning at units, and from it deduct the sum of the digits in the even places. In case the sum of the digits in the even places exceeds the sum of the digits in the odd places, add 11 to the sum of the digits in the odd places.

SUBTRACTION

Definition.—Subtraction is the process of finding the difference between two numbers.

Minuend, Subtrahend, Remainder, Sign of Subtraction.—In the example, 9 minus 7 equals 2, 9 is the minuend; 7 is the subtrahend, and 2 is the remainder. The sign of subtraction is —.

Use.—"Making change" is the simplest and most frequent use of subtraction in business. It is also used in finding the balance of accounts, finding the bank balance, and in finding profits or losses.

Subtraction is but a phrase of addition. The so-called Austrian or "Making change" method is the one most commonly used in the elementary schools today. It is the process of finding the number to be added to the lesser number in order that the sum may equal the greater.

Illustration:

Find the difference between 742 and 1937.

1937 Add to the subtrahend, digit by
742 digit until the minuend is obtained,
— thus: 2 (subtrahend) plus 5 = 7
1195 (minuend). Write the 5 as a unit difference. 4 (subtrahend) plus 9 = 13 (minuend). Write the 9 in tens' place and add the 1 to the 7 (subtrahend). 7 plus 1 = 8 (subtrahend) plus 1 = 9 (minuend). Write the 1 in hundreds' place of difference. 0 (subtrahend) plus 1 = 1 (minuend).

It is often more practical to place the lesser number above the greater, thus bringing out the process more concretely. The above example might be written:

742
1937
—
1195

MULTIPLICATION

Uses.—Multiplication is continually used in business. Probably it stands next to addition in the frequency of use. For this reason it should be thoroughly mastered by everyone who wishes to become a successful clerk, accountant or business man in any capacity. Very frequently situations arise when it is necessary for the business man to perform mental multiplications quick and accurately.

Definitions.—MULTIPLICATION, MULTIPLIER, MULTIPLICAND. Multiplication is the process of taking one number, called the multiplicand, as many times as the number one is contained in another number, called the multiplier.

—PRODUCT. The result obtained by multiplication is called the product.

—FACTORS. The multiplier and the multiplicand are called the factors of the product.

Example: 2×4=8. In this example, 2 is the multiplier; 4 is the multiplicand; 8 is the product, and 2 and 4 are the factors of 8.

MULTIPLICATION TABLES—All multiplication is based upon the multiplication of the numbers from one to ten, inclusive. In a large majority of the cases of multiplication in business, the factors are small numbers and the multiplication

should be performed mentally. This is especially true in billing. For this reason both the basic and supplementary tables given below should be perfectly memorized.

BASIC TABLE

	2	3	4	5	6	7	8	9	10
1	2	3	4	5	6	7	8	9	10
2	4	6	8	10	12	14	16	18	20
3	6	9	12	15	18	21	24	27	30
4	8	12	16	20	24	28	32	36	40
5	10	15	20	25	30	35	40	45	50
6	12	18	24	30	36	42	48	54	60
7	14	21	28	35	42	49	56	63	70
8	16	24	32	40	48	56	64	72	80
9	18	27	36	45	54	63	72	81	90
10	20	30	40	50	60	70	80	90	100

SUPPLEMENTARY TABLE

11	22	33	44	55	66	77	88	99	110
12	24	36	48	60	72	84	96	108	120
13	26	39	52	65	78	91	104	117	130
14	28	42	56	70	84	98	112	126	140
15	30	45	60	75	90	105	120	135	150
16	32	48	64	80	96	112	128	144	160
17	34	51	68	85	102	119	136	153	170
18	36	54	72	90	108	126	144	162	180
19	38	57	76	95	114	133	152	171	190
20	40	60	80	100	120	140	160	180	200

The process of multiplication is indicated by placing the sign × between the two numbers, thus: 5×7=35. This is read: Five times seven equals 35.

Multiplying by 10 or a Multiple of 10.—It is inherent in the decimal system of notation that the placing of a zero to the right of a number multiplies that number by ten; for example, 20 is ten times as great as 2; 200 is ten times as great as 20, etc. Therefore in multiplying by 10 or a multiple of ten it is only necessary to multiply by the integer or integers of value and add as many zeros as there are in the multiplier; e. g., 2000×68=136,000. (2×68=136; adding the three zeros of the 2000 gives the answer).

Multiplication Illustrated.—Multiply 4362 by 243. The process of performing this operation is as follows: (1) Multiply by the 3; (2) multiply by the forty represented by the 4 in the tens' place; (3) multiply by the 200 represented by the 2 in hundreds' place; (4) add the products; thus:

(*A*)		(*B*)		(*C*)	
4362		4362		4362	
243		243		243	
13086	(1)	13086	(1)	8724	(3)
174480	(2)	17448	(2)	17448	(2)
872400	(3)	8724	(3)	13086	(1)
1059966	(4)	1059966	(4)	1059966	(4)

In practice the zeros at the end of (2) and (3) are omitted and the work appears as in (*B*).

It is not absolutely necessary to begin with the units digit of the multiplier. By beginning with the highest order the work will appear as in (*C*). This method is sometimes advantageous.

When two numbers are to be multiplied, either may be taken as the multiplier. It is usually better to use the smaller as the multiplier. When one of the numbers contains 1's or 2's or two or more digits alike, it is easier to multiply by that number. In finding the cost of 748 machines at $112 each, use 112 as the multiplier.

When one of two numbers to be multiplied contains one or more zeros, that number should be taken as the multiplier. The product of zero and any number is zero. In example (*D*), since the products of the tens' and hundreds' places are zero, the results need not be written.

(*D*)

6348
1005
31740
6348
6379740

Checking Multiplication.—There are a number of methods by which multiplication may be checked. The most practical and commonly used ones follow:

1. By interchanging the factors; i. e., by taking the multiplicand as the multiplier in repeating the multiplication. (*A*)

2. By division. Dividing the product by either factor will give the other factor. (*B*)

3. By casting out 9's—sometimes called excess of 9's. (*C*)

4. By casting out 11's—sometimes called excess of 11's. (*D*)

(*A*)			(*B*)		45)1620(36
45	36		45	135	
36	45		36		
270	180		270	270	
135	144		135	270	
1620	1620		1620		

(*C*) 2345—5; 317—2; 16415 10—1; 2345; 7035; 743365—1

The excess of 9's in the multiplicand is 5. The excess of 9's in the multiplier is 2. The product of the excesses is 10 and the excess of 9's in this product is 1. The excess of 9's in the product in the example is 1. THE EXCESS OF 9's IN THE PRODUCT IS EQUAL TO THE EXCESS OF 9's IN THE PRODUCT OF THE EXCESSES. (Explanation of finding excess of nines is given under Checking Addition).

(*D*) 2345—2; 317—9; 16415 18—7; 2345; 7035; 743365—7

The excess of 11's in the multiplicand is 2 (5 minus 4 plus 3 minus 2 equals 2). The excess of 11's in the multiplier is 9. (7 minus 1 plus 3 equals 9). The product of these excesses is 18 and the excess of 11's in 18 is 7. The excesss of 11's in the product is 7. (5 plus 11 minus 6 plus 3 minus 3 plus 4 minus 7 equals 7). (The finding of the excess of 11's is explained under the checking of addition).

The first two of these checking methods are practical only when the factors are small. When the factors of the multiplication are large numbers the last two methods should be used. The casting out of either nines or elevens alone is not an absolute check but when the two are used together the possibility of error is so small as to be practically negligible.

Short Methods of Multiplication.—To multiply by 10, 100, 1000, etc. When the multiplicand is an integer, annex as many zeros as there are in the multiplier; e. g., 10×75=750; 100×75=7500. When the multiplicand is a decimal, move the decimal point as many places to the right as there are zeros in the multiplier; e. g., 100×.75=75.

To multiply numbers ending in zeros: When both the multiplicand and multiplier are integers, multiply by the significant figures and annex as many zeros as there are in the endings of both multiplier and multiplicand; e. g., 220×400 equals 4 times 22 with three zeros added to the right. When one of the numbers is a decimal fraction, multiply the significant numbers and move the decimal point as many places to the right as there are zeros in the ending of the integer. Thus: .256×200. .256×2=.512; moving the decimal point two places to right makes the answer 51.2.

To multiply by 21, 31, 41, etc. This can best be explained by taking an example, as 234×21=4914. The process is as follows: The first figure on the right is evidently 4; 2×4 plus 3 (1×3) equals 11 Write 1 and carry 1. 2×3 plus 1 (carried) plus 2 (1×2) equals 9, the third figure. 2×2 equals 4, the fourth figure in the product.

This same method of solution can be used in multiplying by 101, 201, 301, etc. In the example, 432×201=86832, it is evident the first two figures of the product are 32. Multiplying and adding, 2×2=4 plus 4 (1×4) equals 8, the third figure. Completing the multiplication by 2, the fourth figure is 6 and the fifth, 8.

To multiply by 9, 99, 999, etc. To multiply by 9, annex one zero to the multiplicand, thus multiplying it by 10. From this result subtract the number to be multiplied. Multiply 348 by 9.

Solution: 3480
348
3132

To multiply by 99, annex two zeros to the multiplicand, thus multiplying it by 100, and subtract the multiplicand. 348×99=34800−348=34452.

This same method of solution may be applied to multiplications by 19, 29, 39, etc., by multiplying by the significant figure, adding a zero and subtracting the number to be multiplied.

This short method may also be extended to multiplication by any number slightly less than 100, 1000, 10,000, etc. The method of multiplying by 101, 201, etc. may be extended to multiplication by any number slightly more than 100, 1000, 10,000, etc.

Multiply 321 by 997=321,000−963=320,037.

Multiply 321 by 102=32742.

To multiply by 11 or multiples of 11. The first figure of the product is the first figure of the multiplicand; the second figure of the product is the sum of the first and second figures of the multiplicand; the third figure of the product is the sum of the second and third figures of the multiplicand, etc. In case the sum of two figures is ten or more, the 1 must be carried. Multiply 247 by 11: The first figure is 7; the second figure is the sum of seven and 4, 11; the third figure is the sum of the 1 (carried) 4 and 2, 7; and the fourth figure is 2. The product is 2717. In the case of multiples of 11, multiply by 11 first mentally and then multiply that product by the factor necessary to produce the multiplier. Multiply 247 by 33: 11×247=2717. 3×2717=8151.

To multiply by 111: Multiply 132,476 by 111: By inspecting the solution by the ordinary method, it will be seen that the first figure in the product is the first figure in the multiplicand. The second figure in the product is the sum of the units' and tens' figures in the multiplicand; the third figure in the product is the sum of the units', tens' and hundreds' figures in the multiplicand; the fourth figure in the product is the sum of the tens', hundreds' and thousands' figure in the multiplicand, etc. When the sum is ten or more the tens' digit in the sum must be carried to the next sum.

132476
132476
132476
14704836

To multiply two numbers ending in 5: First case: When the sum of the digits to the left of the 5's is an even number. Rule: Set down 25 as the first part of the product. To the product of the digits to the left of the 5's add ½ their sum. Write this amount before the 25. Example: Multiply 65×45. Since the sum of 6 and

4 is even, 25 is the first part of the product. 6×4 plus ½ (6 plus 4) = 29. Setting the 29 before the 25, the product is 2925.

Second case: Rule: Set down 75 as the first part of the product. To the product of the digits to the left of the 5's add ½ their sum, disregarding the fraction. Example: 85×135. Since the sum of 8 and 13 is odd, 75 is the first part of the product. 8×13 plus ½ (8×13) = 114½. Drop the ½ and write 114 before the 75. The product is 11475.

To square any number of two figures. Multiply 32 by 32. The solution of this problem is based upon the algebraic solution of the problem $(a+b)^2=a^2+2ab+b^2$. The number 32, is composed of the two parts, 30 or 3 tens plus 2 units. Taking the formula from right to left the steps are as follows: (1) Square the units' digit and write this as the first figure in the product; in this case 4. (2) Multiply the product of the units' and tens' digit by 2 and write this as the second figure in the product. (3×2 equals 6; 2×6 equals 12. Write the 2 as the second figure and carry the 1). (3) Square the tens' digit and add any figure "carried". (3×3=9; 9 plus 1 equals 10. Write the 10 as the last part of the product. 1024 is the product).

To multiply by 25, 50, 75, 125, 250, etc. 25 is ¼ of 100. Multiplying by 100 gives a product four times as great as multiplying by 25. Therefore, to multiply by 25, annex two zeros to the multiplicand (thus multiplying by 100) and divide the result by 4. To multiply by 50, annex two zeros to the multiplicand and divide the product by 2. To multiply by 75, annex two zeros to the multiplicand and divide by 4, and multiply the result by 3.

125 is ⅛ of 1000. Hence, to multiply by 125, annex three zeros to the multiplicand and divide by 8. 250 is ¼ of 1000. Hence, to multiply by 250, annex three zeros and divide the result by 4.

(For further application of aliquot parts of 10, 100 and 1000 to multiplication, see Aliquot Parts.)

To multiply when one figure of the multiplier is a factor of the other figure or figures of the multiplier. Multiply 426 by 279. It will be noticed that 9 is a factor of 27. Therefore, multiply by 9 and then multiply this result by 3.

426	
279	
3834	9×426
11502	3×3834
118854	

Cross multiplication. This method is practical only for multiplication by a multiplier of two figures. With practice a high degree of speed and accuracy can be acquired. Multiply 43 by 27. 43×27=1161. (1) 3×7=21; write 1 and carry 2. (2) 7×4 plus 2 (carried) = 30; 2×3=6. Add 30 and 6, giving 36. Write 6 and carry 3. (3) 2×4=8; add the 3 (carried), equaling 11. Write the 11. NOTE: Always add the "carried" figure to the first product so that it may not be forgotten.

Supplement and complement methods of multiplication.

The supplement of a number is the difference between that number and the next lower MULTIPLE of 10. 2 is the supplement of 12; 8 is the supplement of 108; 25 is the supplement of 1025.

The complement of a number is the difference between that number and the next higher multiple of 10. 4 is the complement of 6; 7 is the complement of 93; 3 is the complement of 997.

To multiply two numbers slightly larger than 100 or 1000 or 10,000: Add the supplement of either number to the other and annex the same number of zeros as occur in the power of ten used. To this add the product of the supplements. 102×104. The supplement of 102 is 2. Add 2 to 104 and annex two zeros and the result is 10600. 2×4=8; add 8 to 10600 and the result, 10608, is the product of 102×104.

To multiply two numbers slightly less than 100, 1000 or 10,000: Subtract the complement of either number from the other number and annex as many zeros as occur in the power of 10 used. To this add the product of the complements. Multiply 93 by 97. The complement of 93 is 7; the complement of 97 is 3. 97−7=90; annexing two zeros, the result is 9000. 3×7=21. Add 21 to 9000 and the result, 9021, is the product of 97 and 93.

DIVISION

Uses.—Division does not occur so frequently in business as either multiplication or addition, but problems involving division are frequently met and the business man and his employees should be able to divide with accuracy and reasonable speed. Furthermore, it is a rather awkward operation on an adding machine and few operators know how to use the machine for division. There are various types of machines upon which a skillful operator can divide with speed and accuracy.

Definitions.—DIVISION, DIVISOR, DIVIDEND, QUOTIENT, REMAINDER. Division is the process of finding how many times one number, called the *divisor*, is contained in another number, called the *dividend*.

The number to be found is called the *quotient*.

When the divisor is not a factor of the quotient; i. e., will not exactly divide the dividend, the part of the dividend remaining is called the *remainder*. Divide 20 by 6. 20 divided by 6 equals 3 with a remainder of 2. In this example, 20 is the dividend, 6 is the divisor, 3 is the quotient, and 2 is the remainder.

The SIGN OF DIVISION is ÷. 24÷6 is read "24 divided by 6". It indicates that the number preceding it is to be divided by the number following it. Division may also be indicated by fraction; e. g., 9/3 means 9 divided by 3.

Short Division.—The following illustrates short division:

6)2384616
397436

Short division should be used in all cases where the divisor is 20 or under.

Long Division.—The following illustrates long division:

	146	
	672)98746	*In practice the zeros marked by * are omitted.
100×672=	67200**	
	31546	
40×672=	26880*	
	4666	
6×672=	4032	
	634	

Division by Continued Subtraction.—Divide 754 by 142. Division by this method is sometimes required. It has been required on civil service examinations. It is the basis upon which division upon adding machines and the various calculating machines is performed.

	754
1—	142
	612
2—	142
	470
3—	142
	328
4—	142
	186
5—	142
Remainder	44

Checking Division.—The following are practical checking methods for division:

(1) Where the divisor and quotient are small numbers, the most practical method is to reverse the operation; i. e., multiply the quotient by the divisor and add the remainder to the product of these two. If the result of these operations is the dividend, the work is probably correct.

(2) Casting out nines. Find the excess of nines in the divisor, dividend, quotient, and remainder. Multiply the excess in the quotient by the excess in the divisor and add the excess in the remainder. The excess of nines in this result should equal the excess of nines in the dividend. See example *A*.

(3) Casting out elevens. Find the excess of elevens in the different parts of the division and proceed as in the proof by casting out nines. See example *B*.

	146	The excess of nines in the
A.	672)98746	divisor is 6.
	672	The excess of nines in the
	——	quotient is 2.
	3154	The excess of nines in the
	2688	dividend is 7.
	——	The excess of nines in the
	4666	remainder is 4.
	4032	6×2 plus 4=16.
	——	The excess of nines in 16
	634	is 7. Since this is the same as the excess of nines in the dividend, the work is probably correct.

B Using the same example as in *A*.

The excess of elevens in the divisor is 1 (11 plus 2 minus 7 plus 6=12). Casting out the elevens in 12 gives an excess of 1.

The excess of elevens in the dividend is 10 (6 minus 4 plus 7 minus 8 plus 9=10).

The excess of elevens in the quotient is 3 (6 minus 4 plus 1=3).

The excess of elevens in the remainder is 7 (4 minus 3 plus 6=7). 3×1 plus 7=10. Since this result is the same as the excess in the dividend, the work is probably correct.

Casting out nines and elevens is a satisfactory method of checking the work when the numbers involved are large. Both the nine and eleven check should be used because one will catch the errors not checked by the other.

Short Methods.—To divide by 10, 100, 1000, etc. point off as many places as there are zeros in the divisor. Divide 47246 by 10. 47246÷10=4724.6. Divide 47246 by 100. 47246÷100=472.46.

To divide by 20, 300, 500, etc. point off as many places as there are zeros in the divisor and then divide by the significant figure.

Divide 3600 by 20. 3600÷20=360.0÷2=180.

Divide 3600 by 600. 3600÷600=36.00÷6=6.

To divide by 25, 50, 125, etc. Since 100 is 4 times 25, it follows that if we divide a number by 100 it will be ¼ of what it would be if divided by 25. Therefore, to divide by 25, first divide by 100 as indicated above and multiply the quotient by 4. For example, divide 32800 by 25. $32800 \div 25 = 328 \times 4 = 1312$.

Since 50 is ½ of 100, to divide by 50, divide by 100 and multiply the quotient by 2. $32800 \div 50 = 328 \times 2 = 656$.

125 is ⅛ of 1000. Therefore, to divide by 125, divide by 1000 and multiply the quotient by 8. $32800 \div 125 = 32.8 \times 8 = 262.4$.

(For further application of aliquot parts to division, see Aliquot Parts.)

AVERAGE

A merchant makes the following daily sales during a week: Monday, $1267.25; Tuesday, $1327.80; Wednesday, $1416.10; Thursday, $1409.65; Friday, $1386.30; Saturday, $1572.50. What are his average daily sales?

Monday	$1267.25
Tuesday	1327.80
Wednesday	1416.10
Thursday	1409.65
Friday	1386.30
Saturday	1572.50
6)8379.60	Total
$1396.60	Average

Rule: To find the average of several amounts, find their sum and divide by the number of amounts.

FACTORS, DIVISORS AND MULTIPLES

Definitions.—An INTEGER is a number of whole units.

The FACTORS of a number are the integers which multiplied together produce the given number. The factors of 12 are 3 and 2 and 2, or 3 and 4, or 2 and 6.

A PRIME NUMBER is a number that is not exactly divisible by any other number.

FACTORING is the process of finding the factors of a number.

Tests of Divisibility of Numbers.—

(1) Even numbers are divisible by 2.

(2) A number is divisible by 3 if the sum of the digits is divisible by 3. 4638 is divisible by 3.

(3) The number is divisible by 4 if the two right hand digits are zeros or express a number which is divisible by 4. 4600 and 4628 are divisible by 4.

(4) If the number ends in 5 or a zero, it is divisible by 5.

(5) Even numbers which are divisible by 3 are divisible by 6. Since 4638 is even and divisible by 3, it is divisible by 6.

(6) There is no practical test for divisibility by 7.

(7) If the number expressed by the last three digits of a number is divisible by 8 or if the last three digits are zeros, the number is divisible by 8. 164000 and 164128 are both divisible by 8.

(8) 7, 11, and 13 will divide 1001 and any of its multiples.

(9) If the sum of the digits of any number is divisible by 9, the number is divisible by 9; e. g., 1386 or 3168.

(10) If the right hand digit of any number is zero, the number is divisible by 10.

(11) If the two right hand digits are zeros or express a number which is divisible by 25, the number is divisible by 25. 14875 is divisible by 25.

(12) If the difference between the sums of the digits of the even and odd orders is divisible by 11, the number is divisible by 11. In the number 6324846, the sum of the digits of the even order is 22; the sum of the digits of the odd order is 11; and the difference, 11, is divisible by 11. Therefore, the number is divisible by 11.

(13) If the three right hand digits are zeros or represent a number divisible by 125, the number is divisible by 125. 78457250 is divisible by 125.

DIVISORS

Definitions.—A COMMON DIVISOR or FACTOR of two or more numbers is a factor of each of the numbers.

THE GREATEST COMMON DIVISOR is the greatest factor that is common to two or more numbers.

Finding the Greatest Common Divisor (G. C. D.)—To find the Greatest Common Divisor of two or more numbers, separate the numbers into their prime factors and find the product of the prime factors common to the numbers.

First Method:

Find the G. C. D. of 27−36−63

3)27−36−63

3)9−12−21

3− 4− 7 G. C. D. $= 3 \times 3 = 9$

Second Method: The G. C. D. of two numbers is their difference or a factor of their difference. Find the G. C. D. of 84 and 124. The difference between these numbers is 40 but this is not a factor of either of them. The factors of 40 are $2 \times 2 \times 2 \times 5$. Inspection shows that the numbers are not divisible, 5 nor 10 nor 8, but are divisible by 4. 4 is therefore the G. C. D.

The G. C. D. of three or more numbers is the smallest difference or a factor of this difference. Find the G. C. D. of 60, 96 and 120. The smallest difference is 24. The factors of 24 are $2 \times 2 \times 2 \times 3$. Inspection shows that they are not divisible by 24, but are divisible by 2, 4, 8 and 12. Therefore, 12 is the G. C. D.

The practical application of G. C. D. is in the reduction of common fractions to lower terms.

LEAST COMMON MULTIPLE

Definitions.—A MULTIPLE of a given number is a number that will exactly contain the given number.

A number that will exactly contain each of two or more numbers is called a COMMON MULTIPLE.

The smallest number that will exactly contain each of two or more numbers is called the LEAST COMMON MULTIPLE (L. C. M.)

The practical application of L. C. M. is found in addition and subtraction of common fractions.

To find the Least Common Multiple of two or more numbers:

First Method: Separate each number into its prime factors. Find the product of these factors using each factor the greatest number of times it occurs in any one of the given numbers.

Example: Find the L. C. M. of 24−36−21.

$24 = 2 \times 2 \times 2 \times 3$.

$36 = 2 \times 2 \times 3 \times 3$.

$21 = 3 \times 7$.

$2 \times 2 \times 2 \times 3 \times 3 \times 7 = 504$.

Second Method: Set the numbers down in a line and divide by any factor common to any two or more of the numbers. Bring down the quotients and the indivisible numbers on the next line. Repeat the operation until the quotients are prime to each other. The product of the divisors and last quotients is the L. C. M.

Example: Find the L. C. M. of 24−36−21.

A

3)24−36−21

2) 8−12− 7

2) 4− 6− 7

2− 3− 7

or

B

3)24−36−21

4) 8−12− 7

2− 3− 7

C

12)24−36−21

or 3) 2− 3−21

2− 1− 7

A. $3 \times 2 \times 2 \times 2 \times 3 \times 7 = 504$.

B. $3 \times 4 \times 2 \times 3 \times 7 = 504$.

C. $12 \times 3 \times 2 \times 7 = 504$.

Third Method: Set the numbers down in a line. Use any one of them as a divisor and bring down the quotients, or the result of extracting common factors, or, in case a number is indivisible either by the divisor or a common factor, bring down that number.

Example: Find the L. C. M. of 24, 36 and 21.

24)24−36−21

1− 3− 7 $7 \times 24 \times 3 = 504$.

CANCELLATION

It sometimes happens that the product of several numbers is to be divided by the product of several other numbers. A problem of this kind can be quickly and simply solved by cancellation method.

Divide the product of $8 \times 6 \times 10 \times 15$ by the product of $3 \times 4 \times 9 \times 2$.

$$\frac{\cancel{8}^{2} \times \cancel{6}^{2} \times \cancel{10}^{5} \times \cancel{15}^{5}}{\cancel{3} \times \cancel{4}^{2} \times \cancel{9}^{3} \times \cancel{2}} = \frac{100}{3} = 33\ 1/3$$

Place the elements of the dividend above the line; the divisor below the line.

Process: Divide 3 and 6 by the common factor 3 and place the 2 above the 6. It is not necessary to write the 1 below the 3. Cancel the 3 and 6.

Divide 8 and 4 by the common factor, 4, and place the 2 above the 8. Cancel the 8 and 4.

Divide the 10 and 2 by the common factor, 2, and place the 5 above the 10. Cancel 10 and 2.

Divide 9 and 15 by the common factor, 3, and place the 5 above the 15 and the 3 below the 9. Cancel the 9 and 15.

As there is no factor common to numbers on opposite sides of the line, perform the indicated multiplication and division.

COMMON FRACTIONS

Use.—Quantities, prices, dimensions, relations, etc., in business are frequently stated in fractions. For this reason, anyone who wishes to be in a position to handle the arithmetic of business must understand fractions.

Definitions.—A FRACTION is one or more equal parts of a unit. If a pie be divided into five equal parts, each of these parts is called a fifth. If a person takes two of these equal parts, he will have two-fifths of the pie. The whole pie, or unit, contains five fifths.

A FRACTION is also defined as an indicated division.

A COMMON FRACTION is one usually expressed in the following form: ½.

The DENOMINATOR of a fraction is the number below the line and is the number which indicates into how many equal parts the unit is divided. In the fraction 2/5, the 5 shows that the unit has been divided into five equal parts.

The NUMERATOR of a fraction is the number written above the line and is the number which shows how many of these parts of the unit have been taken. In the fraction 2/5, the 2 is the numerator and it shows that two of the five equal parts have been taken.

The numerator and denominator of the fraction are called the TERMS of the fraction.

A PROPER FRACTION is one in which the numerator is smaller than the denominator; e. g., 2/3.

An IMPROPER FRACTION is one in which the numerator is as large as or larger than the denominator; e. g., 5/5; 5/2.

A MIXED NUMBER is a number which consists of a whole number and a fraction; e. g., $1\frac{1}{2}$.

A COMPLEX FRACTION is one in which the numerator or denominator, or both, is a mixed number.

A fraction in which the numerator and denominator contain common factors may be reduced to its LOWEST TERMS by dividing both numerator and denominator by the common factor. $8)\frac{8}{16}=\frac{1}{2}$

A fraction may be raised to HIGHER TERMS by multiplying both numerator and denominator by the same number:

$$\frac{4\times 2=}{4\times 3}\quad\frac{8}{12}$$

Reducing to lowest terms or raising to higher terms does not change the value of the fraction.

An improper fraction may be changed to a mixed number by performing the indicated division:

$$\frac{12}{3}=3)12\qquad\frac{7}{2}=2)7\qquad 3\tfrac{1}{2}$$

A mixed number may be changed to an improper fraction by multiplying the whole number by the denominator of the fraction and adding the numerator to the product. The result is the numerator of the improper fraction. The denominator is the denominator of the fractional part of the mixed number. Change $2\frac{1}{2}$ to an improper fraction. 2×2 plus 1=5. 5/2 is the improper fraction.

Fractions may be reduced to a common denominator by finding the common multiple of the denominators. When the common denominator is found, multiply both terms of the fraction by the number necessary to raise the denominator to the common denominator. Reduce 3/4 and 2/5 to a common denominator. The L. C. M. of 4 and 5 is 20. Multiply both terms of 3/4 by 5 and both terms of 2/5 by 4. The result is 3/4 equals 15/20 and 2/5 equals 8/20.

Addition of Fractions.—To add fractions:

(1) Reduce the fractions to the least common denominator.

(2) Add the numerators to form the numerator of the sum.

(3) Write the common denominator as the denominator of the sum.

(4) Reduce the result to its simplest form.

(5) If the fractions are mixed numbers, add the fractions and reduce to simplest form, and then add the sum of the whole numbers and the sum of the fractions.

(6) *Example*: Add 2/3, 4/5 and 3/4.

2/3—40
4/5—48
3/4—45

$$\frac{133}{60}=2\frac{13}{60}$$

Add 5 1/2 and 6 2/3

5 1/2—3
6 2/3—4

11 7/6=1 1/6
1 1/6

12 1/6

(7) To add two fractions having the same numerator: Find the product of the denominators for the denominator of the sum; multiply the sum of the denominators by the common numerator and this is the numerator of the sum. *Example*: Add 3/5 and 3/7. The numerator of the sum is 3×(5+7)=36. The denominator of the sum is 5×7=35. The sum is 36/35=1 1/35.

Subtraction of Fractions.—To subtract fractions:

(1) Reduce the fractions to the least common denominator.

(2) If the minuend is larger than the subtrahend, subtract the numerators and write the result as the numerator of the remainder and the common denominator as the denominator.

(3) If the minuend is a mixed number and the fractional part is smaller than that of the subtrahend, borrow one unit from the whole number of the minuend and add to the fractional part, making it an improper fraction. Subtract as in (2); subtract the whole numbers, remembering to take account of the unit borrowed, and add the two remainders.

(4) *Example*: Subtract 3/4 from 5/6.

5/6—10
3/4— 9

1

12

Subtract 1 5/6 from 3 3/4. 3 3/4—1 5/6=1 11/12.

3 3/4—21
1 5/6—10

1 11/12

Multiplication of Fractions.—To multiply fractions:

(1) Multiplication may be indicated by "×" or "of".

(2) Multiply the numerators to find the numerator of the product.

(3) Multiply the denominators to find the denominator of the product.

(4) Reduce to simplest form.

(5) Mixed numbers may be reduced to improper fractions and multiplied as above but see (8) and (9).

(6) The work of multiplication of fractions may be simplified by cancellation.

$$\frac{1}{7}\times\frac{\cancel{2}^{\,2}}{5}=\frac{2}{5}$$

(7) Where the multiplier is a whole number, multiply the numerator of the fraction by the whole number.

3×1/2=3/2=1 1/2

(8) Particularly where the whole numbers are large, the multiplication of a whole number by a mixed number may be simplified as follows:

(*a*) Multiply the whole number by the numerator of the fraction.

(*b*) Divide the above result by the denominator of the fraction.

(*c*) Proceed with the multiplication by the whole number of the mixed number and add the results.

Multiply 24 2/5×14.

24 2/5
14

$5)\overline{28}\quad=2\times 14$

53/5=2/5×14

96
24

341 3/5

(9) Particularly when the integral parts of mixed numbers are large, the work may be simplified as follows:

(*a*) Multiply the fractional parts of the mixed numbers.

(*b*) Multiply the integral part of the multiplicand by the fractional part of the multiplier.

(*c*) Multiply the integral part of the multiplier by the fractional part of the multiplicand.

(*d*) Multiply the integral parts of the two numbers.

(*e*) Add the results.

(*d*) *Example*: 248 1/2×15 1/4:

1/2×1/4= 1/8
1/4×248= 62
1/2×15 = 7 1/2
15×248=3720

3789 5/8

(10) To square a mixed number ending in $\frac{1}{2}$. Square the fraction. Add 1 to the whole number of the multiplicand and multiply by the whole number of the multiplier. $7\frac{1}{2}\times 7\frac{1}{2}=56\frac{1}{4}$. (7 plus 1)×7=56; $\frac{1}{2}\times\frac{1}{2}=\frac{1}{4}$.

(11) To multiply two mixed numbers ending in $\frac{1}{2}$.

(*a*) If the sum of the integers is even, square the fraction, and to the product of the integers add one-half their sum.

(*b*) If the sum of the integers is odd, write $\frac{3}{4}$ as the fractional part of the product. To this annex the product of the integers plus the one-half of their sum, dropping the fractional part of the sum.

Division of Fractions.—

(1) To divide a number by a fraction, invert the terms of the divisor and multiply. $3/4\div 2=3/4\times 1/2=3/8$.

(2) If the divisor is a mixed number or fraction and the dividend is a mixed number or fraction, the mixed numbers should be reduced to improper fractions.

(3) The work may be simplified in (2) by multiplying both numbers by the common denominator of the fractional parts.

Example: 48 3/4÷7 1/3. Reduce the mixed numbers to improper fractions having a common denominator. 48 3/4=585/12; 7 1/3=88/12. Since 585/12÷88/12=585/12×12/88=585/22, the common denominator may be disregarded and the numerator of the dividend divided by the numerator of the divisor. 88)585

6 57/88

(4) If the divisor is a whole number and the dividend is a mixed number, divide each part by the divisor and add the quotients.

24 1/2÷3=8 1/6
24÷3=8; 1/2÷3=1/6

(5) The work on (4) may also be performed as described in (3):

24 1/2÷3=8 1/6
24 1/2=49/2; 3=6/2; 49÷6=8 1/6

DECIMAL FRACTIONS

Use. In Business.—Fractions probably occur in the decimal form in business computations more frequently than in the

common form. As any common fraction can be changed to decimal form and is more easily handled in that form, every business man should acquire facility in handling them. When calculations involving fractions are performed on the various types of calculating machines, the fraction is nearly always reduced to the decimal form.

Definition.—A decimal fraction is one whose denominator is some power of ten. The denominator is indicated by the number of the places to the right of a period, called the decimal point, occupied by right-hand figure of significance. Thus, the indicated denominator of .2 is 10; the indicated denominator of .125 is 1000. The reading of the integral and decimal orders is indicated in the following table:

Integers	Order	Decimals
Units	1	Tenths
Tens	2	Hundredths
Hundreds	3	Thousandths
Thousands	4	Ten-thousandths
Ten-thousands	5	Hundred-thousandths
Hundred-thousands	6	Millionths
Millions	7	Ten-millionths
Hundred-millions	8	Hundred-millionths
	etc.	

To Add Decimals.—Arrange the amounts to be added in such a way that the decimal points fall in a vertical line. Proceed as in ordinary addition. Place the decimal point in the sum directly below in a line with the decimal points in the numbers added. Add 28.5, 125.03, 1.5, 78.105.

```
  28.5
 125.03
   1.5
 78.105
-------
233.135
```

To Subtract Decimals.—Arrange the amounts in such a way that the decimal points fall in a vertical line. Proceed as in ordinary subtraction of whole numbers. Place the decimal in the remainder directly below and in a line with the decimal points in the subtrahend and minuend.

Subtract .1463 from 2.46.

Solution:

```
  2.46
 .1463
------
2.3137
```

Multiplication of Decimals.—Multiply as with whole numbers. The number of decimal places in the product is the sum of the number of decimal places in both the multiplier and multiplicand. $416\times.25=104.00$. $.4016\times.025=.01004$.

Division of Decimals.—Divide as with whole numbers.

Rules for pointing off in the quotient:

Rule 1. The number of decimal places in the quotient is equal to the number of places in the dividend minus the number of places in the divisor. If there are more places in the divisor than in the quotient, add enough zeros to make the number of places equal to the number of places in the divisor. Example *A* and *A*2.

Rule 2. (*a*) If the divisor is a whole number, insert the decimal point in the quotient when it is reached in the dividend. Example *B*.

(*b*) If the divisor is not an integer, multiply both divisor and dividend by the least power of ten that will make the divisor a whole number and proceed as in (*a*). Example *B*2.

If there is a remainder in the division of decimals, zeros may be added and the division carried to as many places in the quotient as is desired.

When the quotient is required to be to the *nearest* tenth, hundredth, etc., carry the division one place further than the order required and then adjust the quotient.

Example A: Divide 3.9905 by 3.47. $39905\div347=115$.

4 places in the dividend minus 2 places in the divisor equals 2 places in the quotient. Therefore $3.9905\div3.47=1.15$.

*Example A*2: Divide 3990.5 by 3.47. Since there are two places in the divisor and but one in the dividend, add a zero to the dividend. $399050\div347=1150$. 2 places − 2 places = 0 places. Therefore $3990.50\div3.47=1150$.

Example B: Divide 399.05 by 347:

```
   1.15
347)399.05
  347
  ---
  520
  347
  ---
 1735
 1735
```

*Example B*2: Divide 399.05 by 34.7. Multiplying both dividend and divisor by 10 eliminates the decimal in the divisor. $\cdot\ 3990.5\div347=11.5$

```
   11.5
347)3990.5
```

Division by 10, 100, 1000, etc. To divide by 10 or a power of ten, move the decimal point in the dividend to the left as many places as there are zeros in the divisor. It may be necessary to place zeros between the decimal point and the first left figure of significance in the quotient; thus, $24\div1000=.024$. This same principle may be extended to 20, 200, 3000, 5000, etc., by moving the decimal point and dividing by 2, 3, or 5 as the case may be.

Division by 25, 50, 125, etc. To divide by 25, divide by 100 and multiply the result by 4.

To divide by 50, divide by 100 and multiply the result by 2.

To divide by 125, divide by 1000 and multiply by 8.

For other applications of aliquot parts to division, see Aliquot Parts.

Changing Decimal Fractions to Equivalent Common Fractions.—To change a decimal fraction to its equivalent common fraction, omit the decimal point and write the indicated denominator. Reduce to lowest terms. *Example*:

$$.125=\frac{125}{1000}=\frac{1}{8}\qquad .16=\frac{16}{100}=\frac{4}{25}\qquad .2=\frac{2}{10}=\frac{1}{5}$$

Changing Common Fractions to Equivalent Decimal Fractions.—To change a common fraction to a decimal fraction, divide the numerator by the denominator, carrying the division to as many decimal places as desired. It is usually not necessary to carry the division further than four or five places.

Example:

```
        .4375                    .875
7/16=16)7.0000   7/8=8)7.000
        64               64
        ---              ---
         60               60
         48               48
         --               --
        120               120
        112               112
        ---               ---
         80                80
         80                80
         --                --
```

Reciprocals.—The reciprocal of any number is unity divided by that number. ¼ is the reciprocal of 4. Where several numbers are to be divided by another number, as in pro-rating, it is frequently much easier to find the reciprocal decimal and multiply each number by it.

ALIQUOT PARTS

Definition.—An aliquot part of a number is that part which is contained an integral number of times in the given number. *Examples*: 2½ is an aliquot part of 10, 100, and 1000 because it is contained in each of these an even number of times. 25 is an aliquot part of 100 and 1000. 125 is an aliquot part of 1000.

Use.—The use of aliquot parts has been mentioned in the methods of multiplication and division. Through the use of the methods, which will now be further explained, the work of multiplication and division by certain numbers is made much easier and the results can be obtained very much more quickly. Since prices are very frequently fixed at aliquot parts of one dollar, the multiplication in billing and similar work can be very much simplified and speed can be developed by gaining facility in handling these short cuts.

Table.—The following is a general table of the more common aliquot parts. It will be noticed that only the simplest forms of fractions are given. The equivalents which are very seldom used have been omitted. Aliquot parts less frequently used have been marked with an asterisk (*).

Numbers	1/2	1/3	2/3	1/4	3/4	1/5	2/5
10	5	3 1/3	6 2/3	2 1/2	7 1/2	2	4
100	50	33 1/3	66 2/3	25	75	20	40
1000	500	333 1/3	666 2/3	250	750	200	400

Numbers	3/5	4/5	1/6	5/6	1/7*	1/8	3/8
10	6	8	1 2/3	8 1/3		1 1/4	3 3/4
100	60	80	16 2/3	83 1/3	14 2/7*	12 1/2	37 1/2
1000	600	800	166 2/3	833 1/3		125	375

Numbers	5/8	7/8	1/9*	1/11*	1/12	5/12	7/12
10	6 1/4	8 3/4					
100	62 1/2	87 1/2	11 1/9*	9 1/11	8 1/3	41 2/3	58 1/3
1000	625	875			83 1/3		

Numbers	11/12	1/15	1/16	1/10	1/20	1/30	1/40	1/50
100	91 2/3	6 2/3	6 1/4	10	5	3 1/3	2 1/2	2
1000			62 1/2	100	50	33 1/3	25	20

Multiplying by aliquot parts of 10:

$416\times2\ 1/2$. Since 2 1/2 is 1/4 of 10, $(416\times10)\div4=1040$.

$920\times7\ 1/2$. Since 7 1/2 is 3/4 of 10, $(920\times10\times3)\div4=6900$.

OR $(920\div4)\times10\times3=6900$.

Multiplying by aliquot parts of 100:

$32\times6\ 1/4$. Since 6 1/4 is 1/16 of 100, $(32\times100)\div16=200$.

25×288. Since 25 is 1/4 of 100, $(288\times100)\div4=7200$.

$640\times87\ 1/2$. Since 87 1/2 is 7/8 of 100, $(640\times100\times7)\div8=56000$.

OR $(640\div8)\times100\times7=56000$.

Multipling by aliquot parts of 1000:
1280×125. Since 125 is 1/8 of 1000 $(1280\times1000)\div8=160000$.
OR $(1280\div8)\times1000=160000$.
1680×625. Since 625 is 5/8 of 1000, $(1680\times1000\times5)\div8=1050000$.
OR $(1680\div8)\times1000\times5=1050000$.
Dividing by aliquot parts of 10:
Divide 16 by 1 1/4. Since 1 1/4 is 1/8 of 10, the quotient of $16\div10$ will be 1/8 of the quotient of $16\div1$ 1/4. Therefore, $16\div1\ 1/4=(16\div10)\times8=12.8$.
Dividing by aliquot parts of 100:
$1720\div33\ 1/3=(1720\div100)\times3=51.6$.
$1284\div37\ 1/2=[(1284\div100)\div3]\times8=34.24$.

Interchanging multiplier and multiplicand sometimes makes possible the application of the short methods of aliquot parts: $.32\times7500=.75\times3200=2400$.

DENOMINATE NUMBERS

Uses.—Civilized man makes constant use of measures and measurement. He buys and sells by units of measure; he indicates size and magnitude of quantity by measure; he compares quantities by measure. For example, he buys butter by the pound; he orders a bin to contain fifty bushels of wheat; and he finds that Henry's farm contains sixty-five acres, while Brown's farm contains sixty-two acres.

A Denominate Number is a concrete number whose unit of measure is established by law or custom.

A Simple Denominate Number is one that is expressed by the units of one denomination; e. g., five pounds, or three gallons.

A Compound Denominate Number is one that is expressed by the units of two or more denominations that are related to one another; e. g., five pounds six ounces, or three gallons one pint.

Tables.—The following tables show the most commonly used measures:

United States Money is the legal currency of the United States. It consists of gold, silver, nickel, and copper coins; treasury, and Federal Reserve Bank notes.

Table of United States Money

10 mills	= 1 cent	*c. ct. ¢*
10 cents	= 1 dime	*d.*
10 dimes	= 1 dollar	*$.*
10 dollars	= 1 eagle	*E.*

The mill is not coined; it is used only as the decimal part of a cent.

The following denominations are now coined
Gold.....$20, $10, $5.
Silver.....$1, 50c, 25c and 10c pieces.
Nickel.....5c piece.
Bronze.....1c piece.

WEIGHTS AND MEASURES.—Practically all the commerce of the world is conducted through the medium of two systems of weights and measures, namely, the English system and the metric system. Practically all the engineering work done in the world with the exception of that done in Japan is based upon one or the other of these systems. In the United States and in Great Britain and its possessions both systems are legal and in use, the English being used in all ordinary commercial transactions and the metric in all scientific work and to a lesser extent in technical work.

The English System.—The customary system of weights and measures in use in the United States is the same as the system in everyday use in Great Britain, with some important differences in some of the units which must be noted. For all practical purposes the units of length and mass are identical in value, although the fundamental standards of the two countries are quite different. In Great Britain the standard yard is a bronze bar in the custody of the board of trade and preserved in the standards office, Westminster. Its legal value in terms of the international meter is, one yard equals $\frac{36}{39.370113}$ meters.

In the United States the meter is the fundamental standard and the yard is defined as $\frac{3600}{3937}$ meters. The difference in the value of the two yards in terms of the meter only amounts to a little more than one part in 400,000, which is about the difference found in comparing the imperial yard with its authentic copies at different periods. It is therefore doubtful whether there is a real difference between the length of the English bronze yard and United States yard derived from the meter.

A similar condition exists with respect to the avoirdupois pounds; in England a certain platinum cylinder deposited in the standards office is regarded as the standard pound, while in the United States the pound is defined as 453.5924277 grams, of which the international kilogram contains 1,000. This is the same as the legal value in Great Britain, so that the only difference in the two pounds is one of standards.

On the other hand the capacity measures of the two countries are quite different. The United States gallon of 231 cubic inches and the Winchester bushel of 2150.42 cubic inches have not been legal measures in Great Britain since 1825, having been superseded by the present imperial gallon, which is defined as the volume of 10 pounds of pure water at 62 degrees Fahrenheit, weighed against brass weights in air at the same temperature as the water, and with the barometer at 30 inches. The imperial bushel is defined as the volume of 80 pounds of water weighed under the same conditions as the gallon. The bushel of Great Britain is, therefore, exactly equal to 8 gallons.

The volume of the imperial gallon, according to the most reliable data available at this time, is 277.420 cubic inches and the bushel 2219.36 cubic inches, the first being larger than the United States gallon by approximately 20 per cent, and the latter larger than the United States bushel by 3.2 per cent.

The methods of subdividing and multiplying the yard, pound, gallon, and bushel in the two countries are substantially the same.

Standard Weights and Measures of United States

AVOIRDUPOIS WEIGHT

Dram	dr.	=27 1/2 grains (27.34375).
Ounce	oz.	=16 drams, 437.5 grains.
Pound	lb.	=16oz.,256dr.,7,000grains.
Legal stone	st.	=14 lbs.
Quarter (Eng.)	qr.	=28 lbs.
Quarter (Can.)	qr.	=25 lbs.
Cental or quintal	cent.	=100 lbs.
Hundredwgt.(Eng.),cwt.		=4 qrs., 112 lbs.
Hundredwgt.(Can.),cwt.		=4 qrs., 100 lbs.
Ton (Eng.)	T.	=20 cwt., 2,240 lbs.
Ton (Can.)	T.	=20 cwt., 2,000 lbs.

Ton of Coal.—The United States ton is legally defined in some states as 2,000 pounds and in other states as 2,240 pounds. In Arizona, Colorado, Connecticut, Idaho, Indiana, Kansas, Kentucky, Louisiana, Massachusetts, Montana, Nebraska, New Jersey (net ton), New York, Ohio, Rhode Island (net ton), Vermont, Washington, and Wisconsin, it is fixed at 2,000 pounds, and in the District of Columbia, Pennsylvania, New Jersey (gross ton), Rhode Island (gross ton), it is fixed at 2,240 pounds. For tariff purposes Congress has fixed the ton of coal at 2,240 pounds.

TROY WEIGHT

Carat		=3.17 grains.
Pennyweight	dwt.	=24 grains.
Ounce	oz.	=20 dwts., 480 grains.
Pound	lb.	=12 oz.,240dwts.,5,760grs.
Hundredweight	cwt.	=100 lbs.

Troy is the weight used by goldsmiths and jewelers. The grains troy, apothecaries', and avoirdupois are equal, and the same in England, France, the United States, Holland, and in most other countries.

The oz. troy and apothecaries' =1.09714 oz. avoirdupois; but the lb. troy and lb. apothecaries' =only 0.82286 lb. avoirdupois, while 175 lbs. troy and apothecaries' =144 lbs. avoirdupois.

APOTHECARIES' WEIGHT

Scruple	℈	=20 grains = 20 grains.
Dram	ʒ	= 3 scruples = 60 grains.
Ounce	℥	= 8 drams = 480 grains.
Pound	lb	=12 ounces =5,760 grains.

APOTHECARIES' FLUID MEASURE

		Marked
60 minims	♏ (drops)	=1 fluid dram f ʒ
8 drams		=1 ounce f ℥
16 ounces		=1 pint O
8 pints		=1 gallon C., or Cong.

1 dram	=1 teaspoonful.
2 drams	=1 dessertspoonful.
4 drams	=1 tablespoonful.
2 ounces	=1 wineglassful.
3 ounces	=1 teacupful.

LIQUID MEASURE

		Cubic Inches
4 gills	1 pint (O)	= 28.875
2 pints	1 quart (qt.)	= 57.75
4 quarts	1 gallon (gal.)	=231.0
63 gallons	1 hogshead (hhd.).	
2 hogsheads	1 pipe or butt.	
2 pipes	1 tun.	

DRY MEASURE

		Cubic Inches
2 pints	1 quart (qt.)	= 67.20
4 quarts	1 gallon (gal.)	= 268.80
2 gallons, or 8 quarts	1 peck	= 537.60
4 pecks	1 struck bushel	=2150.42

HOUSEHOLD MEASURES

120 drops water	=1 teaspoon.
60 drops thick fluid	=1 teaspoon.
2 teaspoons	=1 dessertspoon.
3 teaspoons	=1 tablespoon.
16 tablespoons	=1 cup.
1 cup	= 1/2 pt.
1 cup water	= 1/2 lb.
4 tablespoons flour	=1 oz.
2 tablespoons butter	=1 oz.
3 teaspoons soda	= 1/2 oz.
4 teaspoons baking powder	= 1/2 oz.
2 cups granulated sugar	=1 lb.
2 1/2 cups confectioners' sugar	=1 lb.
2 1/2 cups wheat flour	=1 lb.
3 1/2 cups whole wheat flour	=1 lb.
2 1/2 cups buckwheat flour	=1 lb.
5 1/2 cups coffee	=1 lb.
6 1/2 cups tea	=1 lb.
2 cups rice	=1 lb.
2 cups lard	=1 lb.
2 cups butter	=1 lb.
2 cups graham flour	=1 lb.
2 cups rye flour	=1 lb.
2 cups corn meal	=1 lb.
2 cups rolled oats	=1 lb.
2 cups powdered sugar	=1 lb.
2 cups brown sugar	=1 lb.
2 cups raisins	=1 lb.
2 cups currants	=1 lb.
2 cups bread crumbs	=1 lb.
9 eggs	=1 lb.

CUBIC OR SOLID MEASURE

Cubic foot	=1,728 cubic inches.
Cubic yard	=27 cubic feet, 21,033 bushels.
Cord of wood	=128 cubic feet.
Shipping ton	=40 cubic feet merchandise.
Shipping ton	=42 cubic feet of timber.
Ton of displacement of a ship	=35 cubic feet.

LINEAR MEASURE

3 barleycorns, or 12 lines, or 72 points, or 1,000 mils (mi.)	1 inch (in.).
3 inches	1 palm.
4 inches	1 hand.
9 inches	1 span.
12 inches	1 foot (ft.).
18 inches	1 cubic.
3 feet	1 yard (yd.).
2 1/2 feet	1 military pace.
5 feet	1 geometrical pace.
2 yards	1 fathom.
5 1/2 yards	1 rod, pole, or perch.
66 feet, or 4 rods	1 Gunter's chain.
40 poles, or 220 yards, or 8 furlongs, or	1 furlong (fur.).
1,760 yards, or 5,280 feet	1 mile.
3 miles	1 league.

The hand is used to measure horses' height. The military pace is the length of the ordinary step of a man. One thousand geometrical paces were reckoned to a mile.

LAND MEASURE (LINEAR)

7.92	inches	1 link.
100	links, or	1 chain (ch.).
66	feet, or	
22	yards, or	
4	poles	
10	chains	1 furlong (fur.).
80	chains, or	1 mile.
8	furlongs	

LAND MEASURE (SQUARE)

144 square inches	1 square foot (sq. ft.).
9 square feet	1 square yard (sq.yd.).
30¼ square yards	1 sq.pole, rod,or perch.
16 square poles	1 square chain (sq.ch.).
40 square poles, or	1 square rood.
1,210 square yards	
4 square roods, or	
10 square chains, or	
160 square poles, or	1 acre.
4,840 square yards, or	
43,560 square feet	
640 acres, or	1 square mile.
3,097,600 square yards	
30 acres	1 yard of land.
100 acres	1 hide of land.
40 hides	1 barony.

GEOGRAPHICAL AND NAUTICAL MEASURE

6086.44	feet, or	=1 nautical mile.
1000	fathoms, or	
10	cables, or	
1.1528	statute miles	
1	nautical mile per hr.	=1 knot.
60	nautical miles, or	=1 degree.
67.168	statute miles	
360	degrees	=1 circumference of the earth at the equator.
1	league	=3 nautical miles.
1	cable's length	=120 fathoms.

TIME

The unit of time measurement is the same among all nations. Practically it is $\frac{1}{86400}$ of the mean solar day, but really it is a perfectly arbitrary unit, as the length of the mean solar day is not constant for any two periods of time. There is no constant natural unit of time.

1 minute	=60 seconds.
1 hour	=60 minutes, 3,600 seconds.
1 day	=24 hours, 1,440 minutes, 86,400 seconds.
1 sidereal day	=86,164.1 seconds.
1 sidereal month	=27.321661 mean solar days (average).
1 lunar month	=29.530589 mean solar days (average).
1 anomalistic month	=27.544600 mean solar days (average).
1 tropical month	=27.321582 mean solar days (average).
1 nodical month	=27.212222 mean solar days (average).
Mean solar year	=365 d. 5 h. 48 m. 46.045 s. with annual variation of 0.00539.

The change in the length of the mean sidereal day, *i. e.*, of the time of the earth's rotation upon its axis, amounts to 0.01252 s. in 2,400 mean solar years.

ANGULAR MEASURE

There is perfect unanimity as to the standard angle (i. e., the right angle) and practical unanimity as to its subdivision, for the subdivision into grades, etc., once favored by the French, is now abandoned.

1 minute of angle or arc = 60 seconds.
1 degree of angle or arc = 60 minutes.
90 degrees of angle or arc = 1 right angle or ¼ of circumference.

Radian of angle or arc	=arc same length as radius.
Radian of angle or arc	=57.295779513082°.
Length of arc of 1°	= 0.017453292520.
Length of arc of 1′	= 0.015707963268.
Length of arc of 1″	= 0.000290888209.

Time on Shipboard.—The twenty-four hours are divided on board ship into seven parts, and the crew is divided into two parts or watches, designated *port* and *starboard watches*. Each watch is on duty four hours, except from 4 to 8 p.m., which time is divided into two watches of two hours each, called *dog watches*, by means of which the watches are changed every day, and each watch gets a term of eight hours' rest at night. *First watch*, 8 p.m. to midnight; *middle watch*, midnight to 4 a.m.; *morning watch*, 4 to 8 a.m.; *forenoon watch*, 8 a.m. to noon; *afternoon watch*, noon to 4 p.m.; *first dog watch*, 4 to 6 p.m.; *second dog watch*, 6 to 8 p.m. The bell is struck every half-hour to indicate the time, as follows:

1 bell	12.30 a.m.	1 bell	12.30 p.m.
2 bells	1.00 a.m.	2 bells	1.00 p.m.
3 bells	1.30 a.m.	3 bells	1.30 p.m.
4 bells	2.00 a.m.	4 bells	2.00 p.m.
5 bells	2.30 a.m.	5 bells	2.30 p.m.
6 bells	3.00 a.m.	6 bells	3.00 p.m.
7 bells	3.30 a.m.	7 bells	3.30 p.m.
8 bells	4.00 a.m.	8 bells	4.00 p.m.
1 bell	4.30 a.m.	1 bell	4.30 p.m.
2 bells	5.00 a.m.	2 bells	5.00 p.m.
3 bells	5.30 a.m.	3 bells	5.30 p.m.
4 bells	6.00 a.m.	4 bells	6.00 p.m.
5 bells	6.30 a.m.	1 bell	6.30 p.m.
6 bells	7.00 a.m.	2 bells	7.00 p.m.
7 bells	7.30 a.m.	3 bells	7.30 p.m.
8 bells	8.00 a.m.	4 bells	8.00 p.m.
1 bell	8.30 a.m.	1 bell	8.30 p.m.
2 bells	9.00 a.m.	2 bells	9.00 p.m.
3 bells	9.30 a.m.	3 bells	9.30 p.m.
4 bells	10.00 a.m.	4 bells	10.00 p.m.
5 bells	10.30 a.m.	5 bells	10.30 p.m.
6 bells	11.00 a.m.	6 bells	11.00 p.m.
7 bells	11.30 a.m.	7 bells	11.30 p.m.
8 bells	12.00 n'n.	8 bells	12.00 ngt.

Board and Timber Measure.—A board one foot square and one inch thick is the unit of board measure, the number of feet in a board being determined by the number of times its volume equals that of the unit: Thus a board 2 inches thick, 1½ feet wide and 10 feet long contains 30 feet. A board of the same length and width ½ inch thick would contain 7½ board feet.

The Doyle Rule.—Known in some sections as the Connecticut River Rule, the St. Croix Rule, the Thurber Rule, the Moore & Beeman Rule, and the Scribner Rule—is used throughout the entire country and is more generally employed than any other. It is constructed by the following formula: Deduct 4 inches from the diameter of the log as an allowance for slab; square one-quarter of the remainder and multiply the result by the length of the log in feet. It is the usual custom to measure the diameter inside the bark at the small end. One cord of wood is 128 cubic feet.

In metric countries all wood is measured in cubic meters.

Water Measure.—*The Miner's Inch* is usually defined as the quantity of water that will pass through an orifice 1 square inch in cross section under a given head. The head has been fixed in various localities at from 4 to 6½ inches to the center of the orifice. In states where the miner's inch is defined by statute it varies from $\frac{1}{40}$ to $\frac{1}{50}$ of a cubic foot per second. The miner's inch is rapidly becoming obsolete, its place being taken by the cubic foot per second or the gallon per second. The United States reclamation service uses the cubic foot per second.

Visibility Distance at Sea.—Table of elevations of objects above sea level, with their corresponding distances of visibility.

Height in Feet	Distance in Nautical Miles	Height in Feet	Distance in Nautical Miles
5	2.555	110	11.986

95	11.139	1000	36.140
100	11.428		

Metric System.—The unit of length in the metric system is the *meter*, a length originally planned to be equal to the one ten-millionth of the distance between the equator and the pole, measured along a terrestrial meridian. A platinum bar of this supposed length was constructed and deposited in the archives of the French republic in 1799. At the same time a platinum weight was constructed which was made equal to the mass of a cube of pure water at 4 degrees centigrade, the sides of the cube being one-tenth the length of the meter. This weight, which is equal to one thousand units of mass in the metric system, is called the *kilogram*.

Subsequent geodetic measures showed that the lengths of arcs differ on different parts of the earth and also that the value of the arc from which the meter was derived was in error by about one part in a thousand, causing a similar error in the length of the meter. Nevertheless the length of the original meter bar, known as the meter of the archives, has been retained, although its reference to the quadrant has been abandoned.

In 1875 an international bureau of weights and measures was established near Paris, France, by the concurrent action of the principal nations of the world for the purpose of constructing exact copies of the meter and kilogram deposited in the archives. Thirty-one standard meters of iridioplatinum and forty kilograms of the same alloy were constructed and carefully compared with the standards of the archives and with one another.

International Prototypes.—This great work was completed in 1889 and the meter and the kilogram which agreed most nearly with the original standards of the archives were called international prototypes and were deposited at the international bureau, where they are maintained to-day subject to the authority of the international committee on weights and measures.

The remaining meters and kilograms were distributed by lot to the different nations which contributed to the support of the bureau. The United States secured two copies of the meter and two copies of the kilogram, which are in the custody of the bureau of standards at Washington. One of the meters known as No. 27 and one kilogram, No. 40, were selected as the United States standards, while the other meter and kilogram are used as working standards.

Determinations of the Units.—The length of the international meter has been determined in terms of the wave lengths of the red, green and blue radiations of cadmium, so that if every meter in the world were destroyed the length could be reproduced within less than one part in ten million. The number of wave lengths of the different radiations at 15 degrees centigrade and 760 millimeters pressure are as follows:

Red	1 m.	=	1,553,163.5
Green	1 m.	=	1,966,249.7
Blue	1 m.	=	2,083,372.1

The unit of capacity in the metric system is the *liter*, which was intended to be both equal to the volume of a cubic decimeter and to the volume of pure water under normal atmospheric pressure and at the temperature of maximum density (4°C.) that would exactly balance one kilogram in vacuo.

Extent of Use.—The use of the metric system is obligatory in France, Germany, Austria, Hungary, Belgium, Brazil, Bulgaria, Chili, Colombia, Denmark, Spain, Holland, Italy, Mexico, Montenegro, Peru, Portugal, Argentina, Roumania, Servia, Sweden, Norway, Switzerland, and Uruguay. Also in Cuba, the Philippine Islands, Porto Rico, and Guam. Its use is legal in the United States, Great Britain and possessions, in Russia, Japan, Egypt,

Bolivia, Greece, Guatemala, Nicaragua, Paraguay, Venezuela, Turkey, and Siam.

The units of length, mass and capacity described are subdivided decimally and the Latin prefixes *milli*, *centi*, and *deci*, are used to indicate the order of the division, and multiplied by powers of ten, the order being indicated by the prefixes *deka*, *hecto*, *kilo* and *myria*.

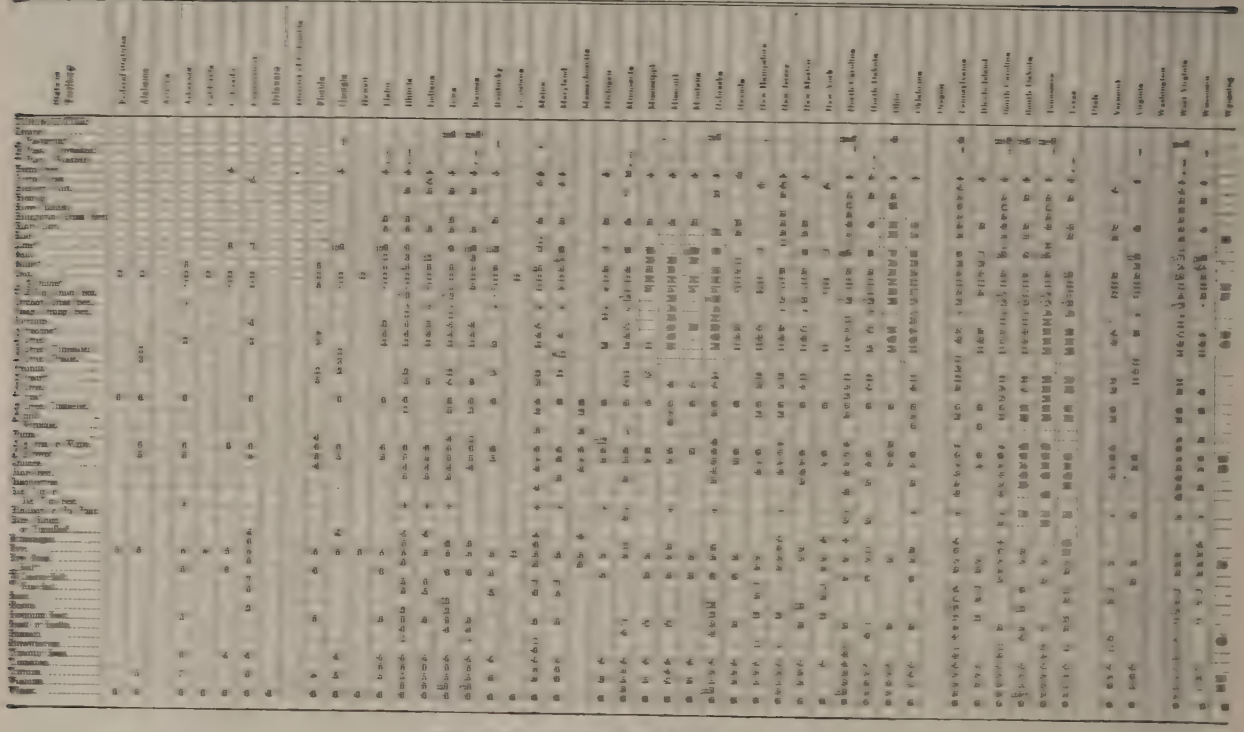
UNITED STATES LEGAL WEIGHTS (in pounds) PER BUSHEL.—Continued



NOTES FOR ENTIRE LEGAL WEIGHT TABLE

1 Two years, 56 pounds.
2 Two years, 58 pounds.
3 Two years, 60 pounds.
4 Two years, 62 pounds.
5 Two years, 64 pounds.
6 Two years, 66 pounds.
7 Two years, 68 pounds.
8 Two years, 70 pounds.

recognized as legal in accordance with the table of equivalents.

Russia.—The basis of Russian weights is the funt, equal to 0.40951241 kilogram, or 0.9028 pound avoirdupois. The funt is divided into 96 zolotniks or 32 loths, and the zolotnik is divided into 96 dolias; 40 funts equal 1 pood.

The basis of the length measure is the archine, equal to 28 inches or 0.71120 meter. The archine contains 16 verskops; 3 archines equal 1 sagene and 500 sagenes equal 1 verst.

The dessiatine, equal to 2,400 square soganes, or 2.6997 acres, is the unit for land measure.

The chetvert, equal to 2.09908 hectoliters, or 5.7748 United States bushels, is the unit for dry measure. The chetvert is divided into 8 chetveriks, and the chetverik into 8 garnetz. Twelve chetverts equal 1 lost.

The vedro, equal to 12.2993285 liters, or 3.249 United States gallons, is used for measuring liquids.

Chinese Measures.—The following gives the new system of weights and measures adopted by China in pursuance of the imperial rescript of August 28, 1908:

MEASURES OF LENGTH

Chinese.		Metric.
1 hao	=	0.0032 centimeter.
1 li	=	0.032 centimeter.
1 fen	=	0.32 centimeter.
1 tsun	=	3.2 centimeters.
1 chih	=	0.32 meter.
1 pu	=	1.6 meters.
1 chang	=	3.2 meters.
1 li	=	576.° meters.

MEASURES OF SURFACE

Chinese.		Metric.
1 hao	=	0.006144 are.
1 li	=	0.06144 are.
1 fen	=	0.6144 are.
1 fang pu	=	0.0256 are.
1 mu	=	6.144 ares.
1 ching	=	614.4 ares.

MEASURES OF CAPACITY

Chinese.		Metric.
1 shao	=	0.0104 liter.
1 ko	=	0.1035 liter.
1 sheng	=	1.0355 liters.
1 tou	=	10.355 liters.
1 hu	=	51.7734 liters.
1 tan or picul	=	103.5469 liters.

MEASURES OF WEIGHT

Chinese.		Metric.
1 hao	=	0.0037301 gram.
1 li	=	0.037301 gram.
1 fen	=	0.37301 gram.
1 chien	=	3.7301 grams.
1 liang	=	37.301 grams.
1 chin or catty	=	596.816 grams.

TABLE OF FOREIGN WEIGHTS AND MEASURES

Denominations	Where Used	American Customary Equivalents
Almude	Portugal	4.422 gallons
Ardeb	Egypt	7.6907 bushels
Are	Metric	0.02471 acre
Arobe	Paraguay	25 pounds
Arratel or libra	Portugal	1.011 pounds
Arroba (dry)	Argentine Republic	25.3175 pounds
	Brazil	32.38 pounds
	Cuba	25.3664 pounds
	Portugal	32.38 pounds
	Spain	25.36 pounds
	Venezuela	25.4024 pounds
Arroba (liquid)	Cuba, Spain and Venezuela	4.263 gallons
Arshine	Russia	28 inches
Arshine (square)	Russia	5.44 square feet
Artel	Morocco	1.12 pounds
Baril	Argentine Republic and Mexico	20.0787 gallons
Barrel	Malta (customs)	11.4 gallons
	Spain (raisins)	100 pounds
Batman or tabriz	Persia	6.49 pounds
Berkovets	Russia	361.12 pounds
Bongkal	India	832 grains
Bouw	Sumatra	7,096.5 square meters
Bu	Japan	0.119 inch
Butt (wine)	Spain	140 gallons
Caffiso	Malta	5.4 gallons
Candy	India (Bombay)	529 pounds
	India (Madras)	500 pounds
	Morocco	113 pounds
	Syria (Damascus)	575 pounds
	Turkey	124.7036 pounds
Cantaro (cantar)	Malta	175 pounds
Carga	Mexico and Salvador	300 pounds
Catty	China	1.316 pounds (avoir.)
	Japan	1.31 pounds
	Java, Siam and Malacca	1.35 pounds
	Sumatra	2.12 pounds
Centaro	Central America	4.2631 gallons
Centner	Bremen and Brunswick	117.5 pounds
	Darmstadt	110.24 pounds
	Denmark and Norway	110.11 pounds
	Nuremberg	112.43 pounds
	Prussia	113.44 pounds
	Sweden	93.7 pounds
	Vienna	123.5 pounds
	Zollverein	110.24 pounds
	Double or metric	220.46 pounds
Chetvert	Russia	5.7748 bushels
Chih	China	12.6 inches
Coyan	Sarawak	3,098 pounds
	Siam (Koyan)	2,667 pounds
Cuadra	Argentine Republic	4.2 acres
	Paraguay	78.9 yards
	Paraguay (square)	8.077 square feet
	Uruguay	Nearly 2 acres
Cubic meter	Metric	35.3 cubic feet
Cwt. (hundredweight)	British	112 pounds
Dessiatine	Russia	2.6997 acres
	Spain	1.599 bushels
Drachme	Greece	Half ounce
Egyptian weights and measures	(See Consular Reports No. 144)	
Fanega (dry)	Central America	1.5745 bushels
	Chili	2.575 bushels
	Cuba	1.599 bushels
	Mexico	1.54728 bushels
	Morocco	Strike fanega, 70 lbs.; full fanega, 118 lbs.
	Uruguay (double)	7.776 bushels
	Uruguay (single)	3.888 bushels
	Venezuela	1.599 bushels
Fanega (liquid)	Spain	16 gallons
Feddan	Egypt	1.03 acres
Frail (raisins)	Spain	50 pounds
Frasco	Argentine Republic	2.5096 quarts
	Mexico	2.5 quarts
Frasila	Zanzibar	35 pounds
Fuder	Luxemburg	264.17 gallons
Funt	Russia	0.9028 pound
Garnice	Russian Poland	0.88 gallon

Denominations	Where Used	American Customary Equivalents
Gram	Metric	15.432 grains
Hectare	Metric	2.471 acres
Hectoliter: Dry	Metric	2.838 bushels
Liquid	Metric	26.417 gallons
Joch	Austria-Hungary	1.422 acres
Ken	Japan	5.965 feet
Kilogram (kilo.)	Metric	2.2046 pounds
Kilometer	Metric	0.621376 mile
Koku	Japan	4.9629 bushels
Korree	Russia	3.5 bushels
Kwan	Japan	8.28 pounds
Last	Belgium and Holland	85.134 bushels
	England (dry malt)	82.52 bushels
	Germany	2 metric tons (4,480 pounds)
	Prussia	112.29 bushels
	Russian Poland	11⅔ bushels
	Spain (salt)	4,760 pounds
League (land)	Paraguay	4,033 acres
Li	China	0.0126 inches
Libra (pound)	Argentine Republic	1.0127 pounds
	Central America	1.043 pounds
	Chili	1.014 pounds
	Cuba	1.0161 pounds
	Mexico	1.01465 pounds
	Peru	1.0143 pounds
	Portugal	1.011 pounds
	Spain	1.0144 pounds
	Uruguay	1.0143 pounds
	Venezuela	1.0161 pounds
Liter	Metric	1.0567 quarts
Livre (pound)	Greece	1.1 pounds
	Guiana	1.0791 pounds
Load	England (timber)	Square, 50 cubic feet; unhewn, 40 cubic feet; inch planks, 600 superficial feet
Manzana	Costa Rica	1 5-6 acres
	Nicaragua and Salvador	1.727 acres
Mare	Bolivia	0.507 pounds
Maund	India	82 2-7 pounds
Meter	Metric	39.37 inches
Mil	Denmark	4.68 miles
	Denmark (geographical)	4.61 miles
Milla	Nicaragua and Honduras	1.1493 miles
Morgen	Prussia	0.63 acre
Oke	Egypt	2.7225 pounds
	Greece	2.84 pounds
	Hungary	3.0817 pounds
	Turkey	2.82838 pounds
	Hungary and Wallachia	2.5 pints
Pic	Egypt	21½ inches
Picul	Borneo and Celebes	135.64 pounds
	China, Japan and Sumatra	133⅓ pounds
	Java	135.1 pounds
	Philippine Islands	137.9 pounds
Pie	Argentine Republic	0.9478 foot
	Spain	0.91407 foot
Pik	Turkey	27.9 inches
Pood	Russia	36.112 pounds
Pund (pound)	Denmark and Sweden	1.102 pounds
Quarter	Great Britain	8.252 bushels
	London (coal)	36 bushels
Quintal	Argentine Republic	101.42 pounds
	Brazil	130.06 pounds
	Castile,* Chili, Mexico and Peru	101.41 pounds
	Greece	123.2 pounds
	Newfoundland (fish)	112 pounds
	Paraguay	100 pounds
	Syria	125 pounds
	Metric	220.46 pounds
Rottle	Palestine	6 pounds
	Syria	5¾ pounds
Sagene	Russia	7 feet
Salm	Malta	490 pounds
Se	Japan	0.02451 acre
Seer	India	1 pound 13 ounces
Shaku	Japan	11.9303 inches; 0.01806 liquid quart

TABLE OF FOREIGN WEIGHTS AND MEASURES—Continued

Denominations	Where Used	American Customary Equivalents
Sho	Japan	1.6 liquid quarts
Standard (St. Petersburg)	Lumber measure	165 cubic feet
Stone	British	14 pounds
Suerte	Uruguay	2,700 cuadras (see cuadra)
Sun	Japan	1.193 inches
Tael	Cochin China	590.75 grains (troy)
Tan	Japan	0.25 acre 9,884 sq. ft.
To	Japan	2 pecks
Ton	Space measure	40 cubic feet
Tonde (cereals)	Denmark	3.94783 bushels
Tondeland	Denmark	1.36 acres
Tsubo	Japan	98.84 square feet
Tsun	China	1.26 inches
Tunna	Sweden	4.5 bushels
Tunnland	Sweden	1.22 acres
Vara	Argentine Republic	34.1208 inches
	Central America	32.87 inches
	Chili and Peru	33.367 inches
	Cuba	33.384 inches
	Curacao	33.375 inches
	Mexico	33 inches
	Paraguay	34 inches
	Spain	0.911417 yard
	Venezuela	33.384 inches
Vedro	Russia	3.249 gallons
Vergees	Isle of Jersey	71.1 square rods
Verst	Russia	0.6629 mile
Vlocka	Russian Poland	41.98 acres

*Although the metric weights are used officially in Spain, the Castile quintal is employed in commerce in the peninsula and colonies, save in Catalonia; the Catalan quintal equals 91.71 pounds.

WEIGHTS AND MEASURES OF THE BIBLE

WEIGHTS

	Avoirdupois Lbs.	Oz.	Drs.	Troy. Lbs.	Oz.	Dwt.	Gr.
A gerah	0	0	0.439 =	0	0	0	12
10 gerahs = 1 bekah	0	0	4.39 =	0	0	5	0
2 bekahs = 1 shekel	0	0	8.78. =	0	0	10	0
60 shekels = 1 maneh	2	0	14.628 =	2	6	0	0
50 manehs = 1 talent	102	13	11.428 =	125	0	0	0

MEASURES

Long Measure	Feet	Inches
A digit, or finger (Jer. lii. 21)	0	0.912
4 digits = 1 palm (Exod. xxv, 25)	0	3.648
3 palms = 1 span (Exod. xxviii, 16)	0	10.944
2 spans = 1 cubit (Gen. vi, 15)	1	9.888
4 cubits = 1 fathom (Acts xxvii, 28)	7	3.552
1.5 fathoms = 1 reed (Ezek. xl, 3, 5)	10	11.328
13.3 reeds = 1 line (Ezek. xl, 3)	145	11.04

Land Measure	Eng. Miles	Paces	Feet
A cubit	0	0	1.824
400 cubits = 1 furlong (Luke xxiv, 13)	0	145	4.6
5 furlongs = 1 sabbath day's journey (John xi, 18; Acts i, 12)	0	727	3.0
10 furlongs = 1 mile (Matt. v, 41)	1	399	1.0
24 miles = 1 day's journey	33	76	4.0

Liquid Measure	Gallons	Pints
A caph	0	0.625
1.3 caphs = 1 log (Lev. xiv, 10)	0	0.833
4 logs = 1 cab	0	3.333
3 cabs = 1 hin (Exod. xxx, 24)	1	2
2 hins = 1 seah	2	4
3 seahs = 1 bath, or ephah (1 Kings vii, 26; John ii, 6)	7	4.5
10 ephahs = 1 kor, or homer (Isa. v, 10; Ezek. xiv, 14)	75	5.25

WEIGHTS AND MEASURES OF THE BIBLE—Continued

Dry Measure	Pecks	Gallons	Pints
A gachal	0	0	0.1416
20 gachals = 1 cab (2 Kings vi, 25; Rev. vi, 6)	0	0	2.8333
1.8 cabs = 1 omer (Exod. xvi, 36)	0	0	5.1
3.3 omers = 1 seah (Matt. xiii, 33)	1	0	1
3 seahs = 1 ephah (Ezek. xlv, 11)	3	0	3
5 ephahs = 1 letech (Hosea iii, 2)	16	0	0
2 letechs = 1 kor, or homer (Num. xi, 32; Hos. iii, 2)	32	0	0

N. B.—The foregoing table will explain many texts in the Bible. Take, for instance, Isa. v, 10. "Yea, ten acres of vineyard shall yield one bath, and the seed of an homer shall yield an ephah." This curse upon the covetous man was that 10 acres of vines should produce only 7 gallons of wine, *i. e.*, one acre should yield less than 3 quarts; and that 32 pecks of seed should only bring a crop of 3 pecks, or, in other words, that the harvest reaped should produce but one-tenth of the seed sown.

TIME

The natural day was from sunrise to sunset.

The natural night was from sunset to sunrise.

The civil day was from sunset one evening to sunset the next; for, "th. Evening and the Morning were the first day."

Night (Ancient)	Day (Ancient)
First watch (Lam. ii, 19), till midnight.	Morning till about 10 a. m.
Middle watch (Judg. vii, 19), till 3 a. m.	Heat of day till about 2 p. m.
Morning watch (Exod. xiv, 24), till 6 a. m.	Cool of day till about 6 p. m.
Night (New Testament)	**Day (New Testament)**
First watch, evening = 6 to 9 p. m.	Third hour = 6 to 9 a. m.
Second watch, midnight = 9 to 12 p. m.	Sixth hour = 9 to 12 midday.
Third watch, cock-crow = 12 to 3 a. m.	Ninth hour = 12 to 3 p. m.
Fourth watch, morning = 3 to 6 a. m.	Twelfth hour = 3 to 6 p. m.

JEWISH MONEY

With its value in English and American money; the American dollar being taken as equal to 4s. 2d.

	English pound	s.	d.	American Dols.	Cents
A gerah (Exod. xxx, 13) =	0	0	1.36 =	0	2.73
10 gerahs = 1 bekah (Exod. xxxviii, 26) =	0	1	1.68 =	0	27.37
2 bekahs = 1 shekel (Exod. xxx, 13; Isa. vii, 23) =	0	2	3.37	0	54.74
50 shekels = 1 maneh =	5	14	0.75 =	27	37.50
60 manehs = 1 kikkar (talent) =	342	3	9 =	1,642	50
A gold shekel =	1	16	6 =	8	76
A kikkar of gold =	5,475	0	0 =	26,280	0

N. B.—A shekel would probably purchase nearly ten times as much as the same nominal amount will now. Remember that one Roman penny (8½d.) was a good day's wages for a laborer.

The Hebrew maneh, according to 1 Kings x, 17, compared with 2 Chron. ix, 16, contained 100 shekels; though according to one interpretation of Ezek. xiv, 12, it contained 60, but more probably 50. The passage reads thus: "Twenty shekels, five and twenty shekels, fifteen shekels shall be your maneh." This is variously interpreted: (1) 20+25+15=60. (2) 20, 25, 15 are different coins in gold, silver, and copper, bearing the same name. It is well to remark the meaning of these names: Shekel = simply, weight: Bekah = split, *i. e.*, the shekel divided into two: Gerah = a grain, as in our weights, a grain and a barleycorn, the original standard weight: Maneh = appointed, equivalent to sterling, a specific sum: Kikkar = a round mass of metal, *i. e.*, a weight or coin. Hebrew names of weights and coins are not found in the New Testament: *mna* in Luke xix. 13, is Greek, though possibly identical with the Hebrew *maneh*.

ROMAN MONEY

	English Pence		American Cents
A "farthing," quadrans (Matt. v, 26) = nearly	0.125	=	0.25
A "farthing," as in 4 quadrantes (Matt. x, 29) = nearly.	0.5	=	1
A "penny," denarius = 16 asses (Matt. xxii, 19) nearly	8.50	=	17

The Roman sestertius = 2½ asses, is not named in the Bible.

N. B.—Here we learn that:—

Naaman's offering to Elisha of 6,000 pieces (shekels) of gold amounted to more than £10,000 = 48,000 dollars.

The Debtor (Matt. xviii, 24), who had been forgiven 10,000 talents, i. e., £3,000,000 = 14,400,000 dollars, refused to forgive his fellow-servant 100 pence *i. e.*, £3 10s. 10d = 17 dollars.

Judas sold our Lord for 30 pieces of silver, *i. e.*, £3 10s.8d. = 16 dollars 96 cents, the legal value of a slave, if he were killed by a beast.

Joseph was sold by his brethren for 20 pieces, *i. e.*, £2 7s. = 11 dollars 28 cents.

Time.—Three kinds of time are recognized by astronomers, *viz.*, sidereal, apparent solar and mean solar time.

Sidereal Time.—The sidereal day is the interval between two consecutive transits of some fixed celestial object across any given meridian, or it is the interval required by the earth to make one complete revolution on its axis. This interval is constant but it is inconvenient as a time unit because the noon of the sidereal day occurs at all hours of the day and night.

Apparent Solar Time.—The apparent solar day is the interval between two consecutive transits of the *sun* across any given meridian. On account of the variable distance between the sun and earth, the variable speed of the earth in its orbit, the effect of the moon, etc., this interval is not constant and consequently cannot be kept by any simple mechanism, such as a clock or watch.

Mean Solar Time.—To overcome the objection noted above, the mean solar day was devised. The mean solar day is the length of the average apparent solar day. Like the sidereal day it is constant, and like the apparent solar day its noon always occurs at approximately the same time of day.

The sidereal or astronomical day begins at mean noon and the hours run from one to twenty-four, while the civil day (mean solar) begins twelve hours earlier, at midnight, and the hours run from one to twelve, and then repeat from noon to midnight. The hours are in both cases divided into sixty minutes, and the minutes into sixty seconds.

The Year.—In dealing with longer periods, such as the life of a man, the day is too small a period, and for all chronological purposes the year has always been employed.

There are three different kinds of year used—the sidereal, the tropical, and the anomalistic.

The Sidereal Year is the time taken by the earth to complete one revolution around the sun from a given star to the same star again. Its length is 365 days 6 hours 9 minutes 9 seconds.

The Tropical Year is the time included between two successive passages of the vernal equinox by the sun, and since the equinox moves westward 50.2 seconds of arc a year the tropical year is shorter by 20 minutes 23.5 seconds in time than the sidereal year. As the seasons depend upon the earth's position with respect to the equinox, the tropical year is the year of civil reckoning.

Anomalistic Year. — The third kind of year is the anomalistic year—the interval between two successive passages of the perihelion, namely, the time of the earth's nearest approach to the sun. The anomalistic year is only used in special calculations in astronomy.

The Calendar.—Various attempts were made by the ancients to reconcile the month, which originally depended upon the changes of the moon, with the tropical year, but a satisfactory solution is not possible, and the calendars of civilized nations now disregard the moon entirely. The Mohammedan nations, however, still use a lunar calendar with a year of twelve lunar months, which alternately contain 355 and 356 days. According to their method of reckoning the same month falls

in different seasons, and their calendars gain one year on ours every thirty-three years.

The Julian Calendar, which was established 45 B. C., by Julius Cæsar, discarded all consideration of the moon and adopted 365¼ days as the true length of the year. He ordained that every fourth year should contain 366 days, and transferred the beginning of the year from March to January 1. The Julian calendar is still used in Russia and generally by the Greek church.

The Gregorian Calendar.—The true length of the tropical year is not 365¼ days, but 365 days 5 hours 48 minutes 45.5 seconds, a difference of 11 minutes 14.5 seconds by which the Julian year is too long. This amounts to a little more than three days in four hundred years, and consequently the date of the vernal equinox had in Pope Gregory's time fallen back to March 11th instead of occurring on March 21st as it did at the Council of Nice, A. D. 325. The pope therefore decreed that the calendar should be corrected by dropping ten days, so the day following October 4, 1582, should be called October 15th instead of October 5th, and also in the future only such century years shall be leap years as are divisible by 400. Thus 1700, 1800, 1900, etc., are not leap years, while 1600, 2000, 2400, etc., are. The change was immediately made by all Catholic countries, but it was not until 1752 that the Gregorian calendar was adopted by England.

Standard Time.—Prior to 1883 each city had its own time, which was determined by the time of passage of the sun across the local meridian. Consequently the traveler going from one city to another had to continually change his watch to the local time. Largely through the efforts of the railroads a system of standard time was introduced. According to this system the United States, which extends from 65 degrees to 125 degrees west longitude, was divided into four sections, each of 15 degrees longitude.

The *first* (or eastern) section includes all territory between the Atlantic coast and an irregular line drawn from Detroit, Mich., through Pittsburg to Charleston, S. C., its most southern point. The time of this section is that of the 75th meridian, which is five hours slower than Greenwich time.

The *second* (central) section includes all territory between the line mentioned and an irregular line drawn from Bismarck, N. D., to the mouth of the Rio Grande.

The *third* (mountain) section includes all territory between the last-named line and a line which passes through the western part of Idaho, Utah and Arizona.

The *fourth* (Pacific) section covers the rest of the country to the Pacific Ocean. Standard time is uniform in each of these sections, but the time in one section differs by exactly one hour from the section next to it. Thus the time of the first section is five hours slower than Greenwich time, the time of the central section six hours slower, the time of the mountain seven hours, and the time of the Pacific section is eight hours slower than Greenwich mean time.

In cities situated on the border line of two sections, as, for instance, Pittsburg and Atlanta, the standard times of both sections are used; for example, if at Pittsburg it is 7 a.m. eastern time, it is 6 a.m. central time, and in such cities when the time is given, it should be specified as eastern, central, etc.

The system of standard time has been practically adopted in almost all civilized countries. All continental Europe, except Russia, uses a time one hour faster than that of Greenwich; in Japan and Australia the time is nine hours faster, etc.

Temperature Scales.—Temperature is the term used to designate the state of a body as regards hotness or coldness. Two bodies are said to have the same temperature if, when they are put in contact, there is no tendency for one to get hotter while the other gets colder; if there is such a tendency, the one which tends to cool off is said to have the higher temperature.

A Scale of Temperature is a system of numbering temperatures, the numbers being larger as the temperatures are higher. Such scales are based upon two fixed temperatures, *viz.*, the "ice-point" or temperature at which pure ice melts, and the "steam point" or temperature at which pure water boils, both under the standard barometric pressure of 760 millimeters or 29.92 inches of mercury. Three such systems or scales are in use—the centigrade or Celsius, the Fahrenheit, and the Reaumur.

Centigrade.—On the centigrade scale, which is used almost universally in countries which have adopted the metric system of weights and measures, as well as in scientific work everywhere, the ice-point is numbered zero degrees (0° C.) and the steam-point one hundred degrees (100° C.), the unit of measurement, or the centigrade degree (1° C.) being the one-hundredth part of this interval.

Fahrenheit.—On the Fahrenheit scale, which is generally used in English-speaking countries, except among scientific men, the ice-point is numbered 32° F. and the steam-point 212° F., the difference being 180°, and the Fahrenheit degree (1° F.) being the one-hundred-eightieth part of this interval. The Fahrenheit degree is thus $\frac{100}{180}$ or $\frac{5}{9}$ as large as the centigrade degree. The Fahrenheit zero, at 32° below the ice-point, corresponding to $-\frac{5}{9} \times 32 = -17.8$°C., is approximately the lowest temperature that can be obtained with ordinary freezing mixtures of ice and common salt.

Reaumur.—The Reaumur scale is used in a few European countries, but is fast being superseded by the centigrade. It has 0° at the ice-point and 80° at the steam point, so that the Reaumur degree (1° R.) is $\frac{5}{4}$ of the centigrade degree or $\frac{9}{4}$ of the Fahrenheit degree.

Conversion.—*To convert from one scale to another* we have, in accordance with the above definitions, the following practical rules:

Centigrade to Fahrenheit; multiply by $\frac{9}{5}$ and add 32°.

Centigrade to Reaumur; multiply by $\frac{4}{5}$.

Fahrenheit to centigrade; subtract 32° and multiply by $\frac{5}{9}$.

Fahrenheit to Reaumur; subtract 32° and multiply by $\frac{4}{9}$.

Reaumur to centigrade; multiply by $\frac{5}{4}$.

Reaumur to Fahrenheit; multiply by $\frac{9}{4}$ and add 32°.

Care should be taken to make the addition or subtraction algebraically, *i. e.*, taking account of the negative sign when the temperature in question is below zero.

Absolute Temperature.—*By the absolute temperature* of a body is meant its temperature, measured in either of the three kinds of degrees, not from the ice-point or from the Fahrenheit zero, but from a point known as the absolute zero, which is at about —273.1°C. or—459.6°F. or—218.5°R. This mode of numbering temperatures is frequently convenient in scientific and engineering work. To convert centigrade temperatures into centigrade-absolute temperatures add 273.1°.

To convert from Fahrenheit to Fahrenheit-absolute add 459.6°. To convert from Reaumur to Reaumur-absolute add 218.5°. To convert in the other direction, subtract the same amounts. The Reaumur-absolute scale is seldom or never used, and the Fahrenheit-absolute scale only by engineers in English-speaking countries. When the term "absolute temperature" is used without further qualification, it usually means the centigrade temperature plus 273°, though this value, which may also be looked upon as the centigrade-absolute temperature of the ice-point, is sometimes taken as high as 274°.

Barometric Measurements.—By barometer reading is meant the height in inches or millimeters of the column of mercury, under standard conditions, that exactly balances the pressure exerted by the atmosphere at the instant the reading is made. The pressure exerted by a given column of mercury depends upon the altitude of the barometer, and upon the latitude, and it is customary, in order to get accurate comparisons, to refer the readings to latitude 45°, and to sea level. Also since the density of the mercury is affected by the temperature it is usually referred to 0° centigrade.

Since all air movements are the result of difference in pressure, important conclusions regarding the weather to be expected may be deducted from barometric readings, hence their use by mariners and weather experts.

Their value in determining altitudes depends upon the fact that the pressure of the atmosphere decreases with the altitude according to a fairly well established law, which is illustrated by the following table:

PRESSURE OF THE ATMOSPHERE AT DIFFERENT ELEVATIONS

Elev. Feet	Barom. Inches	Elev. Feet	Barom. Inches	Elev. Feet	Barom. Inches
0	29.9	600	29.25	4000	25.81
50	29.845	700	29.14	5000	24.88
100	29.79	800	29.03	6000	23.98
200	29.68	900	28.92	7000	23.11
300	29.57	1000	28.82	8000	22.28
400	29.46	2000	27.78	9000	21.48
500	29.35	3000	26.78	10000	20.70

Beaufort's Wind Scale.—The Beaufort Scale is used by seamen for recording the force of wind. For the guidance of those unaccustomed to its use, the corresponding velocity per hour in statute miles and in nautical miles is added. The force of wind varies from 0, a calm, to 12, a hurricane.

Intensity of Force of Wind — Beaufort's Scale	Velocity Statute miles per hour	Velocity Nautical miles per hour
0. **Calm.** Full rigged ship, all sail set, no headway	0 to 3	0 to 2.6
1. **Light Air.** Just sufficient to give steerageway	8	6.9
2. **Light Breeze.** Speed of 1 or 2 knots, "full and by."	13	11.3
3. **Gentle Breeze.** Speed of 3 or 4 knots, "full and by."	18	15.6
4. **Moderate Breeze.** Speed of 5 or 6 knots, "full and by."	23	20.0
5. **Fresh Breeze.** All plain sail, "full and by."	28	24.3
6. **Strong Breeze.** Topgallant sails over single-reefed topsails	34	29.5
7. **Moderate Gale.** Double-reefed topsails	40	34.7
8. **Fresh Gale.** Treble-reefed topsails (or reefed upper topsails and courses)	48	41.6
9. **Strong Gale.** Close-reefed topsails and courses (or lower topsails and courses)	56	48.6

Intensity or Force of Wind — Beaufort's Scale	Velocity Statute miles per hour	Velocity Nautical miles per hour
10. **Whole Gale.** Close-reefed main topsail and reefed foresail (or lower main top-sail and reefed foresail)	65	56.4
11. **Storm.** Storm staysails	75	65.1
12. **Hurricane.** Under bare poles	90 and over	78.1 and over

The word "force" used in connection with this scale has no relation to pressure, but refers to speed or velocity.

Speed of Winds in the United States.—United States weather bureau records of the average speed of wind in miles per hour at selected stations, and the highest speeds ever reported for a period of five minutes.

Station	Average	Highest
Abilene, Texas	11	66
Albany, New York	6	70
Alpena, Michigan	9	72
Atlanta, Georgia	9	66
Bismarck, North Dakota	8	74
Boise, Idaho	4	55

*Anemometer blew away at a velocity of 84 miles per hour, September, 1900.

Values of Foreign Coins.—The following values of foreign coins in terms of the United States gold dollar were established by the treasury department in October, 1910, for estimating the value of all foreign merchandise exported to the United States:

VALUE OF FOREIGN COINS

Country	Standard	Monetary Unit		Value in Terms of U. S. Gold Dollar	Coins
Argentine Republic	Gold	Peso		$0.965	Gold: argentine ($4.824) and ½ argentine. Silver: peso and divisions.
Austria-Hungary	Gold	Crown		.203	Gold: 10 and 20 crowns. Silver: 1 and 5 crowns.
Belgium	Gold	Franc		.193	Gold: 10 and 20 francs. Silver: 5 francs.
Bolivia	Gold	Boliviano		.389	Gold: *Silver boliviano and divisions.
Brazil	Gold	Milreis		.546	Gold: 5, 10, and 20 milreis. Silver: ½, 1, and 2 milreis.
British Possessions, N. A. (except Newfoundland).	Gold	Dollar		1.000	
Central American States—					
Costa Rica	Gold	Colon		.465	Gold: 2, 5, 10, and 20 colons ($9.307). Silver: 5, 10, 25, and 50 centimos.
British Honduras, Guatemala, Honduras, Nicaragua, Salvador	Silver	Peso		.383	Silver: peso and divisions.
Chile	Gold	Peso		.365	Gold: escudo ($1.825), doubloon ($3.650) and condor ($7.300) Silver: peso and divisions.
China	Silver	Tael	Amoy	.629	
			Canton	.627	
			Cheefoo	.601	
			Chin Kiang	.614	
			Fuchau	.581	
			Haikwan (customs)	.640	
			Hankow	.588	
			Kiaochow	.609	
			Nankin	.622	
			Niuchwang	.589	
			Ningpo	.604	
			Peking	.613	
			Shanghai	.574	
			Swatow	.581	
			Takau	.633	
			Tientsin	.609	
		Dollar	Hongkong	.413	
			British	.413	
			Mexican	.416	
Colombia	Gold	Dollar		1.000	Gold: condor ($9.647) and double condor. Silver: peso.
Denmark	Gold	Crown		.268	Gold: 10 and 20 crowns.
Ecuador	Gold	Sucre		.487	Gold: 10 sucres ($4.8665). Silver: sucre and divisions.
Egypt	Gold	Pounds (100 piasters)		4.943	Gold: pound (100 piasters), 5, 10, 20, and 50 piasters. Silver: 1, 2, 5, 10, and 20 piasters.
Finland	Gold	Mark		.193	Gold: 20 marks ($3.859), 10 marks ($1.93).
France	Gold	Franc		.193	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
German Empire	Gold	Mark		.238	Gold: 5, 10, and 20 marks.
Great Britain	Gold	Pound sterling		4.866½	Gold: sovereign (pound sterling) and ½ sovereign.
Greece	Gold	Drachma		.193	Gold: 5, 10, 20, 50, and 100 drachmas. Silver: 5 drachmas.
Hayti	Gold	Gourde		.965	Gold: 1, 2, 5, and 10 gourdes. Silver: gourde and divisions.
India (British)	Gold	Pound sterling†		4.866½	Gold: sovereign (pound sterling). Silver: rupee and divisions.
Italy	Gold	Lira		.193	Gold: 5, 10, 20, 50, and 100 lire. Silver: 5 lire.
Japan	Gold	Yen		.498	Gold: 5, 10, and 20 yen. Silver: 10, 20, and 50 sen.
Liberia	Gold	Dollar		1.000	
Mexico	Gold	Peso‡		.498	Gold: 5 and 10 pesos. Silver: dollar § (or peso) and divisions.
Netherlands	Gold	Florin		.402	Gold: 10 florins. Silver: 2½, 1 florin and divisions.
Newfoundland	Gold	Dollar		1.014	Gold: 2 dollars ($2.028).
Norway	Gold	Crown		.268	Gold: 10 and 20 crowns.
Panama	Gold	Balboa		1.000	Gold: 1, 2½, 5, 10, and 20 balboas. Silver: peso and divisions.
Persia	Silver	Kran		.072	Gold: ½, 1, and 2 tomans ($3.409). Silver: ¼, ½, 1 2 and 5 krans
Peru	Gold	Libra		4.866½	Gold: ½ and 1 libra. Silver: sol and divisions.
Philippine Islands	Gold	Peso		.500	Silver peso: 10, 20, and 50 centavos.
Portugal	Gold	Escudo		1.080	Gold: 1, 2, 5, and 10 milreis.
Russia	Gold	Ruble		.515	Gold: 5, 7½, 10, and 15 rubles. Silver: 5, 10, 15, 20, 25, 50 and 100 copecks.
Spain	Gold	Peseta		.193	Gold: 25 pesetas. Silver: 5 pesetas.
Straits Settlements	Gold	Pound sterling¶		4.866½	Gold: sovereign (pound sterling). Silver: dollar and divisions.
Sweden	Gold	Crown		.268	Gold: 10 and 20 crowns.
Switzerland	Gold	Franc		.193	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
Turkey	Gold	Piaster		.044	Gold: 25, 50, 100, 250, and 500 piasters.
Uruguay	Gold	Peso		1.034	Gold: peso. Silver: peso and divisions.
Venezuela	Gold	Bolivar		.193	Gold: 5, 10, 20, 50, and 100 bolivars. Silver: 5 bolivars.

Note.—The coins of silver-standard countries are valued by their pure silver contents, at the average market price of silver for the three months preceding the date of this circular.

*Gold standard adopted December 31, 1908, 12½ bolivianos equal the pound sterling or Peruvian pound ($4.866½).

†The sovereign is the standard coin of India, but the rupee ($0.3244⅓) is the current coin, valued at 15 to the sovereign.

‡Seventy-five centigrams fine gold. §Value in Mexico, $0.498.

¶The current coin of the Straits Settlements is the silver dollar issued on government account and which has been given a tentative value of $0.567758⅓.

English Money.—The unit is the pound sterling or sovereign, which is equal to $4.8665 at a normal rate of exchange.

4 farthings (far.) = 1 penny (d.) equals $.0202 plus.

12 pence = 1 shilling (s.) equals $.2433 plus.

20 shillings = 1 pound (£) equals $4.8665.

Canadian Money.—The coinage system of Canada is very similar to that of the United States. Canadian currency is on a decimal scale. The unit of coinage is the dollar and decimal parts of the dollar are expressed in cents as in the United States. There are no Canadian gold coins, but those of Great Britain and the United States are in circulation.

French Money.—The money of France is on a decimal scale. The unit of value is the franc, valued at $.193 in United States money, at normal rate of exchange.

Table.—

10 millimes (ms.)	= 1 centime.....ct.
10 centimes	= 1 decime.....de.
10 decimes	= 1 franc.....fr.

German Money.—The principal units of German money are the mark and pfennig. 100 pfennig (pf.) = 1 mark (M.). The mark contains 5.5513 grains of pure gold, and is therefore equal to $.238 at normal rate of exchange.

Explanation of Leap Year.—The earth requires 365 days, 5 hours, 48 minutes, and 49.7 seconds to complete its revolution around the sun. This is a little less than 365¼ days, so by considering 3 successive years as common years of 365 days each and the fourth as a leap year of 366 days there is a gain of time. To correct this, the extra day is added to only every fourth centennial year. From the foregoing we derive the following statements for the deciding of leap years.

1. All years divisible by 4, except centennial years, are leap years.

2. All centennial years divisible by 400 are leap years.

Table of Months in the Year.—

No.	Month	Abbr.	Days.
1	January	Jan.	31
2	February	Feb.	28 or 29
3	March	Mar.	31
4	April	Apr.	30
5	May	.....	31
6	June	.....	30
7	July	.....	31
8	August	Aug.	31
9	September	Sept.	30
10	October	Oct.	31
11	November	Nov.	30
12	December	Dec.	31

Note.—The month should be known by its number.

Circular Measure.—

60 seconds of arc (″)	= 1 minute of arc (′).
60 minutes	= 1 degree.....(°).
30 degrees	= 1 sign.....S.
12 signs	= 1 circle.....Cir.
60 degrees	= 1 sextant.
90 degrees	= 1 quadrant or right angle.

Notes.—1. Minutes of the earth's circumference are nautical miles.

2. Every circle, great or small, is divisible into the same number of parts, but a division of one circle is not necessarily equal to a division of another, although it has the same name. Thus, every circle has 360 degrees, but a degree of one circle is not equal to a degree of every other circle.

MISCELLANEOUS MEASURES

Books.—The size of the page depends upon the number of times the sheet is folded. A sheet folded into—

2	leaves	making	4	pages,	is called a Folio
4	"	"	8	"	" a Quarto, or 4to.
8	"	"	16	"	" an Octavo, or 8vo.
12	"	"	24	"	" a 12mo.
16	"	"	32	"	" a 16mo.
18	"	"	36	"	" an 18mo.
24	"	"	48	"	" a 24mo.
32	"	"	64	"	" a 32mo.

1 size=⅓ inch. Used by shoemakers.

Paper Measure. Table.—

24 sheets	=1 quire....qr.
20 quires	=1 ream....rm.
2 reams	=1 bundle...bdl.
5 bundles	=1 bale.....bl.

Counting. Table.—

20 units	=1 score.
12 units	=1 dozen.....doz.
12 dozen	=1 gross.....gro.
12 gross	=1 great gr...gr. gro.

Metric System.—The Metric System is a decimal system of weights and measures, the principal unit of which is the meter.

1. The Metric System, which was first introduced in France, is required by law in South America, in parts of Asia, in nearly all European countries, and is legalized by Great Britain, Russia, and the United States.

2. The meter is a trifle less than one ten-millionth part of the distance measured on a meridian of the earth from the equator to the pole, and is equal to 39.37079, or 39.37 inches.

3. The standard meter (of which nearly every civilized nation has procured a copy) is a bar of platinum carefully preserved at Paris.

The Metric System has a number of advantages over our present system, some of which are:

1. It has only five primary units, viz: meter, square meter, cubic meter, liter, and gram.

2. Each primary unit suggests its measure.

3. It does away with the system of compound numbers.

4. As all divisions and multiplications are by 10, or based on the decimal system, it makes all computations relating to measure simpler.

5. It facilitates commerce and exchange by giving all nations a uniform system of weights and measures.

6. It is simpler, more concise, and yet, complete.

The Lower Denominations or Divisions of the primary unit are denoted by the Latin prefixes milli (1/1000), centi (1/100), and deci (1/10), while the Higher Denominations or Multiples are denoted by the Greek prefixes deka (10), hekto (100), kilo (1000), and myria (10000).

By knowing the unit of weight or measurement, it is very simple to prepare the tables, as we use the same prefixes in each case.

In the tables, the abbreviations for divisions often begin with small letters, while those for multiples begin with capital letters.

Wood Measure.—The unit is the *stere*, which is equivalent to the cu. meter.

10 Decisteres (ds.) = 1 Stere (1 cu. meter).
10 Steres (s.) = 1 Dekastere (10 cu. meters).

Reduction of Denominate Numbers.—Reduction of denominate numbers is the process of changing from one denomination to another without changing the value.

Reduction descending is the process of changing from a higher to a lower denomination. Reducing 8 bushels to quarts is an example of reduction descending.

Reduction ascending is the process of changing from a lower to a higher denomination. Reducing 93678 pounds to tons, etc., is an example of reduction ascending.

Reduction Descending.—

Example 1. Reduce 2 miles 164 rods 2 yards to feet.

Solution:

mi.	rd.	yd.
2	164	2
320		
640		
164		
804 rd.		

Solution Continued

804 rd.
5½
402
4020
2
4424 yd.
3
13272 ft.

Explanation.—Since 1 mile = 320 rods, multiply 2 by 320 and to the product add the given number of rods. Thus, 2×320 +164 = 804.

Since 1 rod = 5½ yards, multiply 804 by 5½ and then add the given number of yards. Thus, 804×5½+2 = 4424.

Since 1 yard = 3 feet, multiply 4424 by 3 to find the number of feet.

Reduction Ascending.—

Example 1. Reduce 6212 pence to higher denominations.

Solution.

12)6212d
20)517s+8d.
£25+17s.
£25 17s. 8d.

Explanation.—Since it takes 12 pence to make 1 shilling, there are as many shillings as 12 is contained times in 6212, or 517, and there is a remainder of 8. The result is 517s. 8d. The remainder has the same name as the dividend.

Since it takes 20 shillings to make 1 pound, there are as many pounds as 20 is contained times in 517, or 25, and there is a remainder of 17. The result of this division is £25 17s.

The equivalent higher denominations are £25 17s. 8d.

Addition of Compound Numbers.—

Example 1. Find the sum of 35 bu. 2 pk. 5 qt.; 29 bu. 3 pk. 7 qt.; 18 bu. 4 qt.; 19 bu. 3 pk.; and 37 bu. 1 pk. 7 qt.

Solution:

bu.	pk.	qt.
35	2	5
29	3	7
18	0	4
19	3	0
37	1	7
140	3	7

4)11 8)23
2+3 2+7

Explanation.—Write the numbers to be added, placing like denominations in the same column. Beginning at the right, add the first column. If the sum equals one or more of the next higher denomination, it must be reduced. Thus, 23 qt. equal 2 pk. and 7 qt. Write the remainder, 7 qt., under the first and carry 2 pk. to the next column. Treat each column in the same manner.

Subtraction of Compound Numbers.—Subtraction involves reduction descending.

Illustrations.

	(1)			(2)	
	5 bu.	3 pk.	6 qt.	5 T.	7 cwt. 16 lb.
	2	1	3	2	5 46
Differences	3 bu.	2 pk.	3 qt.	3 T.	1 cwt. 70 lb.

Reduce 1 cwt. of the minuend to pounds. 116 lb.−46 lb. = 70 lb.; 6 cwt.−5 cwt. = 1c wt., etc.

Multiplication of Compound Numbers. *Example*: Multiply 14 days 2 hours 21 minutes 29 seconds by 9.

Solution.

da.	hr.	min.	sec.
14	2	21	29
			9
126	21	13	21
	189	60)261	
	4		4+21
	60)193		
	3+13		

Explanation.—Write the number as indicated and multiply, beginning with the lowest denomination. If the product equals 1 or more of the next higher denomination, divide it by the number necessary to make one of that denomination. Write the remainder, if there is one, under the first column and add the quotient to the product of the second column. Treat each column in like manner.

Division of Compound Numbers.—In division of denominate numbers the divisor may be either abstract or denominate.

Illustrations. (1) Compute the cost, per yd., of 80 yd. cloth invoiced at £180.

Solution (a).

80)£180

£ 2.25 = £2 5s. (cost).

Solution and Analysis (b). The cost per yd. is evidently 1/80 of £180. 1/80 of £180 = £2 and a remainder of £20. £20 = 400s. 1/80 of 400s. = 5s. 1/80 of £180 = £2 5s.

AREAS AND VOLUMES OF VARIOUS FIGURES

Parallelograms.—The area of any parallelogram is equal to the product of its base by its altitude.

Triangles.—The area of any triangle is equal to one-half the product of its base multiplied by its altitude.

The square of the hypotenuse of a right-angle triangle is equal to the sum of the squares of the other two sides. Therefore, to find the hypotenuse when the other two sides are given, find the sum of the squares of the two sides and extract the square root. To find the side when one side and the hypotenuse are given, subtract the square of the given side from the square of the hypotenuse and extract the square root of the remainder.

Circles.—The circumference of a circle is the diameter multiplied by 3.1416. For approximate results, 3 1/7 may be used instead of 3.1416.

The circumference divided by 3.1416 equals the diameter.

The area of a circle may be found in one of three ways:

1. The circumference multiplied by one-half the radius.

2. The square of the radius multiplied by 3.1416.

3. The square of the diameter multiplied by ¼ of 3.1416 (.7854).

To find the diameter of a circle whose area is given, divide the area by ¼ of 3.1416 (.7854) and extract the square root of the quotient. To find the circumference, multiply the diameter by 3.1416.

Prism or Cylinder.—To find the volume of a prism or cylinder, multiply the area of the base by the altitude. The result will be expressed in cube units.

To find the lateral surface of a prism or cylinder, multiply the perimeter of the base by the altitude.

To find the entire surface, add the area of the lateral surfaces to the area of the two bases.

Pyramid or Cone.—To find the volume of a pyramid or of a cone, multiply the area of the base by one-third the altitude. The result will be in cube units.

To find the lateral surface of a pyramid or cone, multiply the perimeter of the base by one-half the *slant* height.

To find the entire surface, add the lateral surface to the area of the base.

TYPICAL PROBLEMS AND SOLUTIONS IN PRACTICAL MEASUREMENTS

Measures of Time.—*Example*: Find the time by compound subtraction from Oct. 17, 1919, to May 15, 1922.

Solution.

1922— 5—15	
1919—10—17	15+30−17 = 28 da.
2— 6—28	4+12−10 = 6 mo.

Explanation.—Write the later date as the minuend, the earlier as the subtrahend, and subtract as in compound numbers.

The months are represented by their numbers. Thus, May being the fifth month is represented by 5 and likewise October by 10. The years and days are written as given.

Counting back or forward from a given date.

Example 1: Count forward 183 days from Nov. 30, 1922.

Example 2: Count back 145 days from Oct. 1, 1923.

Solutions.

1.	183 da.	93 da.
	0 Nov.	31 Mar.
	183	62
	31 Dec.	30 Apr.
	152	32
	31 Jan.	31 May
	121	1 June
	28 Feb.	June 1, 1923.
	93	
2.	145 da.	Proof
	1 Oct.	
	144	31
	30 Sept.	9
	114	22 M.
	31 Aug	30 J.
	83	
	31 July	31 J.
	52	31 A.
	30 June	30 S.
	22	1 O.
		145 da.

May 31 − 22 = May 9, 1923.

Notes.— 1. In counting back, as shown above, we start with the later date and count it.

2. When the time is expressed in months, calendar months are meant. In counting back or forward a number of months from a given date the corresponding day of another month is found. Thus, 5 mo. forward from May 15 gives Oct. 15 (5th mo. + 5 = 10th mo.). Four months back from Aug. 27 is Apr. 27 (8th mo. − 4 = 4th mo.).

3. When counting calendar months forward, if there is not a corresponding day in the month to which we reckon, the last day of that month is taken. Thus, July 31 + 2 mo. = Sept. 30; Jan. 31 + 1 mo. = Feb. 28.

4. The time to be counted is often 30, 60, or 90 days. The correct dates in such cases can be found mentally by adding by 30's as follows:

(a.) The addition of 30 days to any date in a 30-day month produces the same date in the next succeeding month.

(b.) The addition of 30 days to any date (except the first) in a 31-day month produces 1 day less in the next succeeding month. By adding 30 days to the first of a 31-day month the last of that month is found. By adding 30 days to the 30th or 31st of January of a common year the 1st or 2nd of March is found, but in a leap year the same addition would bring Feb.29 or Mar. 1.

(c.) The addition of 30 days to any date in February of a common year gives a date two days later in March but only 1 day later in a leap year.

(d.) The same rules can be applied in counting back, but the date is decided by the number of days in the preceding month.

Carpeting.—Carpet is made in various widths, the more common being 27 in. and 36 in. It is sold by the yard in length regardless of its width.

In estimating the number of yards of carpet required for a room, the "strip method" is generally used. The strips are laid either lengthwise or crosswise, and as there is usually some waste in matching the pattern, it is necessary to buy more carpet than would otherwise be required to cover the floor.

Example:—How many yards of carpet 27 in. wide will be required for a room 18′ 9″ long and 16′ 4″ wide, if the strips run lengthwise and 9 inches per strip are allowed for matching?

Solution.

16′ 4″ = 196 in.

196 ÷ 27 = 7 7/27 or 8 strips.

18′ 9″ + 9″ = 19½′, length of 1 strip.

19½′ × 8 = 156′, total length.

156 ft. ÷ 3 = 52 yd. carpet.

Explanation.—Since the strips run lengthwise, each strip covers 27 inches of the width of the floor. The number of strips is found by dividing the width of the room by the width of one strip. In this case 7 strips leave uncovered a strip 7 in. wide extending the entire length of the room, to cover which an additional strip must be purchased. Every strip must be as long as the room is *long*, and since 9 in. is wasted in matching, each strip must be purchased 9 in. longer than the room, or 18′ 9″ + 9″ = 19½ ft. The entire length of carpet is found by multiplying the length of each strip by the number of strips required. The length is then reduced to yards.

Papering.—Wall paper is put up in single rolls 8 yards long and in double rolls 16 yards long. For a room of ordinary height, 5 strips can be cut from a double roll but only 2 from a single roll. Therefore, double rolls are more economical than single rolls.

American wall paper is generally 18 inches wide, and unless otherwise stated that width is used in this work. Imported papers are of various widths.

If there was no waste in papering, the number of rolls could be found by dividing the area to be papered by the area of one roll. This method is not practical, however, and paper-hangers use the method explained in the following example.

Example: How many double rolls of paper will be required for the walls of a room 24 ft. long, 19 ft. wide, and 9 ft high, if 36 ft. are deducted for the width of doors, windows, mantels, etc.?

Perimeter of room = 24 × 2 = 48 ft. + 19 × 2 = 38 ft. = 86 ft.

86′ − 36′ = 50 feet of wall to be papered

1 strip of paper is 18 in. or 1½ ft. wide.
50÷1 1/2=50×2/3=100/3=33 1/3 or 34 strips required.
Each roll=16 yd.=48 ft. long.
Each strip must be 9 ft., the height of the room.
48÷9=5 1/3 or 5 strips from 1 roll.
34÷5=6 4/5 or 7 rolls required.

Finding the Number of Board Feet.—When lumber is 1 inch or less in thickness, to find the number of board feet, *multiply the length in feet by the width in inches and divide the product by 12.*

Note—When the width is given in feet it is not necessary to divide by 12.

When more than 1 inch thick, *multiply the length in feet by the width and thickness in inches and divide by 12.*

In measuring inch material, every inch of the width of a board 12 ft. long is a board foot. This is often taken as a basis of measurement in selling lumber at the yard. When the length is uniform but the boards are of various widths, the entire width of the boards is measured and from this the correct number of board feet can readily be found. Thus, if the boards are 15 ft. long, every inch of the width is 1 1/4 bd. ft.; if 16 ft. long and 2 in. thick, every inch of the width is 1 1/3×2 or 2 2/3 board feet.

A pile of lumber can be measured by finding the number of cubic feet and then, by multiplying by 12, the number of board feet can be found.

Hewn or round timber is sometimes measured by cubic measure.

Example 1. How many board feet are there in a board 15 ft. long, 8 in. wide, and 1 in. thick?

Solution:
15×8=120
120÷12=10=10 bd. ft.

Or, by cancellation,

$$\frac{\cancel{15}^{5}\times\cancel{8}^{2}}{\cancel{12}_{1}}=10 \text{ bd. ft.}$$

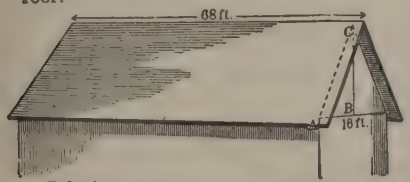
Example 2. How many feet, board measure, are there in a plank 15 ft. long, 10 in. wide, and 2 in. thick?

Solution:
15×10×2=300
300÷12=25=25 bd. ft.

Or, by cancellation,

$$\frac{\cancel{15}^{5}\times\cancel{10}^{5}\times\cancel{2}}{\cancel{12}_{1}\ \cancel{2}_{1}}=25 \text{ bd. ft.}$$

The accompanying diagram represents the roof of a shed 16 ft. wide. If the ridgepole is 68 ft., the pitch of the roof one half, and the projection of the rafters 18 in., how many shingles 16 in. long, laid 4½ in. to the weather, will be required to cover the roof?



Solution:
½ of 16 ft.=8 ft.=the base of the triangle *ABC*.

The pitch of the roof is ½; ½ of 16 ft.=8 ft.=the altitude of the triangle *ABC*. $8^2+8^2=128$; $128^{\frac{1}{2}}=11.31$, number of feet in the hypotenuse of *ABC*.

18 in.=1.5 ft.; 11.31 ft.+1.5 ft.=12.81 ft.=the length of the rafters or the width of each side of the roof.

2×68×12.81 ft.=1742.16 sq. ft.=the entire surface of the roof.

1742.16 sq. ft.=17.4216 squares; 17.4216×800 shingles=13937 shingles.

As bundles of shingles are not broken it will be necessary to buy 14000 shingles.

Excavation.—*Example:* Find the cost of digging a cellar 30 ft. long, 24 ft. wide, and 7½ ft. deep, at 21c per cubic yard.

Solution:
30×24×7½=5400 cu. ft.
5400÷27 = 200 cu. yd.
200 cu. yd. @ 21c.=$42.00

Or, by cancellation,

$$\frac{\cancel{10}\ \ \cancel{30}^{10}\times\cancel{24}^{4}\times\cancel{15}^{5}\times 21}{\cancel{27}_{1}\ \cancel{2}_{1}}=4200=\$42.00$$

Explanation.—The product of length, breadth, and thickness is the number of cubic feet of earth to be thrown out in digging the cellar. Reduce the cubic feet to cubic yards by dividing by 27 and then multiply by the price per cubic yard.

In the solution by cancellation, all multipliers are written above the line and all divisors below the line.

Cylindrical.—How many gallons will fill a cylindrical tank 4 ft. in diameter and 12 ft. deep?

Solution:

4	192
4	5 7/8
16	168
12	960
192	1128=1128 gal.

Explanation.—Every unit of the capacity of a cylinder found by squaring the diameter and multiplying by the height is .7854 of a cubic foot. Since a cubic foot holds 7.48 gal., a unit of the cylinder holds .7854 of 7.48 gal.=5.87479 or 5 7/8 gal.

PERCENTAGE

Use.—Nearly all of the fractional relations in business are expressed in per cent. Percentage has a very wide and varied application in the different business activities. The business man is more likely to talk of per cents than of fractional parts.

Definition.—Per cent are two words derived from the Latin per centum, meaning by the hundred or hundredths. Percentage is, therefore a name applied to calculations in which fractional parts of a hundred are used as the basis. It is clear, therefore, that percentage is simply a special application of decimal fractions in which the indicated denominator is always 100.

Terms Used in Percentage:—

BASE. The number of which a number of hundredths or per cents are taken is called the base.

Example: 8% of 300=24. 300 is the base.

RATE is the number of per cents or hundredths taken. In the above example, 8 is the rate.

PERCENTAGE is the product of the rate times the base. In the above example, 24 is the percentage.

The AMOUNT is the sum of the base and the percentage.

The DIFFERENCE is the base minus the percentage.

Aliquot Parts and Percentage.—Since the indicated denominator is always 100 in percentage, it is frequently possible and advantageous to make use of the aliquot parts of 100 when working percentage. Care must be exercised in placing the decimal point in the result.

PROBLEMS IN PERCENTAGE are solved in accordance with the fundamental processes in handling decimal fractions. These problems may be grouped under these three headings:

1. Rate×base=percentage,
   Then, transposing,
2. Percentage÷base=rate
   And
3. Percentage÷rate=base.

To find the percentage:

When the base and rate are given and the percentage is to be found, express the rate as a decimal and multiply the base by it.

Example: Find 6% of $400.00.
6%=.06. Therefore, 6% of $400.00=.06×$400.00=$24.

To find the rate:

When the base and percentage are given and the rate is to be found, divide the percentage by the base.

Example: $24 is what per cent of $400?
$24÷$400=.06 or 6%

To find the base:

When the percentage and the rate are given and the base is to be found, express the rate as a decimal and divide the percentage by it, or divide the percentage by the rate to find 1% and multiply the quotient by 100 to find 100%.

Example: If a sum of money invested at 6% produces $24, what is the sum invested?
6%=.06 $24÷.06=$400.
OR
$24÷6=$4=1%
100%, the amount, =100×$4=$400.

Per cents of increase:

When the amount and the rate of increase are given and the base is to be found, divide the amount by the sum of the rate and 100% expressed as decimals.

Example: A merchant sold a hat for $8 and thereby gained 33 1/3%. What was the cost of the hat?
33 1/3%=.33 1/3
1.00 plus .33 1/3=1.33 1/3
$8.00÷1.33 1/3=$6.00, the cost.

When the rate is an aliquot part of $1.00, the solution is frequently easier by fractions.
33 1/3%=1/3 1 plus 1/3=4/3
4/3=$8, then 1/3=$2 and 3/3=$6.

Per cents of decrease:

When the difference and the rate are given and it is required to find the base, subtract the rate from 100% and divide the given difference by the difference in per cent expressed as a decimal OR divide the given difference by the difference in per cent to find 1% and then multiply the quotient by 100 to find 100%.

Example: A man sold his automobile for $600 and thereby lost 20%. What was the cost of the automobile?
100%−20%=80%=.80
$600.00÷.80=$750
OR
$600÷80%=$7.50=1%
100%=100×$7.50=$750.

In this case, as in the case of per cents of increase, the work may be simplified by the use of common fractions.

DISCOUNTS

A discount is an amount deducted from a sum owing. Discounts may be trade discounts (sometimes called commercial discounts) or cash discounts (sometimes called time discounts). The amount of a discount is usually indicated by a rate per cent.

A trade or commercial discount is an amount deducted from the list price of an article. Manufacturers and wholesalers publish price lists and catalogs at great expense. To avoid issuing a new catalog with every fluctuation of the market, they

issue discount sheets which show the discounts to which the prices in the catalog are subject. Trade discounts may also vary upon the size of the order, the desirability of the customer, etc. These variations are frequently expressed by two or more discounts called a DISCOUNT SERIES. When two or more discounts are quoted, one denotes a discount off of the list price; another, a discount off of the remainder; another, a discount off of that remainder, etc. It is immaterial in what order the discounts are deducted, as will be found by deducting a series in different order.

A cash or time discount is an allowance made for the payment of the bill in less time than allowed by the terms of the sale. These discounts are expressed upon the invoice in the following form: 5/10, 2/30, n/60 and are read, "five per cent off in ten days, two per cent off in thirty days, net in sixty days".

It will be evident that the amount of the commercial discount is determined by the quotation, while the amount of the cash discount is determined by the time of payment.

The amount of the invoice before any deductions are made is termed the GROSS AMOUNT. The amount of the invoice after deducting the discounts is termed the NET AMOUNT.

To find the net amount when the price is subject to trade discount:

(a) When there is only one discount:

Find the percentage and subtract from the price.

\$48 less 12 1/2% = \$48 × .12 1/2 = \$48 × 1/8 = \$6.

\$48 − \$6 = \$42 the net price.

(b) When the discount is expressed in a series:

\$50 less 25% and 20%

\$50 less 20% = \$40 and \$40 less 25% = \$30, the net amount.

OR

\$50 less 25% = \$37.50 and \$37.50 less 20% = \$30, the net amount. (It is evident that the work is rendered easier by selecting the order in which the discounts are deducted.)

(c) Finding a single rate of discount equivalent to a series of two discounts:

(1) Add the discounts;

(2) Multiply the discounts;

(3) Subtract the product (2) from their sum (1), and the result will be a single discount equivalent to the two. When there are three or more discounts, the first two may be combined as above and then this result and the third combined, etc.

Example: A certain article is sold subject to 25%, 20% and 20% off. The work may be simplified by finding a single discount equivalent to the series: Mentally find an equivalent discount for the first two (25% plus 20% minus 5%, the product, equals 40%). Now mentally combine this equivalent and the last rate of the series (40% plus 20% minus 8% equals 52%, the single equivalent of the series).

Finding the cash discount:

The cash discount is deducted from the invoice after the trade discounts have been deducted. Determine from the date of payment what discount is applicable and find this amount of the invoice.

Example: An invoice dated March 10 for \$2500 is subject to the following terms: 5/10, 2½/30, n/60. Find the net amount to be paid on March 18. Since it is to be paid within ten days, deduct 5%. 5% of \$2500 = \$125. \$2500 − \$125 = \$2375, the net amount.

PROFIT AND LOSS

Profit and Loss is one of the business applications of percentage. In these problems, the base is either the cost or the selling price. The percentage is the profit or loss. The rate is the rate of profit or loss. When the cost is taken as the base:

To find the selling price, add the profit to the cost, or subtract the loss from the cost.

To find the rate of profit or loss, find the profit or loss and then find how many per cent of the cost this is.

To find the cost when the selling price and the rate of profit are given, add the rate of profit to 100% and divide the selling price by this sum expressed as a decimal.

To find the cost when the selling price and the rate of loss are given, subtract the rate of loss from 100% and divide the selling price by the remainder expressed as a decimal.

Buying by the dozen and selling by the unit.

This kind of problem is of frequent occurrence in business.

The following table gives a short method to find the selling price per unit when the purchasing price is by the dozen and the profit is at a certain rate. Other rates of profit may be solved in the same way but the fractions are complicated.

Rate of Profit	Number of places to left decimal point is moved in cost per dozen	Fractional part of the result to be added
20%	1 place	0
25%	1 "	1/24
30%	1 "	1/12
33 1/3%	1 "	1/9
35%	1 "	1/8
40%	1 "	1/6
50%	1 "	1/4
60%	1 "	1/3
80%	1 "	1/2

Example: Hammers are bought for \$18 a dozen. What must be the selling price per hammer to gain 40%? From the table, \$2.10.

Proof: The cost of each hammer is $\frac{\$18}{12}$

The selling price is $1.4 \times \frac{18}{12} = \frac{1.4}{12} \times 18 = \frac{14}{12} \times 1.8 = (1 \text{ plus } 1/6) \times 1.8$.

MARKING GOODS

In large mercantile establishments, it is necessary to have both the price and cost marked upon each article. In order that this information may not come into the hands of those who should not have it, these prices are written in letters or characters. The following are examples of such schemes:

Cost Key

S I L K T H R E A D 3 2 5

1 2 3 4 5 6 7 8 9 0 L I T

Repeaters X and Y

Selling Price Key

P U R C H A S E N O W

1 2 3 4 5 6 7 8 9 0 Repeater 5.00 H O W

COMMISSION AND BROKERAGE

Use.—A large part of business is carried on through agents, brokers and factors. This is particularly true in the case of insurance, real estate, stocks and bonds, and certain classes of merchandise.

Definitions.—An AGENT, FACTOR, BROKER, or COMMISSION MERCHANT is one who transacts business for the account of another. The person or company for whom the business is transacted is called the PRINCIPAL.

The compensation paid to the agent or broker is called the COMMISSION or BROKERAGE. The commission is usually a certain per cent of the amount involved in the transaction, or a certain amount per unit handled. Commission merchants frequently make an additional charge for assuming some special risk in connection with the transaction; such as the quality of the goods, collection of the accounts, etc.

The goods sent to an agent is called a CONSIGNMENT. Sometimes the sender of the goods calls it a SHIPMENT and the agent calls it a CONSIGNMENT.

The person sending the goods is called the CONSIGNOR or SHIPPER; the one to whom they are sent is called the CONSIGNEE.

The statement rendered to the principal by the agent is called an ACCOUNT SALES in the case of a sale of goods and an ACCOUNT PURCHASE in the case of a purchase. The statements contain an account of the gross amount involved and the expenses and commission.

In the sale of goods, the GROSS PROCEEDS is the total amount received by the agent and the NET PROCEEDS is the amount received less the expenses and commissions. In the purchase of goods, the NET PRICE is the amount the agent actually pays for the goods and the GROSS PRICE is the amount after all expenses and commissions have been added.

Problems in commission and brokerage are merely special applications of percentage as the following comparison of terms will show.

The *sales price*, or the *purchase price*, is the *base* in percentage.

The *rate of commission* is the *rate* in percentage.

The *commission* is the *percentage*.

ACCOUNT SALES

Chicago, Ill., March 18, 1922

Sold for the account of Greenwood & Co.

By C. H. BAIR AND COMPANY

March	8	300 bbl. Flour	\$8.00			\$2400	00
	15	200 bbl. Pastry Flour	9.00			1800	00
		CHARGES					
March	7	Freight and Drayage		\$ 50	25		
	15	Commission 5%		210	00		
	16	Proceeds remitted		3939	75		
				\$4200	00	\$4200	00

ACCOUNT PURCHASE

Baltimore, Md., March 18, 1922

Purchased by **FRANCE AND BARRETT**
Commission Merchants

For the account and risk of Archer and Roe,
York, Pa.

100 boxes Oranges	$6.50	$650 00	
100 boxes Lemons	6.00	600 00	$1250 00
CHARGES			
Freight		$25 50	
Drayage		10 00	
Commission 2%		25 00	60 50
Amount charged to your account			$1310 50

The *gross cost* in the account purchase is the *amount* in *percentage*.

The *net proceeds* in the account sales is the *difference* in percentage.

TO FIND THE COMMISSION when the rate and price are given. This is the same as the problem of finding the percentage when the base and rate are given. Thus, if the selling or buying price is $2000 and the rate of commission is 5% the commission is 5% of $2000 or $100.

TO FIND THE NET PROCEEDS when the selling price and the rate of commission are given. This is the same as the problem of finding the difference when the base and rate are given. Thus, if the selling price is $2000 and the rate of commission is 5%, the net proceeds is $2000 − $100 = $1900.

TO FIND THE GROSS PRICE (the total sales or purchases) when the rate and commission are given. This is the same as the problem of finding the base when the rate and the percentage are given. Thus, if the commission is $100 and the rate is 5%, 1% equals $20 and 100% equals $2000.

TO FIND THE NET PRICE IN BUYING when the gross price and the rate of commission are given. This is the same as the problem of finding the base when the rate and amount are given. $2100 ÷ 105% = $20 or 1%; 100% = $2000.

It will be noticed that the commission is always computed upon the total amount of the sales or purchases.

SIMPLE INTEREST

Use.—Interest is the most common of all the applications of percentage. At one time or another, practically every one needs to figure interest. In business the problem of interest is of frequent occurrence and in the banking business it is in constant use.

Definitions.—INTEREST is the amount paid as compensation for the use of money. A man borrows $100 for a year and at the end of the year he must pay back $106. The extra $6 is paid for the use of the $100 for one year and is called interest.

The PRINCIPAL is the amount on which the interest is paid.

The AMOUNT is the principal plus the interest.

The RATE OF INTEREST is the percentage of the principal which is paid for the use of the principal for one year.

Since the rate of interest is nearly always expressed in terms of one year, the time is an important element in computing interest.

When the time is one year, problems in interest are problems of ordinary percentage, and

(*a*) The principal is the base;

(*b*) The rate of interest is the rate of percentage;

(*c*) The interest is the percentage;

(*d*) The amount is the same in both cases.

When the time is more than one year the interest is the interest for one year multiplied by the number of years. Thus, the interest on $100 for two years is 2×$6 or $12.

When the time is less than one year the interest is the interest for one year multiplied by the fractional part of a year. Thus, the interest on $100 for six months is ½ of $6, or $3.

The legal and maximum rates of interest in the different states are determined by the laws of the different states. The legal rate of interest is the rate charged when no rate is agreed upon between the parties. The maximum rate is the highest rate allowed by law. A binding contract to pay more than the maximum rate of interest cannot be made. Charging more than the maximum rate of interest is called usury and is penalized in most of the states. The following table shows the legal and maximum rates of interest in the different states:

	Legal rate	Maximum rate
Alabama	8	8
Alaska	8	12
Arizona	6	10
Arkansas	6	10
California	7	any
Colorado	8	any
Connecticut	6	6
Delaware	6	6
District of Columbia	6	10
Florida	8	10
Georgia	7	8
Idaho	7	12
Illinois	5	7
Indiana	6	8
Iowa	6	8
Kansas	6	10
Kentucky	6	6
Louisiana	5	8
Maine	6	any
Maryland	6	6
Massachusetts	6	any
Michigan	5	7
Minnesota	7	10
Mississippi	6	8
Missouri	6	8
Montana	8	12
Nebraska	7	10
Nevada	7	12
New Hampshire	6	6
New Jersey	6	6
New Mexico	6	12
*New York	6	6
North Carolina	6	6
North Dakota	6	10
Ohio	6	8
Oklahoma	6	10
Oregon	6	10
Pennsylvania	6	6
Rhode Island	6	any
South Carolina	7	8
South Dakota	7	12
Tennessee	6	6
Texas	6	10
Utah	8	12
Vermont	6	any
Virginia	6	6
Washington	6	12
West Virginia	6	6
Wisconsin	6	10
Wyoming	8	12

*Corporations may contract to pay any rate of interest and any rate may be charged on call loans of $5000 and upwards.

Kinds of Interest.—The following kinds of interest will be discussed: Ordinary or commercial year interest, accurate interest, and compound interest.

Ordinary or commercial year interest is computed on a 360-day year basis.

Methods of Computing Ordinary Interest.—The most widely used method of computing interest for commercial purposes is what is known as the Bankers' Sixty-Day Method. It is based upon the 360-day year, 12 months of 30 days each, at 6%. Since the rate of interest for one year is 6%, the rate for 60 days or two months is 1% and the interest for six days is .1%. The work can therefore be simplified by working upon the basis of sixty days and aliquot parts of sixty days. Moving the decimal point two places to the left in the principal (which is the same as multiplying the principal by 1%) will give the interest for two months or sixty days; moving the decimal point three places to the left will give the interest for six days, and moving the decimal point one place to the left will give the interest for six hundred days at 6%.

Example 1. Find the interest on $1950 for three months at 6%.

$19 50	interest for two months
9 75	interest for one month (½ of two months)
$29 25	interest for three months (sum of two months and one month)

Example 2. Find the interest on $1250 for five months twenty days at 6%.

$12 50	interest for two months
25 00	interest for four months
6 25	interest for one month
4 166	interest for 20 days
$35 42	interest for five months and twenty days.

Example 3. Find the interest on $1396 for 46 days at 6%.

$ 1 396	interest for 6 days
9 772	interest for 42 days (7×6 days)
931	interest for 4 days (2/3 of 6 days)
$10 703	interest for 46 days at 6%.

OR (Working with a different combination of days also constitutes a check on the work).

$13 96	interest for 60 days
6 98	interest for 30 days (½ of 60)
3 49	interest for 15 days (½ of 30)
2326	interest for 1 day (1/30 of 30 days)
$10 7026	interest for 46 days.

Example 4. Find the interest on $4240 for 93 days at 6%.

$42|40 interest for 60 days
21|20 interest for 30 days
2|12 interest for 3 days
$65|72 interest for 93 days

Example 5. Find the interest on $2440 for 1 yr. 7 mo. 6 days at 6%.

$244|00 interest for 20 mo. or 600 days
12|20 interest for 1 month
231|80 interest for 19 months, 1 yr. 7 mo.
2|44 interest for 6 days
$234|24 interest for 1 year 7 months 6 days at 6%.

Interchanging Time and Principal.—It is sometimes possible to shorten the work a great deal by interchanging the time and the principal. This is particularly true where the interest is to be computed upon even hundreds of dollars at an odd number of days; e. g., $2400 for 117 days at 6%. The interest on $2400 for 117 days at 6% is the same as the interest of $117 for 2400 days at 6%.

$24|00 interest on $2400 for 60 days at 6%
48|00 interest on $2400 for 120 days at 6%
1|20 interest on $2400 for 3 days at 6%
$46|80 interest on $2400 for 117 days at 6%

Interchanging principal and time:
($117 for 2400 days at 6%)
$11|70 interest for 600 days
$46|80 interest for 2400 days (4×600 days)

To Find the Interest at Any Rate per Cent.—First find the interest for the given time at 6%. Divide this interest by 6 to find the interest at 1% and then multiply the interest at 1% by the given rate

Example: The interest on $60 for 36 days at 6% is 36c; the interest for the same time at 1% is 6c. The interest at 5% is 5×6c; at 7% it is 7×6c; etc.

The work may be somewhat simplified in the common rates of interest as follows:

Interest at 6% decreased by:
1/8 of itself equals 5¼% interest
1/12 of itself equals 5½% interest
1/6 of itself equals 5% interest
1/4 of itself equals 4½% interest
1/3 of itself equals 4% interest

Interest at 6% divided by:
2 equals the interest at 3%
3 equals the interest at 2%
6 equals the interest at 1%

Interest at 6% increased by:
1/12 of itself equals 6½% interest
1/8 of itself equals 6¾% interest
1/6 of itself equals 7% interest
1/4 of itself equals 7½% interest
1/3 of itself equals 8% interest
1/2 of itself equals 9% interest

Interest at 6% multiplied by 2 equals the interest at 12%.

The work can frequently be simplified and shortened by applying the above increases and decreases to the principal or time, since if either the principal or the time be increased or decreased by any fraction of itself, the interest is increased or decreased by the same fraction. *Example:* Find the interest on $480 for 77 days at 4½%. Since 4½% is ¼ less than 6%, decrease the principal by ¼ of itself and the result is $360. Interchanging principal and time, the problem is the interest on $77 for 360 days at 6%. The interest for 60 days is 77c and for 360 days, 6×77c, or $4.62.

Pointing Off for Rates Other Than 6%.—Pointing off two places in the principal will give the interest at the rates and for the time as follows:

At 1% for one year
2% for six months or 180 days
3% for four months or 120 days
4% for three months or 90 days
4½% for 80 days
5% for 72 days
7½% for 48 days
8% for 45 days
9% for 40 days
10% for 36 days
12% for 30 days

It is not necessary to remember these figures as they can easily be found as follows: 4% is 2/3 of 6%. To earn 1c it will take as many days as 60÷2/3=3/2×60=90.

The Six per Cent Method.—This method is very satisfactory when the tme is one year, or more than one year.

Method:
Multiply the number of years by $0.06
Multiply the number of months by $0.005
Multiply the number of days by $0.000 1/6
Find the sum of these products and multiply the principal by the sum.

Example: Find the interest on $250 for 1 year 8 months 15 days at 6%.

$0.06 interest on $1 for 1 year.
.04 interest on $1 for 8 months.
.0025 interest on $1 for 15 days.
$0.1025 interest on $1 for entire time.
250×$0.1025=$25.63 the required interest.

For rates other than 6% proceed as in the Banker's 60-Day Method.

Calculating Interest by Use of Interest Tables.—In banks and banking houses where a large portion of the work consists of interest computations, tables are employed to lessen the labor, speed up the work, and reduce the probability of error. The following is a sample page of such a table.

INTEREST TABLE AT 6%.

TIME	$1	$2	$3	$4	$5	$6	$7	$8	$9	$10	TIME
1 da.	.00017	.00033	.0005	.00067	.00083	.001	.00117	.00133	.0015	.00167	1 da.
2 da.	.00033	.00067	.001	.00133	.00167	.002	.00233	.00267	.003	.00333	2 da.
3 da.	.0005	.001	.0015	.002	.0025	.003	.0035	.004	.0045	.005	3 da.
4 da.	.00067	.00133	.002	.00267	.00333	.004	.00467	.00533	.006	.00667	4 da.
5 da.	.00083	.00167	.0025	.00333	.00417	.005	.00583	.00667	.0075	.00833	5 da.

7 da.	.00117	.00233	.0035	.00467	.00583	.007	.00817	.00933	.0105	.01167	7 da.
8 da.	.00133	.00267	.004	.00533	.00667	.008	.00933	.01067	.012	.0133	8 da.
9 da.	.0015	.003	.0045	.00667	.0075	.009	.0105	.012	.0135	.015	9 da.
10 da.	.00167	.00333	.005	.00667	.00833	.01	.01167	.01333	.015	.01667	10 da.
20 da.	.00333	.00667	.01	.01333	.01667	.02	.02333	.02667	.03	.03333	20 da.
1 mo.	.005	.01	.015	.02	.025	.03	.035	.04	.045	.05	1 mo.
2 mo.	.01	.02	.03	.04	.05	.06	.07	.08	.09	.10	2 mo.
3 mo.	.015	.03	.045	.06	.075	.09	.105	.12	.135	.15	3 mo.
4 mo.	.02	.04	.06	.08	.10	.12	.14	.16	.18	.20	4 mo.
5 mo.	.025	.05	.075	.10	.125	.15	.175	.20	.225	.25	5 mo.
6 mo.	.03	.06	.09	.12	.15	.18	.21	.24	.27	.30	6 mo.
7 mo.	.035	.07	.105	.14	.175	.21	.245	.28	.315	.35	7 mo.
8 mo.	.04	.08	.12	.16	.20	.24	.28	.32	.36	.40	8 mo.
9 mo.	.045	.09	.135	.18	.225	.27	.315	.36	.405	.45	9 mo
10 mo.	.05	.10	.15	.20	.25	.30	.35	40	.45	.50	10 mo.
11 mo.	.055	.11	.165	.22	.275	.33	.385	44	.495	.55	11 mo.
1 yr.	.06	.12	.18	.24	.30	.36	.42	48	.54	.60	1 yr.
2 yr.	.12	.24	.36	.48	.60	.72	.84	.96	1.08	1.20	2 yr.

Example: Find the interest on $7560 for 9 days at 6%.

From the table:
$10.50=interest of $7000 for 9 days
.75=interest on $500 for 9 days
.09=interest on $60 for 9 days
$11.34=interest on $7560 for 9 days.

Accurate or Exact Interest.—Exact interest is based upon a year of 365 days and when the exact number of days between dates is taken. Exact interest is used by the United States Government and sometimes by bankers and city and state governments when the sum involved is very large.

Problems in exact interest can be solved best by the cancellation method using this formula: $\frac{\text{rate}\times\text{days}\times\text{principal}}{365}$ = exact interest. Exact interest may also be found by computing the interest in the usual way for the 360-day year and from the interest so obtained taking 1/73 of itself. Accurate or exact interest may be changed to ordinary interest by adding 1/72 of itself.

The Cancellation Method of Figuring Interest.—Since the interest equals the principal×rate×time, the problem may be solved by expressing the time as a fractional part of a year and using cancellation. This method is sometimes very advantageous. It is applicable to any rate and to either ordinary or accurate interest.

Example: Find the accurate interest on $1850 at 5% for 50 days.

$$\frac{\$1850\times\frac{1}{20}\times\frac{50}{365}}{100\times\frac{365}{73}}=\frac{925}{73}=\$12.67$$

COMPOUND INTEREST.

Compound interest is the interest computed at regular intervals on the sum of the principal and the unpaid interest. Interest may be compounded annually, semi-annually, or quarterly. Interest may be compounded monthly, but this is unusual. Compound interest cannot be collected at law but when it is accepted it does not constitute usury. Compound interest is allowed by savings banks and used by insurance companies in computing premiums. It is also used in computing sinking funds, etc.

Example: Find the compound interest on $100 at 5% for three years compounded annually.

$5.00=interest for the first year
105.00=amount at end of first year—new principal
5.25=interest for the second year
110.25=amount at the end of second year—new principal
5.51=interest for the third year
115.76=amount at the end of the third year
$115.76−$100=$15.76 the compound interest

Business institutions having compound interest to compute use a table of which the following is a sample page:

COMPOUND INTEREST TABLE.

Showing the amount of $1.00 for any number of periods up to 25, at the given rates.

No. Period	Rate Per Period									
	1%	1½%	2%	2½%	3%	3½%	4%	4½%	5%	6%
1	1.010000	1.005000	1.020000	1.025000	1.030000	1.035000	1.040000	1.045000	1.050000	1.060000
2	1.020100	1.030225	1.040400	1.050625	1.060900	1.071225	1.081600	1.092025	1.102500	1.123600
3	1.030301	1.045678	1.061208	1.076891	1.092727	1.108718	1.124864	1.141166	1.157625	1.191016
4	1.040604	1.061364	1.082432	1.103813	1.125509	1.147523	1.169859	1.192519	1.215506	1.262477
5	1.051010	1.077284	1.104081	1.131408	1.159274	1.187686	1.216653	1.246182	1.276282	1.338226
6	1.061520	1.093443	1.126162	1.159693	1.194052	1.229255	1.265319	1.302260	1.340096	1.418519
7	1.072135	1.109845	1.148686	1.188686	1.229874	1.272279	1.315932	1.360862	1.407100	1.503630
8	1.082857	1.126493	1.171659	1.218403	1.266770	1.316809	1.368569	1.422101	1.477455	1.593848
9	1.093685	1.143390	1.195093	1.248863	1.304773	1.362897	1.423312	1.486095	1.551328	1.689479
10	1.104622	1.160541	1.218994	1.280085	1.343916	1.410599	1.480244	1.552969	1.628895	1.790848
11	1.115668	1.177949	1.243374	1.312087	1.384234	1.459970	1.539454	1.622853	1.710339	1.898299
12	1.126825	1.195618	1.268242	1.344889	1.425761	1.511069	1.601032	1.695881	1.795856	2.012197
13	1.138093	1.213552	1.293607	1.378511	1.468534	1.563956	1.665074	1.772196	1.885649	2.132928
14	1.149474	1.231756	1.319479	1.412974	1.512590	1.618695	1.731676	1.851945	1.979932	2.260904
15	1.160969	1.250232	1.345868	1.448298	1.557967	1.675349	1.800944	1.935282	2.078928	2.396558
16	1.172579	1.268986	1.372786	1.484506	1.604706	1.733986	1.872981	2.022370	2.182875	2.540352
17	1.184304	1.288020	1.400241	1.521618	1.652848	1.794676	1.947901	2.113377	2.292018	2.692773
18	1.196148	1.307341	1.428246	1.559659	1.702433	1.857489	2.025817	2.208479	2.406619	2.854339
19	1.208109	1.326951	1.456811	1.598650	1.753506	1.922501	2.106849	2.307860	2.526950	3.025600
20	1.220190	1.346855	1.485947	1.638616	1.806111	1.989789	2.191123	2.411714	2.653298	3.207136
21	1.232392	1.367058	1.515666	1.679582	1.860295	2.059431	2.278768	2.520241	2.785963	3.399564
22	1.244716	1.387564	1.545980	1.721571	1.916103	2.131512	2.369919	2.633652	2.925261	3.603537
23	1.257163	1.408377	1.576899	1.764611	1.973587	2.206114	2.464716	2.752166	3.071524	3.819750
24	1.269735	1.429503	1.608437	1.808726	2.032794	2.283328	2.563304	2.876014	3.225100	4.048935
25	1.282432	1.450945	1.640606	1.853944	2.093778	2.363245	2.665836	3.005434	3.386355	4.291871

Solving the preceding example by the table, we find that $1 will amount to $1.157625 in three years. $100 will therefore amount to $115.76 and the compound interest is $15.76.

Sinking Funds.—A sinking fund is a fund set aside out of assets at regular intervals and accumulating interest for the purpose of paying off bonds or other obligations, replacing machinery, buildings or other assets. A state or city has an issue of bonds which mature in a certain time. It wishes to accumulate a fund by setting aside a certain amount periodically in order that it may have the money to pay off the bonds when they mature. A business wishes to accumulate a fund for the purpose of replacing dynamos or other machinery. Such funds are called sinking funds.

In the following table is shown the sum to which $1, paid at the beginning of each year, will increase at certain rates of compound interest in any number of years not exceeding twenty.

Yr.	2%	4%	4½%
1	1.020000	1.040000	1.045000
2	2.060400	2.121600	2.137025
3	3.121608	3.246464	3.278191
4	4.204040	4.416322	4.470709
5	5.308120	5.632975	5.716891
6	6.434283	6.898294	7.019151
7	7.582969	8.214226	8.380013
8	8.754628	9.582795	9.802114
9	9.949721	11.006107	11.288209
10	11.168715	12.486351	12.841178
11	12.412089	14.025805	14.464031
12	13.680331	15.626837	16.159913
13	14.973938	17.291911	17.932109
14	16.293416	19.023587	19.784054
15	17.639285	20.824531	21.719336
16	19.012070	22.697512	23.741706
17	20.412312	24.645412	25.855083
18	21.840558	26.671229	28.063562
19	23.297369	28.778078	30.371432
20	24.783317	30.969201	32.783136

To Find the Rate of Interest.—It frequently happens that a man investing money in a venture and making a certain profit, wishes to know what rate of interest he has realized on the transaction. *Example:* A man invested $1800 and in six months he had closed out the transaction and taken a profit of $108. What rate of interest did he make on the investment? Since six months are one-half of a year, the profit for a year at the same rate would have been $216 and this is 12% on $1800. For methods of finding this rate refer to method of finding rate of percentage.

To Find the Time When the Principal, Rate and Interest Are Given.—Divide the interest by the interest for one year. This problem does not occur frequently in business.

To Find the Principal When the Rate, Time and Amount Are Given.—Find the amount of $1 for the given time and rate and divide the given amount by it.

Example: Find the principal when the amount in three months at 6% is $2436.00. The interest on $1 for three months at 6% is $0.015 and the amount is $1.015. $2436.00 ÷ $1.015 = $2400.00, the principal.

A certificate of deposit is a negotiable instrument in which a bank certifies that the person named in the instrument has deposited the sum of money named. This money is payable to the person named or his order on the surrender of the certificate of deposit properly indorsed. The money so deposited is not subject to checks.

When a person has a negotiable instrument in his possession he is called the HOLDER. He may transfer it to another by delivery if it is made payable to bearer. If it is drawn to the order of the payee, he may transfer it by INDORSEMENT. An indorsement is any writing on the back of the instrument. Indorsements for the purpose of transferring the instrument are BLANK INDORSEMENTS, FULL OR SPECIAL INDORSEMENTS, or QUALIFIED INDORSEMENTS.

A Blank Indorsement is simply the signature of the holder.

A Full Indorsement is one which names the person to whom it is to be paid; e. g., "Pay to the order of J. G. Smith".

A Qualified Indorsement is one which limits the liability of the indorser by inserting the words, "Without Recourse".

In case of partial payments on a note, a record of the payment is indorsed on the note; e. g., Received on within note:

Jan. 6, 1922..... $500.00
May 15, 1922..... 300.00
June 7, 1922..... 200.00

A negotiable instrument which is not paid or accepted (as the case may be) when presented, is said to be DISHONORED.

Protest is a formal declaration made by a notary public certifying to the presentment, demand and dishonor of a negotiable instrument. It is used for the purpose of proving the proper handling of the instrument to protect the interests of the indorsers. It is required by law upon drafts drawn in one state and payable in another.

Days of Grace are three extra days beyond the due date allowed for the payment of negotiable instruments. Days of Grace have been abolished in all except a few of the states.

Bank Discount is a deduction made from the amount due at maturity on notes and drafts because they are cashed before maturity. It is the interest on the amount due at maturity and collected in advance for the time from the date of discount to the date of maturity.

The Term of Discount is the time from the date of discount to the maturity of the instrument. Banks always count the exact number of days.

The proceeds is the difference between the amount due at maturity and the discount on the instrument.

MATURITY TABLE

1	Jan.	−1	13
2	Feb.	+2	14
3	Mar.	−1	15
4	April		16
5	May	−1	17
6	June		18
7	July	−1	19
8	Aug.	−1	20
9	Sept.		21
10	Oct.	−1	22
11	Nov.		23
12	Dec.	−1	24

Bankers, and others having the counting of terms of discount to do, make use of a table like this.

To Find the Date of Maturity and Term of Discount.

Example: Find the maturity of a note dated June 10 and payable (a) three months after date, (b) ten months after date, (c) ninety days after date.

(a) Referring to the table, notice that June is the sixth month. Add 3 to the 6 months and the result is 9. The 9th month is Sept. (from table) and the note is due Sept. 10.

(b) Add 6 and 10 and the result is 16. The note is due in the 16th month, which, (from the table) is April. The note is therefore due on April 10.

TABLE OF TIME

FROM ANY DAY OF	TO THE SAME DAY OF THE NEXT											
	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
JANUARY	365	31	59	90	120	151	181	212	243	273	304	334

AUGUST	153	184	212	243	273	304	334	365	31	61	92	122
SEPTEMBER	122	153	181	212	242	273	303	334	365	30	61	91
OCTOBER	92	123	151	182	212	243	273	304	335	365	31	61
NOVEMBER	61	92	120	151	181	212	242	273	304	334	365	30
DECEMBER	31	62	90	121	151	182	212	243	274	304	335	365

(c) Three months added to the 6th month (June) equals 9. The note is due in the 9th month, which is September. Since the note is payable in ninety days, exact time must be found. Notice in the table that one day must be subtracted for each of July and August. 10−2=8. The note is therefore due on September 8.

With a little practice it will be unnecessary to use such a table. Counting ahead the number of months or days will establish the due date.

The Term of Discount is found by counting the exact time in days from the date of discount to the date of maturity. *Example:* In a note due on July 14 and discounted on May 3, the term of discount is 72 days. This may be found as follows:

28 days remaining in May
30 days in June
14 days in July
72 days is the term of discount.

Bankers frequently use a table like the foregoing for the purpose of finding the exact number of days between the two dates:

The above example would be solved with the table by looking in the column marked "July" on a line with May. The number of days given there is 61, which indicates that there are 61 days from any date in May to the *same* date in July. From May 3 to July 3 there are 61 days; from July 3 to July 14, there are 11 days; the total is 72 days, and this is the term of discount.

To Find the Bank Discount of a Note or Draft, find the interest on the face of the note for the term of discount. This is a problem in simple interest and is explained under that subject.

To Find the Proceeds of a Discounted Note or Draft, subtract the bank discount from the face of the note.

To Find the Proceeds of an Interest-Bearing Note or Draft, find the interest for the time of the note at the rate of interest stated in the note and add this to the face of the note to find the amount due at maturity. Find the interest for the term of discount on the value of the note at maturity and subtract this interest from the value at maturity.

Example: A 90-day note for $2000 bearing interest at 5% was discounted at 6% 45 days before maturity. Find the proceeds.

Solution:

$2000.00	Face of note.
25.00	Interest on note
$2025.00	Amount due at maturity
15.19	Discount—Interest for 45 days at 6% on $2025
$2009.81	Proceeds of note.

Collection and Exchange Charges:—Banks sometimes make a small charge for collection and exchange on notes and drafts payable out of town. The rate of exchange and the charges for collection are usually expressed in a fraction of a per cent. These charges are computed upon the value of the instrument at maturity; i. e., on the face of a non-interest-bearing note and on the amount of an interest-bearing note.

When an interest-bearing note is discounted on the day it is made and the rates of discount are the same, the bank will usually give credit for the face of the note. When an interest-bearing note is discounted after the date of issue and the rate of interest is the same as the rate of discount, it is customary among some bankers to give the customer credit for the face of the note plus the interest to the date of discount.

BANK DISCOUNT

Negotiable Instruments.—A negotiable instrument is a written evidence of debt which may be transferred from one person to another by indorsement and delivery or by delivery alone. The most common negotiable instruments are checks, drafts, notes, and bonds.

A check is a bill of exchange drawn on a bank and payable on demand.

A draft (or bill of exchange) is an order drawn by one person (called the drawer) directing another (called the drawee) to pay a third (called the payee) or to bearer a certain sum of money at a certain time. Drafts may be made payable at sight, at a certain time after sight, or at a certain time after date.

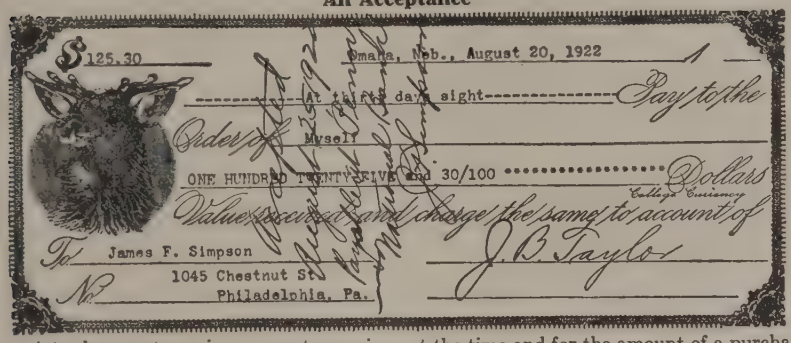
To Wildman & Colvin
No 2 146 Main Street Richmond, Va.

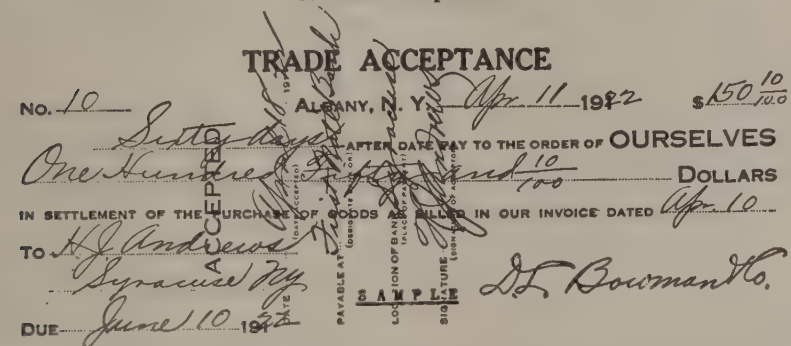
Before a draft can be enforced against the drawee, he must accept it. He does this by writing across the face (usually in different colored ink) "Accepted", the date and his signature. The instrument is then called an acceptance.

An Acceptance



A trade acceptance is an acceptance given at the time and for the amount of a purchase of merchandise.

A Trade Acceptance



A bank draft (sometimes called a New York draft or a Chicago draft from the name of the city upon which it is drawn) is a draft drawn by one bank upon another bank.

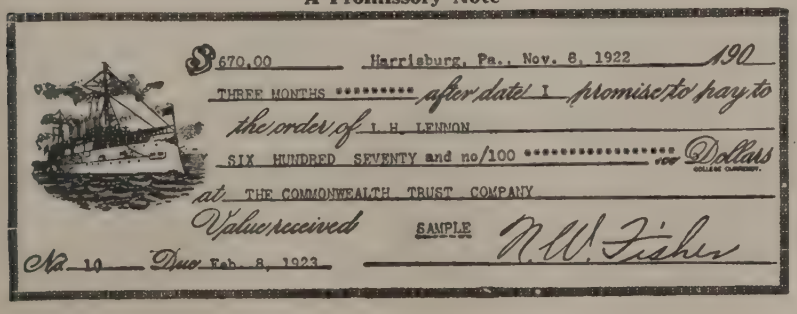
A Promissory Note is an unconditional written promise to pay a sum certain in money to designated person or his order or to bearer on demand or at a fixed or determinable future time.

The one who signs a promissory note is called the maker. The one in whose favor it is made is called the payee.

A promissory note may be several or joint or joint and several. An ordinary note signed by one or two persons is a several note. A note reading "we jointly promise" is a joint note and one reading "we jointly and severally" is a joint and several note.

A Promissory Note



Find the Face of a Discounted Note.—It sometimes happens that it is desired to discount a note so that the proceeds will be a certain amount. *Example:* I wish to borrow $1990 for 30 days. What must be the face of my note discounted at bank at 6% to obtain the amount?

The bank discount on $1.00 for the time is $0.005.

The proceeds of $1.00 are $0.995.

$1990 (the proceeds required) ÷ $0.995 = $2000, the face of the note.

Proof: The discount on $2000 for 30 days is $10.00. $2000.00 − $10.00 = $1990.

Note.—It would be better to give the bank an interest-bearing note for the amount required and pay the interest when the note becomes due. This can also be done by giving a demand note and paying it in thirty days.

Present Worth and True Discount.—Similiar to the problem of finding the face of a note to produce a given proceeds is the problem of present worth. The PRESENT WORTH of a debt is a sum which, if put at interest, will amount to the value of the debt at maturity.

Example: A man owes a note for $2525 due in two months with interest. What is the present worth and the true discount on this note?

Solution: The interest on $1.00 for two months is $0.01

$1.00 will, in two months, amount to $1.01.

$2525 ÷ $1.01 = $2500, the present worth of the note.

The True Discount is the difference between the present worth and the amount of the note at maturity. In the above example it is $2525 − $2500 = $25.

Partial Payments.—When payments are made from time to time on a note or debt, these payments are called PARTIAL PAYMENTS.

Method of computing partial payments according to the United States Rule (so called because it has been adopted by the U. S. Supreme Court).

1. Find the amount of the note up to the date of the first payment. If this payment is sufficient to cover the interest up to that date, deduct it from the amount. The result is the new principal.

2. Using this new principal, find the amount of the note up to the date of the second payment and deduct payment as before.

3. Proceed in this manner until the final date is reached.

4. If a payment is not sufficient to cover the interest for the period next preceding, no deduction is made, but the payment is added to the next payment.

Example: On a note for $1200 dated Jan. 1 and bearing interest at 6%, payments were made as follows: Mar. 1, $212; July 1, $15; Sept. 1, $515. What was the amount due on Dec. 1?

Solution:

Face of note		$1200.00
Interest from Jan. 1 to Mar. 1 (2 mo.)		12.00
Amount due Mar. 1		$1212.00
Payment on Mar. 1		212.00
Balance due, new principal Mar. 1		$1000.00
Interest from Mar. 1 to July 1 (4 mo.) $20.00 (Interest greater than payment)		
Interest from July 1 to Sept. 1 (2 mo.)	$10.00	$30.00
Amount due Sept. 1		$1030.00
Payments July 1 and Sept. 1		530.00
Balance due, new principal Sept. 1		$500.00
Interest, Sept. 1 to Dec. 1 (3mo.)		7.50
Amount due Dec. 1		$507.50

Merchants' Rule.—This rule is frequently used by business men and sometimes by banks to settle short time notes or indebtedness.

(1) Find the amount of the principal to the date of final settlement.

(2) Find the amount of each payment to the date of final settlement.

(3) From the sum in (1) subtract the sum of (2). The remainder is the amount due.

Example: A note for $3000 bearing interest at 6% and dated March 1 was paid as follows: May 1, $1000.00; July 1, $500.00; Sept. 1, the balance was paid. What amount was required to settle on Sept. 1?

Solution:

Original principal		$3000.00
Interest March 1 to Sept. 1 (6 mos.)		90.00
Amount of note on Sept. 1		$3090.00
Payment May 1	$1000.00	
Interest May 1 to Sept. 1	20.00	
Amount of May 1 payment	$1020.00	
Payment July 1	$500.00	
Interest July 1 to Sept. 1	5.00	
Amount of July 1 payment	$505.00	
Total amount of payments		$1525.00
Balance due Sept. 1		$1565.00

TAXATION

A tax is a sum levied for the support of government or for other public purposes.

A DIRECT TAX is one levied on a person, his property or his business. Direct taxes are poll taxes, property taxes, licenses, and income taxes.

A POLL TAX is a tax on a person.

A TAX ON PROPERTY is called a PROPERTY TAX.

A tax on a business is called a LICENSE FEE.

AN INCOME TAX is a tax on a person's income.

INDIRECT TAXES are levied on imports, tobacco and other articles consumed in the country.

Determining the Rate of Taxation.—When it is determined what sum must be raised by property tax for the expenses of government, this amount is divided by the assessed valuation of all the taxable property in the governmental division. Assessors appraise the property in the city or county and in this way find the assessed valuation of the property of each person and the total assessed valuation for the city or county. The division of the sum to be raised by the total assessed valuation gives the tax rate and it is usually expressed in a certain number of mills per dollar, a certain number of cents per hundred dollars, or a certain per cent.

Example: The total assessed valuation is $2,500,000 and the total amount to be raised is $12,500. Dividing $12,500 by $2,500,000, the tax rate is found to be .5%.

To Find the Tax multiply the assessed valuation by that tax rate.

Example: Johnson's property is assessed at $2000. The tax rate is 1.4%. His tax amounts to 1.4%×$2000 or $28.

At the office where the taxes for each person are computed, a tax table shows the amount of tax at the required rate on every dollar from $10 to $100.

Income Tax.—The United States Government and some of the state governments now impose a tax on certain incomes. For the state taxes consult the laws of the states. The Federal Revenue Act of 1921 requires every single person making an income of over $1000 and every married person receiving an income of over $2000 to make an Income Tax Report.

In the case of a single person, a personal exemption of $1,000 is allowed; or in the case of the head of a family or a married person living with husband or wife, a personal exemption of $2,500, unless the net income is in excess of $5,000, in which case the personal exemption shall be $2,000. A husband and wife living together shall receive but one personal exemption. The amount of such personal exemption shall be $2,500, unless the aggregate net income of such husband and wife is in excess of $5,000, in which case the amount of such personal exemption shall be $2,000. If such husband and wife make separate returns, the personal exemption may be taken by either or divided between them. In no case shall the reduction of the personal exemption from $2,500 to $2,000 operate to increase the tax, which would be payable if the exemption were $2,500, by more than the amount of the net income in excess of $5,000.

An exemption of $400 is allowed for each person (other than husband or wife) dependent upon and receiving his chief support from the taxpayer if such dependent person is under eighteen years of age or is incapable of self-support because mentally or physically defective.

The normal income tax on individual citizens or residents of the United States is at the rate of 4% upon the first $4000 of net income subject to the normal tax and 8 per cent upon the excess over that amount.

In addition to the normal tax a surtax is imposed. The following table shows the amounts of these surtaxes for 1922 and subsequent years. In each case the first

The following is a COLLATERAL NOTE

$1,500.00 SAMPLE Albany, N. Y., Feb. 5, 1922.

**** ON DEMAND **** for value received, the undersigned jointly and severally promise to pay to the order of **THE NEW YORK STATE NATIONAL BANK OF ALBANY,** (hereinafter called the Bank), at its Banking Office in Albany, N. Y., the sum of **** Fifteen Hundred and no-100 **** Dollars in United States gold coin or its equivalent, with interest from date hereof, at the rate of .....per cent. per annum, having deposited with the Bank, as collateral security for the payment of this note, or any note given in extension or renewal thereof, as well as for the payment of any other obligation or liability, direct or contingent, of the undersigned, or any of them, to the Bank, due or to become due, whether now existing or hereafter arising, the following property, viz:

25 shares New York Central Stock

of a market value estimated by the undersigned at $2,000.00; and the undersigned agree to deliver to the Bank additional securities, or to make payments on account to its satisfaction, should the market value of the said securities, as a whole, suffer any decline. The undersigned hereby give to the Bank a lien for the amount of all such obligations and liabilities upon all the property or securities now or at any time hereafter given unto or left in the possession of the Bank by the undersigned, whether for the express purpose of being used by the Bank as collateral security, or for any other or different purpose, and also upon any balance of the deposit account of the undersigned, or any of them, with the Bank. The undersigned hereby jointly and severally agree that all assignments or other dispositions of any of said collateral securities by the undersigned, or any of them, are and shall be subject and subordinate to the Bank's lien thereon for the payment of this or of any other note or claim hereby secured or of any renewal or extension of any

On the non-performance of this promise, or upon the non-payment of any of the liabilities above mentioned or in case of the failure of the undersigned to meet at maturity any liability of the undersigned, either to said Bank or to any other party, or upon the failure of the undersigned forthwith, with or without notice, to furnish satisfactory securities in case of any decline in market value as aforesaid, or upon the declared insolvency or failure in business of, or appointment of a receiver for, or commission of any act of bankruptcy or commencement of any bankruptcy proceeding by or against the undersigned, or the entry of any judgment against the undersigned, or in case of any such default, insolvency, appointment of a receiver, bankruptcy proceedings or judgment by or against any endorser or guarantor of this note, all liabilities of the undersigned to said Bank including this note, shall, at the option of said Bank, immediately mature and become forthwith due and payable without demand or notice, and full power and authority are hereby given the said Bank to sell, assign, transfer and deliver the whole of said securities, or any part thereof or any substitutes therefor or any additions thereto or any other securities or property now or hereafter given unto or left in the possession of the said Bank by the undersigned, for safe keeping or otherwise at public or private sale or at the New York Stock Exchange, or at any other Exchange or Broker's Board, at such prices as it may deem best, and either for cash or on credit or for future delivery, at the option of said Bank, or of its President, or Cashier, without either demand, advertisement or notice of any kind, which are hereby expressly waived and if such collateral is disposed of at private sale, the said Bank shall be relieved from all liability or claim for inadequacy of price. At such sale, the said Bank may itself purchase the whole or any part of the property sold, free from any right of redemption on the part of the undersigned, which is hereby waived and released. In case of sale for any cause, after deducting all costs or expenses of any kind for collection, sale or delivery, including all charges for legal services arising from or incidental to the sale, realization or collection of any of such collateral, security, substitutions or additions, or of any of said demands, including this note, the said Bank may apply the residue of the proceeds of the sale or sales so made, to pay one or more or any or all of the said liabilities to the said Bank, as it or its President or Cashier shall deem proper whether then due or not due, making proper rebate for interest on liabilities not then due, returning the overplus, if any, to the undersigned, who agree to be and remain liable to, and to pay the said Bank for any deficiency arising upon such sale or sales, and if any compromise or settlement is made between the said Bank and the undersigned, or between the said Bank and the guarantors or endorsers hereof, or if payment is made to the said Bank by the undersigned, or by the guarantors or endorsers hereof, of any claim of the said Bank for which the undersigned shall be liable, without the sale of any such securities as aforesaid, then the undersigned agree to pay to the said Bank, all costs or expenses including charges for legal services as aforesaid, incurred by said Bank up to the time of such compromise, settlement or payment. The undersigned do hereby authorize and empower the said Bank at its option, at any time to appropriate and apply to the payment and extinguishment of this or any of the above named obligations or liabilities, including interest, costs and expenses, whether now existing or hereafter contracted, any or all moneys and securities now or hereafter in the hands of the said Bank, on deposit or otherwise, to the credit of or belonging to the undersigned, whether the said obligations or liabilities are then due or not due. It is also agreed that the provisions, agreements, terms and conditions hereof shall apply to, and govern any and all notes given in extension or renewal of this note.

The above described property may from time to time, by mutual consent, be exchanged for other property, which shall be held by said Bank subject to all the terms of this note. Upon the transfer of this note the collateral held therefor at the time of transfer or any part thereof, may be delivered to the transferee, who shall thereupon become vested with all the rights and powers above given to said Bank in respect thereto, and the said Bank shall thereafter be forever relieved and fully discharged from any liability or responsibility in the matter.

It is also further agreed that any moneys or other property at any time in possession of said Bank, belonging to the maker, any guarantor or endorser of this note, and any deposits, balance of deposits, or any sums at any time credited by or due from said Bank to any such parties, may at all times, at the option of the said Bank, be held and treated as collateral security for the payment of this note or any other liability of such maker, guarantor or endorser to the said Bank, whether due or not due, and said Bank may at any time, at its option, set off the amount due or to become due hereon, against any claim of any of said parties against said Bank No delay on the part of the holder hereof in exercising any rights hereunder shall operate as a waiver of such rights.

INSURANCE

Insurance is an agreement by one party (called the insurer) for a consideration (called the premium) to indemnify another party (called the insured) against losses arising from certain causes (called the risk).

The INSURANCE POLICY is the written or printed contract containing the agreement between the parties.

Property Insurance.—A VALUED or CLOSED policy agrees to pay a specified amount in case a certain loss is sustained.

An OPEN POLICY provides for an undetermined amount, depending upon the quantity of goods insured at the time of the damage. This policy is used where goods are being deposited and withdrawn from the store or warehouse.

Rate of premium. The premium in property insurance is usually stated at a certain per cent of the amount insured. Rates are usually quoted for a year. Lower rates are charged for long periods and higher rates (known as short term rates) are charged for short terms.

The ORDINARY POLICY is one in which the amount to be paid in case of loss is specified; i. e. the amount of the loss will be paid if it does not exceed the sum stated in the policy.

The AVERAGE CLAUSE provides that where one policy covers several different pieces of property and one of the properties is damaged, the company will pay only that proportion of insurance which the insurance on that property bears to the whole insurance.

The 80% or CO-INSURANCE CLAUSE. Under this clause the insured agrees that he will keep his property insured for a given percentage of its value (80% in New York is the usual percentage) and if he fails to do this, the company will pay only that percentage of the loss which the insured bears to the agreed percentage of the value of the property.

Example: The value of a property is $10,000 and it is insured under the 80% clause but the insured takes out only $4,000 on the property. The property is damaged to the extent of $2000. The company will pay only $\frac{4000}{8000}$ or ½ of the loss.

The PRO RATA CLAUSE is used where there is more than one policy upon the same property. Each company is required to pay the proportion of the loss which its policy bears to the total amount of insurance carried on the property.

Example: A man has his building insured for $5000 in X company, for $10,000 in Y company, and for $15,000 in Z company. The property is damaged by fire to the extent of $6000.

Solution: The total amount of insurance is $30,000.

X Company must pay $\frac{5000}{30000}$ or 1/6 of the loss =	$1000
Y Company must pay $\frac{10000}{30000}$ or 1/3 of the loss =	2000
Z Company must pay $\frac{15000}{30000}$ or 1/2 of the loss =	3000
Total	$6000

The ARITHMETIC PROBLEMS in insurance are simply an application of percentage.

The amount of the insurance is the base in percentage.

The rate of insurance is the rate in percentage.

The premium in insurance is the percentage.

Example: Goods valued at $3000 are insured at the rate of 50c per hundred. The premium for one year is $15.

Life Insurance is a contract in which the insurer, for a consideration called the premium, agrees to pay a specified sum of money upon proof of the death of the insured or at some fixed time.

A STRAIGHT LIFE POLICY is one in which the premiums are paid during the life of the insured and the insurance is paid upon the death of the insured.

A TERM POLICY is one in which the insurance is paid if the insured dies within a fixed period.

An ENDOWMENT POLICY is one in which the insurance is paid at a fixed date, or, if the insured dies before that date, at the death of the insured.

Some policies provide for the payment of the premium for a given number of years and a continuation of the policy after these payments have been made. These policies are named by the number of annual payments as, Twenty Payment Life Policy.

The beneficiary is the person indicated in the policy to receive the payment upon the death of the insured.

EXCHANGE

The system of settling debts between parties residing in different places without sending the actual cash is called EXCHANGE.

DOMESTIC EXCHANGE is the system of settling debts between persons in the same country.

FOREIGN EXCHANGE is the exchange between persons of different countries.

The instruments of exchange are personal checks, bank drafts, commercial drafts, postal money orders, express money orders and telegraphic money orders. The forms of checks, bank drafts and commercial drafts are given under Bank Discount. The form and rates of money orders can be had at post offices, express offices and telegraph offices.

Domestic Exchange. To Find the Cost of a Draft.—

Example: Find the cost of a draft on St. Louis for $400 when exchange is at 1/8% premium.

Solution:

Face of Draft	$400.00
Exchange 1/8% of face	.50
Cost of draft	$400.50

If exchange is at a discount, subtract the exchange from the face of the draft.

To Find the Proceeds of a Draft.—

Solution: Find the proceeds of a draft of $2400, exchange being 1/4%.

Solution: 1/4% of $2400 is $6.00. $2400 −$6.00 = $2394.00.

Foreign Exchange.—Bills of exchange on foreign countries are usually drawn in sets of two or three, called "First and Second of Exchange." These are duplicates and are sent by different mails, but the payment of one cancels the other.

The rates of exchange depend upon the variation of the balances due to or from the different countries. The World War caused great disturbances in exchange rates. The exchange rates used in examples here are the rates that obtain when exchange is in a normal condition. The most important exchange rates are quoted as follows:

Sterling	£1	= $4.8665
French	$1	= F. 5.18
German	M.4	= $.95

A Letter of Credit is a request issued by a bank and addressed to their correspondents in all parts of the world asking them to pay the owner of the letter sums of money up to the amount named in the letter.

To Find the Cost of a Bill of Exchange.—

Example 1. Find the cost of a bill of exchange on Liverpool for £275 15s. 3d. sterling, exchange being quoted at $4.86¼.

£275 15s. 3d. = £275.7625

$4.86¼ × 275.7625 = $1340.90

Explanation: £275 15s. 3d. is equivalent to £275.7625. As £1 sterling is quoted at $4.86¼, £275.7625 will be worth 275.7625 times $4.86¼ = $1340.90.

Example 2. What is the cost of a bill of exchange on Paris for 1449 francs, when exchange is quoted at 5.17½?

1449 ÷ 5.17½ = $280.00.

Explanation: As 5.17½ francs are worth $1, 1449, francs are worth as many dollars as 5.17½ is contained in 1449. or $280.

To Find the Proceeds of a Bill of Exchange.—

Example: Find the proceeds of a bill of exchange for F.4200 at 5.17½—1/32.*

Solution:

F.4200 ÷ F.517½ = 811.59
$811.59 = proceeds at 5.17½
1/32% of $811.59 = 25c
$811.59 − $.25 = $811.34, the proceeds.

*A certain small amount of change in the rate is called a point. When a large amount is to be transferred, the rate is sometimes given in this form.

STOCKS AND BONDS

A corporation is an artificial person created by law and endowed by it with many of the powers of an individual.

The capital of a corporation is divided into a number of shares called the capital stock. This stock may be either preferred or common stock. Preferred stock receives its share of profits first and may have other preferences over the common stock.

Dividends are declared out of the profits of the corporation. The dividend is usually a certain number of dollars per share or a certain per cent of the par value of the stock.

The par value of stock is the value stated in the stock certificate, which the shareholder holds.

The market value of the stock is determined by the price at which the stock can be sold. This price may be above or below par.

Shares of stock are bought and sold through stock brokers who charge a certain percentage, usually 1/8 % of the par value.

To Find the Income From Shares When the Rate Is Known.—

Example: What will be the yearly income from 300 shares of stock which pays 6%.

Solution: 6% means $6 per share of a par value of $100. Hence the income will be $1800.

To Find the Cost of Stock.—

Example: Find the cost of 200 shares at 98½.

Solution: If one share costs $98½, 200 will cost 200 × $98½ = $19,700.

Brokerage.—If stock is bought through a broker (as it usually is), his fee, which is usually 1/8%, must be added to the cost. If brokerage were charged on the above, the cost per share would be $98 5/8. If stock is sold through a broker, the brokerage must be subtracted from the price received per share.

To Find the Proceeds From Sale of Stock.

Example: Find the proceeds of 72 shares sold at 91 1/8 less brokerage 1/8%.

Solution: $91 1/8 less $1/8 = $91 per share, 72 shares will yield 72 × $91 = $6552.

To Find the Rate of Profit on an Investment in Stocks.—

Example: What is the rate of income on an investment in 6% shares costing 120.

Solution: The yield is $6 on an investment of 120. $6.00 ÷ 120 = 5 = the per cent of profit.

To Find the Price per Share Which Will Yield a Given Rate on the Investment.

Example: What must be paid for a 6% stock to yield 5% on the investment?

Solution: $6.00 is 5% of what number. $6 ÷ .05 = $120.

Bonds are long time notes of the national and state governments, cities, counties, and private corporations. A bond bears interest at a specified rate of interest.

A registered bond is one in which the name of the owner is recorded on the books of the issuing corporation.

Coupon bonds have coupons attached which may be clipped off and collected as the interest becomes due. There is one coupon for each interest period.

Bonds are designated by the name of the issues, date of maturity, and the rate of interest. U. S. 4's 1925 means United States bonds maturing in 1925 and bearing 4% interest.

The ordinary ARITHMETICAL PROBLEMS of bonds are the same as those discussed under stocks.

PARTNERSHIP

A Partnership is a contract relation existing between two or more competent parties, uniting their capital, labor, or skill, in some lawful enterprise, agreeing to share the gains, or bear the losses, in certain proportions.

The persons forming a partnership are called Partners or Copartners. Collectively, they are called a Company, House, or Firm.

Partners may be classified, as follows: Real or General, Nominal, Dormant, and Special or Limited.

A Real or General Partner is one who is known to the public as a partner, takes an active part in the management of the business, and is personally liable for all the firm's debts.

A Nominal Partner is one who allows his name to be associated with the partnership, but invests nothing. He is liable to innocent third parties only.

A Dormant Partner is one who makes an investment, but who conceals his identity as a partner from the public. He becomes liable for firm debts when his identity is discovered.

A Special or Limited Partner is one who makes a cash investment, but takes no active part in the management. He is not personally liable for an amount greater than that mentioned in the partnership agreement.

A Partnership Agreement is a contract in writing made between partners specifying the amount of each partner's investment in money, labor, or skill, the time the partnership is to continue, the division of losses and gains, and all other conditions forming the mutual understanding upon which the partnership is based.

Stock companies are often formed for the management of large business enterprises in order to avoid the personal liability involved in ordinary copartnerships and also to more easily perpetuate the business. Each state has special statutes regulating the formation of stock companies.

Sample Solution:

1. A, B, and C are partners to share gain or loss in proportion to investment. A invests $3000, B $4000, and C $5000. They gain $3600. Find each man's share of the gain.

$3000
4000
5000
$12000 whole capital

$\frac{3000}{12000}$ = 1/4 A's part of capital.
$\frac{4000}{12000}$ = 1/3 B's " " "
$\frac{5000}{12000}$ = 5/12 C's " " "

1/4 of $3600 = $900, A's gain.
1/3 of $3600 = $1200, B's gain.
5/12 of $3600 = $1500, C's gain.

Explanation.—The whole capital, $12000, is found by adding the investments of the individual partners. Since A invested $3000, his part of the whole capital is represented by the fraction $\frac{3000}{12000}$, or ¼. Likewise B's part of the whole capital is $\frac{4000}{12000}$, or 1/3, and C's $\frac{5000}{12000}$, or 5/12. A's capital being ¼ of the whole capital, his gain will be ¼ of the whole gain; hence A's gain is ¼ of $3600 = $900. For the same reason, B's gain is 1/3 of $3600 = $1200, and C's gain is 5/12 of $3600 = $1500.

Sample Solution:

2. C and D are partners in business, sharing the loss or gain in proportion to their average investments. C invests Jan. 1, $3000, June 1, $2000. D invests Jan. 1, $5000, and withdraws Aug. 1, $1500. Their net gain for the year is $2050. Find share of each.

$3000 × 5 = $15000 for 1 month.
5000 × 7 = 35000 " " "
C's investment = $50000 " " "
$5000 × 7 = $35000 " " "
3500 × 5 = 17500 " " "
D's investment = $52500 " " "

$50000
52500
$102500 = whole capital for 1 month.

$\frac{50000}{102500} = \frac{20}{41}$ C's share of the total investment.
$\frac{52500}{102500} = \frac{21}{41}$ D's share of the total investment.

$\frac{20}{41}$ of $2050 = $1000, C's gain.
$\frac{21}{41}$ of $2050 = $1050, D's gain.

Explanation.— C's first investment, $3000, was in the business unchanged until June 1, or 5 months. The use of $3000 for 5 months is equivalent to 5 times $3000, or $15000 for 1 month. June 1, C invested $2000 more, which made his total investment $5000. This $5000 was in the business the remainder of the year, or 7 months, which is equal to 7 times 5000, or $35000 for 1 month. By adding the $15000 and the $35000, C's total investment is found to be equivalent to an investment of $50000 for 1 month.

D's investment, $5000, was in the business unchanged until Aug. 1, or 7 months, which is equivalent to the use of $35000 for 1 month. On Aug. 1, D withdrew $1500, leaving him only $3500 in the business for the remainder of the year, or 5 months, which is the same as $17500 for 1 month. By adding $35000 and $17500, D's total investment is found to be equivalent to an investment of $52500 for 1 month. $50000 added to $52500 shows that the net investment of the firm is equivalent to an investment of $102500 for 1 month. Since C's investment is equal to $50000 for 1 month, his share of the whole investment is $\frac{50000}{102500}$ or $\frac{20}{41}$; hence, he is entitled to $\frac{20}{41}$ of the gain, or $1000. In the same manner, D's share of the whole investment is $\frac{52500}{102500}$ or $\frac{21}{41}$, and he is entitled to $\frac{21}{41}$ of the $2050, or $1050.

SQUARE ROOT

Rule.—

1. Point off the number into periods of two figures each, commencing at the right, or at the decimal point. Find the greatest square in the left-hand period, and write its square root as the first figure in the root. Subtract the square of this first root figure from the left-hand period and bring down the next period for a new dividend.

2. For a trial divisor, multiply the root already found by 2, and annex one cipher. Divide the new dividend by the result thus obtained, and write the quotient as the next figure in the root. Add the last-found figure of the root to the trial divisor, and multiply the sum by this same last-found figure of the root. Subtract the product from the new dividend and bring down the next period for a second new dividend.

3. Continue this process until all the remaining periods have been brought down and the root obtained.

Notes.—1. There must be a figure in the root for every period in the power.

2. In pointing off a number involving a decimal, as 31462.874, start at the decimal point and divide into periods going to the left on the whole number and to the right on the decimal. In case there is but one figure in the right-hand period of the decimal, annex a cipher to complete the period. Thus the above number pointed off into periods would appear, 3'14'61.87'40.

Example: Find the square root of 576 sq. ft.

Solution:

```
5'76|24
 4
44|176
  |176
```

CUBE ROOT

Rule.—

1. Separate the number into periods of three figures each, beginning at the right, or at the decimal point.

2. Find the greatest cube in the left-hand period, and place its cube root as the first figure of the required root. Subtract the cube of this root from the left-hand period, and bring down the next period to make a new dividend.

3. Multiply the square of the root already found by 3 and annex two ciphers, for a trial divisor. Divide the new dividend by this trial divisor and write the quotient as the next figure in the root.

4. Multiply 3 times the first part of the root by the last-found root figure, annex one cipher and add the square of the last root figure; then add this sum to the trial divisor for a complete divisor.

5. Multiply the complete divisor by the last figure of the root; subtract the product from the new dividend, and bring down the next period for a second new dividend.

6. Continue this process until the root has been found.

Example: Find the cube root of 91125 cu. in.

Solution:

```
91'125|45
  64
4800|27125
 600|
  25|
5425|27125
```

SIMPLIFIED ARITHMETIC

By

LOUIS C. KARPINSKI

Professor of Mathematics, University of Michigan

EVERYDAY ARITHMETIC

Practical Arithmetic. Our treatment of the subject will be from the practical standpoint of the world of business; arithmetic as it is actually needed outside the school-room rather than the highly artificial work which is still, unfortunately, found in many text-books that are widely used.

In every day life we work commonly with integers, or integers and decimals, of not more than 4 places; we use $2.75 or 37 cents or $1.15 or 18 much more frequently than we use $27,500 or 3,287,246. Real and vital instruction will deal with the numbers such as we use constantly. In fractions we rarely use any other denominators than 2, 3, 4, 5, 6, 8, 10, 12 and 16; our practice work in fractions should deal largely with these denominators, until we can handle them easily and accurately. Problems to be solved without pencil and paper meet us every day and so do problems in which we need only a rough, an approximate answer; practise must be given in this kind of work. If taxes, stocks and bonds and life and fire insurance are to be presented to the children of our eighth grades then these topics should be treated as they are in real life. Arithmetic in every school should be adapted to the business life of the community in which the school is located.

RULES FOR SPEED

Mental Arithmetic—Speed Rules.

1. *Learn the 45 fundamental combinations of addition and multiplication.*
2. *Work from left to right, mentally, and not from right to left.*
3. *Use constantly, wherever possible, the fact that we have a decimal system of numbers, a system based on ten and powers of ten.*
4. *Learn to think numbers.*

ONLY FORTY-FIVE COMBINATIONS TO LEARN

The 45 addition and multiplication combinations must be made by drill absolutely automatic. The combination $\begin{matrix}7\\8\\-\end{matrix}$ when you look at it and *think* addition must spell 15 in just the same way that *c a t* spells *cat.*

In drill work do not place —, +, or × signs before the lower digit: this retards the child's progress later. Drill on the combinations mentioned just as they are to be used; drill by having the combinations written at random, selecting from all those which are given in our tables but not keeping them in order.

RAPID ADDITION

How to Add Rapidly.

After learning the 45 combinations in addition the next step for rapidity is to learn to add mentally any two two-place numbers. With the 6 combination $\begin{matrix}8\\-\end{matrix}$ associate such combinations as 16 6 6 46, and further those like 26 18 68 8 28 68 8 38 76 26 88. Read these sums from left to right; thus in reading 68 you think first 80, $\begin{matrix}46\\26\end{matrix}$ then 94, a glance to the right showing that one is to be carried making the 80 into 90.

$\begin{matrix}4\\7\\8\\6\end{matrix}$ In reading the sums in column addition you begin by reading the sum of the first two digits; read only the sums. Thus you here read 8, 17, 21, 27, 35, 42, 46 or 8, 17, 27 (since as you come to the 4 and 6 you notice that this adds ten to the preceding 17), 35, 42, 46.

$\begin{matrix}4\\9\\3\\5\\-\end{matrix}$ In adding numbers which are near to even hundreds notice that you can frequently save time by adding the full number of hundreds and subtracting the small difference.

396	388	693
425	475	281
821	863	974

Think 400+425 less 4, gives 821; in the second problem think 400+475—12 =863; in the third, 700+281—7 =974.

SPEEDY MULTIPLICATION

How to Multiply Rapidly. No tables of elevens and twelves should be separately learned; particularly with a child who has difficulty with arithmetic these tables increase the troubles and give no return value. No one multiplies by 12 as a single multiplier and even in business there is no more need for the tables of elevens and twelves than for fourteens or eighteens. Learn the combinations automatically up to $\begin{matrix}9\\9\\-\\81\end{matrix}$

Learn to multiply mentally any two place number by a single digit; multiply from left to right, and add mentally. So in getting the product $\begin{matrix}8\\\times17\\-\end{matrix}$ or 17. $\begin{matrix}8\\-\end{matrix}$ think 8×10 is 80, 8×7 is 56, added gives 136. With a little practise you can do this mentally more quickly than you can say the partial products. In 8×27, *think* 160, 56, 216.

MULTIPLICATION TABLE UP TO 20 x 20 MADE EASY

An Easy Rule for the Product of Any Two Teens. To multiply any two numbers between 10 and 20 do as follows; to the whole of one-teen, add the units of the other, and annex a zero; to this number add the product of the units. Example, 18×17, the units are 8 and 7 respectively. To the whole of one, 18, add the units, 7, of the other, making 25; to this annex a zero (multiplies 25 by 10), and add to the result, 250, the product 56 of the units, 7 and 8, giving 306. Mentally to multiply 19 by 14, the following numbers pass rapidly before your mind's eye, 19, +4, 23, 230, 36, *266* which is the product.

Combining this rule with the preceding rule for the product of any two place number by a single digit gives the complete multiplication table up to 20x20. Thus in the product 8x19, the following numbers pass rapidly before the mind's eye, 80, 72, *152*, which is the product.

PRODUCTS OF EVEN TENS

When the Tens are the Same. If you have two numbers beginning with the same tens' digit, you add the whole of one number to the units of the other and multiply by the tens' digit; annex a zero, and to this number add the product of the units. 24×27 is 20×(20+4+7)+4×7; in doing this mentally, 27, you think $\begin{matrix}24\\-\end{matrix}$ 27, +4, 31, ×2, 62, 620, +28, 648. If the units sum to ten as in 87, 26, 92, or $\begin{matrix}83\\35\end{matrix}$ $\begin{matrix}24\\98\\-\end{matrix}$ the product has in the last two places the product of the units and in the first one or two places the product of the ten's digit by a number one greater. Thus 87 $\begin{matrix}83\\24\\-\end{matrix}$ begins with 8×9 and ends with 3×7, 7221; 26 has 6 in the first place (2, the tens' digit ×3, one more than the tens' digit) and 4×6 in the last two places, 624; 92×98 is 9×10 placed before 8×2, or 9016; 35×35 is 3×4 placed before 5×5, or 1225.

LEARNING BY DOING

General Rules. Let the child begin real multiplication examples long before he has all the tables fully memorized; the work will help to make the tables automatic. With a backward child, allow him to write out the tables in vertical form, $\begin{matrix}2&3&4&5&6&7&8&9\\8&8&8&8&8&8&8&8,\\-&-&-&-&-&-&-&-\\16&24&32&40&48&56&64&72\end{matrix}$ and use these tables in working actual problems; he will soon learn the tables by using them.

EASY MULTIPLIERS

Quick Multipliers. To multiply by 10, 100 or 1000, annex one, two, or three zeros, respectively, to the multiplicand. To multiply by 5, 50, or 500 multiply by 10, 100, or 1000, as above, and divide by 2 since $5=\frac{10}{2}$, $50=\frac{100}{2}$ and $500=\frac{1000}{2}$. To multiply by 2.5, 25 or 250, multiply by 10, 100 or 1000, as before, and divide by 4, since $2.5=\frac{10}{4}$, $25=\frac{100}{4}$, and $250=\frac{1000}{4}$. To multiply by 7.5, 75, or 750, multiply by 5, 50 or 500 and add to this product, in each case, ½ of itself.

Examples: 25x48 is $\frac{4800}{4}$ or 1200; 50×48 is 2400; 75×48 is 2400+1200 or 3600

To multiply by ¾, think of ¾ as ½+¼, to ½ the number add ½ of ½ of the number; ¾ of 48 is 24+12 or 36.

50 and 25 are called aliquot parts of 100; two other aliquot parts of 100 are frequently useful, 12½ or ⅛ of 100, and 33⅓ or ⅓ of 100. If you wish to know approximately what 34 or 35×186 you can at a glance state that 33⅓×186 is 186×100 or 6200, and 34×186 is ⅔ of 186 or 124 more than 6200.

EFFICIENCY RULES

Multiplication of Decimals Abbreviated. In finding the cost of 328.4 lbs. of milk at $3.38 per hundred it is not necessary to multiply in the ordinary way $3.38 by 3.284 as this gives numbers in the fifth decimal place where nothing finally beyond the second decimal place is needed.

$\begin{matrix}3.380\\3.284\\-\\10140\\676\\270\\13\\-\\11.099\end{matrix}$ In any product of decimals remember that the first place times the first gives second place, and first times second gives third place, and so on. In such a product begin with the highest place of the multiplier and carry results one place farther than desired in the final result. If both numbers have not the same number of places make the number of places agree by adding zeros as above.

or $11.10

Multiply .37628×.41329, retaining finally only 4 places of decimals.

$\begin{matrix}.37628\\.41329\\-\\15051\\376\\113\\7\\3\\-\\.15550\end{matrix}$ Begin to multiply with the highest place of the multiplier, not the lowest.

Begin 4×2, 8 in 5th place, carry 3 from 4×8, making 11. Then 4×6, 24+1, 25, etc. Cross out the 8 and the 2 in upper number.

Then 1×6, 6, nothing to carry since 1×2 is less than ½, etc. Cross out 6.

Then 3×7, 21, +2 carried from 3×6=18, etc. Cross out 7.

Then 2×3, 6, +1 (from 14), .7. Cross out 3 above.

Then 3, carried from 9×3=27 which is nearer 3 than 2 in the fifth place.

Final result, .1555.

EFFICIENCY IN DIVIDING

Short Cuts in Division. In division, many unnecessary figures can be cut off when only an approximate result is desired. If 3280 articles are manufactured at a total cost of $18,834, what is the cost per article, to one cent?

5.742		5.74
3280)18,834		3280)18,834
16,400		16,400
2434	0	2434
2296	0	2296
138	00	138
131	20	131
6	800	7
6	560	
	240	

After each division cut off one figure in the divisor and use the part left as new divisor; this will keep the right hand digit of all the partial products in a vertical line.

Long Division Made Short. Use the form of short division for long division, and teach children to see that it is the same process. Some children are assisted by having the complete form of quotients and partial products retained in the explanatory solution.

```
                7
               30
              400
             ----          437

ELIMINATING PARTIAL PRODUCTS

The Addition Method in Division.—By using the additive method of subtraction, subtracting from the dividend each part of each partial product as it is obtained, only the remainders need be written, leaving the work quite compact. 4 in the quotient is obtained in the usual way.

```
 437
----
134)58639
  50
 101
  81
```

Now 4×134 is to be subtracted, by the additive method, from 586.

Then 4×4 is 16, +0, makes 6; the *0* is the first figure in the remainder; 4×3, 12, +1 carried from 16, 13, +5, makes 18. 4×1, 4, +1 carried from 18, 5, +0 makes 5.

Then 3×4, 12, +*1*, 13; 3×3, 9, +1, carried from 13, 10, +*0*, 0; 3×1.

3, +1 from 10, 4, +*1* makes 5.

Then 7×4, 28, +*1*, 29; 7×3, 21, +2 from 28, 23, +*8*, 31; 7×1, 7, +3, 10.

50 is the first, 101 the second, and 81 the third remainder.

THE CHECK BY NINES

Casting Out Nines. When 4,328 is divided by 9 the remainder is the same as when 4+3+2+8 is divided by 9; 1000 is 999+1, 100 is 99+1, 10 is 9+1; when 1000 is divided by 9 the remainder is 1, when 100 is divided by 9 the remainder is 1, when 10 is divided by 9 the remainder is 1;

when 4000 is divided by 9 the remainder will be 4×1 or 4;
when 300 is divided by 9 the remainder will be 3×1 or 3;
when 20 is divided by 9 the remainder will be 2×1 or 2;
8 divided by 9 gives as remainder 8.

The total remainder of 4,328 divided by 9 is 4+3+2+8, the sum of the digits, and out of these we can *cast a nine* leaving 8 as remainder. When you have the sum of a column of figures nines can be cast out of all the summands, and the total remainder should be the same as the remainder when nines are cast out of the sum; in subtraction the difference of the remainders of minuend and subtrahend should be the same as the remainder when nines are cast out of the remainder (the answer); in multiplication the remainder, by nines, of the product is the same as the product of the remainders. In division the remainder of quotient, multiplied by remainder of divisor, and added to the remainder's remainder, equals the remainder of dividend

```

DECIMALS—SEE THE POINT

The Point about Decimals. If the decimal point is kept straight there is absolutely *no difference* between division of decimals and division of integers. If .1437 is divided by .123 your quotient will evidently be a little more than one, as 14 hundredths contain 12 hundredths once and a little over; .01437÷.123 gives .1 as first place in the quotient since .1 of .123 is .0123. If in doubt multiply both dividend and divisor by 10, 100, 1000, so as to have the divisor an integer; then the number of places in the dividend required to obtain your successive remainders equals the number of places in the quotient.

The Rule. The number of places in the quotient + the number of places in the divisor must equal the number of places in the dividend. Remember that the quotient multiplied by the divisor must equal the dividend, except for the small remainder.

STANDARDIZING ARITHMETIC

Trouble Points.—How to Locate Them. In large factories they hold stop-watches on men who are doing the same kind of work to compare the daily out-put of the men; every man is expected to come up to a certain standard of production. In arithmetical operations there are certain standard rates at which pupils in different grades should be able to perform these operations.

```
7 6 3 0 8 9 1 6 4 2 7 2 5 4 8 3 9
8 4 2 5 5 4 3 6 3 7 5 8 9 6 1 0 8
- - - - - - - - - - - - - - - - -
```

Place on paper before the child, or have him copy, about 100 of these addition or multiplication combinations, be sure to include all combinations up to 9 with 9 and some combinations involving zero. Time the child, using a watch with a second hand; have paper and pencil prepared; have the child hold up his hand with the pencil, telling him 5 seconds before the minute hand reached 60 to get ready; at exactly the 60 mark, say "Write." The time of copying the examples is not to be included; take only the time of writing the series of answers to problems *previously* copied.

In one minute a child should be able to write the answers, correctly, as follows, depending upon the grade in school:

	III	IV	V	VI	VII	VIII	Middle of Grade
Addition							
Combinations	26	34	42	50	58	63	

The same combinations, recopied, can be used for multiplication; the inverse combinations can be used for subtraction and division (inverse of 7 is 15 or 15; 8 7 8 / — — — / 15

inverse of 8 — — / 7 is 7)56 or 8)56) / 56

STANDARD SCORES

	III	IV	V	VI	VII	VIII
Multiplication	16	23	30	37	41	45
Subtraction	19	25	31	38	44	49
Division	16	23	30	37	44	49
Copying Digits	63	75	84	92	100	108

AVOID DRILL WITHOUT PURPOSE

If a child falls below standard in all four fundamental operations the probability is that he is slow in copying digits. The standard scores for copying digits are for copying, from a printed (or carefully written) sequence of digits, written in no systematic order, e. g., 3, 4, 0, 7, 6, 8, 5, 2, 4, 9, 1, 3, 5.

Take the time you make with each of the four operations. Find out in this way just where your arithmetical weakness lies. Having located the trouble point, drill on that particular work, following the methods indicated in the preceding articles.

Another good type of time drill, devised like the preceding by Mr. S. A. Courtis of Detroit, involves the actual fundamental operations in problems. In addition, place before the individual to be tested about 25 problems, each consisting of nine three-place numbers, time 8 minutes; in subtraction set 24 problems each consisting of an eight-place number to be subtracted from an eight or nine place, time 4 minutes; in multiplication, set 24 problems each consisting of a four place number to be multiplied by a two-place or a three-place number with a zero, like 250, time six minutes; in division place a 4 or 5 place number divided by a two place, having an exact quotient of three places, time eight minutes.

STANDARDS SET FOR THE PRECEDING EXERCISES

	IV	V	VI	VII	VIII
Addition	6	7	9	10	11
Subtraction	6	8	9	10	12
Multiplication	4	6	7	8	9
Division	3	5	6	7	9

After a child attains the standard for his grade in any operation his time should be devoted to bringing up his record in the other operations, and to practical applied problems.

BUSINESS ARITHMETIC

Interesting Interest. (See Index.) At the present time the rules of interest and the problems, should be concerned with the real practise of banks and particularly with war savings. Take the $5.00 first government war savings stamps, sold when issued at $4.12 which pay 4% compound interest. Find the interest on $4.12 and add it to the principal at the end of the first year; do this for five years, carrying the work only to the second decimal price; the result will be the $5.00 which the Government agreed to pay at the end of 5 years. The process illustrates fully the fundamental principles of compound interest. Discuss postal savings bank, according to the actual rules, and discuss the Liberty Bonds This will make interest interesting.

Problem.—Compound interest on $4.12 for 5 years at 4%.

```
$4.12  $4.12                    $4.28  $4.28
 .04    .16                      .04    .17
------  ----                    -----  -----
 .1648  $4.28 end of 1st year.   .1712  $4.45 end of 2nd year.
$4.45  $4.45                    $4.63  $4.63
 .04    .18                      .04    .18
------  ----                    -----  -----
 .1780  $4.63 end of 3rd year.   .1852  $4.81 end of 4th year.
        $4.81  $4.81
         .04    .19
        -----  -----
        .1924  $5.00 end of 5 years.
```

At the end of the fourth year, interest .1852, only 18 cents is credited as in the preceding year the next larger unit, .18, was taken instead of .1780.

NOTE NOTES

Notes on Interest on Notes. (See Index.) Ninety-nine notes out of a hundred are now drawn for 2 months, or 3 months or 6 months, and in most parts of the U. S. at 6% interest. Whether the interest is paid when the note becomes due, or whether it is taken out in advance as discount, the method of computation is the same. Since the interest for 12 months is 6%, the interest for 2 months is 1% of the principal; the interest for 1 month is ½% of the principal; the interest for 3 months or 6 months is respectively 1½% or 3%.

Moving the Decimal Point. The interest on a note of $490 for 2 months, or 60 days, at 6%, is obtained by simply moving the decimal point two places, $4.90 is this interest; moving the decimal point again gives the interest for one tenth of 60 days, or $0.49 for 6 days. For one month take one-half of the interest for 2 months; for 90 days add these two. Work from the interest for 60 days, and it will be easy.

To find the interest at 5% or 7%, subtract or add, respectively, to the interest which you find at the 6% rate, one-sixth of itself. For 4½% take from the interest at 6% one-fourth of itself.

Discount is Interest. The principles of discount are fully discussed in the preceding section, as discount is nothing but interest taken out *in advance*. The discount on a note of $490 for 60 days at 6% is $4.90; the bank gives to the maker of the note not $490, but $490 less the *discount*, $4.90.

COMPOUND INTEREST

How Money Grows. One dollar placed at interest for one year at 6% grows to $1.06; in five years at compound interest it grows to $1.338, and in ten years to $1.790; at the end of 12 years the dollar has more than doubled itself.

HOW ONE DOLLAR GROWS!

	4%	5%	6%
1 year	1.04	1.05	1.06
5 years	1.216	1.276	1.338
10 years	1.480	1.628	1.790
12 years	1.601	1.795	2.012
15 years	1.801	2.078	2.396
18 years	2.025	2.406	2.854
20 years	2.191	2.653	3.207
50 years	7.106	11.467	18.420
100 years	50.504	131.501	339.02

MEASURES AND MONEYS

Denominate Numbers. (See index for tables.) So far as practical problems are concerned these should deal, in general, with only two denominations; to change miles to inches is arithmetical exercise, but the practical value is almost *nil*. Children in public schools should not be required to learn Troy and apothecary tables, and obsolete measures; their work should be on the measures which ordinary people use in ordinary business.

SPENDING MONEY

How the Money Goes—Foreign and Domestic Exchange. (See Index.) Send the boy to the post-office to get a foreign and a domestic money order blank, send him to the Express office for similar blanks, show to the boy your checks as you send them even to out-of-town firms; when you have done these three things you can make clear to him the way money is sent from one place to another, whether at home or abroad. A boy who has *actually sent real money* by P. O. order, or by Express order, ot by his father's check knows more about domestic exchange than any book can teach him. Give the boy and girl a chance to do things in a real way, and arithmetic will become easy and interesting.

EXTRACTING THE ROOT

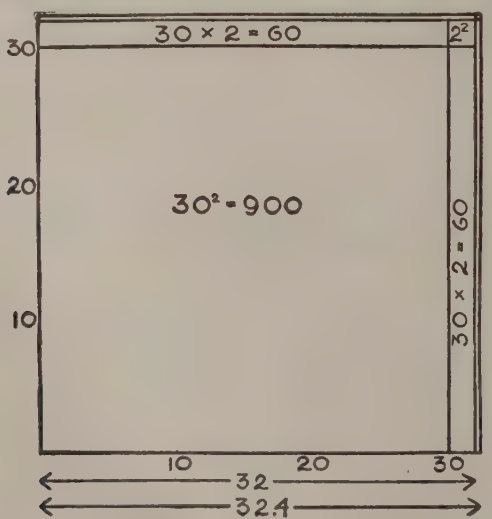
Square Root—the Easy Way. The easiest way to get square root is to find by trial, some number whose square is near to the given number; divide the given number by this trial root; half the sum of the trial root and the quotient, carried to only one place farther than the trial root, is a nearer trial root.

Example.—Find the square root of 153.16. Evidently 12 is near to the root.

```
12.76
12)153.16
12
--
33      gives 153.16.  Try (12+12.76)/2 or 12.38; taking the
24      nearest number one place, farther gives 12.4 which
--      is shown, by division, to be the exact root.
91
84
--
76
72
--
4
```

12 is too small; 12.76 is too large, since 12×12.76

The ordinary process of square root can be readily explained by a diagram on cross-section paper which can be procured at any book-store, or supply house.



Build up on the diagram $(32.4)^2$ as $30\ (+2+.4)^2$. Note that 30^2 is 900, the larger square; 32^2 is $30^2 + 2\times30\times2$ (the two rectangles) $+2^2$ (the little square), $(32.4)^2$ is 32^2 (the second of the large squares, with side 32) $+2\times32\times.4$, or the two rectangles, one at the side and one at the top, with longest dimension 32 and shorter dimension .4. Note that in extracting the square-root of 1049.76 you take out these squares and rectangles and little squares in the order mentioned. Looking at 1049 you see that 30 is the largest even ten whose square can be taken out of 1049.76. Doubling 30 gives 60, the total length of our two rectangles which are at the top and side of our square of side 30. Dividing 149 by 60 we see that the width of these two rectangles is greater than 2 and less than 3. We add the 2 to 60, making 62 and multiply by the 2, giving $2\times60+2\times2$ or the area of the two rectangles and the little square of side 2. Now we have taken out $900+124$ or 1024 which is the square of 32. The total length of the two rectangles, at top and side of our square of side 32, is 64. Divide 25.76 by 64 and we get .4; evidently the other dimension of our long, narrow rectangles is near to .4; to the 64 add the .4 and multiply the sum by .4 giving the area of the two narrow rectangles $.4\times64$ or 25.6 and the area of the tiny square of side .4, $.4\times.4$ or .16, total 25.76.

```
  32.4
30)1049.76
  900   the large square
 149.76
 124
 ----
2576
```

Problem. Extract the square root of 1176.49, both methods.

In each method begin by dividing 1176.49 off in periods of two digits each way from the decimal point. The root of this number will then have two places to the left of the decimal point. The first trial root is 30, since 30^2 is 900 and 40^2 is 1600.

By Division.

```
  39.2
30)1176.49
30 is too small; 39.2 is too large.
Try ½ (30+39.2) or 34.6.
  34.00
34.6)1176.490
  1038
  ----
  1384
  1384
  ----
    90

  34.3
34.3)1176.49
  1029
  ----
  1474
  1372
  ----
  1029
  1029
```

1176.49÷30 = 39.2

1176.49÷34.6 = 34.00

34.6 is too large; 34. is too small.

Try ½ (34.6+34) or 34.3

34.3 is the number which multiplied by itself gives 1176.49.

By Regular Process.

```
 3  )1176.49
    9
    ----
64   276
     256
     ----
68.3 20.49
     2049
```

the 3 for 30, the 9 for 900, 30^2; the 6 (first 3 doubled) for 60; divide 276 by 60 gives 4; annex to 6, 64×4, gives two rectangles 4×30 and 4×30 and little square 4×4.

The 4 doubled, 68; and 20.49÷by 68 (or 20 by 60) gives .3; annex to 68. $68.3\times.3$ gives two rectangles $34\times.3$ and $34\times.3$ and tiny square $.3\times3$.

BIG BUSINESS

Stocks and Bonds. Stock brokers charge ⅛ of one dollar for buying or for selling a share of stock, with a minimum charge of $1.25, the price of buying or selling 10 shares of stock. The minimum charge is disregarded in ordinary arithmetical work. To find the price of a share of stock to a purchaser add ⅛ to the quotation, which on reliable stocks is given in dollars and fractions of dollars; to find the price received by one who sells given shares of stock through a broker, subtract from the market price, ⅛, and multiply by the number of shares sold. Brokers usually make a separate item on the bill for their brokerage. On bonds the brokerage is commonly computed on each $100 of the face of the bond. To make this work mean anything to a boy or girl in the eighth grade, get a newspaper which gives stock quotations and make up actual problems from actual quotations in the paper.

GOVERNMENT ARITHMETIC

Duties, Customs, Commission. (See Index.) The fundamental idea in duties *ad valorem* (on the value) and commission on price of articles bought or sold is precisely the same. In each case a certain *percentage* of the money is found; when the government receives this percentage for permitting the goods to be imported into the country (or for permitting the manufacture as in liquor) it is called *duty*, but when the buyer or seller of goods receives the percentage as pay for buying or selling the goods, the percentage is called commission. A *duty* of 15% on books worth $400, at the price of purchase, is the same in value as a commission of 15% on selling 400 bushels of corn at $1.00 per bushel. *Customs revenue* or *tariff* or *duty* determined on the quantity of goods imported, irrespective of the cost, is called *specific duty*; to find this duty is always a matter of multiplication.

Problem. Find the import duty on 400 lbs. of Cigars, at $4.50 per lb. *Specific duty*, plus 25% *ad valorem*; value of cigars, $1200.

```
$4.50          $1200          $1800
 400            .25            300
-----          -----          -----
```

$1800 *specific* duty. $ 300 *ad valorem* duty. $2100 total import duty.

If these cigars were sold for $4500, with a commission of 10%, the importer would receive not $4500 from their sale but $4500 less 10% of $4500.

```
$4500          $4500
 .10            450
-----          -----
```

$ 450 commission. $4050 net proceeds of sale.

ARITHMETIC ON THE FARM

Gallons in a Gasolene Tank. Measure the diameter of the circular base and the height in inches; multiply the diameter by itself and the product by the height; take ⅓ of 1% of this number and the result is the number, correct to one gallon for any tank holding less than 50 gallons. Where greater accuracy is desired, add to this 1 gallon for every 50 gallons, and proportionally for smaller parts (i.e., add 2% of your first result).

Find capacity in gallons of a tank 15 inches circular base, by 20 inches high, $15\times15\times20 = 4500$; 1% is 45; ⅓ of 1% is 15. The tank holds 15 gallons, or, if accurately measured, you can add 2% of 15, or 3 gallons. A circular tank, 30 inches diameter by 36 inches high, holds $108+2.16$ gallons, or about 110 gallons. Computation $30\times30\times36 = 32400$; take ⅓ after moving decimal point two spaces, gives 108; for greater accuracy, add 2% of 108 or 2.16. Total capacity, 110.16 gallons.

The 1918 Ford tank is 10 inches in diameter by 30 inches long. $10\times10 = 100$, $100\times30 = 3000$; 1% is 30; ⅓ of this gives 10 gallons, *the capacity*.

The rule depends, of course, on the formula $\frac{3.1416\times d^2\times h\times15.}{4\times1728}$. The area of a circle is $\frac{3.1416d^2}{4}$ or $\frac{22\times d^2}{7\times4}$ where d is the diameter; $\frac{22\times d^2\times h}{7\times4}$ is the volume of a circular cylinder of height, base of diameter d; $\frac{22\times d^2\times h}{7\times4\times1728}$ is the volume in cubic

feet, 1728 cu. in.=1 cu. foot; since a gallon contains 231 cu. in., a cubic foot equals 7½ gallons giving an error, of excess, of 2 gallons in 100 cu. feet (100 cu. ft. =748.05 gallons). $\frac{22\times d^2\times h\times 15}{7\times 1728\times 2}=.00341\times d^2\times h$, and using the more accurate values 7.48 instead of $\frac{15}{2}$ and 3.14159 instead of $\frac{22}{7}$, gives .003399 or .003333 +.000066; now ⅓ of 1% is .003333, and 2% of this number is .000066; this sum gives our required .003399, and so the above rule.

THE CISTERN MEASURED

Barrels in a Cistern. Take the diameter and the height in feet, multiply the square of the diameter by the height; of this number take 1/6 and also take 2%; the sum gives the number of barrels within 1 barrel in 1000.

How many barrels in a cistern 8 feet in diameter, 9 feet high? 8×8×9=576; 1/6 of 576=94; 2% of 576 is 11.52; 94+11.52=105.52 bbl.

Check up on this by finding the number of cubic feet in the cistern $\frac{22\times d^2\times h}{7\times 4}$ and dividing by 4.21, which is the number of cubic feet in a barrel (31½ gallons).

For a square tank find the number of cubic feet and divide by 4.2 or 4.21; or take ¼ of the number of cubic feet and from this number subtract ½ of 1/10 of itself. Thus a tank 8×8×9 holds ¼ of 8×8×9 or 144 bbls. less 7.2 bbl. (1/10 of 144 is 14.4, and ½ of this is 7.2 bbl.).

GAUGING THE SILO

Capacity of Silos. To find the number of cubic feet of content within a silo, measure accurately the inside diameter. Square the diameter and divide the result by 4; this number multiplied by 3 1/7 gives the number of cubic feet per foot of height.

Problem. How many cubic feet in a silo 24 feet high, with inside diameter 12 feet, 14 feet, 16 feet?

12×12=144; 144÷4=36; 3 1/7×36=133 1/7 cu. feet per foot of height; 24×113 1/7=2715 cubic feet.

14×14=196; 196÷4=49; 3 1/7×49=154; 24×154=3696 cu. feet.

16×16=256; 256÷4=64; 3 1/7×64=201 1/7; 24×201 1/7=4827 cu. feet.

For 13, 15, and 17 foot diameters, you would get 3187, 4243, and 5450 cu. ft. for this height, or 132 5/6, 176 5/6, and 227 cu. ft., respectively, per foot of height. No appreciable error is made if with a 12½ foot silo, or 14½ foot silo, you take the middle value, thus between the 12 foot and 13 foot values of 113 1/7 and 132 5/6 you find 123 as middle value, ½ (113 1/7 +132 5/6).

In general in measuring the capacity of silos the computation should not be carried out beyond whole cubic feet, as the measurements of silos are not sufficiently accurate to warrant carrying the computation to fractions.

A SILO CAPACITY TABLE

The Silo Table. This table gives for 12 to 18 foot circular silos the capacity in cubic feet and in tons, figuring 40 lbs. of silage to the cubic foot; heights of 20, 24, and 30 feet are given.

	12 Foot		13 Foot		14 Foot		15 Foot		16 Foot		17 Foot		18 Foot	
Height	Cu. Ft.	T'ns	Cu. Ft.	T'ns	Cu. Ft.	T'ns	Cu. Ft.	Tons	Cu. Ft.	Tons	Cu. Ft.	Tons	Cu. Ft.	Tons
20 feet..	2262	45.2	2655	53.1	3080	61.6	3536	70.7	4023	80.4	4541	90.8	5089	111.8
24 feet..	2715	54.3	3186	63.7	3696	73.9	4243	84.9	4827	96.5	5449	109	6107	122
30 feet..	3393	67.8	3983	79.6	4620	92.4	5304	106	6035	120.6	6811	136.2	7633	167.7

CANCELLATION

The Ice by Cancellation. Cancellation simplifies calculation in many problems that arise in business. A cubic foot of ice, containing 12×12×12 cubic inches, weighs 56 lbs. How much ice will your ice box hold if it takes a piece 24×18×15 inches?

$$\frac{\cancel{24}^{2}\times\cancel{18}^{3}\times 15\times\cancel{56}^{14}}{\cancel{12}\times\cancel{12}\times\cancel{12}}$$ lbs. or 15×14 lbs. or 210 lbs.

A piece 8×9×12 weighs $\frac{\cancel{8}^{2}\times\cancel{9}^{3}\times\cancel{12}\times\cancel{56}^{28}}{\cancel{12}\times\cancel{12}\times\cancel{12}}$ lbs., or 28 lbs.

The same principle applies to finding the weight of 500 sheets of paper of size 33×45 inches when you know that 500 sheets 25×36 inches weigh 50 lbs. 500×33×45 will be the number of square inches of paper in the new ream; but 50 lbs. contains 500×25×36 square inches; the weight of the new ream is then

$$\frac{\cancel{500}\times 33\times\cancel{45}^{9}\times\cancel{50}^{10}}{\cancel{500}\times\cancel{25}\times\cancel{36}^{4}}=\frac{165}{2}$$ lbs. =82½ lbs. per ream.

FRACTIONS MADE EASY

Refractory Fractions. No one in business has any use for such fractions as $\frac{53}{379}$ and 173; it would be well in arithmetic to confine the work largely to those fractions which are used in business. Work many problems with ½, ⅓, ⅔, ¼, ¾, ⅛, ⅝, 1/10, ⅕, 5/6, fifths, tenths, twelfths, and sixteenths; get the fundamental principles firmly fixed in mind with these easy fractions, by much practise, then the drill with more awkward denominators will be easy.

Practise of This Kind. Problems.—Add ½ yd., ¾ yd., ⅜ yd. Note that ¾ is ½+¼; in adding mentally, combine ½ and ¾, giving 1¼, or 1 2/8; then add the 3/8, making 1 5/8. *Three quarters is a half and a quarter.* Find the cost of ¾ yd. ribbon at 24c a yd. Note that ½ yd. costs 12c, and ¼ yd. 6 cents, hence ¾ yd. costs 18c. At 18c a yard, a clerk should say 9+4½, gives 13½; the rule is to charge 14 cents if change is made, or 13 cents if the customer has exact change.

A BURNING QUESTION

Coal in Your Coal-Bin. Anthracite coal varies somewhat in weight per cubic foot, depending on the size and slightly on quality. However, 32 cu. ft. to 34 cu. ft. to the ton is about the average in ordinary sizes of coal. For all practical purposes 3% of the number of cubic feet in a bin gives the number of tons of anthracite coal which a bin will hold; ½ of this is approximately the number of tons of coke; 2½% of the number of cubic feet gives the number of tons of bituminous coal, which runs about 40 cubic feet to the ton.

Problem. Find the number of tons of coal in a bin 8×10×6 feet high; 8×10×6=480; 3% of 480 is 14.40, the number of tons of anthracite which this will hold; 2½% of 480 is 12, the number of tons of bituminous (Pocahontas or soft coal) which the bin will hold.

HAY

Hay in the Mow. Alfalfa hay stacked 30 days runs about 512 feet to the ton. A simple rule is to find the number of cubic feet in the mow by multiplying length by breadth by height, all in feet, then move the decimal point over three places and multiply by 2. This will be too large by one ton in fifty, unless the hay has been standing longer.

A mow 30×40×8 contains 9600 cubic feet; shift the point three places making 9.6 and multiply by 2, gives 19.2 tons for the capacity.

Hay in the Stack. A stack consists of a cone on a cylinder; measure the circumference of the cylindrical base and the height up to the point where the stack begins to taper off; multiply the circumference by itself and by 8 and divide by 100, giving the number of cubic feet for each foot of height of the cylindrical part. Multiplying by the height of the cylindrical part and shifting the decimal point three places gives one-half the number of tons in the cylindrical part. As the tops vary so much it is better to estimate the top separately as a fractional part of the base.

A stack of hay measures 60 feet in circumference and 14 feet high to the point where it begins to taper to the top. How many tons of hay?

$\frac{50\times 50\times 14\times 8}{100}=2800$ cubic feet; moving the decimal point three places gives 2.8 as half the number of tons, or 5.6 tons for a new stack; a six months' stack will contain at least one-fourth more, and an old stack almost one-half more.

WHERE YOU ARE AND WHEN

Latitude and Longitude. (See Index in book.) This topic belongs rather to geography than to arithmetic. The difference between Eastern and Central time should be clearly understood, but elaborate problems on finding the difference in time between two places when the longitude is given have no real meaning in fact except for the astronomer. The sun rises in the East and sets in the West; of two points the one farther east is reached first by the sun so that sunrise takes place earlier at this place, than at the place to the west of it, consequently the time of day, by the sun, is later at the place farthest east. It takes the earth 24 hours to complete the rotation of 360° about its axis, and hence it takes the sun 24 hours to complete the apparent rotation of 360° about the earth; in one hour the sun, or earth really, completes 1/24 of its course, or 1/24 of 360°; a difference of 1 hour in time corresponds then to a difference of 15° of longitude.

In our table of longitudes value are given in hours, minutes, and seconds; multiplying by 15 would give the longitude in degrees, minutes, and seconds. Note that Washington in Eastern time is given as 5 hr. 8 min. +West, or earlier than Greenwich; Chicago in the Central time belt is 5 hrs. 50 min. +West, or about one hour earlier; Denver in the Mountain time belt is 6 hrs. 59 min. +West; and San Francisco in Western time is 8 hrs. 9 min. West. Note that Honolulu is 10 hrs. 31 min. +West, or earlier time than Greenwich, while Yokohama in Japan is 9 hrs. 18 min. East, or later time than Greenwich. Between these two points lies the part of the Pacific which can be considered as either 180° East or 12 hrs. later or as 180° West or 12 hrs. earlier Greenwich; then on the West of this line the date is one day later than on the East. A person who goes around the world westward apparently loses a whole day at the international date line in the Pacific, but he gains by single hours 24 hours as he progresses westward.

SENSIBLE MEASURES

Metric System. (See Index.) The metric system should be understood as a matter of general information, since so much of the civilized world uses that system at the present time. The interest of the boy in this subject can be aroused today by a discussion of the famous French 75-millimeter gun, and by discussing the rations of soldiers and civilians in France and Italy. An item taken from the daily newspaper is worth ten taken from the arithmetic.

Problem. About how large in inches is the 75 mm. gun? the 375 mm.? Our table, page 388, tells us that 10 millimeters = 1 centimeters, and 1 centimeter = .3937 inches. Now 5 centimeters or 50 mm. equals 1.968 inches and 2.5 centimeters equals one-half of this or .984 inches. The total is 2.952 inches; for all practical purposes of discussion, but not for making shells, the 75 mm. gun can be thought of as a three inch gun.

1 cm. is nearly 2/5 of an inch; 5 cm. make 2 inches, lacking .0325 inches, an error of 1⅓%.

ALGEBRA IS HIGHER ARITHMETIC

Algebra Applied to Arithmetic. In elementary algebra you learn that $(x+a)(x+b)=x^2+ax+bx+ab$; now this rule is equally good if we substitute 10 for x. Then $(10+a)(10+b)=10\times 10+10\times a+10\times b+ab$, or $10(10+a+b)+ab$. If you think of a and b as numbers between 1 and 9, this algebraic formula gives the complete explanation for the rule which we have given above, under multiplication, for the product of any two "teens." Note that 10+a is the whole of one number; b as the units of the other; 10+a+b is the sum of one plus the units of the other; 10x (10+a+b) is the product of this sum by 10; ab is the product of the units.

An easy rule for squaring numbers under 100 follows from an easy algebraic formula. $(50+a)^2=2500+100a+a^2$, $(50-a)^2=2500-100a+a^2$; or $(50+a)^2=100(25+a)+a^2$ and $(50-a)^2=100(25-a)+a^2$. The rule then is: find the difference between your given number and 150; if greater than 50, add this difference to 25, and if less, subtract from 25; to this number, resulting, annex two zeros (to multiply by 100); to this number add the square of the difference between 50 and your given number. Find $(57)^2$, $(43)^2$, $(62)^2$. In 57, a is 7, 25+7=32, 3200, $7^2=49$, 3249 $=57^2$; in 43, a is 7 as 43 is (50—7); 25—7=18, 1800, 7^2 is 49, 1849 $=43^2$; in 62, a is 12, 25+12=37, 3700, $12^2=144$, 3844 is 62^2.

As you work problems in algebra learn to substitute numbers, and so make your algebra useful in arithmetical computation.

MATHEMATICS APPLIED TO LIFE PROBLEMS

The training in accuracy and the familiarity with computation which is given by the work explained above is absolutely essential for the individual who works along scientific lines, whether in agriculture, commercial lines, or in the laboratory.

ALGEBRA

H. C. BARBER

WHAT ALGEBRA IS. For three thousand years men have been looking for a brief way to write the explanations of arithmetic problems. The result of this search we call algebra. It is a systematic way of putting down the steps taken to get the answers to problems. It may be thought of as a sort of shorthand, making hard problems easier.

It also shows how to write arithmetic rules very briefly. We call these rules Formulas and find them very useful in learning about many things in science and in business and all sorts of practical affairs. We have formulas for interest and engines, electricity and lighting, ships and sailing, and the study of the stars, and for a thousand other things.

Algebra is not hard if you will study the *reason* for each step you take. Do not think of it as a rule but as the most sensible way to meet the difficulty you have before you. If you will study these paragraphs in this way you will find that you can solve many kinds of problems yourself and that you can read books that have formulas in their explanations, and even use these formulas yourself.

EQUATIONS. The most important tool that algebra uses in doing these things is the equation. To learn what an equation is and how it works is the biggest part of the study of algebra. We are now ready to take some problems and to find how to solve them by means of equations. Very simple ones will be best so that we shall not have to think much about the problem but about the method. It is a curious thing about beginning algebra that you must not think at all about what the answer is. Think only about how to get the equation. The answer will take care of itself.

PROBLEM 1. Four hundred fifty dollars is to be divided between John and Mary so that Mary will have 4 times as much as John.

Let j stand for the number of dollars John gets. Then 4 times j will stand for the number of dollars Mary gets. The algebra way of writing 4 times j is merely $4j$. We read it "four j." We think of it as four j's or as four times j.

We now know that $j+4j=450$. This is our equation. The word "equation" comes of course from the word equals. All of our equations will contain this sign, =, which we read "equals."

① $j+4j=450$

One j and $4j$'s make $5j$'s, so our second equation becomes

② $5j=450$

We want to know how many dollars j stands for. We know that $5j=450$. How shall we find j? You can see for yourself that we must *divide* by 5.

③ $j=90$

This means that John gets \$90. We also want to know Mary's share. The second line we wrote tells us that $4j$ stands for the number of dollars Mary gets. To get $4j$ from ③ we must multiply by 4.

④ $4j=360$

The answer is \$90 for John and \$360 for Mary. We show that this is the correct answer by adding \$90 and \$360 which gives us the right total, \$450.

The numbers ①, ②, ③, and ④ are going to be very useful in talking and writing about our equations. Form the habit of numbering each equation you write.

① is read "equation one."

This problem and its solution are very simple but if you have understood each step you have already gone a long way toward understanding what algebra is, and you are ready to go ahead.

The next problem can be done in the same way. We will put it down without the explanation. Study it carefully, rereading the explanation of problem one. Remember that you are laying the foundation for all your understanding of algebra.

PROBLEM 2. Father and Mother have 1800 books in all. If Father has 24 times as many as Mother, how many has each?

Let M = the number of books Mother has.

Then $24M$ = the number of books Father has.

①	$M+24M=1800$	
②	$25M=1800$	
③	$M=72$	②÷25
④	$24M=1728$	③×24

Check	*Ans.*
1728	Mother, 72 books
72	Father, 1728 books
1800	

Notice that we do not set down the units in the equations. In problem 1 we did not write dollars in the equations: nor did we write "books" in the equations of Problem 2. We do however set down these words in the *first lines* and in the *answer*.

At the right of ③ and ④ is written the explanation or "history" which tells exactly what was done in getting ③, namely divide ② by 25; and in getting ④, namely multiply ③ by 24. Always write your history *before* you write your equation.

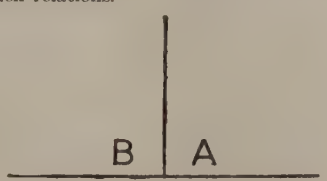
Where you have the answer to a problem your first question should be, "Is my answer right?" Look back to the problem. Both together had 1800 books. To see if we are correct, add the 72 books of Mother's to the 1728 of Father's and get the total 1800. This checks our solution. We *know* we are right.

The next problem is left for you to solve.

PROBLEM 3. There are twice as many lights on the first floor of a house as on the second floor. There are 48 lights on both floors. How many on each?

More of these problems can be found in the Evans & Marsh, First Year Mathematics.

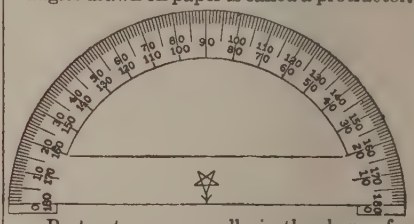
ANGLES. Our next problems are about angles. Before we are ready to solve them we will learn something about angles and their relations.



When two lines meet, as in the figure, so that $\angle A = \angle B$, (The symbol $\angle$ is read "angle"). Each angle is called a *right angle*. For the purpose of measuring smaller angles a right angle is divided into ninety equal parts called degrees. The angle A is 90 degrees. More briefly, $\angle A = 90°$. Also $\angle B = 90°$. If we let A stand for the numbr of degrees in the Angle A, we write

① $A = 90$
② $B = 90$
③ $A+B=180$ ①+②

The instrument used for measuring angles drawn on paper is called a protractor.



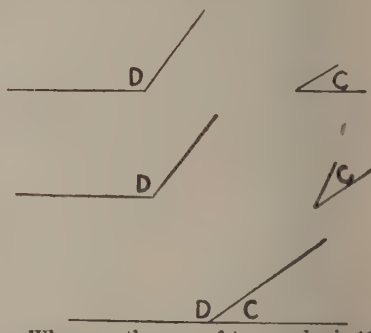
Protractors are usually in the shape of a half circle.

A very convenient form of protractor is the ruler-protractor made of celluloid.

In each protractor you will notice the division into 180 degrees.

In each of these figures

$\perp C = 180°$



Whenever the sum of two angles is 180° the angles are supplementary. 50° and 130° are *supplementary:* so are 10° and 170°, 20° and 160°, 27.5° and 152.5°.

Which of the following pairs of angles are supplementary? How do you know?

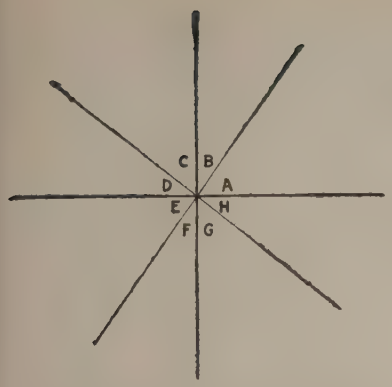
(a)	45° 135°	(d)	18° 148°
(b)	59° 121°	(e)	99° 81°
(c)	75° 105°	(f)	176° 22°

If you can get a protractor and draw these angles and measure them you will understand them much better.

In this diagram we have four right angles made by the heavy lines. Each right angle is divided into two parts by a light line.

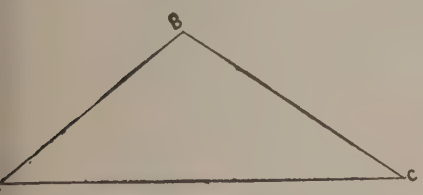
$A+B=90$
$C+D=90$
$E+F=90$
$G+H=90$

Two angles whose sum is 90° are *complementary*.

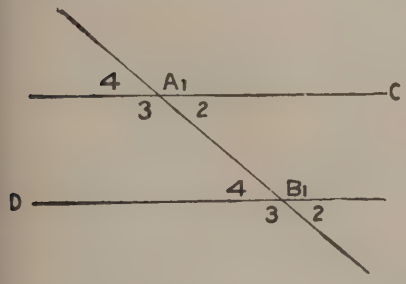


This figure is a triangle. If you measure its three angles and add them the total is 180. The sum of the angles of any triangle is 180 degrees.

$$A+B+C=180$$



This figure is a stripe cut by a transversal. The lines CA and DB are parallel. that is they go in the same direction. AB is a transversal which cuts the two parallels. Eight angles are formed. $A_1+A_2=$ how many degrees? If you cannot answer reread the paragraph about supplementary



angles. You will find that ① $A_1+A_2=180°$ ② $A_3+A_4=180°$. ③ $B_1+B_2=180°$, ④ $B_2+B_3=180°$. Are there other pairs of supplementary angles?

Look at A_1 and A_3. They are equal because their sides are the same lines. Such angles as these, such as $\angle R$ and $\angle S$ in

this small diagram are *vertical* angles. Vertical angles are equal. Returning to the diagram of the stripe, A_1 and B_1 have their sides going in the same direction and are equal. $A_2=B_2$, and $A_3=B_3$ for the same reason.

We can sum this all up in these three statements, calling angles marked 1 and 3 odd, and 2 and 4 even. In a stripe:

① The four odd angles are equal

② The four even angles are equal

③ One odd added to one even angle makes 180 degrees.

These facts about angles will give us many interesting problems to solve.

PROBLEM 4. One of the angles in a stripe is 8 times another. How many degrees in each?

Let $x=$the number of degrees in the smaller angle.

Then $8x=$the number of degrees in the larger angle.

①	$x+8x=180$	
②	$9x=180$	
③	$x=20$	②÷9
④	$8x=160$	③×8

Check
20
160
180

Ans. 20° and 160°

You can now make such problems, for yourself, and solve them.

PROBLEM 5. In the triangle $A\ B\ C$ angle B is twice angle A, and angle C is 3 times A. Find the angles.

Let $x=$no. of degrees in $\angle A$.
Then $2x=$no. of degrees in $\angle B$.
And $3x=$no. of degrees in $\angle C$.

Now we know that the sum of three angles of a triangle is 180 degrees, therefore

①	$x+2x+3x=180$	
②	$6x=180$	
③	$x=30$	②÷6
④	$2x=60$	③×2
⑤	$3x=90$	③×3

Check
30
60
90
180

Ans. $A=30°$, $B=60°$, $C=90°$.

PROBLEM 6. In paying \$68, I used only \$5 and \$2 bills. The number of \$5 bills was 3 times the number of \$2 bills. How many of each?

Let $x=$the no. of \$2 bills
Then $3x=$the no. of \$5 bills

Now we cannot add the number of *bills* and get the number of *dollars*. Think this over carefully. If you count the number of bills in a pile, do you know how many dollars the pile is worth? Does it make a difference whether the bills are ones or twos or fives or tens? Seven \$5 bills make how much money? 10, \$5 bills? x, \$5 bills? The answers to these three questions are found by multiplying five by seven, five by ten and five by x. The answers are \$35, \$50 and $5x$ dollars. How many dollars in 8 \$2 bills? in 20 \$2 bills? in 3 \$2 bills?

Ans. \$16, \$40 and \$6.

Now look back at our problem. How many dollars in x\$2 bills? Answer $2x$ dollars. How many dollars in $3x$\$5 bills? Answer $15x$ dollars. The next two lines of our solution will be

$2x=$the no. of dollars in \$2 bills.
$15x=$the no. of dollars in \$5 bills.

Now we are ready to add *dollars* and find the number of dollars in all.

① $2x+15x=68$

Because the problem says there were 68 dollars in all.

②	$17x=68$	
③	$x=4$	②÷17
④	$3x=12$	③×3

Check
4 \$2 bills = \$ 8
12 \$5 bills = 60
68

Ans.
4 \$2 bills
12 \$5 bills

PROBLEM 7. To pay \$168 I use \$10 and \$2 bills only, 4 times as many 10's as 2's How many of each?

Let $x=$the number of \$2 bills.
Then $4x=$the number of \$10 bills.
$2x=$the number of dollars in 2's.
$40x=$the number of dollars in 10's.
$2x+40x=$the number of dollars in all.
But $168=$the number of dollars in all. therefore.

①	$2x+40x=168$	
②	$42x=168$	
③	$x=4$	②÷42
④	$4x=16$	③×4

Check
4 2's = \$ 8
16 10's = 160
168

Ans.
4, 2's
16, 10's

The next problem does not read at all like problems 6 and 7 but it really is the same kind.

PROBLEM 8. A dealer sold out his stock of used Fords at \$430 each and Buicks at \$920 each. There were 3 times as many Fords as Buicks. He received in all \$15470. How many cars of each kind did he sell?

Let $x=$the number of Buicks sold.
Then $3x=$the number of Fords sold.

$920x=$the number of dollars received for the Buicks.

$1290x=$the number of dollars received for the Fords.

The $1290x$ was found by multiplying $3x$ the number of Fords, by 430, the number of dollars each Ford sold for.

①	$920x+1290x=15470$	
②	$2210x=15470$	
③	$x=7$	②÷2210
④	$3x=21$	③×3

Check
7 Buicks at 920 = 6440
21 Fords at 430 = 9030
15470

Ans.
7 Buicks
21 Fords

PROBLEM 9. A bookseller shipped dictionaries weighing $7\frac{1}{2}$ pounds each and 6 times as many algebra books weighing 2 pounds each.

The total weight of the shipment was 195 pounds. How many books of each kind?

Let $x=$the no. of dictionaries.
Then $6x=$the no. of algebras.
$7\frac{1}{2}x=$the no. of pounds the dictionaries weighed.

$12x=$the no. of pounds the algebras weighed.

Why is it $12x$? Because there are $6x$ algebras at 2 pounds each.

①	$7\frac{1}{2}x+12x=195$	
②	$19\frac{1}{2}x=195$	
③	$x=10$	②÷$19\frac{1}{2}$
④	$6x=60$	③× 6

Check
10 dictionaries at $7\frac{1}{2}$ lb. = 75 lb.
60 algebras at 2 lb. = 120
195 lb.

Ans.
10 dictionaries
60 algebras

One more for you to solve. You can make more problems for yourself about bills or coins; or find them in Evans and Marsh, First Year Mathematics.

PROBLEM 10. To pay \$245 use \$20 and \$5 bills only. Three times as many 5's as 20's. How many of each?

SECOND KIND OF EQUATION

PROBLEM 11. One angle of a stripe is 8 degrees more than the other. Find the number of degrees in each angle.

Let x = the no. of degrees in the smaller angle.

Then $x+8$ = the no. of degrees in the larger angle.

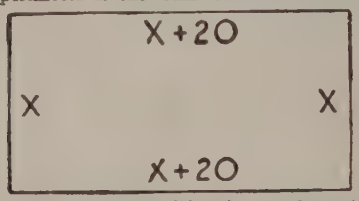
To find a number 8 larger than x, we must add 8 to x. This gives us $x+8$.

① $x+x+8=180$
② $2x+8=180$

This equation cannot be solved by the steps we have been taking. What is the difficulty? Clearly the "8" is in the way. How can we remove it without making our equation untrue? If we have eight too much, the remedy must be to *subtract* eight.

③	$2x=172$	②−8
④	$x=86$	③÷2
⑤	$x+8=94$	④+8
Check		*Ans.*
86°		86°, 94°
94°		
180°		

PROBLEM 12. The perimeter of a rectangle is 136 feet. One side is 20 feet shorter than the other. Find the length of each side. The diagram shows a rectangle. Each of its angles is a right angle. You notice that the two short sides are equal, and the two long sides are equal. The perimeter is the sum of the four sides.



Let x = the no. of feet in one short side.

Then $x+20$ = the no. of feet in a long side.

Adding the four sides to get the perimeter we get $x+x+20+x+x+20$. Uniting these we get $4x+40$. Therefore

①	$4x+40=136$	
②	$4x=96$	①−40
③	$x=24$	②÷4
④	$x+20=44$	④+20
Check		*Ans.*
24		24 feet
44		44 feet
24		
44		
136		

PROBLEM 13. Solve problem 12 in case the perimeter was 150 feet, and one side was 35 feet shorter than the other. Answer 20 ft. and 55 ft.

Make many more of these problems and solve them.

PROBLEM 14. I sold canned corn at 11 cents a can and 5 times as many cans of tomatoes at 14 cents each, and one can of peas at 12 cents. If the total receipts were $4.98, how many cans of corn and tomatoes did I sell?

Let x = the no. of cans of corn.

Then $5x$ = the no. of cans of tomatoes.

$11x$ = the no. of cents for the corn.

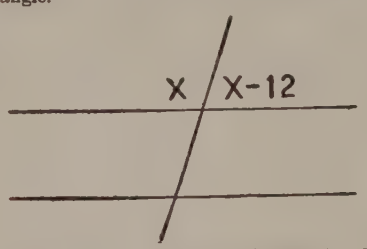
$70x$ = the no. of cents for the tomatoes—because there were $5x$ cans at 14 cents a can.

①	$11x+70x+12=498$	
②	$81x+12=498$	
③	$81x=486$	②−12
④	$x=6$	③÷81
⑤	$5x=30$	④×5

Check		*Ans.*
6 cans corn at .11 =	$ .66	6 cans corn.
30 cans tom. at .14 =	4.20	30 cans tomatoes.
1 can peas at .12 =	.12	
	$4.98	

THE THIRD KIND OF EQUATION SHORTAGES

PROBLEM 15. If one angle of a stripe is 12 degrees less than another angle of the same figure, fin the number of degrees in each angle.



Let x = the number of degrees in the larger angle.

Then $x-12$ = the no. of degrees in the smaller angle—because 12 taken away from x gives $x-12$. This is read x less 12 or x minus 12.

① $x+x-12=180$

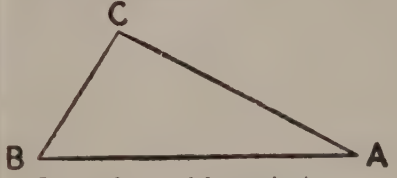
Because the sum of 2 angles of a stripe is 180°.

② $2x-12=180$

None of the steps we have taken so far will solve this equation. What is the difficulty? We are short 12. The left hand side is 12 less than $2x$. If it was just $2x$ we could go ahead. How can we make it just $2x$? By *adding* 12.

③	$2x=192$	②+12
④	$x=96$	③÷2
⑤	$x-12=84$	④−12
Check		*Ans.*
96°		96°, 84°
84		
180		

PROBLEM 16. The $\angle B$ of a triangle is double the $\angle A$, and $\angle C$ is 30 degrees less than the sum of A and B. How many degrees in each angle?



Let x = the no. of degrees in A.

Then $2x$ = the no. of degrees in B.

And $3x-30$ = the no. of degrees in C.

Because the sum of $\angle A$ and $\angle B$ is $3x°$. Thirty degrees less is $3x-30$.

But the sum of the three angles of a triangle is 180°.

①	$x+2x+3x-30=180$	
②	$6x-30=180$	
③	$6x=210$	②+30
④	$x=35$	③÷6
⑤	$2x=70$	④×2
⑥	$3x-30=75$	④+(5)−30
Check	*Ans.*	
35	$A=35°$, $B=70°$, $C=75°$	
70		
75		
180		

Problems like 11 and 12 will give equations of this kind if you let x stand for the *larger* number. Try them.

The Convenience of the Parenthesis in an Equation

PROBLEM 17. I paid $1.45 with nickels and dimes using 7 less nickels than dimes. How many of each?

Let x = the number of dimes.

Then $x-7$ = the number of nickels.

$10x$ = the number of cents in dimes.

$5(x-7)$ = the number of cents in nickels.

The ( ) is a parenthesis. A parenthesis is used to tie two or more terms together to show that they are all to be treated alike. Think of it as a string tieing together the terms inside. The parenthesis containing the $x-7$ merely tells us that the x and the minus 7 are to be treated alike. The 5 in front of the parenthesis means that both the x and the minus 7 are to be *multiplied* by 5. To read an expression with a parenthesis in it merely read "5 times the parenthesis $x-7$" or "five times the quantity $x-7$."

① $10x+5(x-7)=145$. Because this is the number of cents in all.

We will now carry out the instructions in the expression $5(x-7)$, namely multiply the $x-7$ by 5.

② $10x+5x-35=145$

Why is it *Minus* 35. Because we are short 7 five times, that is we are short 35 in all.

③	$15x-35=145$	
④	$15x=180$	③+35
⑤	$x=12$	④÷15
⑥	$x-7=5$	⑤−7
Check		*Ans.*
12 dimes	= $1.20	12 dimes
5 nickels	= .25	5 nickels
	$1.45	

PROBLEM 18. John is twice as old as Will. Eighteen years ago John was five times as old as Will. How old are they?

Let x = the no. of years in Will's age now.

Then $2x$ = the no. of years in John's age now.

The next quantities we must list are their ages 18 years ago. If a man is 38 now how old was he 18 years ago? To answer you must *subtract* 18, therefore

$x-18$ = the no. of years in Will's age 18 years ago.

$2x-18$ = the no. of years in John's age 18 years ago.

But John was then 5 times as old as Will. This gives us the equation

① $5(x-18)=2x-18$

Now multiply both x and minus 18 by 5.

② $5x-90=2x-18$

We now have a shortage on each side of the equation. We must get rid of both of them. How? By adding the larger shortage, that is 90. Try it.

③ $5x=2x+72$ ②+90

Where did we get the 72? We were short 18 and added 90. If the thermometer stood at −18 and rose 90 where would it stand? If you owed a man $18 and you worked for him until you had earned 90, how much should he pay you to balance the accounts? Equation three might be written first in the form ③ $5x+90-90=2x+90-18$ then reduced to $5x=2x+72$.

There is another difficulty in ③. There is a term with x in it in *each* side. We want x on one side and a number on the other. The $2x$ is in the way. How can we get rid of it?

We must *subtract* $2x$.

④	$3x=72$	③−2x
⑤	$x=24$	④÷3
⑥	$2x=48$	⑤×2

Check			*Ans.*
NOW	18 Y's	AGO	
Will	24	6	Will is 24
John	48	30	John is 48
24×2 = 48	6×5 = 30		

Do you understand the check? Is John twice as old as Will now? Eighteen years ago was he 5 times as old?

PROBLEM 19. A father is twice as old as his son. Twenty-two years ago he was 3 times as old. How old are they now?

Let x = the no. of years in son's age now.
Then $2x$ = the no. of years in father's age now.
$x-22$ = the no. of years in son's age 22 years ago.
$2x-22$ = the no. of years in father's age 22 years ago.

① $3(x-22)=2x-22$
② $3x-66=2x-22$
③ $3x=2x+44$ ②+66
④ $x=44$ ③−2x
⑤ $2x=88$ ④×2

Check		*Ans.*
NOW	22 Y's AGO	Father 88 years
Father 88	66	Son 44 years
Son 44	22	
$22\times3=66$		

PROBLEM 20. Apples cost 15 cents a dozen less than oranges. If 2 dozen apples and 3 dozen oranges cost $1.65, what is the cost of a dozen of each?

Let x = the no. cents for 1 doz. oranges.
Then $x-15$ = the no. cents for 1 doz. apples.
$3x$ = the no. cents for 3 doz. oranges.
$2(x-15)$ = the no. cents for 2 doz. apples.

① $3x+2(x-15)=165$
② $3x+2x-30=165$
③ $5x-30=165$
④ $5x=195$ ③+30
⑤ $x=39$ ④÷5
⑥ $x-15=24$ ⑤−15

Check	*Ans.*
2 doz. at .24 = $ .48	Oranges $.39 a doz.
3 doz. at .39 = 1.17	Apples .24 a doz.
1.65	

We will now take some *equations* to practice on. They have been made from problems but just what the problems are we do not know.

Exercise 1

① $13(8-x)+2(x-6)=2x+1$

The first thing to do is to do the multiplying indicated by the parentheses. (Notice how the plural of this word is spelled.)

② $104-13x+2x-12=2x+1$

The next step is to unite the similar terms. $104-12$ gives 92. Short $13x+2x$ leaves us short $11x$.

③ $92-11x=2x+1$

The next step is to remove the shortage by adding $11x$.

④ $92=13x+1$ ③+$11x$

Which term is in the way now? Clearly the "one" because we want x on one side and a number on the other. Therefore take away the number which stands on the same side as the x term.

⑤ $91=13x$ ④−1

To find x we must divide by 13.

⑥ $7=x$ ⑤÷13

Ans. 7

Since there is no problem to check in, in order to discover whether our answer is correct, we must check in ①.

The only kind of a sentence that has an answer is a question. Equation one has an answer therefore it is a question, even though it is written without any question mark. What is the question? It is this. How big is x if $13(8-x)+2(x-6)$ equals $2x+1$.

Our solution indicates that 7 is the answer to this question. Let us see if 7 does make these two quantities equal.

① $13(8-x)+2(x-6)=2x+1$
Supposing x to be 7 we get:
$13(8-7)+2(7-6)=14+1$
$13(1)+2(1)=15$
$13+2=15$
$15=15$

Therefore 7 is the number which makes these two quantities equal. Try all the other numbers you want to. There is no other number which will do.

Exercise 2

① $15(7x-3)=8(13x+7)-20$
② $105x-45=104x+56-20$
③ $105x-45=104x+36$
④ $105x=104x+81$ ③+45
⑤ $x=81$ ④−$104x$

Check	*Ans.*
$15(567-3)=8(1053+7)-20$	81
$15(564)=8(1060)-20$	
$8460=8480-20$	
$8460=8460$	

The parts of an equation which are separated by plus or minus signs are called *terms*. Any term with an x in it is called an x-term.

The steps to take in solving such simple equations as these are:

(1) Perform any indicated multiplications.

(2) Unite similar terms on each side.

(3) If there are any terms with minus signs before them, add enough to make up these shortages.

(4) Subtract from each side the smaller x-term.

(5) Subtract from each side the number that stands beside an x-term.

(6) Divide by the coefficient of the x-term.

You can see for yourself what the long word coefficient means. In exercise 1, the last history was ⑤÷13. In ⑤ the 13 is the coefficient of the x.

Rule (3) is interesting because the arabic word for this step is the source of the word Algebra from which our subject takes its name.

These rules were first formulated for modern students in the Evans & Marsh, First Year Mathematics, Merrill, which you will find very helpful in the further study of Algebra.

Try these exercises, thinking *first* which step you are going to take to meet the difficulty before you.

3. $3(x-7)=2x-11$
4. $2(x+5)=10x-6$
5. $2x+5=3x$
6. $5x-7=3(x+1)-4$
7. $7(x-2)=4(x-4)$
8. $6x=7(10-x)$
9. $8(x+10)=12(x+7)-8$
10. $5(x+4)=14x+2$

Try these problems, looking back, if necessary, to previous models.

PROBLEM 21. One angle of a stripe is seven less than twice the other. Find the number of degrees in each.

PROBLEM 22. Sugar costs 34 cents a pound less than tea. Ten pounds of sugar and 6 of tea cost $3.32. Price of each?

PROBLEM 23. Twenty-one coins, quarters and halves amount to $8.50. How many of each?

Let x = the no. of quarters.
What will stand for the number of halves? There are 21 coins in all x of them are quarters. How many does that leave for the halves?

If you cannot answer, imagine that x is 15. If there are 21 coins in all and 15 of them are quarters, how many are halves. Clearly $21-15$. If x of them are quarters there will be $21-x$ halves.
$21-x$ = the no. of halves.
$25x$ = the no. of cents in quarters.
$50(21-x)$ = the no. of cents in halves.

① $25x+50(21-x)=850$
② $25x+1050-50x=850$
③ $1050-25x=850$
④ $1050=850+25x$ ③+$25x$
⑤ $200=25x$ ④−850
⑥ $8=x$ ⑤÷25
⑦ $13=21-x$ $21-$⑥

Check	*Ans.*
8 quarters = $2.00	8 quarters
13 halves = 6.50	13 halves
$8.50	

PROBLEM 24. Sixteen coins, quarters and dimes amount to $2.95. How many of each?

PROBLEM 25. Forty pounds of tea, part costing 32 cents a pound and part 44 cents a pound come to $15.32. How many pounds of each?

HOW TO FORM AN EQUATION

One of the difficulties in solving the problems of algebra is the construction of the equation. Study of the problems we have solved shows that the steps to take are three. First make a list of the numbers talked about in the problem but not actually given in figures. Second select one of them to be represented by x and then represent the others according to their relations to this first one. Third, when this has been done make a statement that two things are equal, either by using some statement of the problem not used in making the list, or by using two abbreviations for the same number in the list.

Study of the models and of your problems with these three rules in mind will make the formation of equations easier.

Another great help is this: when the answer to a problem is found go over each statement of the problem very carefully to see if the answer meets every condition of the problem. This not only checks the accuracy of the answer but it makes clear the steps you took in forming your equation. Check the answer to every problem.

FRACTIONAL EQUATIONS

The next problems will give us equations with fractions. Suppose we have the equation

① $\frac{x}{2}=9$

how shall we solve it? If x over 2 or $\frac{1}{2}x$ equals 9, how much is the whole of x? We must multiply by 2.

② $x=18$ ①×2

This then is the key to all fractional equations.

Exercise 1

① $\frac{x}{5}=8$

② $x=40$ ①×5

PROBLEM 26. One half of a certain number and one fifth of it make 28. What is the number?

Let x = the number.

$\frac{x}{2}$ = one half the number.

$\frac{x}{5}$ = one fifth the number.

The statement in our problem which we have not used in our list is that one half the number and one fifth the number equal 28. Saying this fact and using the expression in our list we get,

$$① \quad \frac{x}{2}+\frac{x}{5}=28$$

This is read x over 2 plus x over 5 equals 28.

We can take care of the $\frac{x}{2}$ by multiplying by 2.

$$② \quad x+\frac{2x}{5}=56 \qquad ①\times 2$$

We can take care of the $\frac{2x}{5}$ by multiplying by 5.

③	$5x+2x=280$	②×5
④	$7x=280$	③ same values
⑤	$x=40$	④÷7
Check		*Ans.*
One half of 40 = 20		40
One fifth of 40 = 8		
	28	

PROBLEM 26A. Two thirds of a number added to four sevenths of it make 520. What is the number?

Let x = the number.

$\frac{2x}{3}$ = two-thirds of the number.

This may be written $\frac{2}{3}x$ or $\frac{2x}{3}$. The first is read "two thirds x;" the second "two x over three."

$\frac{4x}{7}$ = 4/7 of the number.

$$① \quad \frac{2x}{3}+\frac{4x}{7}=520$$

Instead of multiplying first by 3 and then by 7, what one number can we multiply by? Twenty-one of course.

$$② \quad 14x+12x=10920 \qquad ①\times 21$$

To be sure of each term as you multiply, set it down.

$$\frac{2x}{3}\times 21=14x, \quad \frac{4x}{7}\times 21=12x$$

③	$26x=10920$	③÷26
④	$x=420$	
Check		*Ans.*
2/3 of 420 = 280		420
4/7 of 420 = 240		
	520	

PROBLEM 27. One line is 3 times another, and half the shorter line is 20 in. less than the longer line. Find the length of each line.

Let x = the no. of inches in length of shorter line.

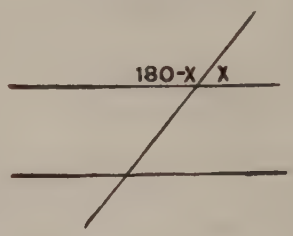
Then $3x$ = the no. of inches in length of longer line.

$\frac{x}{2}$ = the no. of inches in half of shorter line.

The fact not used in making our list is that "half the shorter is 20 in. less than the longer." To say this fact using the word "equals" we may write, half the shorter equals the longer less 20 inches. Say the same thing using the expressions in our list.

①	$\frac{x}{2}=3x-20$	
②	$x=6x-40$	①×2
③	$x+40=6x$	②+40
④	$40=5x$	③−x
⑤	$8=x$	④÷5
⑥	$24=3x$	⑤×3
Check		*Ans.*
1/2 of 8 = 4		8 inches
4 is 20 less than 24		24 inches

PROBLEM 28. In the figure formed by a stripe and a transversal one half the smaller angle equals two-fifths of the larger angle. How many degrees in each angle?



Let x = the number of degrees in the smaller ∠.

How shall we represent the number of degrees in the larger ∠? The larger added to the smaller equals 180°. If the smaller is x the larger will be $180-x$.

$180-x$ = the no. of degrees in the larger ∠.

We are told that

1/2 the smaller = 2/5 the larger, that is:

$$① \quad \frac{x}{2}=\frac{2}{5}(180-x)$$

②	$5x=4(180-x)$	①×10
③	$5x=720-4x$	② same values
④	$9x=720$	③+4x
⑤	$x=80$	④−9
⑥	$180-x=100$	180−⑤
Check		*Ans.*
1/2 of 80° = 40°		80°
2/5 of 100° = 40°		100°

PROBLEM 29. Solve problem 28 changing it to read, one-third the smaller angle equals one-fifteenth the larger.

PROBLEM 30. One angle exceeds half of another by 10° and exceeds the complement of their sum by 30°. Find the angles.

This kind of problem often gives much trouble to beginners but if you will reread, "How to Form an Equation" on page 841 and if you will use care in making your list you will not find it hard.

Let x = the number of degrees in the second ∠.

The first ∠ exceeds half the second by 10°. That is:

$x/2+10$ = the no. of degrees in first ∠.

$x+x/2+10$ = the no. of degrees in the sum of the two ∠s.

The next quantity to set down in our list is, the complement of their sum. How do we find the complement of an angle? What is the complement of 10°, answer 90−10 or 80°; of x, answer $90-x$; of $x+x/2+10$, answer $90-(x+x/2+10)$, therefore $90-x-x/2+10$ = the no. of degrees in the complement of their sum. This completes our list and there is still one statement in the problem which we have not used. The (first) angle exceeds the complement of their sum by 30 degrees. Stating this with the word "equals" we have: The first angle equals the complement of their sum, plus 30°, which when translated from our list reads:

① $x/2+10=90-(x+x/2+10)+30$

② $x/2+10=90-x-x/2-10+30$ ① same values

Notice that the minus sign before the parenthesis told us to subtract all the terms in the parenthesis. Have we *subtracted* all three of them in ②?

③ $x+20=180-2x-x-20+60$

④ $x+20=220-3x$ ②×2

③ same values

Where do we get the $-3x$? You notice that we are *short* $2x$ and *short* x. This makes us *short* $3x$ in all.

⑤	$4x+20=220$	④−3x
⑥	$4x=200$	⑤−20
⑦	$x=50$	⑥÷4
⑧	$x/2+10=35$	⑥/2+10
Check		*Ans.*
1st ∠ = 35°		35°, 50°
Sum = 85°		
Comp. of Sum = 5°		
35° exceeds 5° by 30°		

PROBLEM 31. One angle exceeds half another by 15° and exceeds the complement of their sum by 20°. Find the angles.

Study problem 30 and do this one yourself.

Ans. 35°, 40°.

PROBLEM 32. John, James and Henry shared a sum of money so that John had $30 more than half, James $33 more than a third, and Henry had the rest which was $10. How much did John and James have?

Let x = no. of $ in all.

Then $x/2+30$ = no. of $ John has.

And $x/3+33$ = no. of $ James has.

Adding the shares of John, James, and Henry, we get

①	$x/2+30+x/3+33+10=x$
②	$3x+180+2x+198+60=6x$
③	$5x+438=6x$
④	$438=x$
⑤	$249=x/2+30$
⑥	$179=x/3+33$

Check

$249 John

179 James

10 Henry

438 Total

Ans.

John, $249

James, $179

Considerable practice is required to develop speed and accuracy with fractional equations.

1. $x/3+x/5+4=x-3$
2. $x/2+x/3+1/2=x-1$
3. $x/2-x/5=x/2-3$
4. $x/7-\frac{3x}{7x}=17$
5. $\frac{7x-6}{5}+\frac{-3x-5}{3}=\frac{+x-1}{2}$

$$① \quad \frac{7x-6}{5}+\frac{x}{3}+\frac{3x-5}{2}=+x-1 \qquad ①\times 30$$

②	$42x-36+10x=45x-75+30x-30$	
③	$52x-36=75x-105$	③ same values
④	$52x+69=75x$	③÷10
⑤	$69=23x$	④−52
⑥	$3=x$	⑤÷23

Check *Ans.* 3
[Put 3 in place of x in ①]
$\frac{21-6}{5}+\frac{3}{3}=\frac{9-5}{2}+3-1$
$3+1=2+3-1$
$4=4$

6. $\frac{3x-7}{4}-\frac{3x}{11}=\frac{x-5}{2}$

7. $\frac{x+1}{2}+2+\frac{x+3}{4}=x$

8. $\frac{x-1}{7}+\frac{3x-1}{5}+\frac{1}{7}=\frac{x-7}{3}+\frac{4x-3}{5}$

9. $\frac{x-1}{2}-\frac{2}{5}-\frac{x+3}{5}=0$

① $\frac{x-1}{2}-\frac{2}{5}-\frac{x+3}{5}=0$

② $5x-5-4-(2x+6)=0$ ①×10

The parenthesis is left in ② because the two terms of the numerator of the last fraction must be both *multiplied* and *subtracted*. The minus sign before the fraction says to subtract, and our history, ①×10, says to multiply. Trying to do both of these at once often leads to errors.

③ $5x-9-2x-6=0$ ② same values

Notice that the last term is minus 6 because we are instructed to *subtract* both the $2x$ and the 6.

④ $3x-15=0$ ③ same values
⑤ $3x=15$ ④+15
⑥ $x=5$ ⑤÷3

Check *Ans.* 5
$\frac{5-1}{2}-\frac{2}{5}-\frac{5+3}{5}=0$
$2-\frac{10}{5}=0$
$2-2=0$

10. $\frac{5x-x+7}{10}=8-\frac{1}{2}+\frac{x+1}{5}$

11. $\frac{x+5}{6}-\frac{x+1}{8}=\frac{x+3}{4}$

12. $\frac{x}{4}-\frac{x-5}{3}=\frac{x-8}{4}$

This example looks much like those above but is in fact much more troublesome.

① $\frac{x}{4}-\frac{x-5}{3}=\frac{x-8}{4}$

② $3x-(4x-20)=3x-24$ (1)×12

The quantity to be subtracted is $4x-20$; we are not told to subtract as much as $4x$, we are told to subtract 20 *less* than $4x$. Suppose it read $30-(25-20)$. This says to take from 30 a number which is 20 less than 25. This of course means from 30 take 5. The answer is 25. If we wrote $30-25$ we would be taking away too much, 20 too much because we were told to take away not 25 but 25 less 20. To correct our mistake we must *put back* the 20, and write $30-25+20$ which gives us 25, the correct answer.

③ $3x-4x+20=3x-24$ ② same values

Do you understand the +20? Study the explanation through again. We took the whole of $4x$ when we were told to take away $4x-20$. Consequently we must *put back* the 20. We took away 20 too much, then we put back the 20.

④ $-x+20=3x-24$ ③ same values
⑤ $44=4x$ ④+x+24
⑥ $11=x$ ⑤÷4
Check *Ans.* 11
$\frac{11}{4}-\frac{11-5}{3}=\frac{11-8}{4}$
$11/4-6/3=3/4$
$11/4-2=3/4$
$11/4-8/4=3/4$
$3/4=3/4$

13. $\frac{x+5}{7}=\frac{x-4}{2}-\frac{x-5}{8}$

14. $\frac{7x-11}{45}-1=\frac{x+7}{15}-\frac{3x+1}{25}$

15. $5x+20-2(x+2)=40-4(x-15)$
① $5x+20-2(x+2)=40-4(x-15)$
② $5x+20-(2x+4)=40-(4x-60)$ ① same values

We keep the parentheses in order to avoid the mistakes which come from trying to multiply and subtract at the same time.

③ $5x+20-2x-4=40-4x+60$ ② same values

Why do we write −4, and +60? The $2x$ and 4 are *both* to be subtracted. In the last parenthesis however we are told to take away 60 less than $4x$. When we wrote $-4x$ we took away 60 too much. Then we *put back* the 60.

④ $3x+16=100-4x$ ③ same values
⑤ $7x+16=100$ ④+$4x$
⑥ $7x=84$ ⑤−16
⑦ $x=12$ ⑥÷7

Check *Ans.*
$60+20-2(14)=40-4(-3)$ 12
$80-28=40-(-12)$

Notice the last parenthesis. This is the strangest of all the subtraction cases. We are told to take away minus 12 from 40. Taking away minus 12 is the same as taking away a *debt* of 12, that is the same as adding twelve.

⑧ $80-28=40+12$
⑨ $52=52$

A rule is sometimes stated in algebra as follows: To remove any term from a minus parenthesis change its sign. This is a dangerous rule for two reasons. First because the "change of sign" seems to have something to do with the parenthesis while it really has to do instead with the subtraction which the *minus* sign before the parenthesis tells us to perform. Second because signs do not "change" in algebra and such statements lead us to think of algebra as a kind of juggling instead of something which we can reason out for ourselves. Never use such a rule unless you can tell definitely *why* you put down the plus or the minus sign.

16. $5(x-6)-110=-17-2(x-5)$
17. $2+x+3/5-2x-13/11=x/3$
18. $\frac{8x-3}{7}-\frac{4x-7}{5}=5x-13$

Problems of Rate, Time, and Distance

PROBLEM 33. A man can ride 11 miles per hour and walk 3 miles per hour How long will it take him to go 168 miles if he walks half the time and rides half the time.

Before trying to solve this problem we must understand the simple relation connecting rate, time, and distance. One of the tasks of algebra is to use the formulas which show the relations of such quantities.

If a man walks $3mi/h$ (this is read, three miles per hour) for 5 hours what distance does he walk? Clearly 5 times 3 or 15 miles. In general, the number of hours times the number of miles per hour gives the total number of miles. The *time* multiplied by the *rate* equals the distance. Stated in the symbols of algebra, $TR=D$.

You will notice that TR means T times R just as $5x$ means 5 times x. This equation may be transformed as follows:

① $TR=D$
② $T=D/R$ ①÷R
③ $R=D/T$ ①÷T

All three equations state the same relation but from different points of view. In studying such formulas it is important to be able to see all three of these facts by looking out any ONE of them. If time times rate equals distance, then time equals distance divided by rate, and rate equals distance divided by time.

One mistake to avoid. Do not try to *learn* these formulas. Learn to make up the formula from a simple illustration just as is done on this page.

Now reread these paragraphs thoughtfully, then reread the problem and we will solve it.

	T	R	D
WALKING	$\frac{X}{2}$	$3^{MI}/_{H}$	$\frac{3X}{2}$
RIDING	$\frac{X}{2}$	$11^{MI}/_{H}$	$\frac{11X}{2}$
TOTAL			168 MI.

Make a table and fill in the squares one at a time, beginning with the ones we know most about. In this case the R column can be filled in first, since we know both rates; and the total D is 168 miles.

Next we must decide on what x is to stand for.

Let x=the no. of hours it takes him to go 168 miles. Then $x/2=1/2$ the time, that is, the no. of hours he walks. We can now fill in the T column. The rest is easy because whenever we know two numbers in one *row* we can find the third by one of the three formulas.

This time we use $TR=D$.

The last step is to form an equation.

The D he walks plus the D he rides is the total D.

① $3x/2+11x/2=168$
② $3x+11x=336$ ① ×2
③ $14x=336$ ② same values
④ $x=24$ ③ ÷14

Check
12 h. at $3mi/h$ = 36 mi.
12 h. at $11mi/h$ = 132
168

Ans.
24 hours
12 hours riding and 12 hours walking.

PROBLEM 34. A boy can ride on his wheel 10 miles per hour and walk 4 miles per hour. How long will it take him to go 126 miles if he rides half the time and walks half the time? *Ans.* 18 hours.

PROBLEM 35. Soldiers can hike an average of 2 3/4 miles per hour, trucks transport them 13 miles per hour. How long will it take a regiment to cover 115 miles if they walk 1/3 of the time and ride in trucks 2/3 of the time?

	T	R	D
HIKING	$\frac{X}{3}$	$2\frac{3}{4}$	$\frac{11X}{12}$
RIDING	$\frac{2X}{3}$	13	$\frac{26X}{3}$
TOTAL			115 MI.

The order of filling in the spaces is the same as in problem 33.

Notice the $D-$ hiking space. $x/3$ must be multiplied by $2\ 3/4$, $x/3\times 11/4=11x/12$.

① $11x/12+26x/3=115$
② $11x+104x=1380$ ① ×12
③ $115x=1380$ ② same values
④ $x=12$ ③ ÷115

Check
4 h. at $2\ 3/4$ *mi/h* = 11 mi.
8 h. at 13 *mi/h* = 104
115

Ans.
12 hours
4 hours hiking
8 hours riding

PROBLEM 36. A boy has $3\frac{1}{2}$ hours for exercise: how far can he ride with his father, at the rate of 21 miles per hour, before getting out to walk back, if he walks $3\frac{1}{2}$ miles per hour?

	T	R	D
WALKING	$\frac{2X}{7}$	$3\frac{1}{2}$ MI/H	X
RIDING	$\frac{X}{21}$	21 MI/H	X
TOTAL	3½H		

The known numbers go in first: they are the R's and the total T.

Let x = the no. of miles he can ride. The number of miles he must walk back will be the same.

To fill in the T column we use the formula that $T=D/R$. (Can you get this from the formula at the top of the table?)

T—walking will be $\frac{x}{3\frac{1}{2}}$. T—riding will be $x/21$.

The fraction $\frac{x}{3\frac{1}{2}}$ is rather clumsy. Write it $\frac{x}{\frac{7}{2}}$. It is still clumsy. We would like to get rid of the 2 in the denominator. How? Multiply the numerator and denominator by 2. $7\times\frac{x}{\frac{7}{2}}=\frac{2x}{7}$.

(Notice that the sign ≡ may be used when it is convenient, to show that two expressions are actually the same, though written in different form. This equation is not an equation to be solved. The right side is merely the left side simplified. Such equations are called *identities*.)

This completes the table. It remains to find an equation.

The time walking plus the time riding = the total time.

① $2x/7+x/21=3\frac{1}{2}$
② $12x+2x=147$ ① ×42
③ $14x=147$ ② same values
④ $x=10\frac{1}{2}$ ③ ÷14

Check
$10\frac{1}{2}$ mi. at 21 *mi/h* take ½ hour
$10\frac{1}{2}$ mi. at $3\frac{1}{2}$ *mi/h* take 3 hours
$3\frac{1}{2}$ hours

Ans.
$10\frac{1}{2}$ miles

PROBLEM 37. A certain river flows one mile per hour. A fisherman finds that he can row upstream a few miles in 3 hours, but it takes him only one hour and 48 minutes to come back. How fast can he row in still water?

	T	R	D
DOWN STREAM	1⅗H	X+1	9/5(X+1)
UP STREAM	3 H	X-1	3(X-1)

The known numbers are the $T-$upstream and the $T-$downstream. The one hour and 48 min. may better be written 1 4/5 h.

Let x = the no. *mi/h* he rows in still water.

What then is the $R-$downstream? He rows through the water x miles per hour, and the current carries him along 1 mile per hour. His rowing and the current together carry him $x+1$ miles per hour.

Going upstream however the current carries him *back* one mile every hour. His rate will be $x-1$ miles per hour.

How can we fill in the D column? $D=TR$. $D-$upstream is $9/5(x+1)$. $D-$downstream is $3(x-1)$.

What fact will give us an equation?
Distance downstream = distance back.

① $9/5(x+1)=3(x-1)$
② $9(x+1)=15(x-1)$ ① ×5
③ $9x+9=15x-15$ ② same values
④ $24=6x$ ③ $+15-9x$
⑤ $4=x$ ④ ÷6

Check *Ans.*
R—upstream is $(4-1)mi/h$ 4 *mi/h*
R—downstream is $(4+1)mi/h$
3*h* at 3 *mi/h* = 9*mi*
9/5 at 5 *mi/h* = 9*mi*

PROBLEM 38. A stream flows 4 miles per hour. A boat goes downstream for an hour and takes 3 hours to get back. How fast does the boat go in still water?

PROBLEM 39. A man rows 5 miles per hour in still water. It takes him 5 hours to row upstream a certain distance and only 4 hours to return. How fast does the current flow?

	T	R	D
DOWN	4H	5+X	4(5+X)
UP	5H	5-X	5(5-X)

What are the known numbers?
$T-$downstream and upstream. Let x = the no. *mi/h* the stream flows.

How fast can the man go downstream? Five miles an hour by rowing, plus x miles an hour which the stream carries him. His rate upstream is five *mi/h* which he rows, minus x*mi/h* which the stream carries him back. Some pupils who try to do algebra problems without thinking do not know whether to write $x-5$ or $5-x$. Ask your self which is larger. If the stream flowed faster than the man rowed could he go upstream?

We now find D by the formula, as usual. $TR=D$

Next the equation: the $D-$up = the $D-$back.

① $4(5+x)=5(5-x)$
② $20+4x=25-5x$ ① same values
③ $9x=5$ ② $+5x-20$
④ $x=5/9$ ③ ÷9

Check *Ans.*
$R-$down = 5-5/9*mi/h* stream flows
$R-$up = 5-5/9 = 4 4/9*mi/h* 5/9*mi/h*
4*h* at 5 5/9*mi/h* = 22 2/9*mi*.
5*h* at 4 4/9*mi/h* = 22 2/9*mi*

PROBLEM 40. A boat goes 11 miles per hour in still water. It takes the boat $3\frac{1}{2}$ hours to reach a landing upstream, and only 2 hours to return. How fast does the current flow?

Problems of Ability and Time

PROBLEM 41. It takes B 12 days to do a certain piece of work which A can do in 4 days. In how many days will they do it if they work together?

Should we add the 12 days and 4 days together and answer 16 days for them both? If one man could do the work alone in 4 days would it take them both 16 days? Clearly this is not the way to proceed.

A can do what part of the work in one day? One-fourth.

B can do one-twelfth.

Let x = the no. of days for them both together.

If it takes them x days they would do each day $1/x$ of it.

For our equation: The *Part A* does in one day + the *Part B* does in one day = the part both do in one day.

① $1/4+1/12=1/x$
② $3x+x=12$ ① ×12*x*
③ $4x=12$ ② same values
④ $x=3$ ③ ÷4

Check *Ans.*
A does 1/4 each day 3 days for both
B does 1/12 each day together
Both do $1/4+1/12=4/12=1/3$

Therefore it takes them both 3 days.

PROBLEM 42. B can do a piece of work in 18 days which A can do in 15 days. How long will it take them if they work together?

PROBLEM 42. A boy can run around a block in 6 minutes. His father can walk it in 9 minutes. If they start from the same place, in opposite directions, how long before they will meet?

Let x = no. of minutes they go.

$1/6$ = *Part* of the distance boy can run in 1 minute.

$x/6$ = *Part* of the distance boy can run in x minutes.

$x/9$ = *Part* of the distance father can walk in x minutes.

If we add the *part* the boy runs and the *part* the father walks, what shall we get for the total? We shall get the whole distance. How shall we put this down in our equation? If the boy ran, say, 2/3 of the distance and the father walked 1/3, both would cover 3/3 or 1.

The *part* the boy runs + part father walks = total distance or 1.

① $x/6+x/9=1$
② $3x+2x=18$ ① ×18
③ $5x=18$ ② same values
④ $x=18/5$ ③ +5

Check *Ans.*
$18/5\times 1/6=\frac{3}{5}$ of distance. They will meet
$18/5\times 1/9=\frac{2}{5}$ of distance in 3 3/5 minutes
1, or total distance.

PROBLEM 43. A man can walk to his office in 40 minutes, or he can ride it in10 minutes. How long will it take him if he walks half the time and rides half the time?

Let $2x$ = no. of minutes to reach office.
then x = no. of minutes he walks.
x = no. of minutes he rides.
$1/40$ = *Part* of distance he walks in one min.
$x/40$ = *Part* of distance he walks in x min.
$x/10$ = *Part* of distance he rides in x min.
The part he walks + the part he rides = the total distance or 1.

① $x/40 + x/10 = 1$
② $x + 4x = 40$ ① ×40
③ $5x = 40$ ② same values
④ $x = 8$ ③ ÷5

Check
$8 \times 1/40 = 1/5$ of distance
$8 \times 1/10 = 4/5$ of distance
1 = total distance.

Ans.
16 minutes to reach the office. 8 min. walking, 8 min. riding.

GRAPHS.

PROBLEM 44. Six horses and 11 cows cost \$810. Thirteen horses and 5 cows, at the same prices as before, cost \$1190. Find the cost of each animal.

Let x = the no. of \$ for 1 horse.

It is not easy to find an expression in x for the number of dollars for 1 cow We can however, choose some other letter to stand for this number of dollars.

Let y = the no. of \$ for 1 cow.
$6x$ = the no. of \$ for 6 horses.
$11y$ = the no. of \$ for 11 cows.
From the first statement in our problem:

① $6x + 11y = 810$

From the second statement:

② $13x + 5y = 1190$

Here we are faced by new difficulties. We have two equations to start with instead of one, and each equation has two letters in it. None of the methods previously studied enable us to find the values of x and y.

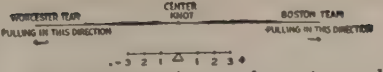
Mathematicians have found a method of solving these problems by drawing lines on ruled sheets of paper. The method has proved so interesting and helpful to the mathematicians, and has been found to have so many practical applications, that it is now one of the most fascinating chapters in algebra. We will take up the method step by step, and then apply it to the solution of problem 44.

SCALES

Study the scale of a thermometer. It is numbered up to perhaps 140° at the top and down to perhaps 40° below zero at the bottom. Temperatures are usually recorded by observers as + if above zero and as − if below zero. Our scale then goes from −40° to +140°. How many degrees is this in all? It is 140° above the zero mark and 40° below the zero mark, or 180° in all.

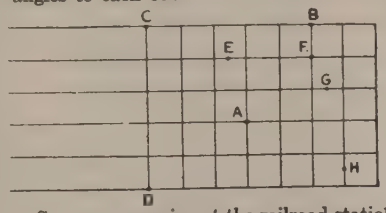
If you compare a very large thermometer with an ordinary small thermometer you will see that the space occupied by one degree on the large thermometer may be perhaps as much as one-fourth of an inch, while on the small one it is only perhaps one sixty-fourth of an inch. Evidently we can adapt the length of our degrees to fit any particular requirements. Would you use the same scale to record the temperature of molten iron and the temperature of a fever patient? The first step in the graphical method is to draw, on our paper, a scale suited to the numbers of our problem.

A scale could be drawn to show the changes in fortune in a tug of war.



When the knot is over the center mark neither team is ahead. When the knot is at 2, which team is ahead? Boston is, by 2 feet. When the knot is at −3 Boston is the loser by 3 feet. And so on.

Many of the cities of the United States are laid out in blocks, with streets at right angles to each other.



Suppose we arrive at the railroad station at A and ask directions to an office at B: we will be told to go 2 blocks east and 3 blocks north. What are the directions for going from A to C? Three blocks west and 3 blocks north. From A to D? Three blocks west and 2 blocks south. From A to E? Two blocks north and ½ block west. From A to F? A to G? G to H? Evidently every building in the city can be located by two numbers measured in two different directions.

The location of a ship at sea by its latitude and longitude depends upon the same idea.

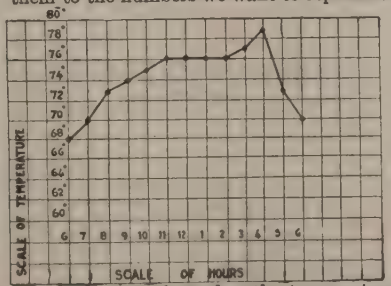
It is just this principle which mathematicians have hit upon for representing facts and solving problems by charts or graphs. As soon as we have illustrated some facts on these charts we shall be ready to use them for solving our problem.

Temperatures for a summer day are observed

to be 68° at	6 A.M.	76° at	1 P.M.
70° at	7 A.M.	76° at	2 P.M.
73° at	8 A.M.	77° at	3 P.M.
74° at	9 A.M.	79° at	4 P.M.
75° at	10 A.M.	73° at	5 P.M.
76° at	11 A.M.	70° at	6 P.M.
76° at	12 M.		

Here are numbers which are changing: the hour of the day, and the temperature. We will represent the hours of the day on a horizontal scale by marking the first line of the scale 6 A.M., the second line 7 A.M. and so on for 13 lines to the right which brings us to 6 P.M.

The temperature will be represented on a vertical — that is, up and down, scale. The range to be covered is from 68° to 79°. Suppose we call the lowest line 60°, the next line above 62° and so on up to 80°. We have now completed our two scales, at right angles to each other, and adapted them to the numbers we want to represent.



How can we show that the temperature was 68° at 6 A.M.? By a dot on the 6 A.M. line just high enough up to be on the 68° line. Can you find this dot? It is the first one at the left.

Next represent a temperature of 70° at 7 A.M. by a dot on the 7 A.M. line, and just high enough up to be on the 70° line. It is the second dot going toward the right. Continue to locate the dots as shown in the figure.

If we connect these dots with a curved line we shall have a graph which will show the approximate temperature at any hour of the day.

At about what time was the temperature highest? How does our graph show this? By the highest point at 4 P.M. At what hours was the temperature changing very little if at all?

At 11, 12, 1, and 2 the temperature stood at 76°.

What was the coolest hour of the day? Six A.M. This is shown by the lowest point on the graph.

As soon as we understand a graph we can see at a glance, facts that would take us some time to discover from a study of the table from which the graph was made. It is for this reason that graphs are used increasingly in magazines and by business and professional men.

If you secure from a stationer some properly ruled paper, you can draw these graphs yourself.

The next table shows the time two Boston and Albany trains leave the stations indicated. Notice that one train goes from Boston to Albany, the other from Albany to Boston.

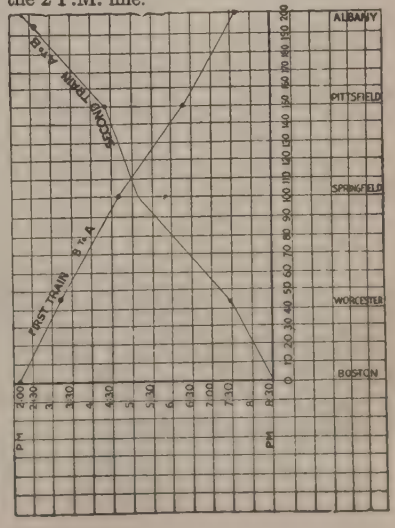
Miles		P.M.	P.M.
0	Boston	2:00	8:35
45	Worcester	3:15	7:25
100	Springfield	4:35	5:55
150	Pittsfield	6:20	4:18
200	Albany	7:35	2:42

The two numbers which are changing are the hour, and the number of miles from Boston. Represent the number of miles on the horizontal scale. To fit 200 miles to our scale we shall use how many miles for each space? Ten will do very nicely.

On the vertical scale we must represent the time. The range is from 2 P.M. to 8:35 P.M. or 6 hours and 35 minutes.

Let each space represent ½ hour.

To show that the first train leaves Boston at 2 P.M., we place a dot on the Boston line and high enough up to be on the 2 P.M. line.



This is the first dot to the right. Put in all the dots and connect them.

Construct the graph for the second train in the same way.

How far from Boston do the trains meet, and at what time? The two lines cross at a point which is on, or very near the 110 mile line. This means that the trains pass about 110 miles from Boston. This same point is on, or very close to the 5 o'clock line, therefore the trains will pass at about 5 P.M.

At 6 P.M. the railroad president steps into the office and asks where each train is at that time. A clerk glances at the graphs, letting his eye follow across the 6 P.M. line. He finds the first train 140 miles from Boston: the second train 80 miles from Boston.

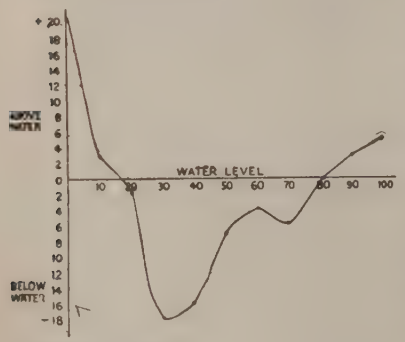
Several other facts can be seen immediately from the graphs after you are familiar with them. All trains from Boston to Albany will be represented by lines sloping *down* to the right: trains from Albany to Boston by lines sloping *up* to the right. The more slowly the train moves the steeper the line becomes. You will notice that the graph for the first train has the steepest slope between Springfield and Pittsfield. This is because it goes slowly between these cities because of the up grade. What similar fact can you discover concerning the second train? The fact that the slope of the graph shows the rate, leads to some very important studies farther along in mathematics.

One more illustration of the use of a graph to show facts at a glance.

Measurements are made of the height of the banks of a river and of the depth of the river, at intervals of ten feet, on a line that passes straight across the river from bank to bank.

The results are as follows, starting at the top of the left bank and making the measurements from the water level. For convenience heights *above* the water level are marked plus: depths below are marked minus.

Distance
From left to right
0 10 20 30 40 50 60 70 80 90 100



Height or Depth
+20 +3 −2 −18 −16 −7 −4 −6 0 +3 +5

The range on our horizontal scale will be 0′ to 100′. Let each space equal 5′.

The range on the vertical scale will be +20 to −18. Let each space equal 2′.

Locate the dots and connect them. This shows at a glance the approximate depth of the river at any point.

Where is the channel, or deepest part of the river? About 30 feet from the top of left bank. Where is a shallow place? About 20 feet from the right edge of the river. Which bank is the steeper?

THE SOLUTION OF PROBLEMS BY GRAPHS

If you will now reread problem 44 you will find that it gave us two equations:

① $6x+11y=810$
② $13x+5y=1190$

Each equation contains two quantities which may change in value, namely x and y. In ① if $x=124$, y will equal 6. Try it for yourself. Substitute 124 for x. $6x$ will then be 744.

③ $744+11y=810$
④ $11y=66$ ③-744
⑤ $y=6$ ④$\div 11$

In the same way if $y=0$ in ①

⑥ $6x+0=810$
⑦ $x=135$ ⑤$\div 6$

Substitute any number you choose in place of y and you can find a value for x For every value of x there is a corresponding value for y.

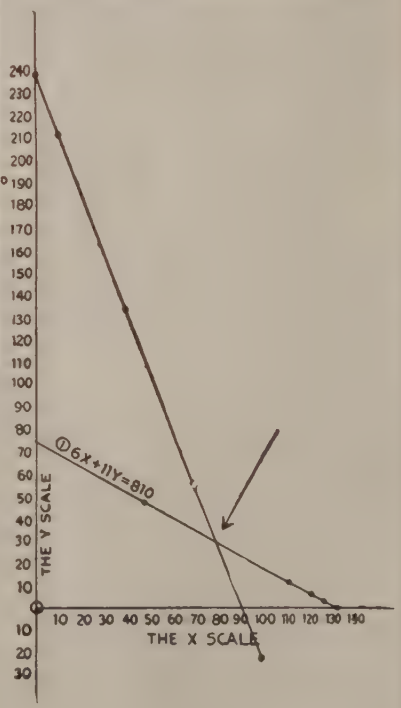
Equation one cannot be said to have an answer, but it has an unlimited number of *pairs* of *answers*. If $x=124$ and $y=6$, $6x+11y$ will equal 810. Try it. $744+66=810$.

Again if $x=135$ and $y=0$, $6x+11y$ will equal 810.

Try it $810+0=810$.

You have probably already discovered that we have just the conditions needed for a graph, namely two numbers that change together.

Make a table of values for equation one.



①	
x	y
0	73 7/11
135	0
129 1/2	3
124	6
113	12
47	48

The first pair was found by letting $x=0$. The second pair by letting $y=0$. The third by letting $y=3$. And so on. Make a similar table for

②	
x	y
0	238
91 7/13	0
10	212
40	134
70	56
100	−22

The complete range for x, in both equations, is from 0 to 135. Let each space represent 10. It is customary to represent x on the horizontal scale. The complete range for y is −22 to 238. Represent the values of y on the *vertical* scale, letting each space represent ten.

We are now ready to represent each pair of values by a dot on our chart. Take the first equation first. The first pair is 0 for x and 73 7/11 for y. Where is the 0 line for x? It is the vertical line marked 0, on which we have placed the y scale. How far upward on this line shall we go? Up to 73 7/11, that is about 1/3 of the distance from 70 to 80. Can you find this first dot?

Now the second dot, $x=135$, $y=0$. Where is the $x=135$ line? It is a vertical line midway between the numbers 130 and 140. How far upward on this line shall we go? Only to $y=0$. In other words we do not go upward at all. The dot is on the x scale line. The third dot, $x=129$ 1/2, $y=3$. This is almost over to the 130 line, and how far up? Up 3, that is about 1/3 of the distance from 0 to 10. Locate all the dots for equation ①.

Connect these dots with a line. A rather curious thing occurs. This line through all these dots is a *straight line*. It is called the graph or the locus of the equation. All such equations have straight line graphs and for this reason are called *linear* equations. (If you are not sure how to pronounce this word look it up in a dictionary).

Draw the graph of ② in the same way, locating the dots and connecting them with a line. This proves to be a straight line as we knew it would.

You have already noticed that every point on our chart can be located by two numbers, an x number and a y number, just as every building in our western city could be located by two distances, one north and one east, or one south and one west, etc., and just as every point on the surface of the earth can be located by a latitude number and a longitude number.

There is one peculiar point on our chart. The point where the two graphs cross. Can you find the two numbers which locate it? They are $x=80$ and $y=30$. Let us see just what must be true of these numbers. How many pairs of numbers will "satisfy" ①, that is make its two sides equal? All the pairs in our table and hundreds more pairs which we could have found in the same way. How many pairs of numbers will satisfy ②? Again the answer is an unlimited number. But of all these two sets of number pairs there is only *ONE* pair that will satisfy both equations, namely 80 and 30.

Try these two numbers in both equations.

① $6(80)+11(30)=810$
$480+330=810$
$810=810$
② $13(80)+5(30)=1190$
$1040+150=1190$
$1190=1190$

These two numbers are the answers to our two equations, and consequently the answers to our problem.

Look back to problem 44 and see if they will check.

6 horses at $80 cost	$480
11 cows at $30 cost	330
Total	$810
13 horses at $80 cost	$1040
5 cows at $30 cost	150
Total	$1190

Ans.
$80 for each horse
30 for each cow

The explanation of this problem has surely been long enough, but you will not wonder at it when you learn that college students often spend a year's time studying these graphs, and that our great statistical organizations have scores of clerks at work all the time making such graphs for the use of factories and business house.

PROBLEM 45. A farmer pays 6 men and 8 boys $32 for a day's work. The next day, paying the same wages, he pays 10 men and 2 boys $42 for the day's work. How much does he pay a man? A boy?

Let x = no. of $ for a man per day
Let y = no. of $ for a boy per day

① $6x+8y=32$
② $10x+2y=42$

A table of pairs of values for ①;
First let $x=0$, then how much is $6x$?
$6x=0$ and ① becomes $8y=32$. Divide by 8, $y=4$.
Next let $y=0$, $6x$ will equal 32, and x will equal 5 1/3
If we subtract $8y$ from ① it will read $6x=32-8y$
Dividing by 6 we get $x=\frac{32-8y}{6}$ or

$$x=\frac{16-4y}{3}$$

①

x	y
0	4
5 1/3	0
2 2/3	2
1 1/3	3

①

X	Y
0	4
5⅓	0
2⅔	2
1⅓	3

Now substitute any number for y and it will be very easy to find the corresponding value of x.

If $y=2$, $x=\frac{16-8}{3}=2\ 2/3$
If $y=3$, $x=1\ 1/3$
A table of pairs of values for ②

③ $10x+2y=42$
④ $2y=42-10x$ ③$-10x$
$y=21-5x$ ④$\div 2$

If $x=0$, $y=21$
If $y=0$, $x=4\ 1/5$
If $x=1$, $y=16$
If $x=5$, $y=4$
We are now ready to plot the graph.

②

x	y
0	21
4½	0
1	16
5	−4

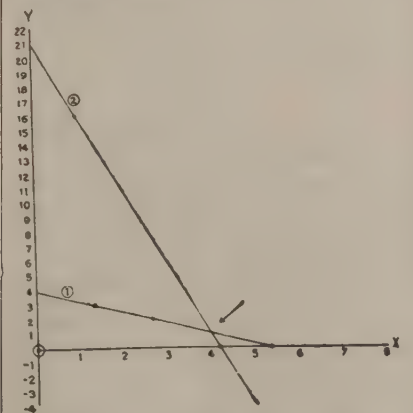
②

X	Y
0	21
4½	0
1	16
5	-4

The range for x is 0 to 5 1/3. Let one space on the x scale represent 1/3.

The range for y is −4 to 21.

Let each space on the y scale represent one. Locate the dots as before $x=0$, $y=4$. If x is 0 we do not go to the right at all. If y is 4 we go *up* 4. $x=5\ 1/3$, $y=0$. If x is 5 1/3 we go to the right 5 1/3. If y is 0 we do not go up at all. If x is 2 2/3 we go 2 2/3 to the right. If y is 2 we go up 2. This gives us a straight line graph for ①.



Plot ② in the same way. Notice the last pair. If x is 5 we go to the right 5. If y is −4 we of course go 4 *downward*.

Again the graphs intersect. What two numbers locate the intersection? $x=4$, $y=1$.

Try these two numbers in our problem.

Check *Ans.*

①	6 men at $4 = $24	Men $4 per day
	8 boys at $1 = 8	Boys $1 per day
	$32	
②	10 men at $4 = 40	
	2 boys at $1 = 2	
	$42	

This is a somewhat cumbersome way to solve problems perhaps but there are two things to be said in its favor. With a little practice and with proper devices it gives solutions very rapidly. In fact modifications of this device are used more and more for the purpose of saving time.

Then too graphs are coming into such common use that we all need to know how to read them and, if need be, to make them.

PROBLEM 46. Six men and 3 boys earn $39 per day. Eleven men and 1 boy earn $38. How much does a man earn in a day? A boy?

Solve by the graphical method

① $5x-8y=-1$
② $15x+y=47$
③ $5x=8y-1$ ①$+8y$
④ $x=\frac{8y-1}{5}$ ③$\div 5$
⑤ $y=47-15x$ ②$-15x$
$x=\frac{8y-1}{5}$ $y=47-15x$

①

−1/5	0
2 2/5	1
3	2
11	7
19	12

②

x	y
0	47
3 2/5	0
5	−28

The range for x is −1/5 to +31
The range for y is −28 to +47

①

X	Y
-⅕	0
2⅖	1
3	2
11	7
19	12

②

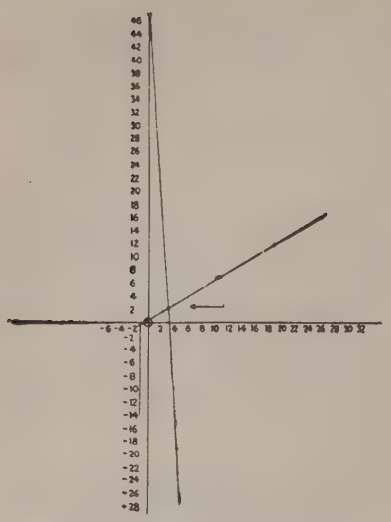
X	Y
0	47
3⅖	0
5	-28

Answer $x=3$, $y=2$

Checks

① $5(3)-8(2)=-1$
$15-16=-1$
$-1=-1$

② $15(3)+2=47$
$45+2=47$
$47=47$



Solve by the graphical method.

1. $x+2y=5$ $3x+7y=17$ *Ans.* 1, 2
2. $3x+7y=22$ $2x+y=11$ *Ans.* 5, 1

It is interesting to try to solve by the graphical method $x+y=8$ and $x+y=12$. Try it.

You will find that the graphs are parallel. They do not meet at all. Why not? Because it is impossible to find two numbers which will add to make 8 and at the same time add to make 12.

ADDITION AND SUBTRACTION

Before studying the *algebraic* method of solving these pairs of linear equations, it may be helpful to review what we have learned about combining terms.

Addition in algebra is more often arranged horizontally than vertically. Ordinarily we have such combinations as we have already made in solving equations.

Unite similar terms:

$3x+6-2x+5+x-3-12$

This is done mentally as follows:

$3x$ less $2x$ is x, plus x is $2x$
6 plus 5 is 11, less 3 is 8, less 12 is minus 4
Ans. $2x-4$

Unite

$6-7x+4-x-2+5x-3$
6 plus 4 is 10, less 2 is 8 less 3 is 5
Short $7x$ less x is short $8x$, plus $5x$ is short $3x$
Ans. $5-3x$

$12x+3-15x-3+8x-2$
$12x$ less $15x$ is short $3x$, plus $8x$ is $5x$
3 less 3 is 0, less 2 is short 2
Ans. $5x-2$

1. $10x-8+3x-2x+7-x$
2. $5x-4x-3x+6+8x-1$
3. $A+B-2A-3B+8A$

It will be found profitable to make several more exercises like these and practice them orally until they go quickly and easily. There are two illustrations which are very helpful. One is money or profit and loss, the other is the thermometer scale.

We wish to unite $8x$ and $-10x$. The illustration is: We *have* \$8, we *spend* \$10. This leaves us \$2 *in debt*. $8x-10x\equiv-2x$. Again $-12x+3x$. The thermometer stands at 12 *below*, it goes *up* 3. Where does it stand? At 9 *below*. $-12x+3x\equiv-9x$.

Use these illustrations while you are learning.

Add $3x-2y+8$
$4x-y-2$

We say mentally $3x$ and $4x$ is $7x$
Short $2y$ and short one more y is $-3y$
8 less 2 is 6

Our answer then is

$7x-3y+6$

Add $x-3y-5$
$2x+8y+5$

$3x+5y$

Add $-2x+8y-7$
$-2x-y+3$

$-4x+7y-4$

Add $A-B+C-8$
$-A-B-3C$

$-2B-2C-8$

Make more of these exercises for practice.

Perform the *subtraction* indicated

$3x-7y-(2x+8y)$

Noticing that the directions tell us to subtract *both* terms in the parenthesis, we write $3x-7y-2x-8y$. Uniting we have $x-15y$.

Again $17-4x-(2x+5)$

We can do this mentally: Say 17 *minus* 5 is 12. Why do we say *minus* 5? Because the 5 is in the parenthesis and we are told to *subtract* all the terms in the parenthesis.

Short $4x$ and *short* $2x$ gives a shortage of $6x$.

The answer is, $12-6x$.

$2A-6B-C-(A+B+C)$
$2A$ minus A is A
Short $6B$ minus B is short $7B$
Short C minus C is short $2C$
Ans. $A-7B-2C$

$2a+3b-(2a+2b+6c)$
$2a$ minus $2a$ is zero
$3b$ minus $2b$ is b

The $6C$ must also be subtracted but there is no C to subtract it from. If you have no money in your pocket and you order a pair of shoes at \$6, you *owe* \$6. From no C subtract $6C$ and we have minus C.

Ans. $b-6C$.

$7-(2a-3)$

Write this out because it is the hardest case in subtraction. $7-2a$——but what about the 3? The directions say from 7 take $(2a-3)$, that is take 3 less than $2a$. When we write $7-2a$ we have taken away too much. We were told to take away 3 less than $2a$, and we have taken away the whole of $2a$. Since we have taken away too much we must *put back* something. We took away 3 too much so we will *put back* 3.

Our answer is $7-2a+3$. Uniting the 7 and 3 we have $10-2a$.

A good illustration of what we have just done is this:

$15-(8-2)$

This says from 15 take $(8-2)$, that is take away 2 less than 8, or take away 6.

$15-6=9$

Writing it as we did in the preceding exercise: $15-8$——we have now taken away 2 too much. We must put back the 2.

$15-8+2=9$, the correct answer.

Another way to look at this case.

$7-(2a-3)$ We are told to take away a shortage of three, a debt of 3. Now taking away your debt is the same as *giving* you money. If your father pays \$3 that you owe at the store he helps you as much as if he gave you \$3 and let you pay the debt.

In other words taking away minus 3 is the same as adding 3. Hence we write $7-2a+3$.

$3x-2y+8-(x+3y-2)$

$3x$ less x is $2x$
Short $2y$ less $3y$ is short $5y$
8 *plus* 2 is 10. We say *plus* 2 because taking away a shortage is the same as *adding*.

Ans. $2x-5c+10$.

$7a-6b+2c-5-(7a-8b+3)$
$7a-6b+2c-5-7a+8b-3$
Ans. $2b+2c-8$

Compare the last three terms in the second line with the last three terms in the first line.

The $7a$ was plus $7a$: it is now minus $7a$.
The $8b$ was minus, now it is plus.
The 3 was plus and is now minus.

Subtracting then had the effect of making each plus sign into a minus and each minus into a plus.

A rule is often stated in algebra: to subtract change all the signs in the number to be subtracted and then add. By "change the signs" is meant to read each *plus* as a *minus*, and to read each minus as a plus.

This rule will do well enough if you remember that it applies only in subtraction and that merely means that to *take away* $2a$ we write $-2a$, while to take away $-3b$ we must add $3b$.

One of the most dangerous habits in algebra is to say glibly, "Change the signs" without thinking why. In reality there is no such process in algebra as changing the signs.

Subtract $3x-4y+5$
$2x+5y+3$

Say mentally $3x$ *minus* $2x$ is x
$-4y-5y-9y$
5 -3 is 2
Ans. $x-9y+2$

Subtract $2a+7b-8c-6$
$3a-5b+c-2$

$-a+12b-9c-4$

Mentally

$2a$ minus $3a$ is $-a$, $7b+5b$ is $12b$
$-8c-c$ is $-9c$, $-6+2$ is -4

The pupil who goes past this point in algebra without *understanding* how to subtract and without practicing enough to subtract well is almost sure to fail.

Before taking more exercises we want to learn how to check so that we may be sure that we are subtracting correctly.

Subtract 8
3

5

How can we be sure that 5 is the correct answer? By *adding* the 3 and 5 which gives us the 8 we started with.

Subtract $3x+7y-2$
$2x-3$

$x+7y+1$ *ans.*
$3x+7y-2$ *check*

Subtract $2a+3b-4c$
$3a-3b+3c+5$

$-a+6b-7c-5$ *ans.*
$2a+3b-7c$ *check.*

In doing the rest of these exercises do not depend too much on the rule. Better use your common sense in subtracting.

1. $2a-2b+3c-d-(5a-3b+4c-7d)$
2. $3x-7y+5xy-(2x-7y+3xy)$
3. $a-(2a-2b+3c-5)$

Subtract

4. $2-7x-5y$
   $3-6x+2y$
5. $2a+3b-c$
   $3a-b+5$

You can make more practice exercises for yourself.

SIMULTANEOUS EQUATIONS

The pairs of two-letter linear equations we solved in problems 44 and 45 are called by the long name, simultaneous, which means, "at the same time." This is because we solve them by finding one pair on numbers which will check both equations at the same time. Another and better name is, "linear pair."

We are now ready to solve them by algebraic means without using graphs.

1. $\begin{cases} ① \ x+2y=11 \\ ② \ x+\ y=\ 8 \end{cases}$

Why can we not solve this pair as we did our simple equations at the beginning of algebra? Because we have *two* letters. If we could get rid of one letter we could go ahead as before.

The question then is how to get rid of one letter. There is one step which will get rid of the x's in the two equations above.

Shall we add, subtract, multiply, or divide them?

Try it. The one which succeeds is subtraction.

③ $y=3$ ① − ②

This gives us one answer. Finding the other is an entirely different task. If we know that $x+y$ is 8 and that y is 3, how can we find x?

④ $x+3=8$	③ substituted in ②

We substitute the 3 in place of y in ②

⑤ $x=5$	④ −3

Check

① $5+2(3)=11$
$5+6=11$
$11=11$

③ $5+3=8$
$8=8$

Ans. $\begin{cases} x=5 \\ y=3 \end{cases}$

2. $\begin{cases} ① \ 5x+y=21 \\ ② \ 3x+y=13 \end{cases}$

③ $2x=8$	① − ②
④ $x=4$	③ ÷ 2
⑤ $20+y=21$	④ sub. in ①
⑥ $y=1$	⑤ −20

Check

① $5(4)+1=21$
$20+1=21$
$21=21$

② $3(4)+1=13$
$12+1=13$
$13=13$

Ans. $\begin{cases} x=4 \\ y=1 \end{cases}$

3. $\begin{cases} ① \ 6x+y=22 \\ ② \ 5x+y=19 \end{cases}$

Ans. $x=3$, $y=4$

4. $\begin{cases} ① \ x+\ 8y=16 \\ ② \ x+13y=16 \end{cases}$

5.

① $2x+7y=52$	
② $2x-3y=\ 8$	
③ $10y=60$	① − ②
④ $y=\ 6$	③ ÷ 10
⑤ $2x+42=52$	④ in ①
⑥ $2x=10$	⑤ −42
$x=\ 5$	⑥ ÷ 2

Check

① $10+42=52$
$52=52$

② $10-18=-8$
$-8=-8$

Ans. $x=5$, $y=6$

6.

① $8y+x=23$	
② $6y-x=\ 5$	
③ $14y=28$	① + ②
④ $y=\ 2$	③ ÷ 14
⑤ $16+x=23$	④ in ①
$x=\ 7$	⑤ −16

Here we have a little something new. Subtracting one of these equations from the other will not get rid of the x. What process will do so? Addition.

Check

① $16+7=23$
$23=23$

② $12-7=\ 5$
$5=\ 5$

Ans. $x=7$, $y=2$

7.

① $6x+9y=66$	
② $-6x-2y=-38$	
③ $7y=28$	① + ②
④ $y=\ 4$	③ ÷ 7
⑤ $6x+36=66$	④ in ①
⑥ $6x=30$	⑤ −36
⑦ $x=\ 5$	⑥ ÷ 6

Check

$30+36=66$
$-30-8=-38$

Ans. $x=5$, $y=4$

8. $\begin{cases} 10x-2y=96 \\ 8x+2y=84 \end{cases}$

9. $\begin{cases} ① \ 5x+8y=34 \\ ② \ 9x+2y=24 \end{cases}$

In this pair of equations neither addition nor subtraction will eliminate, that is get rid of, either the x or the y. Why did the x's drop out in exercise 5 when we subtracted, while they will not do so in exercise 9? Because the two x's had the same coefficient. If we can alter our equations so that either the x's or the y's will have the same coefficient, we can subtract and go ahead. If we multiply ② by 4, what coefficient will y have?

③ $36x+8y=96$	② ×4
④ $-31x\ \ =-62$	① − ③
⑤ $62=31x$	④ +31x+62
⑥ $2=x$	⑤ ÷31
⑦ $10+8y=34$	⑥ in ①
⑧ $8y=24$	⑦ −10
⑨ $y=\ 3$	⑧ ÷ 8

Check

① $10\div 24=24$
$34=34$

② $18+\ 6=24$
$24=24$

Ans. $x=2$, $y=3$

10.

① $6x+\ 4y=\ 90$	
② $3x+15y=123$	

First we shall make the coefficients of the x's alike.

③ $6x+30y=246$	② ×2
④ $-26y=-156$	① − ③
⑤ $156=\ 26y$	④ +26y+156
⑥ $6=\ y$	⑤ ÷26
⑦ $6x+24\ =\ 90$	⑥ in ①
⑧ $6x=\ 66$	⑦ −24
⑨ $x=\ 11$	⑧ ÷ 6

Check

① $66+24=\ 90$
$90=\ 90$

② $33+90=123$
$123=123$

Ans. $x=11$, $y=\ 6$

11.

① $2x+7y=49$	
② $6x-5y=17$	
	① ×3

12.

① $4x+3y=22$	
② $3x+5y=11$	

In this pair we cannot make the coefficients of either x or y alike by multiplying either equation. How shall we accomplish it? By multiplying *both* equations.

③ $12x+\ 9y=66$	① ×3
④ $12x+20y=44$	② ×4
⑤ $-11y\ =22$	③ − ④
⑥ $-22\ =11y$	⑤ +11y−22
⑦ $-\ 2\ =\ y$	⑥ ÷11
⑧ $4x+3(-2)=22$	⑦ in ①
⑨ $4x-\ 6\ =22$	⑧ same values
⑩ $4x=28$	⑨ +6
⑪ $x=\ 7$	⑩ ÷4

Check

① $28-\ 6=22$
$22=22$

② $21-10=11$
$11=11$

Ans. $x=\ 7$, $y=-2$

We can just as well solve exercise 12 by eliminating the y's instead of the x's. Try it.

③ $20x+15y=110$	① ×5
④ $\ 9x+15y=\ 33$	② ×3
⑤ $11x\ \ =\ 77$	③ − ④
⑥ $x=\ 7$	⑤ ÷11
⑦ $28+\ 3y=\ 22$	⑥ in ①
⑧ $3y=-6$	⑦ −28
⑨ $y=-2$	⑧ ÷3

The check consists in comparing this pair of answers with the pair obtained by the first method.

Ans. $x=\ 7$, $y=-2$

13.

① $2x/3+3y/4=\ 700$	
② $y+100=\ 5x/6$	
③ $8x+9y=\ 8400$	① ×12
④ $6y+600=\ 5x$	② × 6
⑤ $-5x+6y=-\ 600$	④ −5x−600
⑥ $16x+18y=\ 16800$	③ ×2
⑦ $-15x+18y=-1800$	⑤ ×3
⑧ $31x\ =\ 18600$	⑥ − 7
⑨ $x=\ 600$	⑧ ÷31
⑩ $4800+9y=\ 8400$	⑨ in ③
⑪ $9y=\ 3600$	⑩ −4800
⑫ $y=\ 400$	⑪ ÷9

Check

① $\frac{1200}{3}+\frac{1200}{4}=700$
$400+300\ =700$
$700\ =700$

② $\frac{400}{400}+\frac{1200}{100}=3000$
$500=500$

Ans. $x=600$, $y=400$

14.

① $\frac{x+3}{y+3}=\frac{5}{6}$

② $\frac{x-3}{y-3}=\frac{2}{3}$

③ $6(x+3)=5(y+3)$	① ×6(y+3)
④ $6x+18=5y+15$	③ same values
⑤ $6x-5y=-3$	④ −5y −18
⑥ $3(x-3)=\ 2(y-3)$	② ×3(y−3)

⑭ $x=\ 7$	⑬ ÷3

Check

① $10/12=5/6$
$5/6=5/6$

② $4/6=2/3$
$2/3=2/3$

Ans. $x=7$, $y=9$

Turn back to problems 44, 45, 46 and see if you can solve their equations by the method of elimination and get the same results we got by the graphical method.

It was suggested that we try to solve by the graphical method the pair.

① $x+y=\ 8$
② $x+y=12$

If you tried it you found that the two graphs were parallel. They had no intersection. The equations were inconsistent, that is they could not both be true at the same time.

Try the new method on them.

① $x+y=\ 8$
② $x+y=12$
③ $0=-4$ ① − ②

Equation ③ is an absurdity.

When we subtract both x and y drop out. Again we have no answer.

Sometimes we have more than two unknown letters in a set of equations.

①	$3x+4y+5z=39$	
②	$x+2y+3z=19$	
③	$4x+5y+7z=51$	
④	$3x+6y+9z=57$	②×3
⑤	$-2y-4z=-18$	①−④
⑥	$4x+8y+12z=76$	②×4
⑦	$-3y-5z=25$	③−⑥

What have we accomplished so far? We have reduced our set from three equations with three unknowns to two equations with two unknowns. Now proceed as usual.

⑧	$-y-2z=-9$	⑤÷2
⑨	$-3y-6z=-27$	⑧×3
⑩	$z=2$	⑦−⑨
⑪	$-y-4=-9$	⑩ in ⑧
⑫	$5=y$	$11+y+9$
⑬	$3x+20+10=39$	⑩ and ⑫ in ①
⑭	$3x=9$	$13-30$
⑮	$x=3$	$14\div3$

Check

① $9+20+10=39$
$39=39$

② $3+10+6=19$
$19=19$

③ $12+25+14=51$
$51=51$

Ans.
$x=3$
$y=5$
$z=2$

APPROXIMATE COMPUTATION AND MEASUREMENT

The first thing to decide in making any measurement is the unit in which to express the result. A distance may be measured in miles or feet or inches or meters or in any one of many other units. We ordinarily let our convenience decide what unit we shall use.

When the last measurement mark comes exactly at the end of the distance we are measuring, the length number is a whole number; when it does not come exactly at the end of the distance, the measurement is continued in subdivisions of the unit. We divide a foot up into 12 inches and divide the inch in halves, fourths, eights and so on. This system of subdivision is cumbersome and has been replaced where accurate work is done by a division of the foot into tenths. Why? You will see for yourself if you undertake to find the area of a rectangular field using first the ordinary subdivision and then the decimal subdivision.

Find the area of a rectangular field whose length is 32 feet 8 1/4 inches and width is 11 ft. 6 1/8 inches. The same problem stated decimally gives the length 32.7 ft. and width 11.5 ft. Which can you compute the more quickly? Wherever we can we shall use decimal subdivisions, to save time.

No human measurement is absolutely correct. This surprising statement may require considerable thought to convince you of its truth, but let us see. A carpenter in fitting boards measures them and saws them to perhaps the nearest eighth of an inch; for fine cabinet work he measures and saws to the nearest thirty-second of an inch. Only experienced and careful carpenters can do such fine work. A machinest making tools may work to the nearest thousandth of an inch; but no trained workman, no matter how expert, ever claims that his work is precisely correct. He tells instead how close it is. After making the finest measurements that have ever been made, using the most elaborate instruments and painstaking care, the expert discusses the *amount of his error.*

If you will measure the width of a block of wood yourself you will be convinced that a skilled workman with a better ruler could measure more accurately than you have. His measurement could be improved in turn by the use of a magnifying glass, and so on. No human measurement is absolutely correct.

The precision of measurement is shown by the *number of figures* required to express the result and not, as is often assumed, by the number of places *after* the decimal point. Suppose a length of a line is measured to the nearest hundredth of a foot, as 7.35 feet; the result may just as well be recorded as 88.2 inches, or 2.24 meters or even as .00139 miles. Each of these numbers expresses the same degree of accuracy though one of them has one place after the point and another has five places.

Quoting from the Evans & Marsh "First Year Mathematics": "Measurements which are expressed like these, in three figures, are said to be of three-figure accuracy: they may be made with ordinary instruments and skill. Five-figure accuracy requires good instruments and great care, as where a city building lot is measured to thousandths of a foot: six-figure accuracy is possible to experts: and eight-figure accuracy is beyond human skill at present."

Ordinary measurements are made as close as we need them for the use to which they are to be put. Some measurements are made as accurately as we can make them. Cases of the second kind are the standards of length which are kept by the United States government, or better still the international standard which is kept in Paris. It is measured just as accurately as men know how to measure.

Let us examine the last figure of a measured number. The length of a building lot is recorded as 43.7 feet. Is the 7 exactly 7 or may it be a little more than 7 or a little less? Suppose the field was remeasured with more care, the length might be found to be 43.72 feet. Again it might be measured with great care and this time the result might be 43.718. Now if the last measurement is correct to five figures, was the 7 of our first measurement exactly 7? No, it was really a little more than 7. It was the closest we could record it to three figures.

Change one third to a decimal. The answer is .3. But this is not exactly correct. Try again .33. Again our answer is not exact, .333 is closer, and .3333 is closer still. In fact we cannot write a decimal which is exactly equal to 1/3. The last figure is never exact. It is the best we can do to three figures or four figures or five figures, etc.

One more illustration: the number 3.1416 which is the ratio of the circumference of a circle to its diameter is not exactly 3.1416, more accurately stated it is 3.14159—and so on. For ordinary use 3.14 is sufficiently accurate, but the 4 is not exactly 4 as you know.

The last figure of all such numbers is peculiar; it is never an exact number: it is the best we can do in that place.

This has very important results in computing with such numbers. Let us find the area of a rectangular strip whose length is 43.72 ft. and width 3.831 feet. The last figure of each number is approximate. Whenever we multiply by the 2 or the 1 our product will be only approximate. Underline all the approximate figures.

```
 43.72
  3.831
 ------
  4372      The 9 is an approximation
 13116      only and all the figures after
 34976      the 9 are entirely worthless.
 13116      There are two things to be
 ------     understood here.
167.49132
```

First that we do not *care* what the area of the strip is to the nearest $\frac{1}{100000}$ of a square foot, as our answer pretends to show. It is not necessary to measure land to such a degree of accuracy.

Second we *cannot* get our answer correct to more than four figures because we measured to only four figures.

The area of our field will then be set down as 167.5 square feet. This is as close as we can get it from our measurements and it is as close as we need it for any practical purposes.

Men who figure with measured numbers have resorted to various devices to shorten the labor of computation. A table of logarithms is one such device and a slide rule is another. Both these and other similar devices make use of the principle we have just learned: thay *cut off the number at the required number of places.*

The question for us is, Is there a method of multiplication which will save setting down these unnecessary figures? There is and it takes but a few minutes to learn it. Once learned it saves a great deal of time.

It will seem a little strange at first but after a little practice you will never multiply in the old way again.

The first thing to notice is that we can get the same result by multiplying "backwards" as forwards. It makes no difference whether we begin to multiply these numbers with the 7 or with the 2. The product is the same either way.

```
  134        134
  247        247
 ----       ----
  938        268
  536        536
  268        938
 ----       ----
32098      32098
```

One way is no harder or easier than the other, except that one way is strange and one is familiar.

We will now find the area of our rectangular strip again multiplying in the reverse or natural order.

```
 43.72
  3.831
 ------
 13116      The result is the same
 34976      as before.
 13116
  4372
 ------
167.49132 Square feet.
```

Now we will cut off the doubtful figures as we multiply.

```
 43.72
  3.831
```

We want only four figures in our result. When we multiply 43.72 by 3 we get five figures. Therefore we

check off the 2 before beginning to multiply. Then we say 3 times 2 is 6 but do not put down the 6; instead say carry one. 3 times 7 is 21 and 1 is 22. Set down 2 and carry 2.

1312 Continue as usual.
Check off the 7. 8 times 7 is 56 do not put it down, but carry 6 because 56 is nearer to 6 tens than to 5 tens.
350 Check off the 3. 3 times 3 is 9, carry 1.
13 Check off the 4. 1 times 4 is 4, nothing to carry, because we do not carry to the next column unless we have 5 or more.
Add:
167.5 Square feet.

We still have to locate the point in our answer. We do this by common sense. The number we had to multiply was about 40. The number we had to multiply it by was about 4. Therefore our answer is about 40 times 4 or 160. Therefore our point goes after the 7. We *know* that our answer is 167.5 not 16.75 or 1.675 or 1675.

This is very important in handling numbers to know about how large our answer ought to be before we begin. This prevents absurd results.

We will check by setting the 3.831 above the 43.72 and multiplying again.

3.831 Estimate: 40×4 is 160.
43.72 Check off the 1 and go ahead as before.

115
27
1
167.5
Check

The "5 case"

The number we have last checked off never gives us anything to *set down* but it may give us something to *carry*.

15.25 Estimate: 15 times 2 is 30.
2.123 We do not check off the 5 the first time because 15.25 times 2
3050 gives us only 4 figures. Now check off the 5. 1 times 5 is 5, shall we carry 1 or nothing? 5 is
153 just midway between 0 and 10.
30 The simplest rule is to carry when
5 we have 5 or more. Now say 1 times 2 is 2 and 1 is 3. Check off
32.38 the 5. 3 times 5 is 15, carry 2. Point off after the 2 because we *know* our answer is about 30.

Check
2.123
15.25
Estimate: 2×15=30.
2123

2.19 Division
80
Estimate —=2
35.2)87.2 35
704
Now check off the 2 in the
68 divisor because it would give
35 us too many figures.
The point will come after the
33 2, because the answer must be
32 about 2.

Check
35×2=70
2.19 It is clear that our answer, 2.19,
35.2 is a little too small. When we check our product is 87.1. This is
657 .1 too small. It is possible that 2.20
110 might be more accurate. Let us
4 try it.
87.1

Second Check

2.20
35.2
660
110
4
87.4 This time we get 87.4 which is .2 more than the correct value. Therefore 2.20 is *not* a more accurate answer; 2.19 is the best possible answer to three-figure accuracy.

It is important to think correctly here. A great deal of the figuring done by practical men, in technical schools, and in the great fields of engineering, is done to three-figure accuracy only, because that is sufficient for their purpose.

Such men would call the answer to our division, 2.19, choosing always the *nearest* figure in the *last* place.

Divide 7267 by .1146.

.1146 It is a little more convenient to place the divi-
sor over the dividend,
63410 Answer leaving space for the answer.
7267 Our estimate, or rough
6876 check, is 1/10 into 7000 = 70,000.
391 When we get the four
344 figures of our answer, 6341 we have still to place the
47 point.
46 We know that 1/10 will
go into 7000 about
1 70,000 times. We must add a zero to make our answer 63,430.

Square Root

What is the square root of 16? It is 4. If we divide 16 by 4 what is the answer? It is 4. Whenever we divide a number by its own square root we get the same square root for an answer. Stated another way that is merely saying that 4×4=16.

A square root may be defined as *one of the two equal factors* of a number.

There are several methods of finding the square root of a number. The guess and try method will teach you most about square root and most about dealing with numbers. The use of a table is the quickest. We will consider the guess and try method. You can learn the use of a table yourself.

Find the square root of 16. Suppose we do not know what it is. We *estimate* that it is 3. Divide 3 into 16. If 3 is the correct square root how will we know? The answer will be 3. But 3 into 16 goes about 5 times. Therefore 3 is not *one of the two equal factors* of 16, 3 is too small, 5 is too large. If we "split the difference" we get 4 which is the correct square root of 16.

These steps will find the square root of any number. Reread the last paragraph and find the square root of 41.12.

First we will make as good a guess as possible.

6×6=36 Therefore 6 is too small.
7×7=49 Therefore 7 is too big.
6.5×6.5=42.25 Therefore 6.5 is too big.

We will try 6.4.
First trial.

6.400 Our guess was 6.400. Our
answer is 6.426. Our two
6.426 *Ans.* 1. factors are not equal. Split
the difference. The dif-
41.12 ference is .026. Half of it
3840 is .013. Add this to the
6.400 or subtract it from
272 the 6.426. In either case
256 we get 6.413.
16
12
4

Second trial.

6.413
6.413 *Ans.* 2. This time our two factors are equal.
41.12 The square root of 41.12
3848 is 6.413.
264
256
8
6
2

Find the square root of 86.32.

$8\times 8=64$
$9\times 9=81$
$10\times 10=100$

86 is between 81 and 100, therefore the square root is between 9 and 10 but much nearer 9 than 10. Try 9.2.

First trial		Second trial
9.200	Difference .182	9.291
9.382		9.290
86.32		86.32
8280	1/2 of .182 = .091	8363
352	9.200	269
276	.091	186
76	9.291	83
74		83
2		0

The only question remaining is whether 9.291 or 9.290 is nearer.

First check	Second check
9.291	9.290
9.291	9.290
8362	8361
186	186
83	83
1	
86.32	85.30

The first product is nearer the correct value, therefore 9.291 is the square root to four place accuracy.

Find to four places, the square root of 2.

$1\times 1=1$
$2\times 2=4$
$1.5\times 1.5=2.25$

The square root lies between 1 and 1.5 but nearer 1.5. Try 1.4.

First trial.		Second trial.
1.400		1.414
1.428	Difference .028	1.414 *Ans.*
2.000		2.000
1400		1414
600	1/2 of .028 = .014	586
560		566
40		20
28		14
12		6
11		6

This is sometimes written $\sqrt{2}=1.414$.

In this way you can make a table for yourself. Next find the square root of 3, and so on.

Equations With Approximate Coefficients.

① $3.42x-4.25+8.13x=18.11$
② $11.55x=22.36$ ① + 4.25
③ $x=1.94$ ② ÷ 11.55

Check

$3.42\times 1.94-4.25+8.13\times 1.94=18.11$
$6.64-4.25+15.77=18.11$
$18.2=18.1$

Ans.
1.94

Notice that we expect this equation to check to 3 figures only.

2. $82.7+36.1x=18.2x-3.00$

MULTIPLICATION

We have considered the simple and most common cases of multiplication:

$4(x-3)$ which equals $4x-12$.

and $x-4(x-2)$ which equals $x-(4x-2)$ which equals $x-4x+8$. Now consider the case:

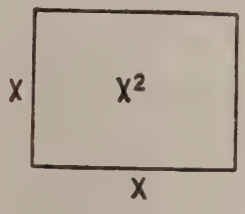
$(x+3)(x+5)$. This clearly means that both terms in the first parenthesis are to be multiplied by both terms of the second parenthesis.

That is $x(x+5)+3(x+5)$
$xx+5x+3x+15$

Uniting similar terms
$xx+8x+15$

The form xx becomes cumbersome if we have much multiplying to do. For convenience it is written x^2, and read x square.

The reason for this name is that it is the area of the square which is x on each side.



In the same way xxx is x^3, read $x-$ cube; $xxxx$ is x^4, read $x-$ fourth; $xxxxx$ is x^5, read $x-$ fifth, and so forth.

Multiply $(x-5)(x-6)$
$x(x-6)-5(x-6)$
$x^2-6x-(5x-30)$
$x^2-6x-5x+30$
$x^2-11x+30$

The same two multiplications may be more conveniently arranged thus:

$x-5$
$x-6$
x^2-5x
$-6x+30$
$x^2-11x+30$

The four lines indicate the four steps of the multiplication. The x^2 and the 10 are called the straight products. The $3x$ and $5x$ are cross products.

x^2+3x
$+5x+15$
x^2+3x
$+5x+10$
$x^2+8x+10$

Just why it is $+30$ is not clear in this case but looking back to the other method we see that we had to subtract -30, which is the same as *adding* 30.

Whenever you have two numbers both with minus signs, to multiply, the product is plus because one of them in effect puts the other in a minus parenthesis.

x^2-5x-3
$-x+4$
$-x^3+5x^2+3x$
$4x^2-20x-12$
$-x^3+9x^2-17x-12$

$x-y$
$x+y$
x^2-xy
$+xy-y^2$
x^2-y^2

This is a very common case in multiplication and becomes so familiar that we remember it. Other illustrations of the same case are:

$(a+b)(a-b)\equiv a^2-b^2$
$(x+5)(x-5)=x^2-25$
$(ax+4)(ax-4)=a^2x^2-16$
$[(x-3)-5][(x-3)+5]\equiv(x-3)^2-25$
$[(x+2)-7][(x+2)+7]\equiv(x+2)^2-49$

There are other cases to remember.

$(x+3)(x+3)\equiv(x+3)^2\equiv x^2+6x+9$
$(x+8)^2\equiv x^2+16x+64$

$x+8$
$x+8$
x^2+8x
$+8x+64$
$x^2+16x+64$

Notice that 16 is *double* the 8, and that 64 is the *square* of 8.

$(x-3)^2\equiv x^2-6x+9$
$(x-8)^2\equiv x^2-16x+64$
$(x+y)^2\equiv x^2+2xy+y^2$
$(x-y)^2\equiv x^2-2xy+y^2$
$(x+10)^2\equiv x^2+20x+100$
$(x-10)^2\equiv x^2-20x+100$
$(x-10)(x+10)\equiv x^2-100$

x^2y+xy^2
$x-y$
$x^3y+x^2y^2$
$-x^2y^2-xy^3$
x^3y-xy^3

Division

If we multiply 2 by 6 we get 12. If we divide the 12 by the 6 we get back the 2. This gives us the key to division.

$x\times x=x^2$, therefore $\frac{x^2}{x}\equiv x$

This may also be written $\frac{xx}{x}\equiv x$

$2x)6x^3$ $\qquad$ $5xy^2)10xy^3$
$3x$ $\qquad$ $2y$
$7x^2y^3)21x^5y^3$
$3x^3$

Now try a longer division.

First multiply $(x+6)(x+5)$

$x+6$
$x+5$
x^2+6x
$+5x+30$
$x^2+11x+30$

Divide $x^2+11x+30$ by $x+6$.

We know the answer must be $x+5$. We want a method for getting $x+5$. Arrange our work as in arithmetic.

$x+6$

x

$x^2+11x+30$

The first step is simple: x into x^2 goes x times. x then is the first term of the answer.

Looking back to the multiplication we see that the $11x$ is made of two parts, $6x$ and $5x$. We must get out the $5x$ in order to get the second term in our answer, namely 5.

$x+6$

$x+5$ *Ans.*

Multiply the $x+6$ by the x.

$x^2+11x+30$

x^2+6x

$5x+30$

$5x+30$

Subtract

This gives $5x+30$, the lower line of our product back again.

x into $5x$ goes 5 times.

There are than three steps in each long division divide, multiply, subtract; and these are repeated in the same order as many times as is needful.

Divide $x^2+5x-24$ by $x-3$.

$x-3$

$x+8$ *Ans.*

$x^2+5x-24$

x^2-3x

$8x-24$

$8x-24$

$x+7$

$x-10$ *Ans.*

$x^2-3x-70$

x^2+7x

$-10x-70$

$-10x-70$

$x-y$

x^2+xy+y^2 *Ans.*

x^3-y^3

x^3-x^2y

x^2y-xy^2

x^2y-y^3

xy^2-y^3

xy^2-y^3

Notice that x^2y cannot be subtracted from $-y^3$ because they are not similar terms.

$x+y$

x^2-xy+y^2 *Ans.*

Check

x^2-xy+y^2

$x+y$

x^3+y^3

x^3+x^2y

$x^3-x^2y+xy^2$

$-x^2y+y^3$

$+x^2y-xy^2+y^3$

$-x^2y-xy^2$

$x^3 \quad + y^3$

xy^2+y^3

xy^2+y^3

Divide $a^5+15+10a-a^4-3a^3-4a^2$ by a^2+2a+3.

Notice that the terms are not arranged in systematic order.

Rearrange thus:

$a^5-a^4-3a^3-4a^2+10a+15$ putting the highest power first.

a^2+2a+3

a^3-3a^2+5 *Ans.*

$a^5-a^4-3a^3-4a^2+10a+15$

$a^5+2a^4+3a^3$

$-3a^4-6a^3-4a^2$

$-3a^4-6a^3-9a^2$

$5a^2+10a+15$

$5a^2+10a+15$

Check

a^3-3a^2+5

a^2+2a+3

$a^5-3a^4 \quad +5a^2$

$2a^4-6a^3 \quad +10a$

$3a^3-9a^2 \quad +15$

$a^5-a^4-3a^3-4a^2+10a+15$

FACTORING

The expression $5(x-2)$ tells us to multiply x and -2 both by 5. This gives $5x-10$. It is sometimes convenient to be able to reverse this process and take the five out again.

$5x-10 \equiv 5(x-2)$. This simple process is called taking out a distributive factor. We take out the 5 which is distributed; that is which is in both the $5x$ and the -10, and put it out side the parenthesis.

Cover up the left hand row below and see if you can write them yourself.

$3x-9 \equiv 3(x-3)$

$5x+50 \equiv 5(x+10)$

$ax+a^2 \equiv a(x+a)$

$3a^2b-3ab^2-6a^2b^2 \equiv 3ab(a-b-2ab)$

$8x^2-72x+32 \equiv 8(x^2-9x+4)$

Learn to recognize a distributive factor at a glance.

The three special cases of multiplication which were mentioned as worth remembering give us three more kinds of factoring.

First: $(x+y)^2 = x^2+2xy+y^2$

$(x+9)^2 = x^2+18x+81$

$(x+2a)^2 = x^2+4ax=4a^2$

$(3x+5)^2 = 9x^2+30x+25$

Multiply out some of these yourself, both on paper and mentally.

A harder one:

$[(x+3)+a]^2$

We will do as we did before, square the first part $(x+3)^2$; then multiply the first by the second and double the answer $2a(x+3)$: then square the second a^2

$(x+3)^2+2a(x+3)+a^2$

Second: $(x-y)^2$

This is really just the same as the first only the sign of the y is minus instead of plus.

Multiply and discover for yourself how much of a change this makes in the product.

$(x-y)^2 \quad \equiv x^2-2xy+y^2$

$(x-9)^2 \quad \equiv x^2-18x+81$

$(3x-5)^2 \quad \equiv 3x^2-30x+25$

$[(x+3)-a]^2 \equiv (x+3)^2-2a(x+3)+a$

Third: $(x+y)(x-y)$

This is the odd case where the cross products disappear and only the end products remain.

$x+y$

$x-y$

x^2+xy

$-xy-y^2$

x^2-y^2

$(x+y)(x-y) \equiv x^2-y^2$

$(x+8)(x-8) \equiv x^2-64$

$(x+2a)(x-2a) \equiv x^2-4a^2$

$(3x+5)(3x-5) \equiv 9x^2-25$

$[(x+3)-a][(x+3)+a] \equiv (x+3)^2-a^2$

$[(x+5)-2][(x+5)+2] \equiv (x+5)^2-4$

Learn to go, in these columns, from left to right (multiplication) and from right to left (factoring).

Factor

$x^2+2xy+y^2$ *Ans.* $(x+y)^2$

$x^2-2xy+y^2$ *Ans.* $(x-y)^2$

$x^2-8x+16$ *Ans.* $(x-4)^2$

$x^2-10x+25$ *Ans.* $(x-5)^2$

x^2-25 *Ans.* $(x-5)(x+5)$

x^2-64a^2 *Ans.* $(x-8a)(x+8a)$

$25x^2-100y^2$ *Ans.* $(5x+10y)(5x-10y)$

$(x+2)^2-36$

Ans. $(x+2-6)(x+2+6) \equiv (x-4)(x+8)$

$(3x-4)^2-49$

Ans.

$(3x-4-7)(3x-4+7) \equiv (3x-11)(3x+3)$

x^4-y^4

Ans.

$(x^2-y^2)(x^2+y^2) \equiv (x-y)(x+y)(x^2+y^2)$

$a^2-20ab+100$ *Ans.* $(a-10b)^2$

Notice that in the first and second kinds the coefficient of the second term is a *double* and the last term is the *square* of the same number.

$x^2-10x+25 \equiv (x-5)^2$

The 10 is double 5, the 25 is the square of 5.

If we multiply $x+3$ by $x+2$:

$x+3$

$x+2$

x^2+5x+6

The coefficient of the second term is the sum of the 3 and 2. The last term is the product of 3 and 2.

Factor

x^2+5x+6 *Ans.* $(x+3)(x+2)$

We factored this expression by finding two numbers whose sum is 5 and whose product is 6. It is another guess and try method. Practice it.

$x^2+8x+12$ *Ans.* $(x+6)(x+2)$

$x^2+10x+9$ *Ans.* $(x+9)(x+1)$

$x^2+18x+32$ *Ans.* $(x+16)(x+2)$

$x^2+22x+57$ *Ans.* $(x+3)(x+19)$

$x^2-11x+18$ *Ans.* $(x-9)(x-2)$

Here the signs of the 9 and 2 must be minus so that their sum will be -11.

$x^2-15x+50$ *Ans.* $(x-10)(x-5)$

$x^2-8a+12$ *Ans.* $(a-6)(a-2)$

$a^2-8ab+15b$ *Ans.* $(a-8b)(a-3b)$

$x^2+10x-24$ *Ans.* $(x+12)(x-2)$

The sum of $+12$ and -2 is $+10$: the product of $+12$ and -2 is -24.

$x^2+18x-63$ *Ans.* $(x+21)(x-3)$

$x^2+20x-125$ *Ans.* $(x+25)(x-5)$

$a^2+6ab-55b$ *Ans.* $(a+11b)(a+5b)$

$x^2-10x-24$ *Ans.* $(x-12)(x+2)$

The sum of -12 and $+2$ is -10; their product is -24.

$x^2-18x-63$ $(x-21)(x+3)$

$a^2-3a-460$ $(a-23)(a+20)$

$x^2-14xy-51y^2$ $(x-17y)(x+3y)$

The next kind is a little harder. At least it often takes more trials.

Multiply

$4x+15$

$2x+9$

$8x^2+30x$

$36x+135$

$8x^2+66x+135$

Factor $8x^2+66x+135$

To get $8x^2$ we may multiply x by $8x$
or $2x$ by $4x$
To get 135 we may multiply 1 by 135
or 3 by 45
or 9 by 15

We want the combination which will give cross products whose sum is $66x$
Try some:

x	1	
$8x$	135	
	$135x$	
	$8x$	
	$143x$	This is not the combination.
x	3	
$8x$	45	
	$24x$	
	$45x$	
	$69x$	Not the one
x	9	
$8x$	15	
	$72x$	
	$15x$	
	$87x$	No.
x	15	
$8x$	9	
	$120x$	
	$9x$	
	$129x$	No.
$2x$	15	
$4x$	9	
	$18x$	
	$60x$	
	$78x$	Not the one.
$2x$	9	
$4x$	15	
	$36x$	
	$30x$	
	$66x$	This is the combination we are seeking. Our factors are

$2x+9$ and $4x+15$.

Factor $6x^2+46x+80$

$3x$	1		$3x$	40
$2x$	80		$2x$	2
	$240x$			$80x$
	$2x$			$6x$
	$242x$	No		$86x$ No
$3x$	8			
$2x$	10			
	$16x$			
	$30x$			
	$46x$	This is the one.		

Ans. $(3x+8)(2x+10)$

$3x$	80		$3x$	4
$2x$	1		$2x$	20
	$160x$			$8x$
	$3x$			$60x$
	$163x$	No		$68x$ No
$3x$	2		$3x$	20
$2x$	40		$2x$	4
	$120x$			$20x$
	$4x$			$12x$
	$124x$	No		$32x$ No

Factor $15x^2+28x+12$

$5x$	2		$5x$	6
$3x$	6		$3x$	2
	$6x$			$18x$
	$30x$			$10x$
	$36x$	No		$28x$ Yes

Ans. $(5x+6)(3x+2)$

Check

$5x + 2$
$3x + 2$

$15x^2+18x$
$10x+12$

$15x^2+28x+12$

Factor $20x^2-23x+6$

$4x$	2		$4x$	3
$5x$	3		$5x$	2
	$10x$			$8x$
	$12x$			$15x$
	$22x$	No		$23x$ Yes

Ans. $(4x-3)(5x-2)$

Multiply: $6x - 5$
$2x + 3$

$12x^2-10x$
$+18x-15$

$12x^2+ 8x-15$

Notice that the sign of the 15 is minus, and that the $8x$ is the *difference* between the $18x$ and the $10x$.

Now factor $12x^2+8x-15$

Try	$3x$	1	$6x$	3
	$4x$	15	$2x$	5
		$45x$		$30x$
		$4x$		$6x$
		$41x$ No		$24x$ No
	$3x$	15	$6x$	5
	$4x$	1	$2x$	3
		$60x$		$10x$
		$3x$		$18x$
		$57x$ No		$8x$ Yes: but it

still remains to decide which is minus, the 5 or the 3.

Try making it -3. This gives us $-8x$. This is wrong.

Then it must be -5.

Ans. $(6x-5)(2x+3)$

Factor $24x^2-53x-7$

Ans. $(8x+1)(3x-7)$

Factor $6a^2-11a-10$

Ans. $(2a-5)(3a+2)$

Factor $12a^2-7ab-45b^2$

Ans. $(4a-9b)(3a+5b)$

It is not difficult to remember two more cases.

Factor x^3+y^3

Ans. $(x+y)(x^2-xy+y^2)$

Factor x^3-y^3

Ans. $(x-y)(x^2+xy+y^2)$

QUADRATIC EQUATIONS

PROBLEM 47. A farmer sets out apple trees so that the number of trees in a row is two more than the number of rows. If there are 624 trees, how many rows and how many trees in a row?

Let x=no. of rows.

Then $x+2$=no. of trees in a row.

$x(x+2)$=no. of trees in all (that is 624).

①	$x(x+2)=624$	
②	$x^2+2x=624$	① same values
③	$x^2+2x-624=0$	② -624
④	$(x+26)(x-24)=0$	③ factored

We have here two numbers multiplied together giving as a product zero. This is only possible if one or the other of the numbers equals zero.

⑤	$x-26=0$	
⑥	$x-24=0$	
⑦	$x=26$	⑤ $+26$
⑧	$x=24$	⑥ $+24$

Check

24 rows of 26 = 624 trees

Ans.

24 Rows. 26 trees in a row. The 26 rows would be the answer if the problem read, "two less trees in a row than rows."

Try problem 47 with these numbers.

1. 5 more trees in a row than rows, trees in all, 500.

2. 6 more trees in a row than rows, trees in all, 216.

3. 8 more trees in a row than rows, trees in all, 128.

PROBLEM 48. A rectangle is 15 feet long, and its area is 36 sq. ft. more than a square of the same width. How wide is it?

Let x=no. of ft. in width of rectangle (and square).

$15x$=no. of sq. ft. in area of rectangle.

x^2=no. of sq. ft. in area of square.

Area of square plus 36 sq. ft. = area of rectangle.

That is ①	$x^2+36=15x$		
②	$x^2-15+36=0$	①	$-15x$
③	$(x-12)(x-3)=0$	②	factored
④	$x-12=0$		
⑤	$x-3=0$		
⑥	$x=12$	④	$+12$
⑦	$x=3$	⑤	$+3$

Check

12′ by 12′ = 144
12′ by 15′ = 180
144 + 36 = 180

Ans. Rectangle is 12 ft. wide

OR

3′ by 3′ = 9
3′ by 15′ = 45
9 + 36 = 45

Rectangle is 3 ft. wide

Here we have *two* answers to one problem and both answers are correct.

PROBLEM 49. A rectanglar room takes 68 feet of picture molding and 32 square yards of carpet. What is the size of the room?

Let x=no. of feet in width (short side).

$2x$=no. of feet in two short sides.

$68-2x$=no. of feet in two long sides, because there are 68 feet in all four sides.

$1/2(68-2x)$=no. of ft. in length. That is $34-x$.

$x(34-x)$=no. of sq. ft. in area. That is 288.

[Change 32 square yards to ft.]

①	$x(34-x)=288$	
②	$34x-x^2=288$	① same values
③	$0=x^2-34x+288$	② $+x^2-34x$
④	$0=(x-18)(x-16)$	③ factored
⑤	$x=18.$ 16	

Check *Ans.*

18 18′ by 16′
18
16
16

68 ft. of molding
$18\times16=288$ sq. ft. = 32 sq. yds.

PROBLEM 50. A fraction having 70 for its numerator is inverted and multiplied by 6. Its new value is one more than its original value. What is the fraction?

Let x=the denominator.

Then $\frac{70}{x}$=the fraction.

And $\frac{6x}{70}$=the fraction inverted and multiplied by 6.

The new value = one more than its original value.

$$\textcircled{1}\quad \frac{6x}{70}=\frac{70}{x}+1$$

② $6x^2=4900+70x$	①×70x
③ $6x^2-70x-4900=0$	②−70x−4900
④ $3x^2-35x-2450=0$	③÷2
⑤ $(x-35)(3x+70)=0$	④ factored
⑥ $x=35$	
⑦ $3x=-70$	
-70	
⑧ $x=\frac{-70}{3}$	

Check	*Ans.*
35	70
$\frac{70}{35}\times 6=3$	$\frac{70}{35}$
70	
$\frac{70}{-70}=2$	
$2+1=3$	

The $\frac{-70}{3}$ will also check, though it makes a curious fraction.

Such equations as ④ above are often laborious to factor by the guess and try method. We need a more systematic process. "Completing the square" is such a process for factoring quadratics. Remember that if we square $x+6$ we get $x^2+12x+36$. The 12 is *double* the six and 36 is the *square* of 6. If we had the 12 but not the 36 how could we find the 36? By taking half of the double term and squaring it.

Factor $x^2+20x+96$.

The 20 is the double, therefore the original number is 10.

Its square is 100

$x^2+20x+100$ is the complete square.

$x^2+20x+100\ +96-100$ If we add 100 in order to get a perfect square, we must subtract 100 to bring the expression back to its former size.

Rewrite: $(x+10)^2-4$

or $(x+10)^2-(2)^2$

This is a familiar kind of expression to factor. It is called the difference of two squares.

$$(x+10-2)(x+10+2)$$

or $(x+8)(x+12)$ *Ans.*

Check

$x+8$

$x+12$

x^2+8x

$+12x+96$

$x^2+20x+96$

Solve

$$x^2-6x-27=0$$

②	$x^2-6x+9-27-9=0$
③	$(x-3)^2-36=0$
④	$(x-3-6)(x-3+6)=0$
⑤	$(x-9)(x+3)=0$
⑥	$x=9,-3$

Check	*Ans.*
$81-54-27=0$	9 or −3
$0=0$	
$9+18-27=0$	
$0=0$	

Solve

$$\textcircled{1}\quad x^2+7x-18=0$$

$$\textcircled{2}\quad x^2+7x+\frac{49}{4}-18-\frac{49}{4}=0 \qquad \textcircled{2}\quad +\frac{49}{4}-\frac{49}{4}$$

$$+\frac{7}{2}$$

If 7 is the double, the original is $\frac{7}{2}$. Its square is $\frac{49}{4}$

$$\textcircled{3}\quad \left(x-\frac{7}{2}\right)^2-\frac{72}{4}-\frac{49}{4}=0$$

$$\textcircled{4}\quad \left(x-\frac{7}{2}\right)^2-\frac{121}{4}=0$$

$$\textcircled{5}\quad \left(x+\frac{7}{2}-\frac{11}{2}\right)\left(x+\frac{7}{2}+\frac{11}{2}\right)=0$$

Check	*Ans.*
$4+14-18=0$	2, −9
$0=0$	
$81-63-18=0$	
$0=0$	

This is a hard way to solve an easy quadratic, and an easy way to solve a hard quadratic.

Solve

$$\textcircled{1}\quad 3x^2-x-2=0$$

$$\textcircled{2}\quad x^2-\frac{1}{3}x-\frac{2}{3}=0$$

$$\textcircled{3}\quad x^2-\frac{1}{3}x+\frac{1}{36}-\frac{2}{3}-\frac{1}{36}=0$$

$$\textcircled{4}\quad \left(x-\frac{1}{6}\right)^2-\frac{25}{36}=0$$

$$\textcircled{5}\quad \left(x-\frac{1}{6}-\frac{5}{6}\right)\left(x-\frac{1}{6}+\frac{5}{6}\right)=0$$

$$\textcircled{6}\quad (x-1)\left(x+\frac{4}{6}\right)=0$$

$$\textcircled{7}\quad x=1,\ -2/3$$

Check	*Ans.*

We are now able to solve the three kinds of equations of elementary algebra. They are sufficient for the use of most of the equations and formulas you will find in your reading. The study of geometry and trigonometry will bring many more formulas within your reach.

PLANE GEOMETRY

George Macfeely Conwell, Ph. D.

INTRODUCTION

"The enemies of geometry, those who know it only imperfectly, look upon the theoretical problems, which constitute the most difficult part of the subject, as mental games which consume time and energy that might better be employed in other ways. Such a belief is false, and it would block the progress of science if it were credible. But aside from the fact that the speculative problems, which at first sight seem barren, can often be applied to useful purposes, they always stand as among the best means to develop and to express all the forces of human intelligence." —Abbé Bossut.

"It may seem strange that geometry is unable to define the terms which it uses most frequently, since it defines neither movement, nor number, nor space—the three things with which it is chiefly concerned. But we shall not be surprised if we stop to consider that this admirable science concerns only the most simple things, and the very quality that renders these things worthy of study renders them incapable of being defined. Thus the very lack of definition is rather an evidence of perfection than a defect since it comes not from the obscurity of the terms, but from the fact that they are so well known." —Pascal.

"We may look upon geometry as practical logic, for the truths which it studies, being the most simple and most clearly understood of all truths, are on this account the most susceptible of ready application in reasoning."—D'Alembert.

"The method of making no mistakes is sought by every one. The logicians profess to show the way, but the geometers alone ever reach it, and aside from their science there is no genuine demonstration."—Pascal.

HISTORICAL

Mathematics in general and geometry in particular have a very ancient and honorable history. Of all the sciences its development has been accompanied by the least error. One generation of mathematicians has not been chiefly occupied with the correction of the mistakes of the previous generation but has been free to devote its energies to further developments of the science.

The virtues of mathematics, precision in definition and logical exactness in reasoning, are especially evident in geometry. Its elements—the point, the line, and the plane—are the most universal of all concepts, and have always meant the same thing to all peoples, and this gives a common and undisputed ground for development. On the contrary, what may seem beautiful to one people at one time may not seem to be so at a later date. Even the moral values of acts are differently appraised by different ages and by different races, but the geometrical concepts have in them the elements of the unchangeable and eternal. The shortest distance between two points always has and always will bring to the mind the same concept—the line.

Our knowledge of what the ancients knew of geometry is limited to what may be inferred from inscriptions and tablets. Necessity often serves as the mother of invention, and hence the earliest geometry deals with the practical problems, such as the measurement of lands. The Babylonians had formulas for areas of squares, rectangles, and right triangles. They asserted that the circumference of a circle was three times its diameter. This is also the statement in the Bible in I Kings 7:23. The Egyptians, whose civilization goes back beyond record, had a practical use for geometry in the surveying of land, especially in the vicinity of the Nile, which so often floods its banks. In Herodotus we find: "They said also that this king divided the land among all Egyptians so as to give each one a quadrangle of equal size and to draw from each his revenues, by imposing a tax to be levied yearly. But every one from whose part the river tore away anything, had to go to him and notify what had happened; he then sent overseers, who had to measure out how much the land had become smaller, in order that the owner might pay on what was left, in proportion to the entire tax imposed. In this way, it appears to me, geometry originated, which passed thence to Hellas." The pyramids also are an enduring monument to the geometrical science of the Egyptians.

From the seventh century B. C. the Greeks came into active contact commercially and intellectually with the Egyptians. Plato, who visited Egypt said: "Whatever we Greeks receive, we improve and perfect." By 320 B. C. a Greek, Euclid, had written a geometry which in its translation has been used as the standard text almost universally in England until this century and is used at the present time in some places. The vogue of this text for over 2,200 years was deserved and has made the word Euclid synonymous with geometry. The Egyptians cared only for geometry as required in every day life but the Greeks were interested in the logical and speculative side of the science.

Soon there arose the three famous problems of geometry:

(1) To trisect an angle.

(2) To "double the cube", i. e., to find a cube whose volume is double that of a given cube.

(3) To "square the circle", i. e., to find a square exactly equal in area to a given circle.

These problems became the incentive of much geometrical study, and while they were never satisfactorily dealt with in ancient times those engaged in seeking the solutions were always finding out new and important geometrical truths. Many of the Greek philosophers, as Plato and Aristotle, were keenly interested in geometry. Plato wrote over the entrance to his school, "Let no one who is unacquainted with geometry enter here."

Euclid, whose name is by far the greatest in geometry, was born about 365 B. C. and wrote his Elements 330-320 B. C. He was extraordinarily skillful in arranging in an orderly and logical manner the facts and theorems of geometry. Very few of the separate proofs were his own, but his power to organize and systematize all the available knowledge of geometry entitles him to the high place he holds.

There are two stories handed down from the days of Euclid which indicate that human nature does not change and that the conflict between knowledge for its own sake and knowledge for utilitarian purposes only is not modern. When Ptolemy asked if there was no easy method of acquiring geometric knowledge Euclid replied: "There is no royal road to geometry." Literally hundreds of geometric texts have been written whose object is to make Euclid easy, but there are many who maintain that this product of Greek culture has never been surpassed.

A youth who had begun to read geometry with Euclid, when he had learned the first proposition inquired: "What do I get by learning these things?" So Euclid called his slave and said: "Give him three pence, since he must make gain out of what he learns." While the average man uses geometry very little yet he enjoys the advantages of modern inventions, all of which are the products of applied geometry.

Practical Utility.—How is geometry used? I walk a certain distance; here is the problem of the measurement of distance. I buy a piece of ground, a drawing must be made to indicate its shape and position for the deed; here is a problem of area. A tank must be constructed to hold so many gallons; here is a question of volume. A tunnel is to be made under a river, a bridge is to be constructed, a ship is to be built; all these are but a few of the many thousands of geometric problems. In war there are endless problems of geometry to solve. The position of a big gun, of an airplane, or of a submarine, is found by geometrical means.

Relation to Sciences.—Without a knowledge of geometry, progress in the study of physics is impossible. Indeed in the modern developments of physics, there has arisen a demand for peculiar concepts of space called non-Euclidean geometries and for what is known as four dimensional geometry. At present all matter is supposed to be composed of electric charges, positive and negative. The physical and chemical properties of all substances thus depend upon the manner in which these electrical charges are arranged. In the case of crystals many geometrical solids are found in nature.

Universality.—Geometry is founded upon statements about which there is universal agreement. History is supposed to deal with facts, but what passes for history in one country will not be accepted in another, and even in the same country opinions differ. Moreover, if the facts

themselves are not disputed, at least their interpretation is called in question. What is music to the Oriental ear is mere noise to the European. Often that which is considered beautiful in one age is derided in the next. But objects like the monuments of Greek architecture, which found their inspiration and proportions in the laws of geometry, have found universal admiration and approval, since the fundamental laws of geometry have been the same for all times and all peoples.

Essentials.—Geometry teaches the student to separate the essential from the non-essential. The statements of geometry when they have reached a final form are such that a single word can not be added or taken away without destroying the meaning.

Intellectual Beauty.—There is a unity, simplicity, and beauty in the development of geometry which appeals to many. Lincoln, whose writings and speeches are especially noteworthy for the above qualities, found joy in middle life in reading the proofs of Euclid.

Intellectual Requirements.—Geometry is especially fitted as a subject of study for the youthful mind. It demands intelligence, imagination, and diligence. Travel and experience add much to the ability to master many subjects but "there is no royal road to geometry."

1. Elements.—The elements first met with in plane geometry are the point and the line. We also require one plane in which all the points and lines are supposed to lie. Before we attempt to define these terms we must consider the nature of a definition.

2. Definition.—A definition is a statement explaining the precise meaning of a word or phrase. It should be complete and clear and in terms more simple and better known than the word defined.

3. Geometrical Definitions.—A few moments of thought will show the impossibility of definitions for the elements of geometry. We naturally choose for our fundamental elements the simplest; and if there were anything simpler than the point we should choose it as our first element rather than the point itself. Here is one of the advantages of geometry as a study: we all know what is meant by a point and a line and thus have a common body of knowledge upon which to build. There have been many clever descriptions of a point and of a line but one must acknowledge that if one did not know what was meant by the word point before reading the description one would not know afterward.

4. Point.—A point is that which has no part. A point is that which has position but no magnitude.

5. Line.—A line is that which has length without breadth or thickness. A line is breadthless length. Euclid's definition of a straight line is: A straight line is that which lies evenly with respect to the points on itself.

6. Axiom.—Certain facts are so elemental they can not be reduced to anything simpler. They are statements which meet with universal agreement and are called axioms.

7. Postulate.—A postulate is a geometric statement whose truth is assumed. The distinction between a postulate and an axiom is merely that the postulate is a geometric truth while the axiom is of broader application. Many ignore or neglect this distinction, and we shall at times.

There is a certain amount of freedom in our choice of axioms and postulates. There is always a choice in the fundamental unit. If one chooses the dollar as the unit then the cent is the one hundredth part of a dollar; if the cent is the unit then the dollar is one hundred cents.

Just as there are many different orders in which the separate stones of a building may be set, so also there have been many different lists of assumptions in geometry. We shall use the list from the New York State Syllabus in Geometry, which has itself been based on a list used by Harvard University in its entrance examinations.

8. One straight line, and only one, can be drawn through two given points.

9. Two points determine a straight line.

10. Two straight lines can intersect in only one point.

11. A straight line may be produced to any required length.

12. A straight line is the shortest path between two points.

13. A circle may be described with any given point as a center, and any given line as a radius.

14. Any figure may be moved from place to place without altering its size or shape.

15. Through any point outside a given line, one line, and only one, can be drawn parallel to the given line.

16. All straight angles are equal.

17. All right angles are equal.

18. From a given point in a given line, one perpendicular, and only one, can be drawn to the line.

19. Equal angles have equal complements, equal supplements, and equal conjugates.

If a careful man should build a house he might make a complete list of all the kinds of materials which entered into its construction and of the various tools which were necessary. Thousands of careful students and teachers have been over the subject of geometry and the above postulates, or assumptions, are the ones which have been found to be the most necessary and convenient.

Again, in the building of a house one might try to determine what was the least number of tools that were necessary, but in actual practice it is better to have a sufficient number. As a matter of fact, some of the above list of assumptions result from the others so the list is not so small as it might be. In a course in higher mathematics it would be proper to consider the question of the least number of assumptions, but for the beginner in geometry the number of the assumptions is not so important as their convenience. Having the assumptions listed, it is possible, when one becomes more familiar with the subject, to investigate their relations.

20. Equipment.—What equipment does a student need in the study of geometry? When we discuss this question we shall see the relation of the practical to the theoretical.

First, the student needs a sheet of paper, a slate, or a blackboard as a representation of a plane. On consideration it will be evident that no such thing as a perfect plane can be obtained. Your slate or blackboard is full of imperfections and your sheet of paper will refuse even to be flat unless it is placed on a good desk top. However, the idea of a perfect plane is fixed in our minds. We are content if a concrete sidewalk is fairly smooth, a plate glass window must be more accurately made, while the manufacturer of an astronomical instrument may work for months or years to obtain a smooth surface for an instrument requiring great accuracy. He must have a pencil, a piece of chalk, or an instrument of some kind to indicate points and draw lines. Any point we can make with a pencil has size but again as we make the point smaller, thus approaching the ideal, we increase the accuracy of our work. A ruler is necessary to aid in the drawing of straight lines and again this can only be approximately free from error. Finally a pair of compasses is necessary to draw circles. We shall leave to the reader the consideration of the question—why is a pair of compasses a more accurate instrument than a ruler?

From the earliest days the ruler and the compasses have been the only instruments that have been considered legitimate in the solution of plane geometry problems. To become proficient in many sciences requires elaborate equipment and costly apparatus but even crude drawings made in the sand enabled the ancient Greek scholars to attain their perfection in geometry.

21. Drawings.—We can now discuss the postulates §8-19 in reference to the making of geometrical drawings.

We represent points by small dots and put a capital letter as A in the vicinity of the point to label it.

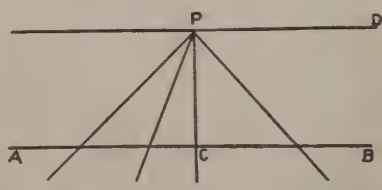
Two given points A and B determine the position of our ruler to draw the line with the symbol AB in agreement with §8-9 which line by §11 we can extend in either direction beyond the points A or B.

With our pencil we can draw any number of paths or curves between the points A and B but §12 tells us that the straight line drawn with our ruler is the shortest distance between the two points.

In the moving of a figure from one position to another according to §14 we have a theoretical and practical difference. Any physical object, if moved from one position to another on our earth, would in general experience many changes due to the alteration of the force of gravity, of the atmospheric pressure, of the temperature, etc., which would change its shape, but one readily imagines the ideal solid which experiences no change.

22. Uniqueness.—Geometry is particularly concerned with unique objects. The highest mountain, the largest city, the worst war have an immediate significance. The designation of any other mountain, city or war requires many words. When two points A and B are given the first unique object determined is the line AB which can be prolonged in either direction.

23. Segment.—When we consider the portion of the line AB which lies between A and B we have a second unique object called the line—segment AB, which has related to it a unique number called its length.

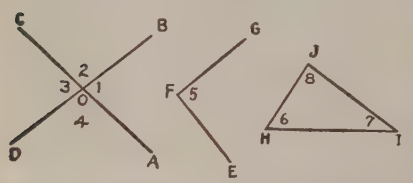


Consider the line AB and the point P outside it. Consider all the lines which can be drawn through P, two of these lines are unique in reference to AB, i. e., PC and PD.

24. Parallel.—(Symbol II). Two lines are called parallel when they lie in the same plane and do not intersect however far they are produced. There is one line and one only, §15, which passes through P and is parallel to AB, i. e. PD. This is a very famous axiom or postulate and in the past there have been many attempts by well known mathematicians to derive it from the other postulates.

The two rails of a railroad correspond to our ideas of parallel lines and if prolonged forever in straight lines we believe they would never meet, and it seems as if there should be some way to prove it.

The proof is impossible, for it has been shown that it is the realm of possibility for something entirely different to take place. Lobatschewski (1793-1856) showed that the postulate that more than one parallel can be drawn through a point to a given line leads to a consistent and at the same time a different geometry. In this geometry the sum of the angles of a triangle is less than two right angles. Riemann (1826-1866) took as his postulate that there is no parallel to a line from a point outside it. This leads to still another consistent geometry in which the sum of the angles of a triangle is greater than two right angles. This of course leaves it to experiment or observation to find out which is the true geometry. If the true geometry is that of Euclid then the sum of the angles of a triangle should be always two right angles. I see a man in New York and I again see him in Canton, China. He may have gone from one place to the other by way of the Atlantic or the Pacific oceans, but it is also a geometric possibility that he went through the center of the earth. How he did go can be accurately answered only from observation of his trip.



25. Ray or Half Line.—When two lines intersect in a point the plane is divided into four parts. AC and BD intersect in O dividing the plane into the four parts 1, 2, 3, 4.

We designate a line beginning at a definite point and extending indefinitely in only one direction as a ray or half line. OA and OC are half lines.

26. Angle.—(Symbol ∠). When two half-lines or rays extend indefinitely from a common point the figure formed is an angle. The concept of the half-line or ray is introduced to secure uniqueness. When two lines as AC and BD intersect in O we have four angles determined which we can designate by the numbers 1, 2, 3, 4. The common point is called the *vertex* and the two rays the *sides*. Thus angle 1 has the vertex O and the sides OA and OB and can be named the angle AOB or the angle BOA; the vertex letter is always written between the other two letters. When there is no danger of ambiguity we can designate the angle by a single letter or number, thus ∠JHI = ∠6 = ∠H; but it would not do to say the angle O, for there is not a unique angle at O.

27. Straight Angle.—Closely connected with the angle is the idea of a rotation. If OB turns about O as a fixed point counterclockwise while OA remains fixed the angle AOB will increase and OB will ultimately coincide with OC. The angle AOC or COA is called a straight angle. A straight angle is formed when the sides extend in opposite direction from a common vertex and form a straight line.

28. Geometric Figure.—Any combination of the geometric elements, points, lines, surfaces, and solids is a geometric figure.

29. Boundaries.—The boundaries of a geometric figure are the points, lines, or surfaces by which it is limited.

30. Polygon.—A polygon is a plane figure bounded by three or more straight lines.

Triangle.—(Symbol △). A triangle is a portion of the plane bounded by three straight lines, and is the simplest of the polygons.

31. Equality.—(Symbol =). Equality has various meanings in geometry. The fundamental equality is congruence.

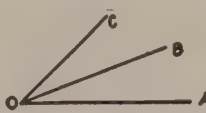
32. Congruence—(Symbol ≅). Two geometrical figures are congruent if they can be made to coincide in all their parts by use of postulate §14.

The segment AB is congruent or equal to segment CD if AB can be made to coincide with CD. A can be made to coincide with C, the line AB to coincide with the line CD, then if B falls on D the segments coincide throughout and are congruent. Also if AB ≅ CD then AB ≅ DC.

The two angles AOB and CLD are congruent if it is possible to place them so that OA coincides with LC at the same time that OB coincides with LD, or in general that the vertices and sides can be made to coincide at the same time. Also they can then be made to coincide in the reverse order, that is OA with LD and OB with LC. These two methods are denoted symbolically by ∠AOB ≅ ∠CLD or ∠AOB ≅ ∠DLC.

A circle and a square, however, may have equal areas, but they are not capable of being made to coincide.

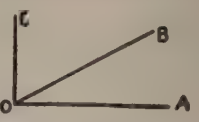
The method of showing that two figures are congruent by placing one upon the other so they coincide in all their parts is called proof by the method of *superposition*.



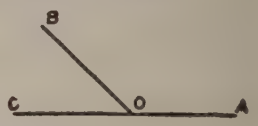
33. Adjacent Angles.—Two angles which have the same vertex and the side between them common are adjacent. Thus ∠AOB and ∠BOC are adjacent and ∠AOC is their sum.

34. Right Angles.—When two straight lines meet so that any two of the adjacent angles are equal the angles are called right angles. An angle less than a right angle is called an acute angle. An angle greater than a right angle is an obtuse angle.

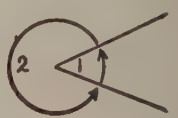
35. Perpendicular.—(Symbol ⊥). Two lines are perpendicular when they meet to form right angles. There is but one line perpendicular to a given line at a given point by postulate §18. This is the second unique line PC of §23.



36. Complementary Angle.—One angle is the complement of another when their sum is a right angle. ∠AOB and ∠BOC are complementary angles.



37. Supplementary Angles.—One angle is the supplement of another if their sum is a straight angle or two right angles. ∠AOB and ∠BOC are supplementary.



38. Conjugate Angles.—One angle is the conjugate of another if their sum is two straight angles or four right angles, ∠1 and ∠2 are conjugate.

AXIOMS

39. If equals are added to equals, the sums are equal.

40. If equals are subtracted from equals, the remainders are equal.

41. If equals are multiplied by equals, the products are equal.

42. If equals are divided by equals, the quotients are equal.

43. Like powers or like positive roots of equals are equal.

44. If unequals are operated on by positive equals in the same way, the results are unequal in the same order.

45. If unequals are added to unequals in the same order, the sums are unequal in the same order; if unequals are subtracted from equals, the remainders are unequal in the reverse order.

46. Quantities that are equal to the same quantity or to equal quantities are equal to each other.

47. A quantity may be substituted for its equal in an equation or in an inequality.

48. If the first of three quantities is greater than the second, and the second is greater than the third, then the first is greater than the third.

49. The whole is greater than any of its parts and is equal to the sum of all its parts.

50. Magnitude.—Any thing that is measurable is a magnitude. The above axioms are universal statements which apply to numerical quantities or magnitudes. They enumerate all the operations that are necessary in dealing with numbers.

Consider axiom 45.

7 is greater than 3 or in symbols $7>3$,
6 is greater than 4 or in symbols $6>4$,

Adding 13 is greater than 7 Adding $13>7$.
10 equals 10 or in symbols $10=10$
6 is greater than 4 or in symbols $6>4$

Subtracting 4 is less than 6 Subtracting $4<6$

Of course nothing can be said about the result of adding unequals to unequals which are in the reverse order, as can be seen below.

$10>6$,
$3<13$,
Adding $13<19$,
but $10>6$,
$3<4$,
Adding $13>10$.

Thus the first sum may be either greater or less than the second. The reader can verify the other axioms for numbers in a similar way.

51. Solids.—All the objects which we can see are solids. Physics is concerned with the nature and properties of the substances of which the physical solids are constituted, while geometry is concerned only with the shape and size of the solid. Thus a geometrical solid can not be seen or touched and has its existence only in the imagination.

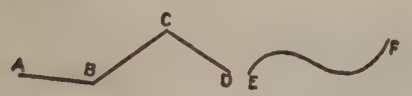
52. Geometrical Solid.—A geometrical solid is a limited portion of space.

53. Surface.—The boundaries of a geometric solid are called surfaces. Consider some water standing in a glass. The exposed surface of the water is neither air nor water, it is what is between the air and the water.

A sheet of paper is a representation of a surface, or rather of two surfaces, as its two faces are separated by the thickness of the paper.

54. Line.—A line is the intersection of two surfaces. Thus in the case of water standing in a glass the surface of the water meets the surfaces of the glass in a curved line or an approximate circle, if the glass is an ordinary drinking glass.

We have already considered the straight line in § 5.



55. Broken Line.—A broken line is composed of portions of straight lines. AB+BC+CD is a broken line.

56. Curved Line or Curve.—Any line which is neither straight nor broken is a curved line. EF is a curved line.

57. Motion in Geometry.—Since geometry is closely connected with mechanics, which discusses the motion of physical objects, we should see the relation of motion to the fundamental elements of geometry.

A moving point generates a line.

A moving line generates a surface unless it moves along itself.

A moving surface generates a solid unless it moves along itself.

58. Plane.—A definition of a plane can be given in terms of points and lines. A plane is a surface such that a straight line joining any two of its points lies wholly within the surface.

59. Theorem.—Geometry is the study of the properties of figures and the relations which exist between them. The results of these studies are formulated in statements called theorems. A theorem consists of two parts: the hypothesis and the conclusion. The *hypothesis* gives all the conditions which are granted or assumed. The *conclusion* gives the result of these conditions. From the stand point of the student, a theorem is something which is to be proved; that is, he is to reproduce the steps by which the original discovery was made.

60. Proof.—A proof is an argument or an ordered arrangement of statements by which we show the truth of an assertion. For each statement given, a reason must be assigned.

These reasons must be—

(1) granted in the hypothesis,
(2) an axiom or postulate,
(3) a definition,
(4) or a theorem which has itself been previously proved. The student must take every opportunity to learn what the axioms postulates, and definitions mean; then he will be able to write them in his own words.

Read every word in a theorem, and if there is a single word or phrase of which you do not know the exact meaning, consult the definitions; because you can not be honest with yourself if you attempt to prove something when you do not understand what it is you are about to prove.

61. Method of Writing a Proof.—

(1) Write the theorem.
(2) Draw a figure indicating what is given.
(3) Write down the hypothesis.
(4) Write down the conclusion.
(5) Draw a line down the middle of the page and for each step written on the left of the line give the reasons on the right. This method will be followed for only a part of the propositions.

62. Symbols.—

$+$ plus.	$\triangle$ triangle.
$-$ minus.	$\triangleq$ triangles.
$\times$ or multiplied by.	$\perp$ perpendicular, is perpendicular to.
$=$ equals.	$\perp s$ perpendiculars.
$\doteq$ equivalent, is equivalent to.	$\parallel$ parallel, is parallel to.
$\cong$ congruent, is congruent to.	$\parallel s$ parallels.
$\sim$ similar, is similar to.	$\square$ parallelogram.
$>$ is greater than.	$\square s$ parallelograms.
$<$ is less than.	$\bigcirc$ circle.
$\therefore$ therefore.	$\bigcirc s$ circles.
$\because$ since.	π ratio of the circumference to the diameter of a circle.
$\angle$ angle.	
$\measuredangle s$ angles.	

$\sqrt{}$ square root, $\sqrt{16}=4$.
$^\circ$ degrees.
$'$ minutes.
$''$ seconds.

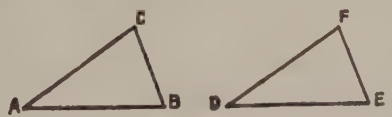
63. Abbreviations.—

Adj.	Adjacent.
Alt.	Alternate.
Ax.	Axiom.
Con.	Conclusion.
Cons.	Construction.
Corresp.	Corresponding.
Def.	Definition.
Ext.	Exterior.
Hyp.	Hypothesis.
Int.	Interior.
Post.	Postulate.
Rect.	Rectangle, Rectangular.
Rt.	Right.
Str.	Straight.
Sup.	Supplementary.

ANGLES, TRIANGLES AND PERPENDICULARS.

64. Theorem 1.—

If two triangles have two sides and the included angle of one equal respectively to two sides and the included angle of the other, the triangles are congruent.



Hyp. Given the triangles ABC and DEF, in which AB equals DE, AC equals DF, and the angle A equals the angle D.

Con. The triangle ABC is congruent to the triangle DEF.

Proof.

Statements.	Reasons.
1. Place the triangle ABC on the triangle DEF so that the side AB coincides with its equal DE, and so that the point A falls on the point D and the point B on the point E.	1. §14. Postulate. Any figure may be moved from place to place without altering its size or shape. § 32. Definition. The segment AB is equal to the segment DE if AB can be made to coincide with DE.
2. The side AC will coincide with the equal side DF since the angle A equals the angle D.	2. §32. Definition. Two angles which are equal can be made to coincide. Angle A equals angle D by hypothesis.
3. Point C will fall on point F.	3. Segment AC equals segment DF by hypothesis.
4. Point B now coincides with point E, hence the side BC coincides with the side EF.	4. §8. Postulate. One straight line, and only one can be drawn through two given points.
5. Triangle ABC is congruent to the triangle DEF.	5. §32. Definition. Two geometrical figures are congruent if they can be made to coincide in all their parts.

Let us consider the proof of the theorem. It is obvious that when one looks at the drawing alone it is impossible to tell what is given or what is to be proved. There are six statements which can be made regarding the two triangles, (we will use the symbols of §62.)

$\angle A = \angle D$
$\angle B = \angle E$
$\angle C = \angle F$
$AB = DE$
$BC = EF$
$CA = FD$

But in geometry it is not enough to tell the truth. I may write down six truths

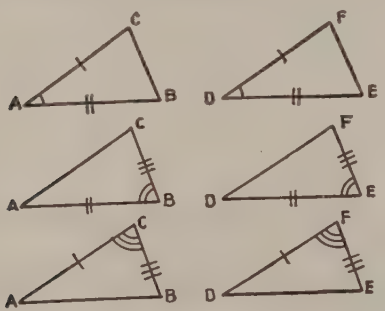
Water is wet.
The sky is blue.
The moon is a sphere.
There are seven days in the week.
Honesty is the best policy.
All crows are black.

It is impossible to trace any sequence in the above statements, or to show that one is the result of any number of the others, as is required in a geometric proof.

There are three ways in which the above figures can be used to prove the same theorem, starting with the three different hypotheses,

(1) $AB = DE$, $AC = DF$, $\angle A = \angle D$;
(2) $AB = DE$, $BC = EF$, $\angle B = \angle E$;
(3) $BC = EF$, $CA = FD$, $\angle C = \angle F$.

So it is especially important to know just which of these three cases has been chosen. This can often be indicated by markings on the equal segments and angles so that immediately on looking at the figure it will be possible to tell what facts are given in the hypothesis. The three figures below give in order the three possible hypotheses enumerated above.



From this point on we shall frequently make use of this method of indicating equal segments and angles.

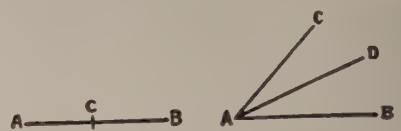
65. Theorem 2.—
If two triangles have a side and the two adjoining angles of one equal respectively to a side and the two adjoining angles of the other, the triangles are congruent.

Hyp. In the triangles ABC and DEF, AB equals DE, angle A equals angle D, and angle B equals angle E.
Con. The triangles ABC and DEF are congruent.

Statements.	Reasons.
1. Place triangle ABC on triangle DEF so that segment AB coincides with its equal DE, with A falling on D and B on E.	1. §14. Postulate. Any figure may be moved from place to place without altering its size or shape. §32. Definition. The segment AB is equal to the segment DE if AB can be made to coincide with DE.
2. Then the line AC will coincide with the line DF and the line BC with the line EF, since angle A equals angle D and angle B equals angle E.	2. Angles are equal by hypothesis. They will coincide by definition, §32.
3. Point C will coincide with point F.	3. §10. Postulate. Two straight lines can intersect in only one point.
4. Triangle ABC coincides with triangle DEF. They coincide in all their parts.	4. Definition, §32.

66. Isosceles Triangle.—An isosceles triangle has two of its sides equal.

67. Bisect.—



To bisect a segment AB is to find the point C in the interior of the segment so that $AC = CB$. In which case C is called the mid-point of AB.

To bisect an angle BAC is to draw the half-line or ray AD so that $\angle BAD \cong \angle DAC$ in which case AB is called the bisector of the angle BAC.

How to actually find the point C and the line AD with the ruler and compasses will be shown later.

68. Corresponding, or Homologous Parts.—When two geometrical figures can be made to coincide, any two segments which coincide are called corresponding, or homologous, segments, and any two angles which coincide are called corresponding, or homologous, angles.

Corresponding, or homologous parts, of congruent figures are equal.

69. Theorem 3.—
In an isosceles triangle the angles opposite the equal sides are equal.

Hyp. In the triangle ABC, the side AC equals the side BC.
Con. The angle A equals the angle B.

Statements.	Reasons.
1. Draw CD the bisector of the angle C, meeting the side AB in D. Then the angle ACD equals the angle DCB.	1. §67. Definition of bisection.
2. Side AC equals side BC.	2. Hypothesis.
3. Side CD equals side CD.	3. Identical.
4. Triangle ACD is congruent to triangle BCD.	4. §64. Theorem. If two triangles have two sides and the included angle of one respectively equal to two sides and the included angle of the other, the triangles are congruent.
5. Angle A equals angle B.	5. Corresponding angles of congruent triangles, §68.

70. Theorem 4.—If two angles of a triangle are equal, the triangle is isosceles.

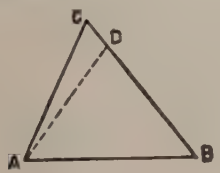
Hyp. Given $\triangle ABC$ with $\angle A = \angle B$.
Con. $AC = BC$ or $\triangle ABC$ is isosceles.

1. Suppose that EFG is ABC in a second position so that $ABC \cong EFG$.	1. Post. §14. Any figure can be moved from place to place without altering its size or shape.
2. Turn EFG over and place it on ABC so that F falls on A and E on B.	2. Post. §14. Same as above.
3. Since $\angle A = \angle B$, and $\angle B = \angle F$, $\angle A = \angle F$.	3. Ax. §46. Quantities that are equal to the same quantity or to equal quantities are equal to each other.

4. $\therefore$ the line FG falls along the line AC.	4. Def. §32. Relative to congruent angles.
5. Similarly the line EG falls on the line BC.	
6. Hence G will coincide with C.	6. Post. §10. Two straight lines can intersect in only one point.
7. GF = AC.	7. §32. Definition.
8. But GF = CB.	8. Const.
9. $\therefore$ AC = BC.	9. Ax. §46. Quantities that are equal to the same quantity or equal quantities are equal to each other.

71. Converse.—If the hypothesis and conclusion of a theorem are interchanged to form a new theorem, this theorem is called the converse of the original theorem. It will be observed that the theorem of §70 is the converse of the theorem of §69.

72. Theorem 5.—If one angle of a triangle is greater than a second angle, the side opposite the first angle is greater than the side opposite the second angle.



Hyp. Given $\triangle ABC$ with $\angle A > \angle B$.
Con. $BC > AC$.

1. Draw the line AD meeting the side CB in D forming the $\angle BAD = \angle CBA$.	1. Construction.
2. AD will be in the interior of the $\angle CAB$.	2. Ax. §49. The whole is greater than any of its parts.
3. AD + DC > CA.	3. Post. §12. A straight line is the shortest path between two points.
4. In $\triangle ABD$, $\angle DAB = \angle DBA$, $AD = BD$.	4. Construction. Theorem 4, §70. If two angles of a triangle are equal, the triangle is isosceles.
5. Substitute BD for its equal in 3, BD + DC > CA.	5. Ax. §47 A quantity may be substituted for its equal in an equation or in an inequality.
6. BD + DC = BC, $\therefore$ BC > CA.	6. Ax. §49. The whole is equal to the sum of its parts. Ax. §47. A quantity may be substituted for its equal in an equation or in an inequality.

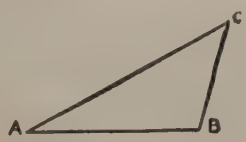
73. Proof by Exclusion.—Sometimes it is not possible or feasible to give a direct proof of a theorem, as has been done with the theorems so far considered. Another method is to make a complete enumeration of all the possible things which can happen and then to eliminate them one by one until there remains but a single possibility, and this must be the true condition of affairs.

The success of this method depends upon the completeness of the enumeration. Because a color is not green does not prove it is red. You do not necessarily find the letter which you were to mail and which you have concealed in a pocket, if you overlook a single pocket in going through your clothes.

In plane geometry a line is either perpendicular to another line or it is not perpendicular to it. Hence you have but two possibilities here; disprove one and you prove the other. In the case of two numbers x and y there are three possibilities, x greater than y, x less than y, or x equal to y; here you must show that two of these are impossible to be certain of the true result.

We shall now have opportunity to use this method.

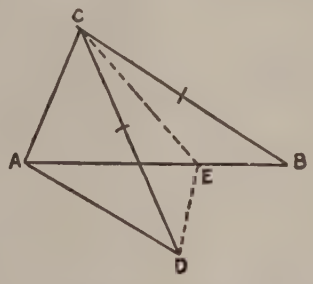
74. Theorem 6.—If one side of a triangle is greater than a second side, the angle opposite the first side is greater than the angle opposite the second side.



Hyp. Given $\triangle ABC$ with $AC > BC$.
Con. $\angle B > \angle A$.

1. There are only three possibilities regarding the $\angle A$ and B, (I) $\angle A = \angle B$, (II) $\angle A > \angle B$, (III) $\angle A < \angle B$.	1. §73.
2. (I) If $\angle A = \angle B$ then AC = BC, which is impossible.	2. Theorem 4. §70. If two angles of a triangle are equal the triangle is isosceles. Contradicts the hypothesis.
3. (II) If $\angle A > \angle B$ then CB > AC, which is impossible.	3. Theorem 5. §72. If one angle of a triangle is greater than a second angle, the side opposite the first angle is greater than the side opposite the second angle. Contradicts the hypothesis.
4. $\therefore \angle A < \angle B$ or $\angle B > \angle A$.	4. The only remaining possibility.

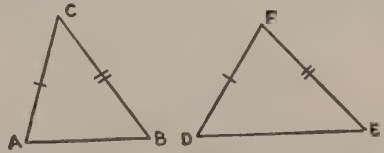
75. Theorem 7.—If two triangles have two sides of one respectively equal to two sides of the other, and the included angles unequal, the triangle which has the greater included angle has the greater third side.



Hyp. Given $\triangle ABC$ and ADC with AC = AC and CD = CB but with $\angle ACB > \angle ACD$.
Con. AB > AD.
Note. According to §14 we can imagine the two triangles moved until they have one pair of equal sides in common as AC.

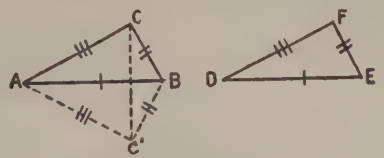
1. Draw CE the bisector of the $\angle DCB$ which meets AB in E.	1. §67.
2. CD = CB, CE = CE, $\angle DCE = \angle ECB$.	2. Hypothesis, Identical, Construction.
3. $\therefore \triangle DEC \cong \triangle BEC$.	3. Theorem 1, §64. If two triangles have two sides and the included angle of one respectively equal to two sides and the included angle of the other, the triangles are congruent.
4. DE = EB.	4. Corresp. parts of congruent triangles §68.
5. AE + ED > AD.	5. Post. §12. A straight line is the shortest distance between two points.
6. AE + EB > AD.	6. Replacing ED by its equal EB.
7. AB > AD.	7. Ax. §49. The whole is equal to the sum of all its parts.

76. Theorem 8.—If two triangles have two sides of one respectively equal to two sides of the other, and the third sides unequal, the triangle which has the greater third side has the greater included angle.



Hyp. Given $\triangle ABC$ and DEF with AC = DF, BC = EF, but DE > AB.
Con. $\angle DFE > \angle ACB$., or $\angle F > \angle C$.
Hint. There are only three possibilities; (1) $\angle C = \angle F$, by §73.
(2) $\angle C > \angle F$,
(3) $\angle C < \angle F$.
Prove that the first two are impossible hence the third must be true.

77. Theorem 9.—If two triangles have the three sides of one respectively equal to the three sides of the other, the triangles are congruent.



Hyp. Given the △ABC and DEF with AB = DE, BC = EF, and CA = FD.

Con. △ABC ≅ △DEF.

Let AB and DE be the longest sides of their respective triangles.

1. Suppose △DEF is brought into the position indicated by △ABC¹ so that DE coincides with its equal AB, D falling on A and E on B and F taking the position C¹.	1. Post. §14. Any figure may be moved from place to place without altering its size or shape.
2. Draw the line CC¹.	2 Post. §9. Two points determine a straight line.
3. AC = DF, DF = AC¹, ∴ AC = AC¹.	Ax. §47. A quantity may be substituted for its equal in an equation or in an inequality.
4. △C¹AC is isosceles and ∠ACC¹ = ∠AC¹C.	4. Theorem 3, §69. In an isosceles triangle the angles opposite the equal sides are equal.
5. In the same way ∠BCC¹ = ∠BC¹C.	
6. ∠ACC¹ + ∠BCC¹ = ∠AC¹C + ∠BC¹C.	6. Ax. §39. If equals are added to equals the sums are equal.
7. ∠ACB = ∠AC¹B.	7. Ax. §47. Same as above.
8. △ABC ≅ △AC¹B.	8. Theorem 1, §64. If two triangles have two sides and the included angle of one respectively equal to two sides and the included angle of the other, the triangles are congruent.
9. △AC¹B ≅ △DEF, ∴ △ABC ≅ △DEF.	9. Ax. §46. Quantities that are equal to the same quantity or to equal quantities are equal to each other.

78. Symmetrical Triangles.—Consider the three △, $A^1B^1C^1$, ABC, and $A^{11}B^{11}C^{11}$ with $AB = A^1B^1 = A^{11}B^{11}$, $BC = B^1C^1 = B^{11}C^{11}$, and $CA = C^1A^1 = C^{11}A^{11}$. If $\triangle A^1B^1C^1$ were cut out with a knife it

would be possible to slide it along to coincide with △ABC without removing it from its plane. In this case the two are called identical. But in order to make $\triangle A^{11}B^{11}C^{11}$ coincide with △ABC it is necessary to remove it from the plane and turn it over. Triangles ABC and $A^{11}B^{11}C^{11}$ are called symmetrical triangles.

Two triangles are identical when they have their sides arranged in the same order, symmetrical when they are arranged in the opposite order.

79. Vertical Angles.—Two angles are vertical when the sides of one are the prolongations of the sides of the other. See figure for theorem 10. Here are two pairs of vertical angles, ∠AOB, DOC and ∠AOD, BOC.

80. Theorem 10.—If two straight lines intersect each other, the vertical angles are equal.

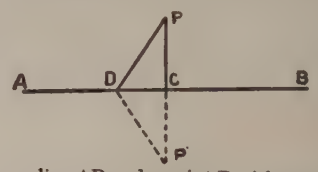
Hyp. Given the two pairs of vertical angles ∠AOB and ∠COD, ∠BOC and ∠AOD formed by the straight lines AC and BD intersecting in O.

Con. ∠AOB = ∠COD and ∠BOC = ∠AOD.

1. ∠AOB + ∠BOC = a straight angle.	1. Def. §27.
2. ∠BOC + ∠COD = a straight angle.	2. Def. §27.
3. ∴ ∠AOB + ∠BOC = ∠BOC + ∠COD.	3. Ax. §46. Quantities that are equal to the same quantity or equal quantities are equal to each other.
4. ∠AOB = ∠COD, subtracting ∠BOC from each side of the above equality. In the same way prove that ∠BOC = ∠AOD.	4. Ax. §40. If equals are subtracted from equals, the remainders are equal.

81. Theorem 11.—There is not more than one perpendicular from a given point without a line to a line.

(Note. We will assume that there is one perpendicular, the method of constructing this perpendicular will be given later on §240.)



Hyp. Given a line AB and a point P without the line, with PC ⊥ AB and PD any other line through P meeting AB in D.

Con. PD is not ⊥ AB.

1. Prolong PC through C to P^1 making $CP^1 = PC$ and draw DP^1.	1. Post. §11. A straight line may be prolonged any required length.
2. In △DPC and DP^1C, $\angle PCD = \angle P^1CD$.	2. Def. §35. All right angles are equal.
3. $PC = P^1C$.	3. Cons.
4. DC = DC.	4. Identical.
5. $\triangle DPC \cong DP'C$.	5. Theorem 1, §64.
6. $\therefore \angle PDC = \angle P'DC$.	6. Def. §68. Corresponding parts of congruent figures.
7. Since PCD′ is a straight line PDP′ can not be a straight line.	7. Post. §8. One straight line, and only one, can be drawn through two given points.
8. $\therefore \angle PDC + \angle P'DC$ is not a straight angle.	8. Def. §27.
9. $\therefore 2(\angle PDC)$ is not a straight angle.	9. Ax. §47. A quantity may be substituted for its equal in an equation or in an inequality.
10. ∴ ∠PDC is not one half of a straight angle or a right angle.	10. Ax. §42. If equals are divided by equals, the quotients are equal. Def. §27, 34. A right angle is one half of a straight angle.
11. PD is not ⊥ AB.	11. Def. §35.

When we know how to draw the one perpendicular PC to the line AB we will be able to prove the theorem below.

From a given point without an unlimited straight line one perpendicular can be drawn to the line, and but one.

82. Theorem 12.—

The perpendicular is the shortest line that can be drawn from a point to a straight line.

We will merely indicate the steps in the proof leaving the reader to fill in the reasons. Making use of the figure of the previous theorem we must prove that PC is less than PD.

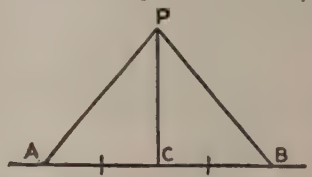
$PC = \frac{1}{2}(PP^1)$, $PD = \frac{1}{2}(PD + DP^1)$, but $PD + DP^1 > PP^1$.

$\therefore PD > PC$.

83. Oblique Straight Line.—Any line which is not perpendicular to a given line is oblique to the line.

84. Theorem 13 —

If two oblique straight lines drawn from a point to a straight line meet the line at equal distances from the foot of the perpendicular drawn from the point to the line, they are equal.



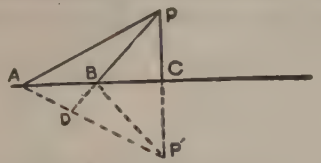
Hyp. PC is the ⊥ from P on AB, meeting it in C, the foot of the ⊥; PA and PB, two oblique straight lines, meeting AB in A and B respectively, so that AC = CB.

Con. AP = BP.

1. ∠ACP = ∠BCP.	1. Both are right angles.
2. PC = PC.	2. Identical.
3. AC = CB.	3. Hyp.

4. $\triangle ACP \cong \triangle BCP$.	4. Theorem 1, §64.
5. $AP = BP$.	5. Def. §68.

85. Theorem 14.—If two oblique straight lines drawn from a point to a straight line meet the line at unequal distances from the foot of the perpendicular, the more remote is the greater.



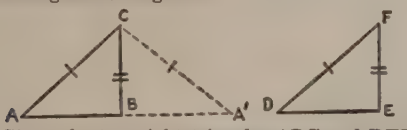
Hyp. C is the foot of the $\perp$ PC from P on AB. The two oblique lines PA and PB meet AB in A and B respectively so that $AC > BC$.

Con. $AP > PB$.

1. Prolong PC through C to P^1 so that $PC = CP^1$. Draw BP^1, AP^1. Let D be the intersection of AP^1 and PB, and if $AC > BC$ then D will be a point in the interior of the segment AP^1.	1. Post. §11.
2. $AD + AP > DP$.	2. Post. §12.
3. $AD + AP > DB + BP$.	3. Ax. §47.
4. $DB + DP^1 > BP^1$.	4. Post. §12.
5. Add the inequalities 3 and 4 $AD + AP + DB + DP^1 > DB + BP + BP^1$.	5. Ax. §45.
6. $DB = DB$.	6. Identical.
7. Subtract equation 6 from equation 5. $AD + AP + DP^1 > BP + BP^1$.	7. Ax. §44.
8. $AD + DP^1 = AP^1$.	8. Ax. §47.
9. $PA = AP^1$ and $PB = BP^1$.	9. Same proof as in Theorems 13, 84.
10. $2AP > 2BP$.	10. Ax. §47.
11. $AP > BP$.	11. Ax. §44.

86. Right Triangle.—A right triangle is a triangle which has one of its angles a right angle. The side opposite the right angle is called the hypotenuse. The other two sides are cal'ed the legs.

87. Theorem 15.—If two right triangles have the hypotenuse and a leg of one respectively equal to a hypotenuse and a leg of the other, the triangles are congruent.



Hyp. Given the two right triangles ABC and DEF with the right angles at B and E respectively. AC equals DF and CB equals FE.

Con. Triangle ABC is congruent to triangle DEF.

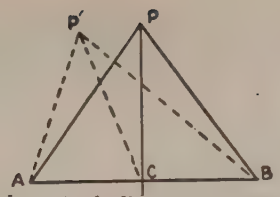
Hint. Place triangle DEF in the position CBA^1 so that FE coincides with its equal BC, E falling on B and F on C, while D takes the position A^1. Then ACA^1 is an isosceles triangle and $\angle A = \angle A^1$. (§69, Theorem 3. In an isosceles triangle the angles opposite the equal sides are equal.) Since $\angle A^1 = \angle D$, we have $\angle A = \angle D$. Now place triangle DEF on triangle ABC so that D falls on A and angle D coincides with its equal angle A. Since $AC = DF$, point F will coincide with C, while line DE falls along line AB. FE will fall along CB, since CB and FE are now perpendiculars from the same point to the same line. (§81. Theorem 11. From a given point without an unlimited straight line one perpendicular can be drawn to the line, and only one.) Hence CB coincides with FE and the triangle ACB and DEF are congruent.

88. Locus.—A locus consists of all points satisfying a given condition and of only those points satisfying the condition.

If you are given a box containing white and black balls and are told to sort out the white balls, you are to get all the white balls and none but the white balls.

In a locus problem you are to sort all the points in the plane and find those which satisfy the condition and those only. What makes the problem different from the sorting of the white and black balls is the fact that the number of points in the plane is very great, or infinite, so that in any particular problem some way must be likewise found to pick out a great number at once, such as finding a line, which consists of an infinite number of points, such that all the points of the line satisfy the condition.

89. Theorem 16.—The locus of points equidistant from two given points is the perpendicular bisector of the line joining them.



Hyp. PC is the $\perp$ to the line AB at its mid-point C.

Con. PC is the locus of points equidistant from A and B.

1. Let P be any point of the line PC and draw the lines AP and BP.	1. Pos. §9.
2. $AC = CB$, $\measuredangle ACP$ and BCP are rt. $\measuredangle$.	2. Hyp.
3. $\therefore \triangle APC \cong \triangle BCP$.	3. Theorem 15. §87.
4. $\therefore AP = BP$.	4. Corresponding parts of congruent triangles §68.

This proves that all points on CP are equidistant from A and B, but we must show that we have all points which are equidistant from A and B. Two methods are possible to complete the proof. First, we can show that all points which are equidistant from A and B are on PC. Second, we can show that any point which is not on PC can not be equidistant from A and B.

First Method.

5. Let P^1 be a point which is equidistant from A and B. Draw the straight lines AP^1, CP^1, and BP^1.	
6. $AP^1 = P^1B$, $AC = CB$, $P^1C = P^1C$.	6. Assumed in 5. Hyp. Identical.
7. $\therefore \triangle AP^1C \cong \triangle BP^1C$.	7. Theorem 9, §77.
8. $\therefore \angle P^1CA = \angle PCB =$ a rt. $\angle$. and P^1C is $\perp$ AB at C.	8. Corresponding parts of congruent triangles, §68. Def. §35.
9. $\therefore$ Lines PC and P^1C coincide, P^1 must be on CP.	9. Pos. §18.

Second Method.

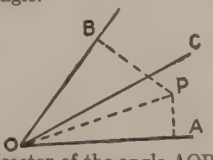
5. Let P^1 be a point which is not on CP^1, then draw AP^1, BP^1 and CP^1.	
6. P^1C cannot be $\perp$ AB at C $\angle ACP^1$ cannot equal $\angle BCP^1$.	6. Pos. §18. Def. §35.
7. Consider the $\measuredangle ACP^1$ and BCP^1, $AC = CB$, $P^1C = P^1C$, $\angle P^1CB > \angle P^1CA$.	7. Hyp. Identical. Reason in 6.
8. $P^1B > P^1A$.	8. Theorem 7. §75.

Hence any point P^1 not on PC is not equidistant from A and B.

90. Distance from a Point to a Line.—(Theorem 12, §82. The perpendicular is the shortest distance that can be drawn from a point to a line.) This is defined to be the distance from the point to the line.

91. Theorem 17.—

The locus of points equidistant from the sides of an angle is the bisector of the angle.



Hyp. OC is the bisector of the angle AOB.

Con. OC is the locus of all points equidistant from OA and OB.

1. Let P be any point such that its distance PB from the line OB equals its distance PA from the line OA. Draw OP.	1. Def. §90.
2. In $\measuredangle OAP$ and OPB, $OP = OP$, $PA = PB$, $\angle PBO = \angle PAO =$ a rt. $\angle$.	2. Identical. Assumed in 1. Def. §90.

3. $\therefore \triangle OAP \cong \triangle OBP$.	3. Theorem 15, §87.
4. $\therefore \angle AOP = \angle BOP$.	4. Corresponding angles of congruent triangles §68.
5. $\therefore$ OP coincides with OC, for an angle has but one bisector.	5. Ax. §42.

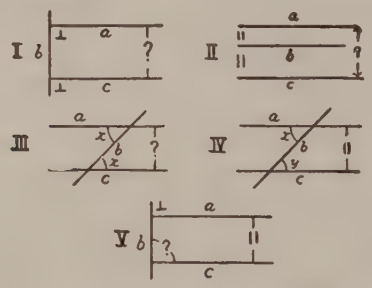
We now know that every point equidistant from OA and OB as P is on the bisector OC.

It remains to prove that every point on the bisector is equidistant from OB and OA.

6. Let P be considered as any point on OC and draw the $\perp$s PA and PB to OA and OB respectively, meeting them in A and B.	
7. Consider $\triangle OAP$ and OBP,	7.
$\angle POA = \angle POB$,	Hyp.
$OP = OP$.	Identical.
8. Place $\triangle OBP$ on $\triangle OAP$ so that $\angle POB$ coincides with its equal $\angle POA$, with line OB falling on OA and line OP falling on OP.	8. Pos. §14.
Since $OP = OP$, O and P will remain fixed.	
9. PB will coincide with PA.	9. Theorem 11, §81.
10. $\therefore$ PB = PA.	10. Corresponding parts of congruent triangles.
And every point as P on OC is equidistant from A and B.	

PARALLELS AND PARALLELOGRAMS.

92.—There are many propositions in geometry which have to do with the relations of three objects to each other. If we are given three objects a, b, and c, they can be formed into pairs in three ways, a, b; b, c; and a, c. When we know the relations existing between the elements of two of the pairs, the problem is to find the relation between the two elements of the third pair. We shall give a few examples below, and the reader is advised to study the situation as indicated in each drawing as they are all important geometrical theorems.



It is a sine qua non of geometry to recognize these theorems at once. In each case we have three lines given which are denoted by a, b, and c.

Case I. Line a is perpendicular to line b, line b is perpendicular to line c; the question is the relation of a to c. In symbols, $a \perp b$, $b \perp c$, b ? c. The answer is given in the theorem—Two straight lines perpendicular to the same straight line are parallel.

Case II. Line a is parallel to line b, line b is parallel to line c, the question is the relation of line a to line c. In symbols a ∥ b, b ∥ c, a ? c. The answer is given in the theorem,—Two straight lines parallel to the same straight line are parallel to each other.

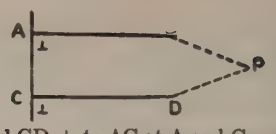
Case III. Line a forms the angle x with the line b, line c forms an angle equal to x with the line b; the question is the relation of line a to line c. The answer is given in the theorem,—When two straight lines are cut by a third, if a pair of corresponding angles are equal, the lines are parallel.

Case IV. Line a is parallel to line c, line b forms an angle x with the line a, line b forms an angle y with the line c; the question is the relation of angle x to angle y. The answer is the theorem,—If two parallel lines are cut by a third line, any two corresponding angles are equal.

Case V. a $\perp$ b, a ∥ c, b ? c. The answer is the theorem,—If a straight line is perpendicular to one of two parallel lines, it is perpendicular to the other.

93. Theorem 18.—

Two straight lines perpendicular to the same straight line are parallel.



Hyp. AB and CD $\perp$ to AC at A and C respectively.

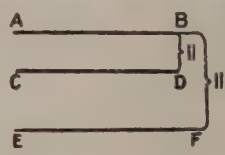
Con. AB ∥ CD.

1. There are only two possibilities, either AB is ∥ CD or AB is not ∥ CD. Suppose that AB meets CD, when they are prolonged, in a point P.	1. §73. There are only two possibilities.
2. This is impossible as we would have two perpendiculars from a point to a line.	2. §81, Theorem 11. From a given point without an unlimited straight line one perpendicular, and only one, can be drawn to the line.
3. $\therefore$ AB ∥ CD.	

94. Reductio ad absurdum.—The above proof is a sample of the proof called by some "reductio ad absurdum." It shows that any other assumption than the given one leads to an absurdity, which in geometry means to a violation of one of the postulates or axioms.

95. Theorem 19.—

Two straight lines parallel to the same straight line are parallel to each other.



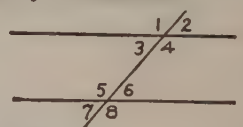
Hyp. CD and EF ∥ AB.

Con. CD ∥ EF.

1. Either CD is ∥ EF or CD is not ∥ EF.	1. §73. There are only two possibilities.
2. If CD is not ∥ EF, suppose they meet in a point P, then there are two lines through P ∥ AB, which is impossible.	2. §15. Pos. Through any point outside a given line, one line, and only one, can be drawn parallel to the given line.
3. Hence CD ∥ EF.	

96. Transversal.—A transversal is a line cutting two or more lines.

97. Angles Formed by a Transversal.—



Exterior angles 1, 2, 7, 8.

Interior angles 3, 4, 5, 6.

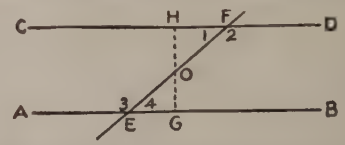
Alternate-interior angles, there are two pairs 3, 6; 4, 5.

Alternate-exterior angles, there are two pairs 1, 8; 2, 7.

Corresponding angles, there are four pairs 1, 5; 2, 6; 3, 7; 4, 8.

98. Theorem 20.—

When two straight lines are cut by a third, if the alternate interior angles are equal, the two straight lines are parallel.



Hyp. Given the line EF meeting the lines AB and CD in E and F respectively, forming the pairs of alternate interior angles 1, 4 and 2, 3, so that $\angle 1 = \angle 4$ and $\angle 3 = \angle 2$.

Con. Line AB is parallel to line CD.

1. Bisect EF and through the point of bisection O draw OH $\perp$ CD, meeting CD in H and AB in G.	1. §67. §81, Theorem 11.
2. Consider $\triangle OEG$ and OHF	2.
$OF = OE$,	Construction.
$\angle 1 = \angle 4$,	Hypothesis.
$\angle EOG = \angle FOH$,	§80, Theorem 10.
$\therefore \triangle OEG \cong \triangle OHF$.	§65, Theorem 2.
3. OG $\perp$ AB or HG $\perp$ AB, since $\angle OHF = \angle OGE$.	3. Corresponding angles of congruent triangles.
4. HG $\perp$ CD.	4. Construction.
5. $\therefore$ CD ∥ AB.	5. §93, Theorem 18.

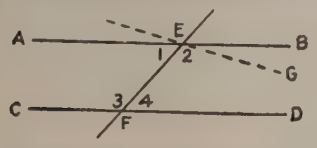
99. Theorem 21.—
When two straight lines are cut by a third, if a pair of corresponding angles are equal, the lines are parallel.

In referring to the figure of §97, it will be seen the equality of corresponding angles always demands the equality of the alternate interior angles, so the theorem follows from theorem 20.

100. Theorem 22.—
When two straight lines are cut by a third, if the sum of two interior angles on the same side of the transversal is equal to two right angles, the two lines are parallel.

Again referring to the figure of §97, if 4+6=two right angles, since 3+4=two right angles, then 3+4=4+6 or 3=6. Thus again we are brought to the equality of alternate interior angles.

101. Theorem 23.—
If two parallel lines are cut by a third line, the alternate interior angles are equal.



Hyp. Two parallel lines AB and CD are cut by the line EF in the points E and F respectively, forming the pairs of alternate interior angles 1 and 4, 2 and 3.

Con. 1=4 and 2=3.

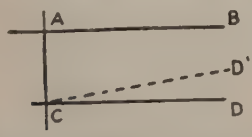
Hint. Draw the line EG through E so that ∠GEF=3, then EF meets CD and EG, so as to form equal alternate interior angles, and EG is parallel to CD. (§98, Theorem 20. When two straight lines are cut by a third, if the alternate interior angles are equal, the two straight lines are parallel.) But EG must coincide with AB, otherwise there are two lines through E parallel to CD, but this is impossible. (§15. Postulate. Through any point outside a given line, one line, and only one, can be drawn parallel to the given line.) ∴ ∠GEF=2=3.

102. Theorem 24.—
If two parallel lines are cut by a third straight line, any two corresponding angles are equal.

103. Theorem 25.—
If two parallel lines are cut by a third straight line, any two corresponding angles are equal.

Both these theorems follow at once from §101 using the figure and definitions of §97.

104. Theorem 26.—
If a straight line is perpendicular to one of two parallel lines it is perpendicular to the other.



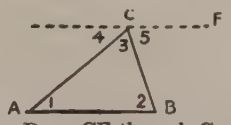
Hyp. AB parallel to CD and AB perpendicular to AC at A. CD meets AC in C.

Con. CD is perpendicular to AC at C.

Hint. Through C draw CD¹ perpendicular to AC, then AB is parallel to CD¹. (§93, Theorem 18. Two straight lines perpendicular to the same straight line are parallel.) Then CD and CD¹ coincide. (§15, Postulate. Through any point outside a given line, one line, and only one, can be drawn parallel to the given line.)

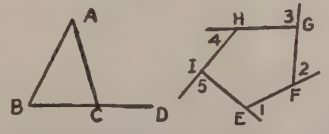
105. Theorem 27.—
If the sides of one angle are parallel respectively to the sides of another, the angles are either equal or supplementary. This follows at once from §101, §102, §103.

106. Theorem 28.—
The sum of the angles of any triangle is a straight angle.



Hint. Draw CF through C parallel to AB. Then 1=4, 2=5 alternate interior angles. 4+3+5=a straight angle, replacing 4 by its equal 1 and 5 by its equal 2 we have 1+2+3=a straight angle.

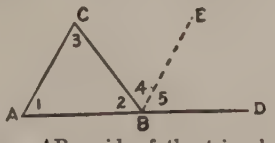
This is an important theorem. We may make the sides of a triangle vary as we please as long as the sum of any two sides is greater than the third, but the sum of the angles of a triangle is always the same. To know two angles of a triangle is the same as knowing all three; hence if two angles of one triangle are equal to two angles of another, the third angle of the first is equal to the third angle of the second.



107. Exterior Angle.—If a side of a triangle as BC is prolonged through a vertex C to a point D, the angle ACD is called an exterior angle of the triangle. Each triangle has six exterior angles, each side can be prolonged in two directions.

In the case of the polygon EFGHI, exterior angles are obtained by prolonging the sides in the same manner as for a triangle. 1, 2, 3, 4, 5 are one set of exterior angles, another set can be obtained by prolonging the sides in the opposite direction.

108. Theorem 29.—
Any exterior angle of a triangle is equal to the sum of the two opposite interior angles.

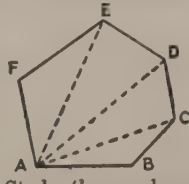


Hyp. AF, a side of the triangle ABC, is prolonged through B to a point D, giving the exterior angle CBD.

Con. ∠CBD=∠1+∠3.

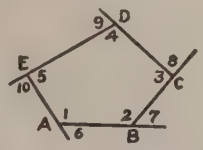
Hint. Draw BE through B parallel to AC. 3=4 and 1=5, therefore 1+3=4+5=∠CBD.

109. Theorem 30.—
The sum of the angles of a polygon of n sides is (n—2) straight angles.



Hint. Study the number of triangles that a polygon of n sides can be cut into and remember that the sum of the angles of each triangle is one straight angle.

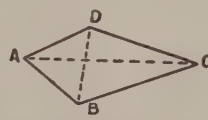
110. Theorem 31.—
The sum of the exterior angles of a polygon, made by producing each of its sides in succession, is equal to two straight angles.



By the previous theorem 1+2+3+4+5=(n—2) straight angles. At each vertex the sum of the interior and exterior angles is one straight angle, i.e., at A we have 1+6=a straight angle. Hence (1+6)+(2+7)+(3+8)+(4+9)+(5+10)=n straight angles. Subtracting the first equation from the second 6+7+8+9+10=n straight angles—(n—2) straight angles =2 straight angles.

111. Theorem 32.—
If the sides of one angle are perpendicular respectively to the sides of another, the angles are either equal or supplementary.

From a drawing it is evident that 1=5=4, but 1 is supplementary to both 2 and 3.

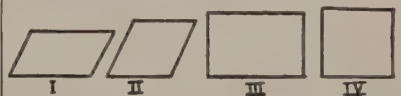


112. A quadrilateral is a portion of a plane bounded by four straight lines. The lines AB, BC, CD, DA are called the sides. The points A, B, C, D the vertices. The lines AC and BD joining the opposite vertices in pairs are the diagonals.

A trapezium is a quadrilateral no two of whose sides are parallel, I.

A trapezoid is a quadrilateral with two and only two sides parallel, II.

A parallelogram is a quadrilateral whose opposite sides are paralled, III.



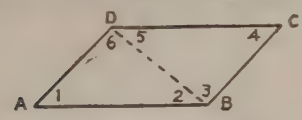
A rhomboid is a parallelogram whose angles are not right angles, and whose adjacent sides are unequal, I.

A rhombus is a parallelogram whose angles are not right angles, and whose adjacent sides are equal, II.

A rectangle is a parallelogram whose angles are right angles, III.

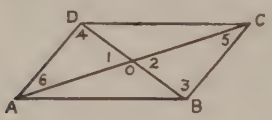
A square is a rectangle whose sides are equal, IV.

113. Theorem 33.—
The opposite sides of a parallelogram are equal, and the opposite angles are equal.



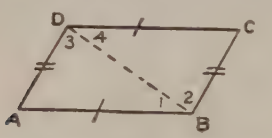
Hint. Draw the diagonal BD. Prove triangle ABD congruent to triangle BCD. (§65, Theorem 2. If two triangles have a side and the two adjoining angles of one respectively equal to a side and two adjoining angles of the other, the triangles are congruent). Hence DC equals AB, CB equals DA, and angle A equals angle C.

114. Theorem 34.—
The diagonals of a parallelogram bisect each other.



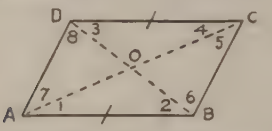
Hint. Prove triangles OAD and OBC congruent. AD=BC, 4=3, and 6=5. (§65, Theorem 2. If two triangles have a side and two adjoining angles of one respectively equal to a side and two adjoining angles of the other, the triangles are congruent.) Hence OB=OD and OA=OC.

115. Theorem 35.—
If the opposite sides of a quadrilateral are equal, the figure is a parallelogram.



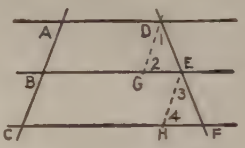
Hint. Draw the diagonal BD. Triangles ABD and BCD are congruent. (§77, Theorem 9. If two triangles have the three sides of one respectively equal to the three sides of the other, the triangles are congruent.) Hence the alternate interior angles 1 and 4 are equal and AB and DC are parallel. (§98, Theorem 20. When two straight lines are cut by a third, if the alternate interior angles are equal, the two straight lines are parallel.) In the same way since 2=3, the sides AD and BC are parallel.

116. Theorem 36.—
If two opposite sides of a quadrilateral are equal and parallel, the figure is a parallelogram.



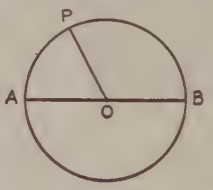
Hyp. AB and DC are parallel and equal.
Con. ABCD is a parallelogram.
Hint. Draw the two diagonals meeting at O. Prove triangles AOB and ODC congruent, then prove triangles OAD and OBC congruent. Then since the alternate interior angles 5 and 7 are equal the sides AD and BC are parallel.

117. Theorem 37.—
If a series of parallel lines cut off equal segments on one transversal, they cut off equal segments on any other transversal.



Hyp. The parallel lines AD, BE, CF cut off equal segments on AC or AB=BC.
Con. The parallel lines cut off equal segments on DF or DE=EF.
Hint. Draw through D, DG parallel to AB and through E, EH parallel to BC. Then ABGD and BCHE are parallelograms, hence DG=AB=BC=EH. Prove the triangles DGE and EHF congruent, 1=3, 2=4, and DG=EH. Therefore DE=EF corresponding sides of congruent triangles.

The Circle and the Measure of Angles.



118. Circle.—A circle is the curved line passing through all points in a plane which are at a given fixed distance from a fixed point of the plane. When there is no ambiguity a circle can be designated by its center.

119. Center of a Circle.—The fixed point is the center.

120. Radius.—A radius of a circle is a straight line drawn from the center to any point of the circle and is equal to the given fixed distance.

121. Diameter.—A diameter is a straight line passing through the center of the circle and having its two extremities on the circle.
In the above figure O is the center, OA and OB are radii, and AB is a diameter.

122. Circumference.—The length of a circle is the circumference. It is the distance traversed by a point in making a complete circuit of a circle.
Note. The word circle has two distinct meanings in ordinary language. We may mean the area bounded by the circumference or we may mean only the circumference itself. It is better, from the geometrical standpoint, to understand the circle to be a curved line and not the surface bounded by the line.
Note. A circle can be defined in terms of its locus properties, §88. A circle is the locus of points in a plane at a given fixed distance from a fixed point. When we choose a center and a radius we divide the points of the plane into three classes: (a) those which are at a greater distance from the center than the radius, and which are said to be outside the circle, (b) those which are at a lesser distance from the center than the radius, and which are said to be inside the circle: (c) those which are at the given distance and which constitute the circle itself.

123. Arc.—An arc is a continuous portion of a circle. AP is an arc.

124. Semicircle.—A semicircle is an arc which is half of a circle.

125. Major Arc.—An arc greater than a semicircle is a major arc.

126. Minor Arc.—An arc less than a semicircle is a minor arc.
If we choose two points as P and B, there are two arcs which have these for end points. A minor arc is described by a point which starts at P and moves clockwise to B, a major arc by a point which starts at P and moves counter clockwise to B. The addition of a point in the major arc will do away with this ambiguity, thus PB denotes the minor arc and PAB the major arc.

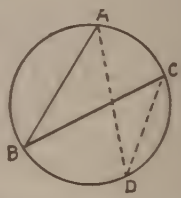
127. Central Angle.—A central angle is the angle formed by the radii of a circle. Since all radii pass through the center the vertex of a central angle is always at the center. Angle POB is a central angle.

128. Intercept and Subtend.—An angle is said to intercept an arc included between its sides and the arc is said to subtend the angle.
The angle POB intercepts the arc PB and the arc PB subtends the angle POB. Two parallel lines can also cut a circle in two pairs of points, thus they are said to intercept two arcs.

129. Chord.—A chord is a straight line joining the extremities of an arc, the chord is said to subtend the arc. Draw the line PB and you have a chord subtending the arc PB.

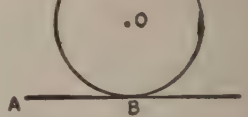
130. Segment.—A segment is a portion of the plane bounded by an arc of a circle and its chord.

131. Sector.—A sector of a circle is a portion of the plane included between an arc and the radii drawn to its extremities. The radii OA and OP with the arc AP bound a sector.



132. Inscribed Angle.—An angle whose vertex is on a circle and whose sides are chords is called an inscribed angle. Angle ABC is an inscribed angle. An angle is inscribed in a segment when its vertex lies on the arc of the segment and its extremities pass through the ends of the segment. Angles ABC and ADC are two angles inscribed in the same segment, the segment denoted by ABC, ADC or ABDC.

133. Concentric Circles.—Circles are concentric when they have the same center.



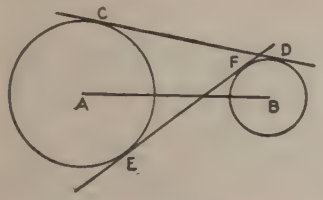
134. Tangent.—A straight line is said to be tangent to, or to touch a circle when it has but a single point in common with the circumference no matter how far the line is extended. The circle is also said to be tangent to the line. Line AB is tangent to the circle with center at O.

135. Point of Contact.—The single point which a line and circle have in common is called the point of contact.

136. Secant.—A straight line meeting a

circumference in two points is a secant.

137. Tangent Circles.—When two circles are tangent to the same line at the same point they are said to be tangent to each other or tangent circles. They are tangent internally or externally according as one circle lies entirely within or entirely without the other.



138. Common Tangent.—A line which is tangent to two circles is called a common tangent. An internal tangent as EF passes between the two circles. A tangent which does not pass between the circles is called an external tangent.

139. Line of Centers.—The line joining the centers of two circles is called the line of centers.

The following statements follow easily from the postulates and axioms.

140.—All radii of a circle are equal, also all diameters are equal.

141.—Two circles are congruent when their radii or diameters are equal.

142.—Two radii or diameters of equal circles are equal.

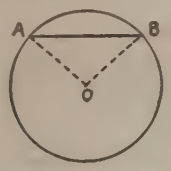
143.—Every diameter bisects the circle and its circumference.

144.—If the centers of two equal circles which lie in the same plane be made to coincide, the circles will coincide.

145.—A radius is equal to one half a diameter.

146. Theorem 38.—

The diameter of a circle is greater than any other chord.



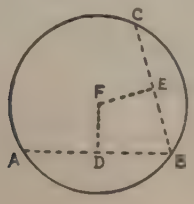
Hyp. AB is any chord of the given circle.

Con. AB is less than a diameter.

Draw the radii OA and OB. OA+OB >AB. (Postulate, §12. A straight line is the shortest distance between two points.) OA+OB is equal to a diameter. ∴ AB is less than a diameter.

147. Theorem 39.—

Through three points not lying in a straight line one circle, and only one, can be drawn.

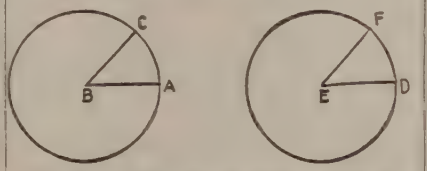


Hyp. Given the three points A, B, and C not in a straight line.

Con. One circle and only one can be drawn through A, B, and C. Imagine a circle drawn through A, B, and C and let F be the center of this circle. Then AF=BF=CF since they are radii of the same circle. Hence F must be on the perpendicular bisector of AB. (§89. The locus of points equidistant from two given points is the perpendicular bisector of the line joining them.) By the same reasoning F must be on the perpendicular bisector of CB. Hence F is the point of intersection of the perpendicular bisectors DF and EF. These two lines must intersect since if they do not they are parallel which means that A, B, and C are in a straight line. This proves that one center exists. There can not be more than one center because the two bisectors can only intersect in a single point.

148. Theorem 40.—

If in the same circle or in equal circles, two angles at the center are equal, the arcs which they intercept are equal.



Hyp. Given the two equal circles with the centers B and E, with the angles B and E equal which intercept the arcs AC and DF respectively.

Con. The arc AC equals the arc DF.

Place the circle with center D on the circle with center B so that the angle B coincides with its equal E. Then the two circles will coincide and the point A will coincide with D and the point C with the point F. Hence AC will coincide with DF, the two end points of an arc determine the arc. If the angles are in the same circle, one angle can be rotated until it coincides with the other.

Note. Many theorems in plane geometry contain the expression "in the same circle or equal circles." The shortest distance between any two points on the surface of a sphere is the arc of a certain circle passing through the two points and this circle always has the same radius no matter what two points are chosen so the theorems are at once useful for different circles on the sphere. When we speak of the distance between New York and London we do not mean the straight line distance but the distance measured along the circumference of a circle drawn on the earth joining the two points. Also when we compare the distances between two pairs of places we are comparing arcs of two different equal circles.

149. Theorem 41.—

If in the same circle, or in equal circles, two arcs are equal, the angles which they subtend at the center are equal.

The figure of theorem 40 can be used.

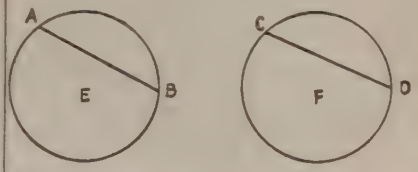
Hyp. Arcs AC and FD, drawn in the equal circles, are equal.

Con. Angles B and E are equal.

The proof is by superposition. Make the two circles coincide with the arcs AC and DF coinciding, then show that the angles B and E coincide. If the arcs are in the same circle make them coincide by a rotation.

150. Theorem 42.—

If in the same circle, or in equal circles, two arcs are equal the chords subtending them are equal.



Hyp. Given the equal circles E and F with the equal arcs AB and CD respectively.

Con. Chord AB equals the chord CD. The proof is by superposition.

151. Theorem 43.—

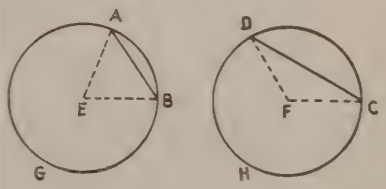
If in the same circle, or in equal circles, two chords are equal, the arcs subtended by them are equal. This is the converse of the previous theorem and the same method of superposition can be used.

Hyp. The chord AB equals the chord CD.

Con. The arc AB equals the arc CD.

152. Theorem 44.—

If in the same circle or in equal circles, two arcs, each less than a semicircle, are unequal, the chords subtending them are unequal; and the greater arc is subtended by the greater chord.



Hyp. Given the equal circles E and F with the unequal arcs AB and CD respectively, with minor arc DC greater than minor arc AB.

Con. Chord DC is greater than the chord AB.

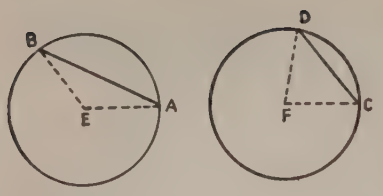
Draw the radii, EB, EA, FC, and FD. If the two circles are made to coincide, with FC coinciding with EB, then since arc DC is greater than arc BA, angle CFD is greater than angle BEA.

Consider the two triangles BEA and CFD. EB=EA=FC=DF, radii of the same or equal circles, but angle CFD is greater than angle BEA. (§75. If two triangles have two sides of one respectively equal to two sides of the other, and the included angles unequal, the triangle which has the greater included angle has the greater third side.) Hence DC is greater than BA.

Note. If we use the arcs which are greater than a semicircle as BGA and CHD, then the greater arc corresponds to the lesser chord.

153. Theorem 45.—

If in the same circle, or in equal circles, two chords are unequal, the arcs subtending them are unequal; and the greater chord subtends the greater arc, provided neither arc exceeds the semicircle.



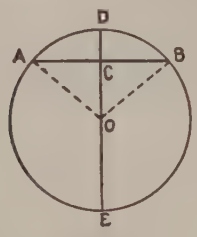
Hyp. Given the equal circles E and F with the chords AB and CD unequal and with AB greater than CD.

Con. Minor arc BA is greater than minor arc CD.

Draw the radii EA, EB, FC, and FD, which are all equal. Consider the triangles EAB and FCD. (§76. Theorem 8. If two triangles have two sides of one respectively equal to two sides of the other, and the third sides unequal, the triangle which has the greater third side has the greater included angle.) Therefore angle AEB is greater than angle CFD. Evidently the greater angle corresponds to the greater arc.

154. Theorem 46.—

The diameter perpendicular to a chord bisects the chord and the arcs which the chord subtends.

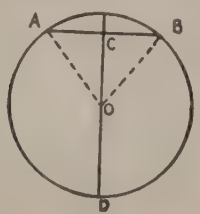


Hyp. The diameter ED is perpendicular to the chord AB, meeting it in the point C, and meeting the minor arc AB in the point D and the major arc AEB in the point E.

Con. AC equals CB, arc AD equals arc DB, and arc AE equals arc EB. Draw the radii OA and OB, which are equal. The right triangles OCA and OCB have OC common and AO equal to OB. (§87. Theorem 15. If two right triangles have the hypotenuse and a leg of one respectively equal to the hypotenuse and a leg of the other, the triangles are congruent.) Hence AC = CB. Also angle AOC equals angle COB. (§148. Theorem. Equal angles at the center subtend equal arcs.) Hence arc AD equals arc DB. Arc DAE equals arc DBE since both are semicircles. Subtracting the equal arcs AD and DB we have arc AE equals arc BE. (§40. Axiom. If equals are subtracted from equals, the remainders are equal.)

155. Theorem 47.—

The perpendicular bisector of a chord passes through the center of the circle.



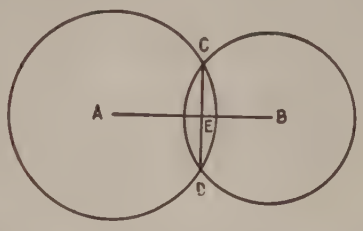
Hyp. CD is the line perpendicular to the chord AB at its mid-point C.

Con. CD passes through O, the center of the circle.

Draw OA and OB radii of the circle. All radii of the same circle are equal, hence OA equals OB, thus O is a point equidistant from A and B. (§89. Theorem 16. The locus of points equidistant from two given points is the perpendicular bisector of the line joining them.) Therefore O is on CD.

156. Theorem 48.—

When two circles intersect each other the straight line through their centers is the perpendicular bisector of their common chords.



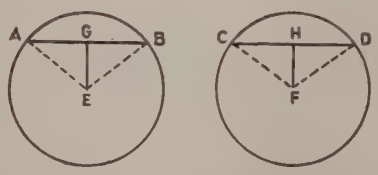
Hyp. The two given circles A and B intersect in C and D. CD is the common chord and AB the line of centers, intersecting in the point E.

Con. AB is the perpendicular bisector of CD.

If AB is not the perpendicular bisector of AB, draw the line perpendicular to CD at its midpoint. By the previous theorem, the line just drawn will pass through the centers of both circles, hence through the points A and B. Hence AB is the perpendicular bisector of AB. (§8. Postulate. One straight line, and only one, can be drawn through two given points.)

157. Theorem 49.—

If in the same circle, or in equal circles, two chords are equal, they are equally distant from the center.



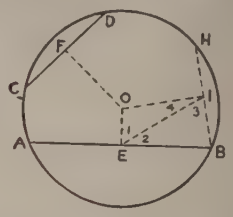
Hyp. Given the equal circles E and F with the equal chords AB and CD respectively. EG and FH the perpendiculars from the centers on their respective chords.

Con. EG equals HF.

Draw the radii FA and FC, which are equal. (§154. Theorem 46. The diameter perpendicular to a chord bisects the chord and the arc which the chord subtends.) Hence AG = ½AB and CH = ½CD but by hypothesis AB = CD, therefore AG = CH. (§46. Postulate. Quantities that are equal to the same quantity or to equal quantities are equal to each other.) Consider the right triangles AGE and CHF. (§87. Theorem. If two right triangles have a leg and the hypotenuse of one equal to a leg and the hypotenuse of the other, the triangles are congruent.) Therefore AGE and CHF are congruent and GE equals FH. The case where they are chords of the same circle permits of the same proof.

158. Theorem 50.—

If in the same circle, or in equal circles, two chords are unequal, the greater chord is at the less distance from the center.



Hyp. Chord AB is greater than the chord DC. OE is the perpendicular from O on AB, meeting it in E, and OF the perpendicular from O and CD, meeting it in F.

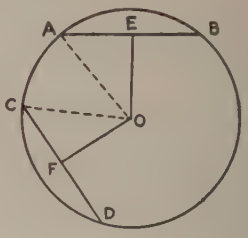
Con. OF is greater than OE.

Let BH be a chord equal to CD and let OI be the perpendicular from O on BH, meeting it in I. By the previous theorem OI equals OF. Draw EI. EB = ½AB and BI = ½BH. Since AB is greater than CD or its equal BH, EB is greater than BI. (§44. Axiom. If unequals are operated on by positive unequals in the same way, the results are unequal in the same order.) In the triangle EBI angle 3 is greater than angle 2. (§74. Theorem. If one side of a triangle is greater than a second side, the angle opposite the first side is greater than the angle opposite the second side.) $\angle 4 + \angle 3 =$ a right angle, $\angle 1 + \angle 2 =$ a right angle, therefore $\angle 1 + \angle 2 = \angle 3 + \angle 4$. But $\angle 2 < \angle 3$ therefore $\angle 4 < \angle 1$. (§45, Axiom. If unequals are subtracted from equals the remainders are unequal in the reverse order.) Now consider triangle OEI with $\angle 4$ less than $\angle 1$; side OE is less than side OI. (§72. Theorem. If one angle of a triangle is greater than a second angle, the side opposite the first angle is greater than the side opposite the second angle.) If OE is less than OI, then OE is less than OF.

Note. The proof when the chords are in different circles is the same.

159. Theorem 51.—

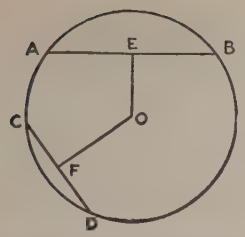
If in the same circle, or in equal circles, two chords are equally distant from the center, they are equal.



Hint. Prove that the two right triangles OEA and OCF are congruent. (§87. Theorem 15. If two right triangles have the hypotenuse and a leg of one respectively equal to the hypotenuse and leg of another, the triangles are congruent.)

160. Theorem 52.—

If in the same circle, or in equal circles, two chords are unequally distant from the center, the chord at the less distance is the greater.



Hyp. OE the perpendicular distance from O, the center of the circle to the chord AB, and OF the perpendicular distance to the chord CD. OF is greater than OE.

Con. AB is greater than CD.

Hint. Use the method of exclusion. There are three possibilities;

(a) AB equal to CD,

(b) AB less than CD,

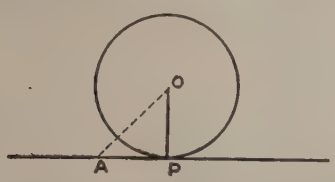
(c) AB greater than CD.

§157. **Theorem 49.**—If in the same circle, or in equal circles, two chords are equal, they are equally distant from the center. This would require in case (a) that OE equals OF, which is impossible.

§158. **Theorem 50.**—If in the same circle or in equal circles, two chords are unequal, the greater chord is at the less distance from the center. This would require in case (b) that OE was greater than OF. Hence only (c) remains as possible.

161. Theorem 53.—

A straight line tangent to a circle is perpendicular to the radius drawn to the point of contact.



Hyp. PA is the tangent to the circle O at the point P.

Con. AP is perpendicular to the radius OP at P.

From the definition of a tangent §134 it follows that the line AP is entirely outside the circle. Take any other point A of the tangent AP and draw AO. Evidently OA is greater than OP, and the least distance from O to AP is OP. Hence OP is perpendicular to AP. (§82. Theorem. The perpendicular is the shortest line that can be drawn from a point to a straight line.)

Note. This shows there is only one tangent to a circle at a given point. (§18. Postulate. From a given point in a given line, one perpendicular, and only one, can be drawn to the line.)

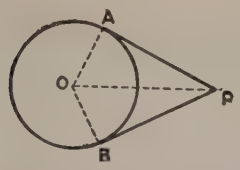
162. Theorem 54.—

A perpendicular to a tangent at the point of contact passes through the center of the circle.

Hint. There is only one tangent at a point and this tangent is perpendicular to the radius drawn to the point of contact by a previous theorem.

163. Theorem 55.—

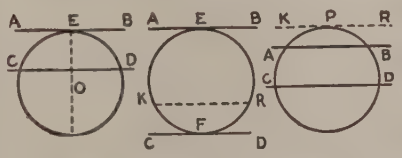
The tangents drawn to a circle from an external point are equal.



Hint. (§161. Theorem 53. A straight line tangent to a circle is perpendicular to the radius drawn to the point of contact.) Hence A and B are right angles. OA and OB are equal radii of the same circle and OP is common to the two right triangles OPA and OBP. (§87. Theorem 15. If two right triangles have the hypotenuse and a leg of one respectively equal to the hypotenuse and a leg of the other, the triangles are equal.) Therefore AP equals BP.

164. Theorem 56.—

Two parallel lines intercept equal arcs on a circle.



Case I Case II Case III

Case I. Only one of the parallels is tangent to the circle.

Hyp. Given AB tangent to the circle at E and CD parallel to AB meeting the circle in C and D.

Con. Arc EC equals arc ED.

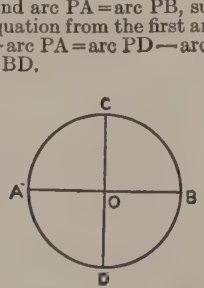
Draw EO which is perpendicular to AB. (§161. Theorem 53. A straight line tangent to a circle is perpendicular to the radius drawn to the point of contact.) Then OE is perpendicular to CD also. (§104. Theorem 26. If a straight line is perpendicular to one of two parallel lines it is perpendicular to the other also.) Arc CE equals ED. (§154. Theorem 46. The diameter perpendicular to a chord bisects the chord and the arcs, which the chord subtends.)

Case II. Both parallels are tangents.

Hint. Draw a line KR parallel to AB and meeting the circle in KR. By case I, arc EK = arc ER, and arc KF = arc FR, add these two equations and we have arc EK + arc KF = arc ER + arc RF or arc EKF = arc ERF.

Case III. Both parallels are secants.

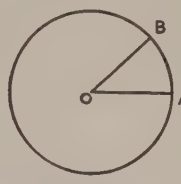
Hint. Draw KR parallel to AB and tangent to the circle at P. Then arc PC = arc PD and arc PA = arc PB, subtract the second equation from the first and we have arc PC − arc PA = arc PD − arc PB or arc AC = arc BD.



165. Measurement of Angles.—If we draw two perpendiculars diameters of a circle as AB and CD we divide the circumference of the circle into four equal arcs AD, BD, BC, and AC and they correspond to the four equal right angles at O. In the same way if we divide the circumference into any number of equal parts and draw the radii to the points of division we will have the same number of equal angles formed at the center of the circle.

166. Degree of Arc.—If the circumference of a circle is divided into 360 equal parts, one of these parts is called a degree of arc. This corresponds to dividing an arc like BC into 90 equal parts.

167. Degree.—If a right angle is divided into 90 equal angles, we call each angle an angle of one degree. Symbol °, A right angle = 90°.

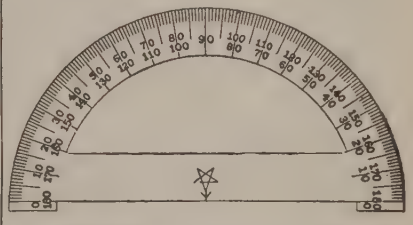


Minute.—If a degree is divided into 60 equal angles, each angle is called a minute. Symbol ′. 1° = 60′.

Second.—If a minute is divided into 60 equal angles, each angle is called a second. Symbol ″. 1′ = 60″.

A central angle is measured by its intercepted arc, where the angle is measured in angle degrees and the arc in arc degrees. When we say that AOB = 45°, we mean that ∠AOB is 45/360 of two straight angles or four right angles. When we say the arc AB is 45° we mean it is 45/360 of the circumference of the circle.

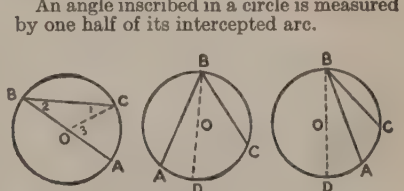
The numbers used in the measuring of the angle and the arc which it subtends are chosen so as to be the same for the sake of convenience. If the railroad fare were one cent a mile, then the number giving the miles would be the same as the number giving the cost of a ticket in cents, it does not mean that one cent is the same as one mile.



168. Protractor.—Based on the ideas just explained, the instrument in common use for the measurement of angles is called a protractor and is illustrated above.

169. Theorem 57.—

An angle inscribed in a circle is measured by one half of its intercepted arc.



Case I Case II Case III

Hyp. Given the inscribed angle ABC, intercepting the arc AC.

Con. Angle ABC is measured by one half the arc AC.

Case I. When one side passed through the center O.

Draw OC. Then triangle OBC is an isosceles triangle and $\angle 1 = \angle 2$. §69. Theorem. In an isosceles triangle the angles opposite the equal sides are equal.) But $\angle 3$ equals $\angle 1 + \angle 2$. (§108. Theorem. The exterior angle of a triangle is equal to the sum of the two opposite interior angles.) But by the previous section $\angle 3$ is measured by the arc AC, hence $\angle 2$, which is one half of $\angle 3$, is measured by one half the arc AC.

Case II. When the center of O falls inside the angle.

Hint. Draw the diameter BO meeting the circle in D. Then $\angle ABD$ is measured by one half arc AD and $\angle DBC$ is measured by one half the arc DC. Adding, we have $\angle ABC$ measured by one half arc AC.

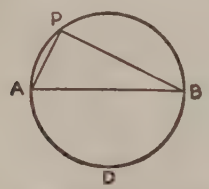
Case III. When the center O falls outside the angle.

Hint. Draw the diameter BO meeting the circle in D. $\angle ABC = \angle DBC - \angle DBA$. Apply case I to each of these angles.

If AC is 80 arc degrees, then angle B is 40 angle degrees.

170. Theorem 58.—

An angle inscribed in a semi-circle is a right angle.



Hyp. Angle APB is angle inscribed in a semi-circle.

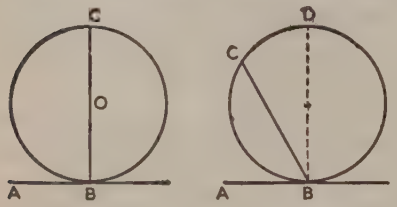
Con. Angle APB is a right angle.

By the previous theorem, APB is measured by one half the arc ADB which is a semi-circle. One half a semi-circle is 90 arc degrees, hence APB is 90 angle degrees.

Note. However P moves about the circle the angle APB will always be a right angle. The locus of a point which subtends a right angle with two fixed points is a circle having the two points for the extremities of a diameter.

171. Theorem 59.

An angle formed by a tangent and a chord through the point of contact is measured by one-half the intercepted arc.



Case I Case II

Hyp. Given an angle formed by a tangent at B, AB, and a chord CB.

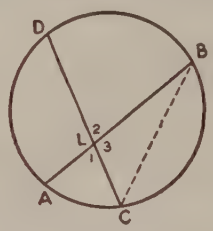
Con. The angle is measured by one-half the intercepted arc.

Case I. BC passes through O, the center of the circle. §161 Theorem 53. A straight line tangent to a circle is perpendicular to the radius drawn to the point of contact. Hence angle ABC is a right angle, or 90°. The intercepted arc BC is 180° arc degrees. Therefore $\angle ABC = \frac{1}{2}$ arc BC.

Case II. BC does not pass through O, the center of the circle. Draw the diameter BO meeting the circle in D. §169 Theorem 57. An angle inscribed in a circle is measured by one-half its intercepted arc. Therefore $\angle CBD = \frac{1}{2}$ arc CD. $\angle ABD = \frac{1}{2}$ arc ACD by Case I. Subtracting $\angle ABC = \frac{1}{2}$ arc BC.

172. Theorem 60.

An angle formed by two chords intersecting each other within a circle is measured by one-half the sum of the arc intercepted between its sides and the arc intercepted between the sides of its vertical angle.



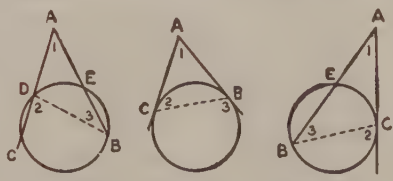
Hyp. Chords AB and CD intersecting in L to form the angle 1 and 2 which are vertical angles.

Con. $\angle 1$ and $\angle 2$ are measured by $\frac{1}{2}$ (arc AC+arc DB).

Draw CB. $\angle 1 = \angle B + \angle C$. (§108. Theorem 29. Any exterior angle of a triangle is equal to the sum of the two opposite interior angles.) $\angle C$ is measured by $\frac{1}{2}$ arc DB and $\angle B$ is measured by $\frac{1}{2}$ arc AC. (§169. Theorem 57. An angle inscribed in a circle is measured by one-half its intercepted arc.) Hence $\angle 1 = \angle 2$, is measured by $\frac{1}{2}$ (arc AC+arc DB).

173. Theorem 61.

An angle formed by two secants, or two tang nts, or a secant and a tangent, intersecting without a circle, is measured by one-half the difference of the intercepted arcs.



Case I Case II Case III

Case I. Hyp. AB and AC are two secants meeting in the point A, outside the circle.

Con. Angle A is measured by $\frac{1}{2}$ (arc BC — arc ED).

Draw DB. $\angle 2 = \angle 3 + \angle 1$. (§108. Theorem. Any exterior angle of a triangle is equal to the sum of the two opposite interior angles.) Therefore $\angle A = \angle 1 = \angle 2 - \angle 3$. $\angle 2$ is measured by $\frac{1}{2}$ arc BC, $\angle 3$ is measured by $\frac{1}{2}$ arc ED (§169. Theorem 57. An angle inscribed in a circle is measured by one-half its intercepted arc). Hence A is measured by $\frac{1}{2}$ (arc BC — arc ED).

Case II. Hint. $\angle 3 = \angle 2 + \angle 1$, therefore $\angle 1 = \angle 3 - \angle 2$.

Case III. Hint. $\angle 2 = \angle 3 + \angle 1$, therefore $\angle 1 = \angle 2 - \angle 3$.

Similar Polygons

We are perfectly familiar in every day life with objects which are just alike except for size. We speak for instance of enlarging a photograph to be two or three times its original size, or of drawing a map to a certain scale so that one inch represents a mile. It will be the purpose of the present chapter to give expression to these ideas in precise gometrical language.

174. Measurement.—The first problem of measurement is that of determining a length. The unit of length must be an arbitrary distance, the straight line distance between two marks on a rod which is fixed as the standard unit.

Each government preserves a platinum rod on which is indicated the standard unit of length and all other units are derived from this by comparison. The French government at the time the metric system was established intended that the unit of length, the meter, should depend upon the size of the earth; but the data upon which the calculations were made have since been found to be incorrect, so that the meter is also an arbitrary distance.

A E F B C D

What do I mean when I say that the rod or line AB is 3 feet long? If I take a rod or line CD, one foot long, and make it coincide with the line AB so that C coincides with A, then D will fall at some point E, and AE will be one foot, repeating the operation on EB, D will fall on some point F, again repeating the operation on FB, if D coincides with B, I say that AB is 3 feet long. When I wish to measure 5 inches, I must divide CD into 12 equal parts and measure off one of these units 5 times.

175. Ratio.—The ratio of one magnitude a to another magnitude b is the quotient resulting from dividing a by b or a/b. It is read, the ratio of a to b. The numerator a is called the antecedent and the denominator b is called the consequent.

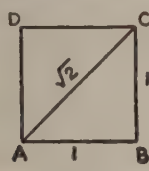
176. Relation of Ratio to Measurement.—When we measured the rod AB in §174 we were in reality finding the ratio of AB to the unit length CD, that is AB/CD=3. In finding the value of a geometric ratio it is very important that the two distances are measured in the same units. If we were allowed to measure AB in inches while CD was measured in feet, AB/CD=36/1=36. Thus any number of values could be obtained for the ratio, if this essential is neglected. The true value of the ratio is independent of the units used; thus if both AB and CD are expressed in inches AB/CD=36/12=3.

177. Difficulties in Measurement. — There are difficulties in an exact treatment of measurement, which correspond to certain complications in our number system. We will illustrate some of these difficulties and show how they are related to measurement.

If we try to express 1/3 as a decimal we have a never ending sequence, 1/3=.33333 . . . which is the same as 3/10+3/100+3/1000+3/10000 . . . This means that if we have any numbers of rods 1/10, 1/100, 1/1000 . . of an inch long and take 3 of the 1/10 inch rods, 3 of 1/100 inch rods, 3 of 1/1000 inch rods and place them end

to end we will obtain a length which is only approximately 1/3. No matter how many such rods we take we can never obtain exactly 1/3 of an inch. The mathematician prefers if possible to solve his problem in a definite number of steps. Perhaps we can imagine an infinite number of steps, but life is short and we can actually carry out only a finite number. Of course we can obtain 1/3 of an inch by dividing an inch into 3 equal parts.

But we now come to a difficulty that cannot be dismissed so easily.



If we take a square ABCD with each side one inch, then the length of the diagonal AC is $\sqrt{2}$ inches. What shall we mean by the ratio AC/AB? We should call this $\sqrt{2}$. But how are we to interpret it in terms of measurement? $\sqrt{2} = 1.4142\ldots. = 1+4/10+1/100+4/1000+2/10000\ldots.$ We can take a rod 1 inch long, 4 rods 1/10 inch long, one rod 1/100 inch long, 4 rods 1/1000 inch long, ...put them end to end and obtain an approximation to AC. In the case of 1/3 we could escape the difficulty by trisecting the unit instead of repeatedly dividing it into 10 parts, but there is no such escape here. There is no finite number of parts into which AB can be divided so that their sum will be exactly equal to AC. This is only a theoretical difficulty as it is evident that we can calculate the value of $\sqrt{2}$ as closely as we please. What gives the mathematician concern is that he must use an infinite number of processes to obtain the exact result, and these can only be carried out in the imagination.

178. Commensurable Magnitudes.—Two magnitudes are said to be commensurable when there exists a unit of measure which is contained an integral number of times in each. Lines of length 2 1/3 feet and 4 3/5 feet are commensurable, for $2\ 1/3 = 7/3 = 35/15$ and $4\ 3/5 = 23/5 = 69/15$, thus 1/15 of a foot is contained 35 times in 2 1/3 feet and 69 times in 4 3/5 feet.

179. Incommensurable Magnitudes.—Two magnitudes are said to be incommensurable when there is no unit of measure which is contained an integral number of times in each. As explained in §177, $\sqrt{2}$ and 1 are incommensurable.

180. Proportion.—Four magnitudes a, b, c, and d, are in proportion if the ratio of the first pair equals the ratio of the second. Symbol $a/b = c/d$ or $a:b = c:d$. This is read, a is to b as c is to d or a divided by b equals c divided by d.

There are many different forms that can be derived from the equality $a/b = c/d$ by use of the axioms.

I. Thus if $a/b = c/d$,

$1 = 1$, identity,

$a/b + 1 = c/d + 1$, §39,

therefore $\frac{a+b}{b} = \frac{c+d}{d}$ reducing to a common denominator. This is called the addition theorem of proportion.

II. Again, if $a/b = c/d$,

Then $bd(a/b) = bd(c/d)$, §41,

Thus $ad = bc$, reducing.

Dividing by cd, $\frac{ad}{cd} = \frac{bc}{cd}$ §42.

Reducing $a/c = b/d$.

This is called the alternation theorem in proportion.

III. Given $\frac{a}{b} = \frac{a_1}{b_1} = \frac{a_2}{b_2} = \frac{a_3}{b_3}$.

Con. $\frac{a+a_1+a_2+a_3}{b+b_1+b_2+b_3} = \frac{a}{b} = \frac{a_1}{b_1} = \ldots\ldots$

Let $\frac{a}{b} = \frac{a_1}{b_1} = \frac{a_2}{b_2} = \frac{a_3}{b_3} = r$.

Then $a = br$,

$a_1 = b_1 r$,

$a_2 = b_2 r$,

$a_3 = b_3 r$.

Adding $a + a_1 + a_2 + a_3 = br + b_1 r + b_2 r + b_3 r$,

$= (b + b_1 + b_2 + b_3) r$.

$\therefore \quad \frac{a+a_1+a_2+a_3}{b+b_1+b_2+b_3} = r$.

Hence $\frac{a+a_1+a_2+a_3}{b+b_1+b_2+b_3} = \frac{a}{b} = \frac{a_1}{b_1} = \ldots\ldots$

This is called the general addition theorem in proportion.

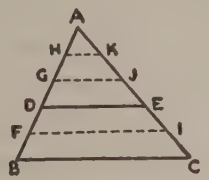
IV. **Mean Proportional.**—A mean proportional between two magnitudes a and b is the magnitude x defined by $a/x = x/b$, or $x = \sqrt{ab}$.

V. If $a/b = c/d$,
then $b/a = d/c$.

This is called the inversion theorem in proportion.

181. Theorem 62.—

A straight line parallel to the base of a triangle divides the other two sides proportionally.



Hyp. The line DE parallel to the base BC of the triangle ABC meets AB in D and AC in E.

Con. $\frac{AD}{DB} = \frac{AE}{EC}$

First we shall prove the so called commensurable case, that is where it is possible to find a segment as BF which is contained an integral number of times in the two segments BD and DA.

For the sake of clarity we will assume that BF is contained 2 times in BD and 3 times in DA. Let F, G, and H be the points corresponding to the division of the segments into multiples of BF. Then draw through each of the points F, G, and H, lines parallel to BC which meets AC in the points I, J, and K. Then by §117, Theorem 37. (If a series of parallel lines cut off equal segments on one transversal they cut off equal segments on any other transversal.) $CI = IE = EJ = JK = KA$

Hence $\frac{AD}{BD} = \frac{3(BF)}{2(BF)} = \frac{3}{2}$, and $\frac{AE}{EC} = \frac{3(IC)}{2(IC)} = \frac{3}{2}$

Therefore $\frac{AD}{BD} = \frac{AE}{EC}$, (§46, Axiom. Things equal to the same things are equal to each other).

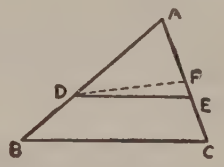
The proof of the incommensurable case goes beyond the work in a first reading of geometry.

It follows also by the method of §180, that $\frac{AD}{AB} = \frac{AE}{AC} = \frac{3}{5}$.

182. Theorem 63.

If a straight line divides two sides of a triangle proportionally, it is parallel to the third side.

This is the converse of the previous theorem.



Hyp. DE meets the sides AB and AC of the triangle ABC in the points D and E respectively, so that $\frac{AD}{DB} = \frac{AE}{EC}$

Con. DE is parallel to BC.

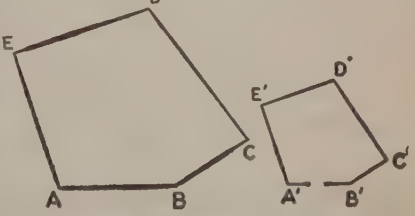
DE is either parallel to BC or it is not.

If it is not parallel, draw DF parallel to BC through D, meeting AC in F; but by the previous theorem, $\frac{AD}{DB} = \frac{AF}{FC}$ or $\frac{AD}{AB} = \frac{AF}{AC}$.

But if $\frac{AD}{DB} = \frac{AE}{EC}$ then $\frac{AD}{AB} = \frac{AE}{AC}$ by the previous theorem. Hence $\frac{AE}{AC} = \frac{AF}{AC}$ (§46 Axiom. Things equal to the same things are equal to each other.) Then $AE = AF$ (§41 Axiom. If equals are multiplied by equals the products are equal.) Therefore E coincides with F.

183. Polygon.—A polygon is a plane figure bounded by three or more straight lines. A polygon bounded by three lines is a triangle, one bounded by four lines is a quadrilateral, one bounded by five a pentagon, one bounded by six a hexagon, etc.

184. Convex and Reentrant Polygons.—A polygon is convex if each of its angles is less than two right angles and reentrant if one of its angles exceeds two right angles.



185. Similar Polygons.—Two polygons are similar (symbol ∾) when the angles of one are equal respectively to the angles of the other and the sides taken in order are proportional each to each. The conditions which must be satisfied in order that the two polygons ABCDE and $A^1B^1C^1D^1E^1$ may be similar are:

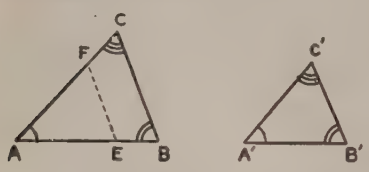
Angles equal $\angle A = \angle A^1$, $\angle B = \angle B^1$,

$\angle C = \angle C^1$, $\angle D = \angle D^1$, $\angle E = \angle E^1$,
Sides proportional

$$\frac{AB}{A^1B^1} = \frac{BC}{B^1C^1} = \frac{CD}{C^1B^1} = \frac{DE}{D^1E^1} = \frac{EA}{E^1A^1}$$

186. Theorem 64.—

If two triangles have the angles of one respectively equal to the angles of the other, the triangles are similar.



Hyp. Given the triangles ABC and $A^1B^1C^1$ with $\angle A = \angle A^1$, $\angle B = \angle B^1$ and $\angle C = \angle C^1$.

Con. $\frac{AB}{A^1B^1} = \frac{BC}{B^1C^1} = \frac{CA}{C^1A^1}$

Since $\angle A = \angle A^1$ it is possible to place triangle $A^1B^1C^1$ on ABC so that A^1B^1 takes the position AE, A^1C^1 the position AF, and B^1C^1 the position EF. Then FE is parallel to BC. (§99, Theorem 21. When two straight lines are cut by a third, if a pair of corresponding angles are equal, the lines are parallel.) Since $\angle E = \angle B^1 = \angle B$.

Then $\frac{AE}{AB} = \frac{AF}{AC}$, (§181, Theorem 62, A straight line parallel to the base of a triangle divides the other two sides proportionally.) Replace AE and AF by their equals A^1B^1 and A^1C^1 respectively we have $\frac{A^1B^1}{AB} = \frac{A^1C^1}{AC}$. The theorem can be completed by causing angle B^1 to coincide with B.

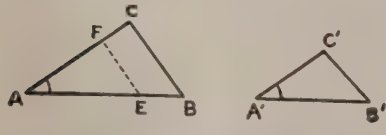
187. Theorem 65.—

If two triangles have two angles of one respectively equal to two angles of the other, the triangles are similar.

This follows at once from the previous theorem, for if two angles of one triangle are equal to two angles of another, the third angles are also equal. (§106, Theorem 28. The sum of the angles of any triangle is a straight angle.)

188. Theorem 66.—

If two triangles have an angle of one equal to an angle of the other and the sides including these angles proportional, the triangles are similar.



Hyp. Given the triangles ABC and $A^1B^1C^1$ with $\angle A = \angle A^1$ and $\frac{A^1C^1}{AC} = \frac{A^1B^1}{AB}$

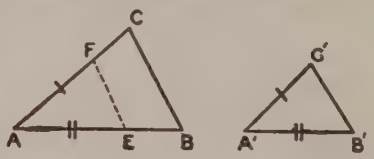
Con. ABC and $A^1B^1C^1$ are similar.

Hint. Place $A^1B^1C^1$ on ABC so that A^1 coincides with its equal A and B^1 takes the position E and C^1 the position F. Then EF divides AC and AB proportionally, which follows from replacing A^1B^1 and A^1C^1 by their equals AB and AF in $\frac{A^1C^1}{AC} = \frac{A^1B^1}{AB}$ to give $\frac{AF}{AC} = \frac{AE}{AB}$. Then FE is parallel to BC. (§182, Theorem 63. If a straight line divides two sides of a triangle proportionally it is parallel to the third side.) Then $\angle F = \angle C = \angle C^1$ and $\angle E = \angle B = \angle B^1$. (§102, Theorem 4. If two parallel lines are cut by a third line any two corresponding angles are equal.)

Hence the three angles of $A^1B^1C^1$ are equal to the three angles ABC and we are led back to the previous theorem. (§186, Theorem 64. If two triangles have the angles of one respectively equal to the angles of the other, the triangles are similar.)

189. Theorem 67.—

If the sides of two triangles are proportional, the triangles are similar.



Hyp. Given the two triangles ABC and $A^1B^1C^1$ with $\frac{AB}{A^1B^1} = \frac{BC}{B^1C^1} = \frac{CA}{C^1A^1}$

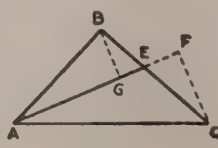
Con. The triangles ABC and $A^1B^1C^1$ are similar.

On AC measure off AF equal to A^1C^1 and on AB measure off AE equal to A^1B^1. Replace A^1B^1 and A^1C^1 by their equals AE and AF respectively in $\frac{AB}{A^1B^1} = \frac{AC}{A^1C^1}$ we have $\frac{AB}{AE} = \frac{AC}{AF}$. Hence triangles ABC and AEF are similar. (§188, Theorem 66. If two triangles have an angle of one equal to an angle of the other and the sides including these angles proportional, the triangles are similar.) Hence $\frac{FE}{CB} = \frac{AE}{AB}$ from the definition of similar triangles. Replace AE by its equal A^1B^1 and we have $\frac{FE}{CB} = \frac{A^1B^1}{AB}$, but $\frac{C^1B^1}{CB} = \frac{A^1B^1}{AB}$ by hypothesis. We now have two values for $\frac{A^1B^1}{AB}$, $\frac{FE}{CB}$ and $\frac{C^1B^1}{CB}$, and these are equal to each other. (§46, Axiom. Things equal to the same things are equal to each other.)

Hence $\frac{FE}{CB} = \frac{C^1B^1}{CB}$. Multiply both sides by CB and we have $FE = C^1B^1$. (§41, Axiom. If equals are multiplied by equals, the products are equal.) This shows that the triangle AEF has its three sides equal to those of the triangle $A^1B^1C^1$. Since AEF is similar to ABC its equal $A^1B^1C^1$ is also similar.

190. Theorem 68.—

The bisector of an angle of a triangle divides the opposite side into segments proportional to the adjacent sides.



Hyp. AE is the bisector of the Angle A of the triangle ABC.

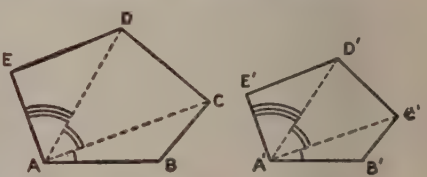
Con. $\frac{BE}{AB} = \frac{EC}{AC}$

Prolong AE sufficiently and draw the perpendicular from C to AE, meeting it in F, and draw the perpendicular from B on meeting it in G. Triangles ABG and AFC are similar; $\angle BAG = \angle FAC$ by hypothesis and $\angle G = \angle F$, both right angles. (§187, Theorem 65. If two triangles have two angles of one respectively equal to the angles of the other, the triangles are similar.) Therefore $\frac{AB}{AC} = \frac{BG}{FC}$, definition of similar triangles. $\angle BEG = \angle CEF$, being vertical angles; $\angle F = \angle G$, both being right angles.

Hence, by Theorem 65 quoted above, the triangles BGE and CEF are similar. Therefore $\frac{BG}{FC} = \frac{BE}{EC}$, definition of similar triangles. Equating the equal values for $\frac{BG}{FC}$ we have $\frac{AB}{AC} = \frac{BE}{EC}$.

191. Theorem 69.—

If two polygons are composed of the same number of triangles, similar each to each and similarly placed, the polygons are similar. We shall prove this for the case where the triangles of which each polygon is composed have a vertex in common.



Hyp. Two polygons ABCDE and $A^1B^1C^1D^1E^1$ composed of the same number of triangles which are similar each to each and similarly placed, that is, ABC similar to $A^1B^1C^1$, ACD similar to $A^1C^1D^1$.....

Con. ABCDE is similar to $A^1B^1C^1D^1E^1$.

Hint. The angles of the two polygons are equal because they are either equal angles or the sum of equal angles.

$\frac{A^1B^1}{AB} = \frac{B^1C^1}{BC} = \frac{A^1C^1}{AC}$, since ABC is similar to $A^1B^1C^1$.

$\frac{A^1C^1}{AC} = \frac{C^1D^1}{CD}$, since ACD and $A^1C^1D^1$ are similar.

Therefore $\frac{A^1B^1}{AB} = \frac{B^1C^1}{BC} = \frac{C^1D^1}{CD}$, (§46, Axiom. Things equal to the same thing are equal to each other.)

192. Theorem 70.—

If two polygons are similar, they can be resolved into the same number of triangles, similar each to each and similarly placed.

Hint. Use the figure of the previous theorem, and draw the lines, AC, AD, A^1C^1, and A^1D^1. First prove ABC similar to $A^1B^1C^1$, then ACD similar to $A^1C^1D^1$ and so on.

193. Theorem 71.—

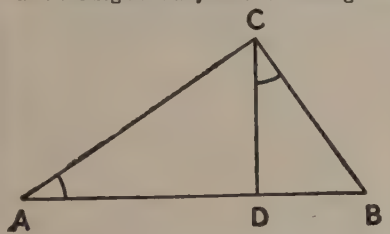
The perimeters of two similar polygons are in the same ratio as any two corresponding sides.

Hint. Make use of the figure in theorem 69. From the definition of similar polygons, $\frac{A^1B^1}{AB}=\frac{B^1C^1}{BC}=\frac{C^1D^1}{CD}=\frac{D^1E^1}{DE}=\frac{E^1A^1}{EA}$.
Apply the result of §180, section III to the above gives $\frac{A^1B^1+B^1C^1+C^1D^1+D^1E^1+}{AB+BC+CD+DE+}$

$\frac{E^1A^1}{EA}=\frac{A^1B^1}{AB}=\frac{B^1C^1}{BC}=\ldots\ldots\ldots$

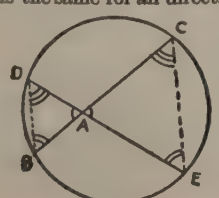
or $\frac{\text{the perimeter of } P^1}{\text{the perimeter of } P}=\frac{A^1B^1}{AB}=\frac{B^1C^1}{BC}$

194. Theorem 72.—
If in the right triangle a perpendicular is drawn from the vertex of the right angle to the hypotenuse.
(a) the two triangles thus formed are similar to the given triangle and similar to each other.
(b) the perpendicular is the mean proportional between the segments of the hypotenuse.
(c) each leg of the right triangle is the mean proportional between the hypotenuse and the segment adjacent to that leg.



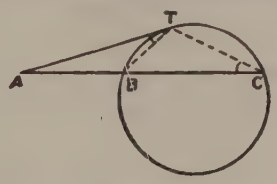
Hyp. ABC is a triangle with a right angle at C. From C a perpendicular is dropped on AB, the hypotenuse, meeting it in D.
Con. (a) ADC, BDC, and ABC are similar triangles.
(b) $(CD)^2=(AD)(DB)$. Definition §180, IV.
(c) $(AC)^2=(AB)(AD)$ and $(CB)^2=(AB)(DB)$. Definition §180, IV.
(a). $\angle A$ equals $\angle DCB$. (§111, Theorem. If the sides of one angle are perpendicular respectively to the sides of another, the angles are either equal or supplementary.) Hence the three triangles ABC, DBC, and ABC, have an acute angle equal, a right angle equal and hence all their angles equal. Therefore they are similar. (§187, Theorem 65. If two triangles have the angles of one respectively equal to the angles of the other, the triangles are similar.)
(b). Since the triangles ACD and CBD are similar, from definition we have $\frac{AD}{CD}=\frac{CD.}{BD}$ Hence $(CD)^2=(AD)(BD)$.
(c). Since the triangles ACD and ABC are similar, from definition we have $\frac{AB}{AC}=\frac{AC.}{AD}$ Hence $(AC)^2=(AB)(AD)$. In the same way we can prove that $(CB)^2=(AB)(DB)$.

195. Theorem 73.—
The product of the segments of a chord that passes through a fixed point within a circle is the same for all directions of the chord.



Hyp. Let A be any point within the circle and DE any chord through A.
Con. The product (AE)(AD) is a constant.
We will prove it a constant by taking any other chord through A as BC showing that (AE)(AD) = (AB)(AC).
$\angle BAD=\angle EAC$, (§80, Theorem 10. If two straight lines intersect each other, the vertical angles are equal.) Draw the lines CE and BD. $\angle DEC=\angle DBC$. (§169, Theorem 57. An angle inscribed in a circle is measured by one-half its intercepted arc.) Thus $\angle DEC$ and $\angle DBC$ are each measured by one-half the arc DC. In the same way $\angle BDE=\angle BCE$. Hence the two triangles AEC and BAD are similar. (§186, Theorem 64. If two triangles have the angles of one respectively equal to the angles of the other, the triangles are similar.) By definition of similar triangles,
$\frac{AE}{AB}=\frac{AC}{AD}$ or $(AE)(AD)=(AB)(AC)$.

196. Theorem 74.—
If through a point outside a circle a tangent and a secant are drawn, the tangent is the mean proportional between the whole secant and its external segment.

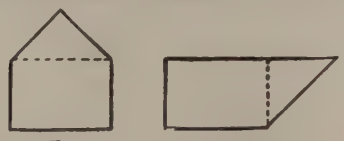


Hint. Show that the triangles ATB and ACT are similar. How is an angle formed by a tangent and a chord measured? See §171. Hence $\frac{AC}{AT}=\frac{AT}{AB}$ or $(AC)(AB)=(AT)^2$.

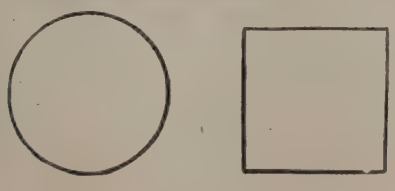
AREAS OF POLYGONS.

We now come to another fundamental concept of geometry, the area of a closed figure.

197. Equal Areas. Equivalence.—Two figures which can be made to coincide are identical and have the same area. But it may be possible in the case of two figures which do not coincide to cut one area up in such a manner that on rearranging its parts it coincides with the second figure. Evidently in this case we must also say that the areas are equal.



Thus figures I and II, which will not coincide as they stand, can be made to coincide by cutting off the triangle along the dotted line in figure I and moving it to the position indicated in figure II. In these circumstances the areas are called equivalent, symbol $\backsim$. However one ordinarily uses merely the term equal.



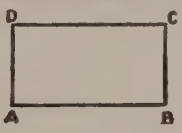
The circle and the square above may have the same area but it is not possible by a finite number of operations to divide the square into pieces so that they will coincide with the circle. We here encounter the same kind of difficulty that occurred in the case of the incommensurable quantities discussed in §177.

One of the famous problems of geometry is to "square the circle," i.e. to construct a square whose area is equal to the area of a given circle. In the process of cutting up the circle to form a square an infinite number of steps would be required, which can not actually be performed.

198. Unit of Area.—The unit of area which is most convenient is the area of a square whose side is one unit in length. This square is called the unit square. If we are measuring the length of straight lines in feet it is convenient to measure the area in terms of a square of side one foot.

199. Area.—The area of a plane figure is its ratio to the unit square.

200. Base and Altitude of a Rectangle.—

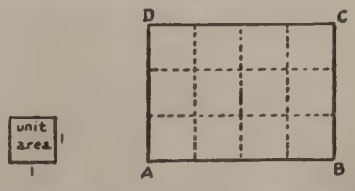


Either one of two adjacent sides of a rectangle can be considered its base. An altitude of a rectangle is a line drawn from any point in one base perpendicular to the other side. If AB is chosen as base, then AD is an altitude. If AD is chosen as base then AB is an altitude. If AB is chosen for the lower base, then DC is the upper base.

201. Base and Altitude of a Parallelogram.—

Either pair of parallel sides can be chosen for the bases, thus if BC is called the lower base then AD is the upper base. The corresponding altitude is the perpendicular distance between the bases. If AB and DC are the bases then EF is the altitude.

202. Area of a Rectangle.—



When the lengths of the two sides are commensurable with the side of the unit square there is no difficulty in proving that the area is the product of the base and the altitude. The rectangle above has its base AB, 4 units long, and its altitude

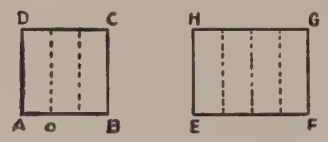
BC, 3 units long. It is evident that it can be cut into $4\times3=12$ squares, each congruent with the unit square. When AB and BC are not commensurable with the side of the unit square we encounter a difficulty which we mentioned before in §197. We pass over the proof of this incommensurable case and assume the truth in all cases of the following theorem:

203. Theorem 75.—

The area of a rectangle is equal to the product of its base and its altitude.

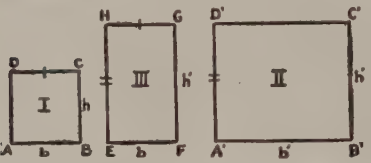
204. Theorem 76.—

The areas of two rectangles having equal altitudes are to each other as their bases.



Hint. If AB and EF are commensurable so that it is possible to find a length as AO which is contained in both AB and EF an integral number of time, the theorem is evident. $\frac{ABCD}{EFGH}=\frac{AB}{EF}=\frac{3}{4}$

205.—The areas of two rectangles are to each other as the product of their bases and altitudes.



Hyp. Given the rectangles ABCD and $A^1B^1C^1D^1$, with the bases b and b^1, and with the altitudes h and h^1 respectively.

Con. $\frac{ABCD}{A^1B^1C^1D^1}=\frac{bh}{b^1h^1}$

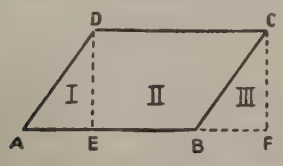
Hint. Construct the rectangle EFGH with the base $EF=b$ and the altitude $FG=h^1$. Rectangles I and III have equal altitudes, b, when BC and FG are considered the bases. Hence by the previous theorem $\frac{I}{III}=\frac{h}{h^1}$. In the same way $\frac{III}{II}=\frac{b}{b^1}$.

Take the product of these two equations,

$\frac{I}{III}\cdot\frac{III}{II}=\frac{I}{II}=\frac{hb}{h^1b^1}$.

206. Theorem 78.—

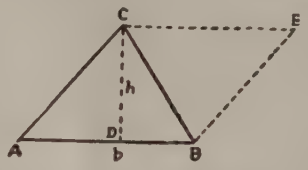
The area of a parallelogram is equal to the product of its base and its altitude.



Hint. Drop the perpendiculars from D and C on AB, meeting it in E and F. Show that triangle I is congruent to triangle III. The parallelogram ABCD is composed of I+II. The rectangle EFCD is composed of II+III. Since I=III, I+II=II+III. Hence the parallelogram is equivalent to the rectangle. The area of the rectangle is (DC)(DE). (§203, Theorem 75. The area of a rectangle is equal to the product of its base and its altitude.) Hence the area of the parallelogram is also (DC)(DE) = (base) (altitude); where DC is considered the base of the parallelogram and DE the altitude of the parallelogram.

207. Theorem 79.—

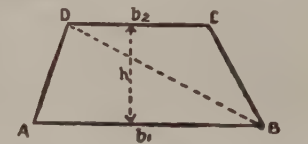
The area of a triangle is equal to half the product of its base and altitude.



Hint. Complete the triangle ABC into the parallelogram ABEC. Show that triangle BEC is congruent to the triangle ABC, hence ABC is one-half the area of the parallelogram. By the previous theorem the area of the parallelogram is bh, hence the area of the triangle is $\frac{1}{2}bh$. AB = b is the base of the triangle and CD = h, the perpendicular distance from C on AB is the altitude.

208. Theorem 80.—

The area of a trapezoid is equal to one-half the product of its altitude and the sum of its bases.



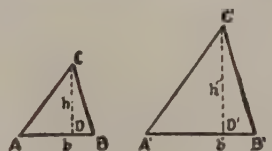
Hint. Draw the diagonal BD dividing the trapezoid ABCD into the two triangles ABD and BDC. $ABD=\frac{1}{2}b_1h$ and $BCD=\frac{1}{2}b_2h$. Therefore

$ABCD=\frac{1}{2}b_1h+\frac{1}{2}b_2h=\frac{1}{2}(b_1+b_2)h$.

Definition. The two parallel sides of a trapezoid are called the bases and the altitude is the perpendicular distance between the bases.

209. Theorem 81.—

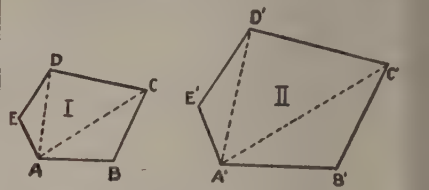
The areas of two similar triangles are to each other as the squares of any two corresponding sides.



Hint. Show that the triangles ACD and $A^1C^1D^1$ are similar. (§187, Theorem 65. If two triangles have two angles of one respectively equal to two angles of the other, the triangles are similar.) Hence $\frac{h}{h^1}=\frac{AC}{A^1C^1}$ but $\frac{AC}{A^1C^1}=\frac{AB}{A^1B^1}$ therefore $\frac{h}{h^1}=\frac{AB}{A^1B^1}=\frac{b}{b^1}$. Area $ABC=\frac{1}{2}bh$, area $A^1B^1C^1=\frac{1}{2}b^1h^1$. Thus $\frac{ABC}{A^1B^1C^1}=\frac{\frac{1}{2}bh}{\frac{1}{2}b^1h^1}$ replacing $\frac{h}{h^1}$ by its equal $\frac{b}{b^1}$, $\frac{ABC}{A^1B^1C^1}=\frac{b}{b^1}$.

210. Theorem 82.—

The area of two similar polygons are to each other as the squares of any two corresponding sides; and also as the squares of their perimeters.



Hint. §192, Theorem 70. If two polygons are similar, they can be resolved into the same number of triangles, similar each to each and similarly placed. Resolve ABCDE into triangles ABC, ACD, and ADE, which are similar to the triangles $A^1B^1C^1$, $A^1C^1D^1$, and $A^1D^1E^1$, respectively, into which $A^1B^1C^1D^1E^1$ is resolved.

Then $\frac{ABC}{A^1B^1C^1}=\frac{(AB)^2}{(A^1B^1)^2}$, $\frac{ACD}{A^1C^1D^1}=\frac{(CD)^2}{(C^1D^1)^2}$ and $\frac{ADE}{A^1D^1E^1}=\frac{(DE)^2}{(D^1E^1)^2}$ (§209, Theorem 81. The areas of two similar triangles are to each other as the squares of any two corresponding sides.)

From the definition of similar polygons we have $\frac{AB}{A^1B^1}=\frac{CD}{C^1D^1}=\frac{DE}{D^1E^1}$. Therefore

$\frac{(AB)^2}{(A^1B^1)^2}=\frac{(CD)^2}{(C^1D^1)^2}=\frac{(DE)^2}{(D^1E^1)^2}$ (§43, Axiom. Like powers of equals are equal.) Hence $\frac{ABC}{A^1B^1C^1}=\frac{ACD}{A^1C^1D^1}=\frac{ADE}{A^1D^1E^1}=\frac{(AB)^2}{(A^1B^1)^2}$ Applying the properties of a proportion §180, III to this expression gives

$\frac{ABC+ACD+ADE}{A^1B^1C^1+A^1C^1D^1+A^1D^1E^1}=\frac{(AB)^2}{(A^1B^1)^2}$, or

$\frac{ABCDE}{A^1B^1C^1D^1E^1}=\frac{(AB)^2}{(A^1B^1)^2}$.

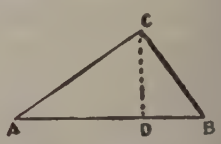
The second part of the theorem follows from §193, Theorem 71. The perimeters of two similar polygons are in the same ratio as any two corresponding sides. Hence $\frac{\text{Perimeter of I}}{\text{Perimeter of II}}=\frac{AB}{A^1B^1}$, thus

$\frac{(\text{Perimeter of I})^2}{(\text{Perimeter of II})^2}=\frac{(AB)^2}{(A^1B^1)^2}$. Therefore

$\frac{ABCDE}{A^1B^1C^1D^1E^1}=\frac{(\text{Perimeter of I})^2}{(\text{Perimeter of II})^2}$.

211. Theorem 83.—

The square of the hypotenuse of a right triangle is equal to the sum of the squares of the other two sides.

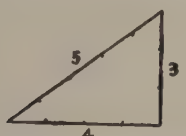


Hyp. Given the triangle ABC with a right angle at C.

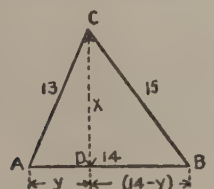
Con. $(AB)^2=(AC)^2+(BC)^2$.

Hint. Draw the perpendicular from C on AB, meeting it in D. Then $(AC)^2=(AB)(AD)$ and $(BC)^2=(AB)(DB)$. (§194, Theorem 72. Each leg of a right triangle is the mean proportional between the hypotenuse and the segment adjacent to

that leg.) Adding these two equalities, $(AC)^2+(BC)^2=(AB)(AD)+(AB)(DB)=AB(AD+DB)=(AB)(AB)=(AB)^2$. This theorem is one of the most important of the theorems of plane geometry and is called the theorem of Pythagoras, a very celebrated Greek geometer (580-500 B. C.). The 3, 4, 5 right triangle was known to the Egyptians, who used a rope 12 units long with knots in it at the proper points to stake out a triangle whose sides should be 3, 4, and 5 units respectively, thus giving them a right angle opposite the side of 5 units.



212. Area of Any Triangle When the Three Sides are Given.—As an application of the theorem of Pythagoras we will find the area of a triangle whose three sides are 13, 14, and 15 inches.



Let ABC be the triangle with the given sides so that AB=14, BC=15, and CA=13. Drop the perpendicular from C on AB, meeting it in D. Let CD=x, and AD=y, then DB=14—y. Applying the theorem of Pythagoras to the two right triangles ADC and CDB gives

(1) $x^2+y^2=(13)^2$,
(2) $x^2+(14-y)^2=(15)^2$.

Square out (2) gives (3) $x^2+196-28y+y^2=225$.

Subtract (1) from (3) gives (4) $196-28y=56$,
or (5) $28y=140$,
or (6) $y=5$.

Substituting $y=5$ in (1) gives (7) $x^2+(5)^2=(13)^2$,
or (8) $x^2=144$,
or (9) $x=12$.

The area equals one half the base times the altitude $=\frac{1}{2}(14)(12)=84$ square inches. §207, Theorem 79.

By the same method a general formula can be obtained for the area of a triangle of sides a, b, c. The area is $\sqrt{s(s-a)(s-b)(s-c)}$, where $s=\frac{1}{2}(a+b+c)$. We will apply this formula to the example above.

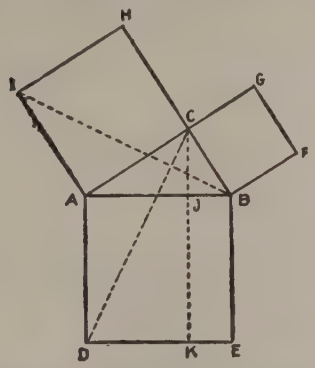
$a=15$
$b=13$
$c=14$

$2s=a+b+c=42$.
$\therefore s=21$.
$s-a=6$,
$s-b=8$,
$s-c=7$,

$\Delta=\sqrt{s(s-a)(s-b)(s-c)}=\sqrt{(21)(6)(8)(7)}$
$=\sqrt{7056}=84$ square inches.

213.—The theorem of Pythagoras has a score of proofs. Its importance justifies the outline of a second proof. We will also change the wording

The square on the hypotenuse of a right triangle is equivalent to the sum of the squares on the other two sides.



Hyp. Given the triangle ABC with C a right angle. On AB erect the square DEBA, on BC the square FGCB, on AC the square HIAC.

Con. DEBA=FGCB+HIAC.

Draw CJ perpendicular to AB through C, meeting AB in J and DE in K. Draw CD and IB. Prove $\triangle IAB=\triangle CAD$, hence $2(\triangle IAB)=2(\triangle CAD)$. But $2(\triangle IAB)=$ HIAC and $2(\triangle CAD)=$ADKJ. Hence square HIAC equals rectangle ADKJ. By drawing AF and CE, in just the same way, square FGCB=rectangle JKEB. Adding these equalities, square FGCB+square HIAC=rectangle ADKJ+rectangle JKEB =square ADEB.

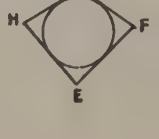
REGULAR POLYGONS AND THE MEASURE OF THE CIRCLE

214.—Equilateral Polygon.—A polygon all of whose sides are equal is an equilateral polygon.

215. Equiangular Polygon.—A polygon all of whose interior angles are equal is an equiangular polygon.

216. Regular Polygon.—A regular polygon is a polygon all of whose angles and all of whose sides are equal. It is both equilateral and equiangular.

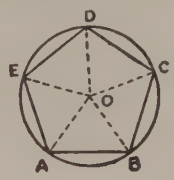
217. Inscribed Polygon.—A polygon is inscribed in a circle when all its vertices lie on the circumference, as ABCD. The circle is said to circumscribe the polygon.



218. Circumscribed Polygon.—A polygon is circumscribed about a circle when all its sides are tangent to the circle, as EFGH. The circle is said to be inscribed in the polygon.

219. Apothem.—The apothem of a regular polygon is the perpendicular from the center of its circumscribed or inscribed circle to any side of the polygon.

220. Theorem 84.—
An equilateral polygon inscribed in a circle is a regular polygon.



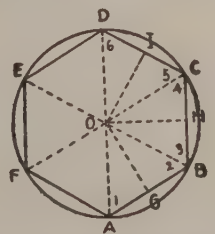
Hyp. The sides of the polygon ABCDE inscribed in the circle are equal, AB=BC=CD=DE=EA.

Con. The polygon is a regular polygon.

Hint. A regular polygon has all of its sides and all of its angles equal, §216. Since the sides are equal by hypothesis it remains to prove that the angles are equal. Angle A is measured by ½ arc BCDE, which is 3/5 of a circumference. (§169, Theorem 57. An angle inscribed in a circle is measured by one-half of its intercepted arc.) In the same way angle B is measured by ½ of the arc AEDC, which is 3/5 of a circumference. Hence $\angle A=\angle B=\angle C=\angle D=\angle E$.

A second method of proof is to draw the radii OA, OB, OC, OD, OE, and show that all the triangles OAB, ODC, OCD,...., are congruent.

221. Theorem 85.—
A circle may be circumscribed about any regular polygon, and a circle may also be inscribed in it.



Hyp. Given the regular polygon ABCDEF.

Con. A circle may be circumscribed about ABCDEF, and a circle may be inscribed in ABCDEF.

Hint. Draw the circle through the three points A, B, and C. Let the center of this circle be O. (§147, Theorem 39. Through three points not lying in a straight line one circle, and only one, can be drawn.) Draw the radii OA, OB, OC and the line OD, which we do not know to be a radius of the circle, through A, B, C until we prove that it is. Consider the triangles OAB and OCD, OB=OC, AB=CD, $\angle 2+\angle 3=\angle 4+\angle 5$ but $\angle 3=\angle 4$, subtraction of equals from equals gives $\angle 2=\angle 5$. Hence the triangles OAB and OCD are congruent. (§64, Theorem 1. If two triangles have two sides and the included angle of one equal to two sides and the included angle of the other, the triangles are congruent.) Hence OA=OD, being corresponding sides of congruent triangles. Therefore OD is a radius of the circle.

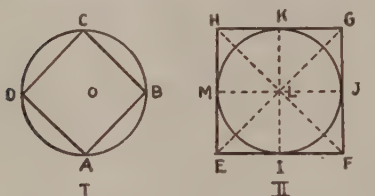
To prove that a circle can be inscribed. Draw all the perpendiculars from O to the sides of the polygon, as OG, OH, OI, ... and prove these all equal. Then a circle with O as center and OG for radius will pass through G, H, I...and this circle will be tangent to the sides AB, BC, CD,... (§161, Theorem 53. A straight line tangent to a circle is perpendicular to the radius drawn to the point of contact.) Hence the centers of the inscribed and circumscribed circle coincide.

222. Center of a Regular Polygon.—The center of a regular polygon is the common center of its circumscribed and inscribed circles, as the point O of §221.

223. Radius of a Regular Polygon.—The radius of a regular polygon is the radius of the circumscribing circle, as OA of §221.

224. Angle at the Center of a Regular Polygon.—The angle at the center of a regular polygon is the angle subtended by a side of the polygon considered as a chord of its circumscribed circle, as angle AOB of §221.

225. Theorem 86.—
If a circle be divided into any number of equal parts, the chords joining the successive points of division form a regular polygon inscribed in the circle; and the tangents drawn at the points of division form a regular polygon circumscribed about the circle



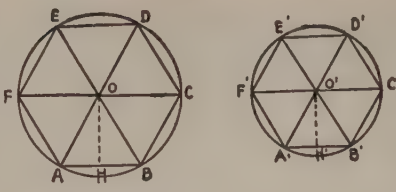
I. II.

See figure I. Hint. The sides AB, CB,... are equal, for the arcs AB, CB,... are equal by hypothesis. (§150, Theorem 42.) The angles A, B,..., are equal, for they are measured by equal arcs. (§169, Theorem 57.) See figure II. Hint. Triangles LJF and LIF are congruent. (§87, Theorem 15.) Hence IF = FJ = JG = ..., therefore the sides are equal, or FG = GH = HE .... Also ∠IFL = ∠LFJ = ∠LGJ = ..., hence the angles are equal, or ∠F = ∠G = = ∠H = ...

226. Theorem 87.—
Regular polygons of the same number of sides are similar.

Hint. We must prove their angles are equal and their sides are in proportion. They can be inscribed in circles. (§221, Theorem 85.) Their angles are equal, for they are measured by one half of the same fractional part of a circumference. Since all the sides of each polygon are equal, the ratio of a side of the first to a side of the second is constant, hence the corresponding sides are in proportion.

227. Theorem 88.—
The perimeters of regular polygons of the same number of sides are to each other as the radii of the circumscribed circles, or as the radii of the inscribed circles; and their areas are to each other as the squares of the radii.



Hint. $\frac{AB + BC + CD + DE + EF,}{A^1B^1 + B^1C^1 + C^1D^1 + D^1E^1 + E^1F^1} = \frac{6(AB)}{6(A^1B^1)} = \frac{AB}{A^1B^1} = \frac{OB}{O^1B^1}$, since triangles OAB and $O^1A^1B^1$ are similar. Also let OH and O^1H^1 be the perpendiculars upon AB and A^1B^1 from the centers O and O^1 respectively, then the triangles OHB and $O^1H^1B^1$ are similar and $\frac{OB}{O^1B^1} = \frac{OH}{O^1H^1}$. Thus

$$\frac{\text{perimeter of ABCDEF}}{\text{perimeter of } A^1B^1C^1D^1E^1F^1} = \frac{OB}{O^1B^1} = \frac{OH.}{O^1H^1}$$

$$\frac{\text{Area of ABCDEF}}{\text{Area of } A^1B^1C^1D^1E^1F^1} = \frac{(AB)^2}{(A^1B^1)^2} =$$

$$\frac{(\text{perimeter of ABCDEF})^2}{(\text{perimeter of } A^1B^1C^1D^1E^1F^1)^2}.$$

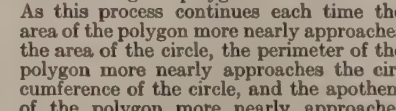
(§210, Theorem 82.) Since $\frac{AB}{A^1B^1} = \frac{OB}{O^1B^1} = \frac{OH}{O^1H^1}$, then $\frac{(AB)^2}{(A^1B^1)^2} = \frac{(OB)^2}{(O^1B^1)^2} = \frac{(OH)^2}{(O^1H^1)^2}$. (§43, Axiom.) Therefore

$$\frac{\text{area of ABCDEF}}{\text{area of } A^1B^1C^1D^1E^1F^1} = \frac{(OB)^2}{(O^1B^1)^2} = \frac{(OH)^2}{(O^1H^1)^2}.$$

228. Theorem 89.—
The area of a regular polygon is equal to one-half the product of its perimeter and its apothem.

Hint. Use the figure of the previous theorem, area ABCDEF = 6(area ABO) = 6(½) (AB) (OH) = ½(6AB) (OH) = ½(perimeter of ABCDEF) (apothem). (§219. Definition).

229. Relation of the Regular Polygons to the Circle.—While the theorems on regular polygons have in themselves interest and use, they have been developed chiefly in order that they may be applied to the circle. We must look upon the circle as a regular polygon of an infinite number of sides.



I II III

Take a series of equal circles. In the first circle inscribe a regular polygon of 4 sides (a square), in the second inscribe a regular polygon of 8 sides, in the third inscribe a regular polygon of 16 sides, in the fourth inscribe a regular polygon of 32 sides.
As this process continues each time the area of the polygon more nearly approaches the area of the circle, the perimeter of the polygon more nearly approaches the circumference of the circle, and the apothem of the polygon more nearly approaches the radius of the circle. If we were able to continue this process an infinite number of times the polygon would coincide with the circle. We shall now restate our theorems for the regular polygons in such a manner that they apply to the circle.

230. Theorem 90.
The circumferences of two circles are to each other as the radii.
This follows from §227, replacing perimeter by circumference.

231. Theorem 91.—
The ratio of the circumference of any circle to its diameter is a constant.
Hint. Given two circles with the radii r and r_1, with the corresponding diameters d and d_1, and with the circumferences C and C_1, then $\frac{C}{C_1} = \frac{r}{r_1} = \frac{2r}{2r_1} = \frac{d.}{d_1}$ (§230, theorem 90.) Since $\frac{C}{C_1} = \frac{d}{d_1}, \frac{C}{d} = \frac{C^2}{d^2}$. (§180, I).
Since $\frac{C}{d}$ or the ratio of the circumference to the diameter is the same for any two circles it must be a constant. This constant is always designated by π. Hence $\frac{C}{d} = \pi$ or $C = \pi d$.

232. Theorem 92.—
The areas of two circles are to each other as the squares of the radii.
Hint. This follows from §227.

233. Theorem 93.—
The area of a circle is equal to half of the product of its circumference and its radius; or the product of the square of the radius and the constant number π.

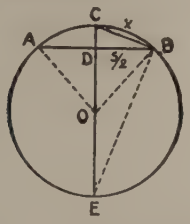
Hint. From §228, Theorem 89, the area of a regular polygon = ½ (perimeter) (apothem), considering the circle as a regular polygon of an infinite number of sides, we must replace perimeter by circumference and apothem by radius. Therefore S = area of a circle = ½Cr = ½(2πr)(r) = πr^2, replacing C by its value 2πr from §231.

234. Computation of π. In §257 we will show that a regular hexagon can be inscribed in a circle and that its side is equal to the radius of the circumscribing circle.

Hence the perimeter of the hexagon is 6r. The circumference of the circle is greater than 6r by a certain amount. If we can calculate the perimeter of a regular polygon of 12 sides this will give us a value nearer to the circumference of the circle. (§229). Instead of calculating the side of a regular polygon of 12 sides in terms of r we will solve the more general problem below.

If s is the side of a regular inscribed polygon, x the side of a regular inscribed polygon having twice as many sides as the first, and r the radius of the circumscribing circle of both, find x in terms of s and r.

Hyp. Given a circle, center O and radius r. Let s=AB be the side of a regular inscribed polygon and x=CB be the side of a regular inscribed polygon of double the number of sides.



Required. To find the value of x in terms of s and r.

Hint. Draw the diameter CE, and the lines OB and BE. Since chord AC=chord CB, CO is perpendicular to AB and meets it in a point D. Triangle CBE is a right triangle, and $(CB)^2=x^2=(CD)(CE)$. (§194, Theorem 72c.) Hence $x=\sqrt{(CD)(CE)}=\sqrt{(CD)(2r)}$. But CD=CO—DO=r—DO and $DO=\sqrt{(OB)^2-(DB)^2}=\sqrt{r^2-\frac{(s)^2}{(2)}}$. (§211, Theorem 83.) Hence $CD=r-\sqrt{r^2-\frac{(s)^2}{(2)}}$, replacing CD by this value in $x=\sqrt{2r(CD)}$ we have the formula desired

$$x=\sqrt{2r^2-2r\sqrt{r^2-\frac{(s)^2}{(2)}}}.$$

If we now put s=r in this equation we will find the length of the side of a regular polygon of 12 sides.

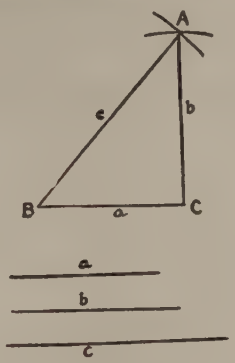
$$x=\sqrt{2r^2-2r\sqrt{r^2-\frac{r^2}{4}}}=r\sqrt{2-\sqrt{3}}.$$

Multiply this by 12 gives the perimeter of a regular polygon of 12 sides, the value is 6.211657r. It is possible to continue the calculations for regular polygons of, 24, 48, 96,... sides. When the value is calculated for a regular polygon of 1,536 sides, the perimeter of the polygon is 6.28318r, dividing by 2r gives the value of π=3.14159, correct to 5 decimal places. In advanced mathematics other and easier methods have been developed for the calculation of this most important constant.

PROBLEMS OF CONSTRUCTION.

235. Constructions by ruler and compasses.—Because I can define an object does not prove that it exists. We define a secant line as a line which cuts a circle in two points. I might define a hypersecant as a straight line which cuts a circle in three points, but it is impossible to draw such a line; in fact it is possible to prove it does not exist. Having defined a geometrical object, the mathematician proceeds, if possible, to prove that it exists. For instance in §69 we made use of the bisector of an angle; we did not at that time tell how to obtain the bisector, we merely assumed that it was possible to obtain it in some as yet unknown manner. Again and again we have drawn lines which we assumed were perpendicular to each other. We will now proceed to show how to carry out these constructions with the use of the ruler and compasses. Note. The constructions are not always given in full, it being assumed that the methods of a previous construction need not be indicated in full in a drawing.

236. To construct a triangle, when the three sides are given.—

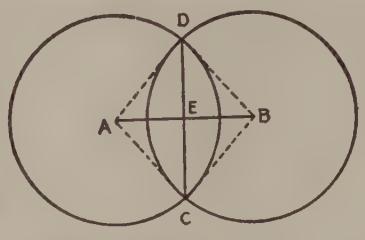


Given the three sides of a triangle a, b, and c.

Required to construct the triangle with these segments for sides.

By use of the compasses mark off BC equal to a. With B as center draw a circle of radius c, with C as center draw a circle of radius b, let these two circles intersect in A. Triangle ABC is the required triangle.

237. To bisect a given line.—

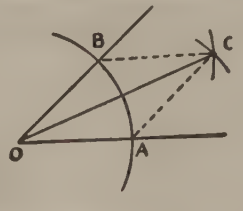


Given the line AB.

Required to construct the midpoint of AB.

Choosing a convenient radius, draw two circles with A and B as centers. Let these two circles intersect in C and D and let CD intersect AB in E. The required midpoint of AB is E. (§91. Theorem 17. The locus of points equidistant from two given points is the perpendicular bisector of the line joining them.) Since AD=BD=AC=BC, C and D are two points equidistant from both A and B, thus they determine the perpendicular bisector.

238. To bisect a given angle.—

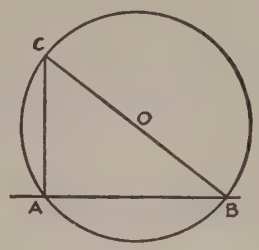


Given the angle AOB.

Required to construct the line bisecting the given angle.

Choosing a convenient radius, draw a circle intersecting the sides of the angle in A and B. Draw two circles with A and B as centers, both circles having the same radius, and let C be the point of intersection of these circles. Draw OC. Consider the triangles OAC and OBC, OA=OB—radii of the same circle; AC=BC—radii of two equal circles; OC is common. Therefore the triangles are congruent. (§77. Theorem 9. If two triangles have the three sides of one respectively equal to the three sides of the other, the triangles are congruent.) Angles AOC and BOC are equal, and AC is the bisector required.

239. At a given point in a straight line to erect a perpendicular to the line.—

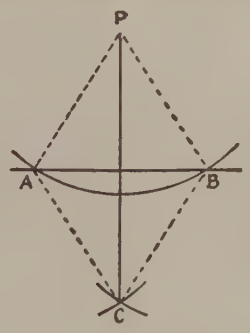


Given a line AB and a point A on it.

Required to construct the line through the point A perpendicular to the given line.

Choose a convenient point as O, and with a radius OA draw a circle cutting AB in A and a second point B. Draw the diameter of the circle BC and the line AC. Angle BAC is measured by one-half of a semicircle, and thus is a right angle. (§170, Theorem 58. An angle inscribed in a semicircle is a right angle.) Therefore AC is the required line.

240. From a given point to let fall a perpendicular upon a given line.—

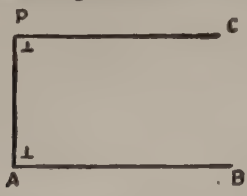


Given a line AB and a point P outside the line.

Required to construct the line through P perpendicular to AB.

Draw a circle with P as center cutting the given line in any two points as A and B. Draw two circles with A and B as centers and having the same radius. Let these two circles intersect in C. Then AP=PB—radii of the same circle; CA=CB—radii of equal circles. Therefore P and C are each equidistant from A and B. Hence PC is the required perpendicular. (§89, Theorem 16. The locus of points equidistant from two given points is the perpendicular bisector of the line joining them.)

241. Through a given point to draw a parallel to a given line.—

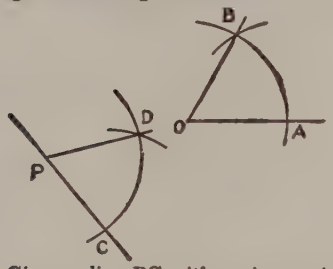


Given a line AB and a point P outside the line.

Required to construct the line through the point P parallel to the line.

From P draw the perpendicular to the line AB; let this line be PA. At P draw the perpendicular PC to the line PA. Then PC is the required parallel to AB. (§93, Theorem 18. Two straight lines perpendicular to the same straight line are parallel.)

242. Through a given point on a straight line, to draw a line making a given angle with the given line.—

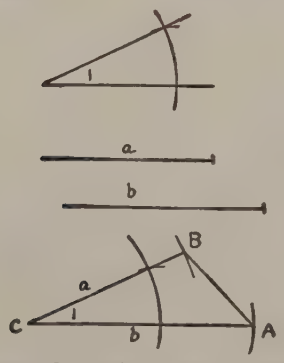


Given a line PC with a given point P upon it, let angle AOB be the given angle.

Required to draw the line through P forming with PC an angle equal to the given angle.

Draw a circle with O for center, cutting the sides of the given angle in the points A and B. With the same radius draw a circle with P for center. Draw a circle with C for center having AB for radius; let D be the point of intersection of the two arcs having P and C for centers. Angle CPD is the required angle. (§149, Theorem 41. If in the same circle, or in equal circles—two arcs are equal, the angles which they subtend are equal.)

243. To construct a triangle, when two sides and the included angle are given.—

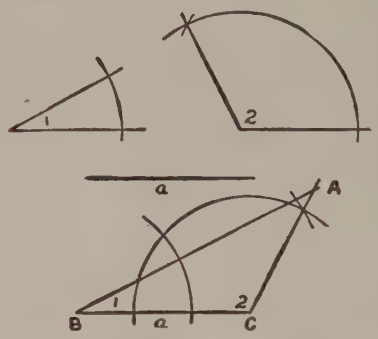


Given the angle 1 and the segments a and b.

Required to construct the triangle, which has a and b for two sides, including the given angle 1.

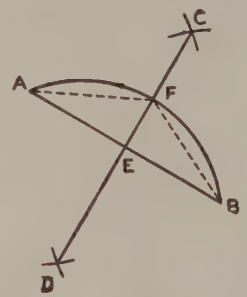
By the method of §242 construct the angle ACB equal to the given angle 1. Mark off CB equal to the segment a, and CA equal to the segment b. Draw AB. ABC is the required triangle.

244. To construct a triangle when two angles and the included side are given.—



The method is the same as the previous construction.

245. To bisect a given circular arc.—

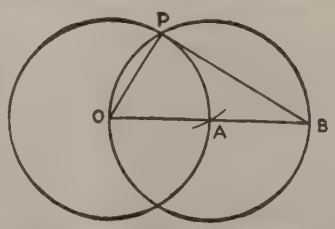


Given the circular arc AB.

Required to construct the mid-point of the arc.

Draw the chord AB and its perpendicular bisector CD. Let the line CD meet the chord AB in E and the arc AB in F. Draw AF and FB. Chord AF = Chord FB. (§89. Theorem 16, The locus of points equidistant from two given points is the perpendicular bisector of the line joining them.) Therefore arc AF = arc FB and F is the required mid-point. (§151, Theorem 43. If in the same circle, or in equal circles, two chords are equal, the arcs subtended by them are equal.)

246. At a given point on a given circle, to draw a tangent to the circle.—

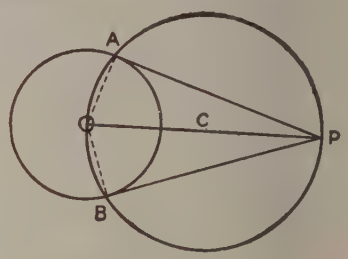


Given a circle of radius r with the center O and the fixed point P on it.

Required to construct the tangent to the given circle at the point P.

One method is to draw the radius OP and construct the line perpendicular to OP at the point P by method of §239. A second method is as follows. With P as center and with a radius equal to r, draw an arc cutting the given circle in A. With A for center draw a circle of radius r. This circle will pass through O and P. Draw OAB the diameter of the circle with the center A, and then draw the chord PB. Angle OPB is a right angle. (§170. Theorem 58. An angle inscribed in a semicircle is a right angle.) Therefore PB is the required tangent. (§161, Theorem 53. A straight line tangent to a circle is perpendicular to the radius drawn to the point of contact.) (18. Axiom. From a given point in a given line, one perpendicular and only one, can be drawn to the line.)

247. Through a given point outside a given circle to draw tangents to the circle.—

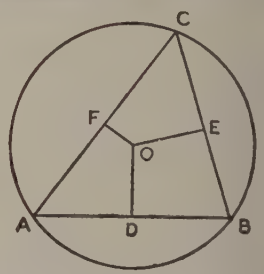


Given the circle with its center at O and the point P outside the circle.

Required to construct the tangents from P to the circle.

Draw the line OP, find the mid-point of this line C, and draw the circle with the center C and the radius OC. Let this circle intersect the given circle in the two points A and B. Draw the lines, OA, OB, AP, and BP. Angles OAP and OBP are right angles. (§170, Theorem 58. An angle inscribed in a semicircle is a right angle.) Therefore AP and BP are the required tangents. As in the previous construction, the tangent is perpendicular to the radius at its extremity.

248. To circumscribe a circle about a given triangle.—



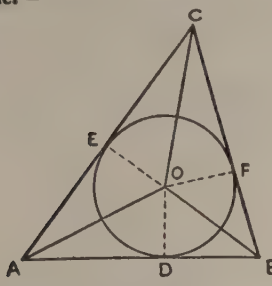
Given the triangle ABC.

Required to circumscribe a circle about ABC.

Draw the perpendicular bisectors of the sides AB and BC, let O be their point of intersection. Designate the perpendicular bisector of AB by DO and the perpendicular bisector of BC by EO. Point O, lying in OD, is equidistant from A and B, lying in OE; it is also equidistant from B and C or OA = OB = OC. Hence the perpendicular bisector of AC also passes through FO. (§89. Theorem 16. The locus of points

equidistant from two given points is the perpendicular bisector of the line joining them.) Since O is equidistant from A, B, and C it is the center of the required circle.

249. To inscribe a circle in a given triangle.—

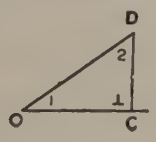


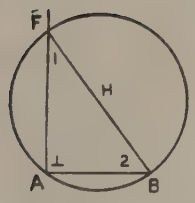
Given the triangle ABC.

Required to inscribe a circle in the triangle ABC.

Let the bisectors of the angles A and B meet in the point O. Then OA and OB are the bisectors of the angles A and B respectively. Draw the perpendiculars from O to AB, BC, and CA, let these be OD, OF, and OE respectively. Every point in AO is equidistant from AC and AB, hence OE = OD. Every point in OB is equidistant from BA and BC, hence OD = OF. We might observe that the bisector of angle C must also pass through the point O. (§91, Theorem 17. The locus of points equidistant from the sides of an angle is the bisector of the angle.) Therefore O is the center of the required circle and the radius = OD = OF = OE.

250. On a given straight line as a base, to construct a circular segment in which a given angle can be inscribed.—



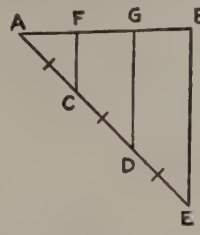


Given the angle COD and the straight line AB.

Required to construct the circular segment in which the given angle can be inscribed.

Take any point D on the side OD of the given angle and drop the perpendicular upon the side OC, meeting it in C. At the point A draw the perpendicular AF to AB; at the point B construct the angle ABF equal to the angle ODC. The triangles ABF and OCD are similar, and angle AFB equals the given angle COD. (§ 187, Theorem, 65. If two triangles have two angles of one respectively equal to two angles of the other, the triangles are similar.) Therefore the circular segment AFB is the segment required, for any angle APB with its vertex P on this segment has the same measure, i. e., one half of the arc AB, as the angle AFB. (§169, Theorem 57. An angle inscribed in a circle is measured by one half its intercepted arc.

251. To divide a given straight line into any number of equal parts.—

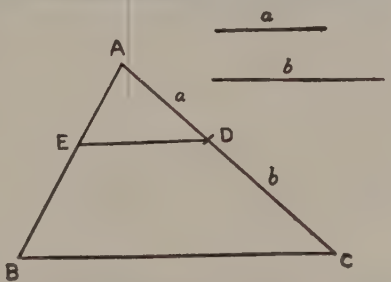


Given the straight line AB.

Required to divide AB into a certain number of equal parts, say three.

Upon any line through A, as AF, lay off by repeated use of the compasses the equal line segments, AC, CD, and DE. Draw the line BE, and the lines through C and D parallel to EB, meeting AB in the points F and G respectively. F and G are the required points to trisection. (§117, Theorem 37. If a series of parallel lines cut off equal segments on one transversal, they cut off equal segments on any other transversal.)

252. To divide a given straight line into parts proportional to two given lines.—



Given the straight line AB and two other given lines a and b.

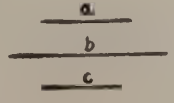
Required to divide the line AB in the ratio of a to b, or to find the point E on AB so that $\frac{AE}{EB} = \frac{a}{b}$.

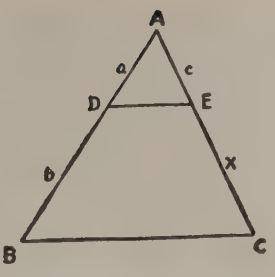
Draw a line through A and on it mark off AD, equal to a, and DC, equal to b.

Draw BC and ED parallel to BC through the point D, meeting AB in E. The required point of division is E. (§181, Theorem 62. A straight line parallel to the base of a triangle divides the other two sides proportionally.)

253. Fourth proportional.—A fourth proportional to three numbers or magnitudes a, b, and c, is the quantity x defined by $\frac{a}{b} = \frac{c}{x}$.

254. To find the fourth proportional to three given lines.—





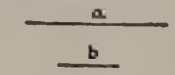
Given the three lines a, b, and c.

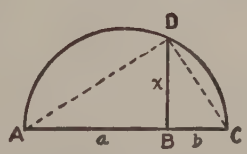
Required to construct the line which is the fourth proportional.

Draw two lines intersecting in a point A. On one of these lines lay off AD equal to a and DB equal to b, on the second line lay off AE equal to c. Draw the line DE and draw a line through B parallel to DE, meeting AE in C. Then EC = x is the fourth proportional required for $\frac{a}{b} = \frac{c}{x}$.

(§181, Theorem 62. A straight line parallel to the base of a triangle divides the other sides proportionally.)

255. To find the mean proportional between two given straight lines.—



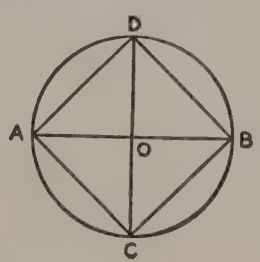


Given the two lines a and b.

Required to construct the mean proportional x between the lines a and b which is defined by the equation $x^2 = ab$.

Draw a straight line through any point A. On this line measure off AB equal to a and BC equal to b. On AC as diameter draw a semicircle. Let the perpendicular to AB at B meet the semicircle in D. BD is the required mean proportional. (194, Theorem 72. The perpendicular is the mean proportional between the segments of the hypotenuse.)

256. To inscribe a square in a given circle.—

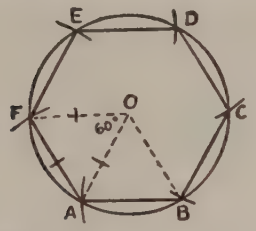


Give the circle O.

Required to inscribe a square in the given circle.

Draw any diameter as AB and draw the diameter CD, which is perpendicular to AB at O the center. Draw AC, CB, BD, DA, which are the sides of the required square. (§148, Theorem 40. If in the same circle, or in equal circles, two angles at the center are equal, the arcs which they intersect are equal.) (§150, Theorem 42. If in the same circle, or in equal circles, two arcs are equal, the chords subtending them are equal.)

257. To inscribe a regular hexagon in a circle.—

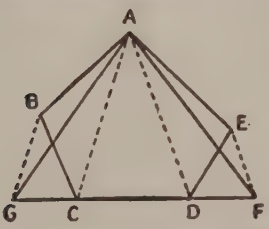


Given a circle.

Required to construct a regular hexagon.

Using any point of the given circle as A for center and with a radius equal to the radius of the given circle draw an arc cutting the circle in F. Draw from O, the center of the given circle, the radii OA and OF. Triangle AOF has all its sides equal, hence all of its angles are equal. Thus angle AOF is one-third of two right angles, or one-sixth of a circumference. Hence AF is the side of the required hexagon.

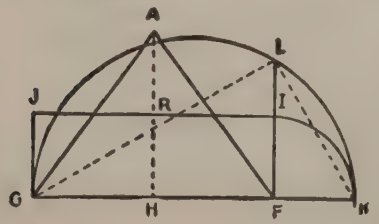
258. To transform any convex polygon into a triangle; a square.—



Given the convex polygon ABCDE.

Required to transform ABCDE (a) into a triangle, (b) into a square.

(a) Choose a vertex as A and draw the lines AC and AD. Prolong a convenient side as CD in both directions. Through B draw a line parallel to AC, to meet CD in G, and through E draw a line parallel to AD, meeting CD in F. Triangles ACB and AGC have a common base AC and equal altitudes, since parallel lines are everywhere equidistant. (§207, Theorem 79. The area of a triangle is equal to half of the product of its base and altitude.) In the same way triangles ADE and AFD are equal. Hence triangle AGF is the required triangle.



(b) Having transformed the polygon into a triangle, we will now transform it first into a rectangle and finally into a square.

Let AGF be the given triangle. Draw the perpendicular from A on GF, meeting it in H. Bisect AH. and let R be the point of bisection. Construct a rectangle which has GF for base and HR for altitude. Let GFIJ be this rectangle. The area of the rectangle equals the area of the triangle. The area of the rectangle is equal to the product (GF) (FI). If x is the side of a square of equal area then $x^2 = (GF)(FI)$. The construction of x leads back to §269. (To construct the mean proportional between two given straight lines.) Following the method of that section, we lay off FK on GF equal to FI, draw the semicircle on FK as diameter, and prolong FI until it intersects the semicircle in the point L. FL is the side of the required square whose area is equal to the area of the rectangle GFIJ, to the area of the triangle AGF, and to the area of the polygon ABCDE.

Note. If the polygon were not convex it would be necessary in the first part of the construction (a) to subtract the areas of certain of the triangles instead of adding them.

PROPOSITIONS AND EXERCISES

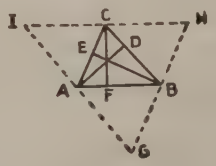
If when three coins are tossed they always all come heads, we know at once that the matter demands investigation. In a like manner in geometry, if three points are always on a straight line, we seek the reason. Again, if three lines are drawn at random in a plane there is small chance that they pass through a point, in general they will form a triangle.

259. Concurrent Lines.—Three or more lines meeting in a common point are called concurrent lines.

We will now consider a few important cases of concurrent lines.

260. Theorem.—The perpendicular bisectors of the sides of a triangle meet in a point equidistant from the three vertices. This point is called the center of the circumscribing circle and the method of proof is given in the construction problem of §248.

261. Theorem.—The perpendiculars from the vertices of a triangle to the opposite sides meet in a point.



Hyp. Given the triangle ABC, with the perpendiculars AD, BE, and CF drawn through the vertices to the opposite sides.

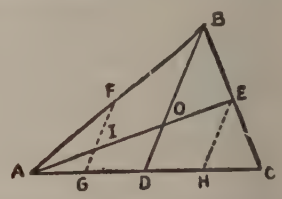
Con. The lines AD, BE, and CF are concurrent.

Hint. Through each vertex of the triangle draw a line parallel to the opposite sides and let these lines intersect to form the triangle GHI. For this triangle the lines AD, BE, CF are the perpendicular bisectors, hence the proof depends upon §260.

262. Theorem.—The bisectors of the angles of a triangle meet in a point equidistant from the three sides. This point is the center of the inscribed circle, and the method of proof is indicated in §289.

263. Median.—A median of a triangle is a line connecting a vertex to the midpoint of the opposite side.

264. Theorem.—The medians of a triangle meet in a point two-thirds of the distance from each vertex to the midpoint of the opposite side.



Hyp. Given the triangle ABC, with D, E, and F, the midpoints of the sides AC, CB, and BA respectively.

Con. The medians AE, BD, and CF are concurrent.

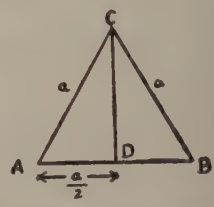
Hint. We will draw only two medians at first, AE and BD intersecting in O. We will show that AO = 2(OE) and BO = 2(OD). Draw FG and EH through F and E respectively parallel to BD to meet AC at G and H. Let FG and AE intersect in I. Then AG = GD = DH = HC. (§117, Theorem 37.) By the same theorem $AI = IO = OE$. Hence $AO = \frac{2}{3}(AE)$. In the same manner we can prove that AE and CF will intersect in a point O^1 such that $AO^1 = \frac{2}{3}(AE)$. Hence $AO = AO^1$, thus O and O^1 coincide, therefore all the medians pass through O.

265. Equilateral Triangle.—A triangle is equilateral when all its sides are equal.

266. Equiangular Triangle.—A triangle is equiangular when all its angles are equal.

267. Scalene Triangle. — A triangle is scalene when no two sides are equal.

268. Exercise.—Find the altitude and area of an equilaterial triangle of side a.



Given the equilateral triangle ABC with the side a.

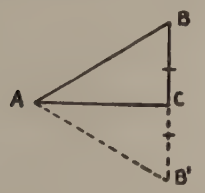
Required to find the altitude CD and the area of the triangle.

The point D is the midpoint of the base, hence AD = a/2. ADC is a right triangle, hence, $a^2 = \left[\frac{a}{2}\right]^2 + (CD)^2$, or $4(CD) = 3a^2$.

(§211, Theorem 83.) Hence $CD = \frac{a\sqrt{3}}{2}$.

The area $= \left(\frac{1}{2}\right)(a)\left(\frac{a\sqrt{3}}{2}\right) = \frac{a^2\sqrt{3}}{2}$. (§207, Theorem 79).

269. Theorem.—If one acute angle of a right triangle is double the other, the hypotenuse is double the shorter side.

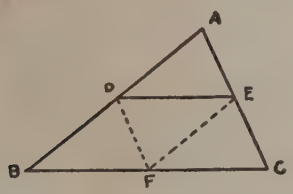


Hyp. Given the right triangle ABC with $\angle C$ the right angle and $\angle B = 2\angle A$.

Con. AB is double BC.

Hint. Prolong BC through C to B^1 making CB^1 equal to BC. Draw AB^1. Triangles ABC and AB^1C are congruent. $\angle BAC + \angle B^1AC = \angle B = \angle B^1$, hence the triangle is equiangular and equilateral. Thus $AB = BB^1$, therefore $AB = 2BC$.

270. Theorem.—The line which bisects two sides of a triangle is parallel to the third side and is equal to one-half of the third side.



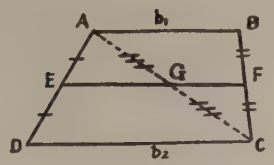
Hyp. D and E are the midpoints of the sides AB and AC respectively of the triangle ABC.

Con. DE is parallel to BC and equal to one-half of BC.

Hint. Take F, the midpoint of BC, and draw DF and EF. DE is parallel to BC, EF is parallel to AB, and DF is parallel to AC. (§182, Theorem 63. If a straight line divides two sides of a triangle proportionally, it is parallel to the third side.) Hence both DEFB and DECF are parallelograms. Thus $DE = BF = FC$. Therefore $DE = \frac{1}{2}$ BC.

271. Theorem.—If a line is parallel to one side of a triangle and bisects a second side it bisects the third side. This is a special case of §181.

272. Theorem.—The line joining the midpoints of the non-parallel sides of a trapezoid is parallel to the two bases and is equal to one-half of the sum of the bases.



Hyp. Given the trapezoid ABCD, with E and F the midpoints of the non-parallel sides AD and BC respectively. Let $AB = b_1$ and $DC = b_2$.

Con. EF is parallel to AB and DC.

$$EF = \frac{1}{2}(b_1 + b_2).$$

Hint. Draw AC and let G be the midpoint of AC. Draw EG, EG is parallel to DC and equal to one-half of it. (§270.) Draw FG. In the same way, FG is parallel to AB and equal to one-half of AB. GF is also parallel to DC. (§95, Theorem 19.) Hence GE and GF are parts of the same straight line. (§15, Postulate.) $EG = \frac{1}{2}b_2$, $GF = \frac{1}{2}b_1$, thus $EG + GF = EF = \frac{1}{2}(b_1 + b_2)$.

273 Theorem.—Two triangles which have their sides respectively parallel or perpendicular are similar. Hint. Prove the angles of one triangle equal the angles of the other and apply §186.

274. Lemma.—A lemma is a preparatory proposition laid down to shorten the demonstration of the main proposition which follows it.

275. Corollary.—A corollary is a consequence drawn immediately from a proposition. In the text books on geometry many theorems are followed by the statement of a particular case as a corollary.

276. Concyclic Points.—Three or more points which lie on a circle are called concyclic points. In general four points chosen at random will not lie on a circle. When we do have four points on a circle there are many relations existing among the lines and angles which are determined by the four points. The consideration of such relations is beyond an elementary discussion of geometry.

277. Conclusion.—The reader who is interested in geometry will never need to grieve for more worlds to conquer, as did Alexander the Great. After the study of plane geometry, naturally comes the study of solid, or three dimensional geometry. In the developments of modern physics it is also convenient, and also almost necessary, to study the geometry of four, five and of any number of dimensions. This is carried out with the assistance of the methods of algebra in what is known as analytical geometry. Geometry also becomes involved in still greater difficulties, for in order that the laws of physics may assume simple forms under all conditions it appears necessary that so called non-euclidean geometries should be developed. Every surface has a geometry of its own. If one is walking in a mountainous country, the shortest distance between two points for a person constrained to walk always on the ground will no longer be a straight line but will be a curve. Three points on the ground will determine three of these shortest distances, bounding an area which we may call a triangle. However two triangles may have their sides equal without being either congruent or equal in area. The curve corresponding to a circle becomes a complicated curve. The reader may investigate a geometry of this kind by stretching strings on the surface of any solid, a taut string in contact with a smooth surface giving the shortest distance between two points. The plane geometry we have studied becomes a special case of this geometry when the surface on which the strings are stretched is a plane.

FORMULAS

278. Symbols.—

a,b,c = sides of a triangle ABC.
p = perimeter.
r = radius.
c = circumference of a circle.
d = diameter of a circle.
h = altitude.
$s = \frac{1}{2}(a+b+c)$.
K = area.
b = base of a triangle, parallelogram.
$\pi = 3.14159\ldots, \frac{22}{7}$ approximately.

279. Length of Lines.—

Right triangle $a^2 + b^2 = c^2$. §211, Theorem 83.

Circle $c = \pi d = 2\pi r$. §231, Theorem 91.

Equilateral triangle $h = \frac{1}{2}a\sqrt{3}$. §268.

Diagonal of a square $d = b\sqrt{2}$. §211, Theorem 83.

Altitude on side c $= h_c = \frac{2}{c}\sqrt{s(s-a)(s-b)(s-c)}$.

Meridian on side c $= m_c = \frac{1}{2}\sqrt{2(a^2+b^2)-c^2}$.

Bisector of the angle opposite $c = t_c = \frac{2}{a+b}\sqrt{abs(s-c)}$.

An arc $= \frac{\text{central angle}}{180^\circ}(r\pi)$.

280. Areas of Plane Figures.—

Rectangle bh. §203, Theorem 75.

Square b^2. §203, Theorem 75.

Parallelogram bh. §206, Theorem 78.

Triangle $\frac{1}{2}bh$. §207, Theorem 79.

Triangle $\sqrt{s(s-a)(s-b)(s-c)}$. §212.

Equilateral triangle $\frac{1}{4}a^2\sqrt{3}$. §268.

Trapezoid $\frac{1}{2}h(b_1+b_2)$. §208, Theorem 80.

Regular polygon $\frac{1}{2}p$(apothem). §228, Theorem 89.

Circle $\frac{1}{2}rc = \pi r^2$. §223, Theorem 93.

Sector of a circle $\frac{1}{2}r$(arc).

INDEX.

SCIENCE IN GENERAL

Pure science is a product of research, questioning nature in order to understand. To explain any phenomenon is to state its relationships to other known phenomena. The relationships most commonly sought are those of quantity, order, and cause, existing or acting in time and space. A cause is any determining factor. *The* cause of any given phenomenon is the sum of all antecedent conditions necessary to bring about the given condition. If this definition is accepted, it becomes evident that *the* cause of any experience can never be stated in full, for, in a sense, everything is the cause of anything. Explanations therefore seek the nearest causes, or those which have been noticeably potent in bringing about the condition observed.

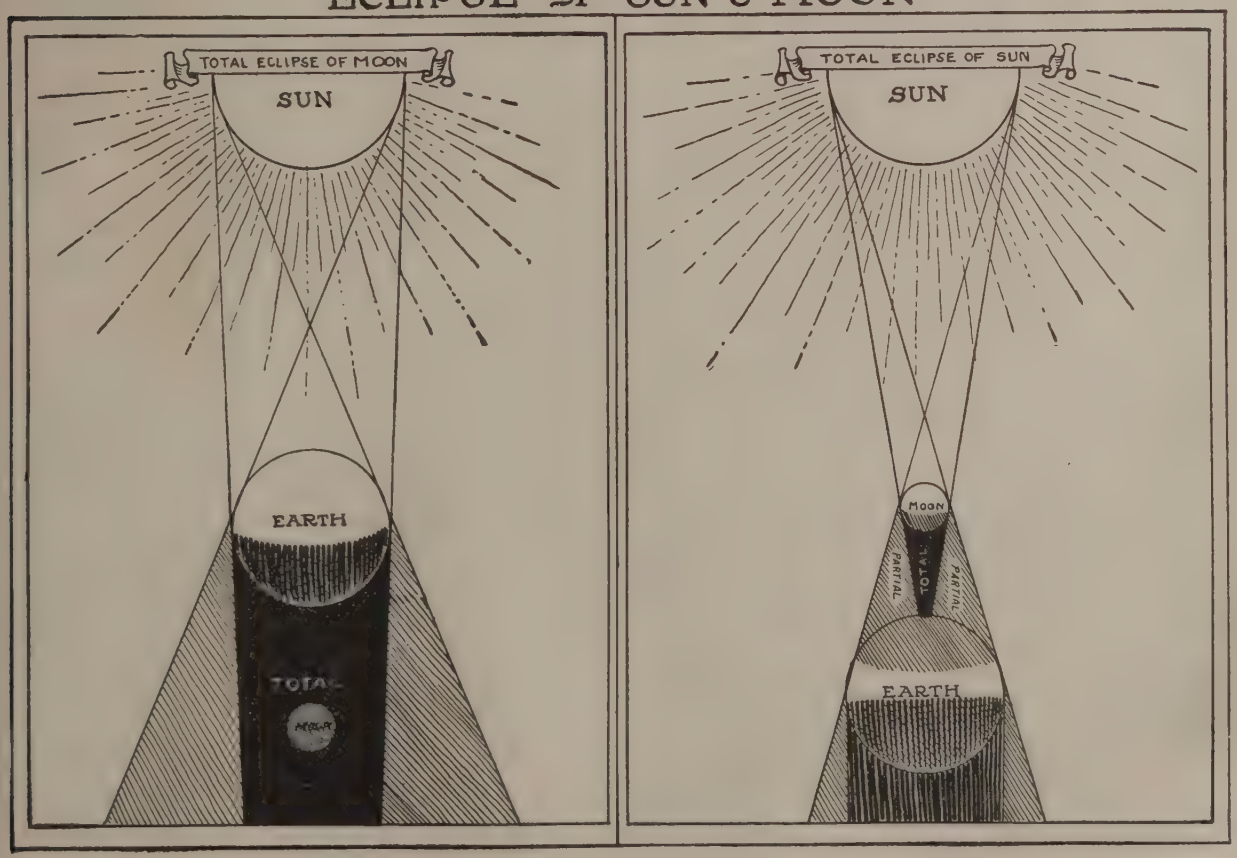
Pure science discovers and explains. Applied science puts the discoveries and the theories of research into practical use, through mechanical inventions. The first production of radium, for example, was a triumph of pure research; but it was promptly followed by mechanical applications resulting in such a commercial demand for radium as to seriously hamper further research in the important field of radio—activity.

Science as such always proceeds by observation of the phenomena to be explained. Experiment is the process of observing phenomena under such control as to permit repetition and variation at the will of the observer. Scientific laws, or laws of nature, are the summaries of observation and experiment approved by "competent authorities" at any given time.

The order of procedure in formulating natural law through experiment is: (1) recognition of the problem; (2) control of the situation; (3) observation of all possible combinations of the variables involved; (4) comparison of the records thus secured; (5) rejection of the irrelevant; (6) synthesis of the relevant; (7) testing of the hypothesis thus formed, by applying it to fresh cases. By sufficiently tested evidence, hypothesis may be confirmed into theories, and theories may become "laws." Natural law thus appears strikingly unlike statute law or ecclesiastical law. Natural law is always held subject to revision whenever authenticated facts in its field fail to conform with the law in question.

Two long accepted "laws of nature" deal with the conservation of matter and the conservation of energy. According to these laws, the sum total of matter in the

ECLIPSE OF SUN & MOON



universe is constant, and the sum total of energy is also constant. The theory of relativity, which is rapidly gaining scientific acceptance, holds that only the sum of matter and energy combined is constant, since matter may pass into and back from a state wherein it is "pure energy," with few or no traits of matter about it. But even if this theory were to become a new law of nature, matter and energy would be two phases of one reality; and nature would still appear as an unbroken web of cause and effect. Ephemerism is thus an ephemerism of form only; and the fact of continuity remains the most sweepingly significant generalization about nature.

CLASSIFICATION OF THE SCIENCES

—Science (Latin, *Scientias*, that which we know) is *human experience, tested* and *set in order*. It differs from creed (that which one believes), resting on bases other than human experience; it differs from philosophy (our generalization as to that which transcends or lies beyond human experience); it differs from mere fact or record not order; it differs from history in dealing set in properly with causes and effects shown in proper relations. It differs also from art, which is essentially action based on human knowledge. In common language, however, the art and the science on which it rests may often receive the same name, as in the case of agriculture, which word implies a science, or group of sciences, relating to the rearing of crops, and also the use of this classified knowledge, or science in actual practice.

In the language of modern Europe, the names of most of the sciences are derived from Greek roots, the second element in each being *Λογος, logos*, a discourse. Thus osteology (*οστεον, osteon*, bone) is a discourse on bones; ornithology (*ορνις, ornis*, bird) a discourse on birds. More exactly we may say that osteology is the science of bones. Again as each science is to the individual man an object of study, osteology becomes pedagogically the study of bones. By the addition of *logy* to a Greek root, an indefinite number of additional words can be framed, and will be framed in the future as the need for expression shall arise. For example, we may have rhodology, the science or the study of roses; orchidology, the science or the study of orchids; cynology, the science or study of dogs.

Other names applied to sciences conventionally terminate in the termination *ics*, which forms in many cases a euphonic ending. Thus optics, the science of vision (*ωκ, ops*, eye); ceramics (*κεραυος*, ceramos, a pitcher), the science of pottery. Other words of this sort might be readily devised, as cynics, the science of dogs; rhodics, the study of roses. Still other terms end in English in graphy (*γραφειν, graphein*, to write), indicating that the science is accompanied by writings or drawings: as geography, description of the earth, as distinguished from geology, the study or science of the earth (*γη, ge*, earth). Still other recognized names of science spring from various roots, mainly from the Greek.

Beginning with inorganic nature, we may make the following classification of those branches of science which have recognized names in the English language.

OUTLINE OF SCIENCES

Concerning the Heavens	ASTRONOMY; science or study of the stars. Cosmology; science of the universe. Uranography; science (mapping) of the heavens.
Concerning the Earth	ANEMOLOGY; science of winds. Climatology; science of climates. Crystallography; science of crystals. Epigene Geology; science of forces molding earth from without. Geodesy: science of the earth's surface. Geognosy; science of the earth's peculiarities. Geography; science (mapping) of the earth's surface. Geology; science of the earth. Hydrography; science of river basins. Hypogene Geology; (Plutonics) science of forces molding earth from within. Lithology; science of stones. Metallography; science of metals. Metallurgy; science (and art) of metals and ores. Meteorology; science of weather phenomena. Mineralogy; science of minerals. Oceanography; science of the ocean basins. Oreography; science of mountains. Petrography; science of rock composition. Physiography; science of the physical features on the earth's surface (also called physical geography). Seismography; science of recording earth tremors. Seismology; science of earthquakes. Stratigraphy; science of rock strata. Topography; science of the modifications of land surfaces.
Concerning Mass and Force	PHYSICS: the science of mass and force. Dynamics; science of force. Mechanics; science of application of force. Thermodynamics; science of force as related to heat. Acoustics; science of sound and hearing. Astrophysics; the science of physical features of the stars. Calorics; science of heat, as a mode of motion. Electricity; the science of the mode of motion known as electric currents. Galvanism; the science of galvanic electricity. Geophysics; science of physical features of the earth. Hydraulics; science of moving water. Hydrodynamics; science of the relation of liquids and power. Hydromechanics; science of power derived from motion of water. Hydrostatics; science of pressure of water at rest. Magnetism; the science of magnetic electricity. Optics; science of light and vision. Pneumatics; science of relations of gases to force or power.
Concerning the Molecules and Lesser Divisions of Matter	CHEMISTRY; the science of the intimate composition of matter. Alchemy; science (and art) of the alleged transformation of baser metals into gold. Biochemistry; the science of the chemistry of living beings. Inorganic Chemistry; science of elements and compounds not produced by the process of life. Organic Chemistry; science of the chemical compounds produced by the processes of life. Physical Chemistry; science of the features of matter involving both physics and chemistry. Physiological Chemistry; science of chemical changes within the bodies of animals. Spectroscopy; science (and art) of relation of chemical substances in the stars or on earth to the light spectrum.
Concerning Living Organisms	BIOLOGY; science of life and of living organisms (animals and plants). Analogy; the science or study of chance relationship. Anatomy; science of the structure of living organisms. Bionomics; science of changes in form of living organisms due to life adjustment and to other causes, from generation to generation. Comparative Anatomy; science of the relation of forms in organs of living beings. Cytology; science of the structure and functions of the organic cells forming tissues in living beings. Dietetics; science of food stuffs in relation to digestion. Ecology; science of the adjustment or behavior toward environment of living organisms (used chiefly in reference to plants). Embryology; science of the development of the fertilized germ-cell through different stages; the science of embryos. Environment; science of the effects of the results of external conditions in the development of individuals or species.* Heredity; science of continuity of type, from generation to generation (the name also applied to the law or fact of such continuity).* Histology; science of the tissues of which organs are formed. Homology; the science of underlying resemblances in man or lower organisms, the supposed impress of common heredity. Hygiene; science of the methods of maintaining health; (is used chiefly in reference to man). Isolation; science of the results of the separation of individuals from the mass of the species.* Morphology: science of forms in organs of living organisms. Ontology; science of the life history of the individual. Organic Evolution; science of orderly change in life forms from generation to generation; (the name more often applied to the fact or process than to the science). Pathology; science of disease in men or other organisms. Phylogeny; science of the history or development of the species or type. Physiology; science of the functions of the organs of living beings. Sanitation; science of the processes of maintaining health. Selection; science of the results of the survival of one class of individuals as compared with others, from generation to generation.* Taxonomy; science of the orderly arrangement of living beings according to their structure or according to their supposed origin or development. Classification is the general name for the processes of taxonomy. Teleology; science of real or supposed purpose or adaptation in structures of men or lower organisms. Teratology; science of monstrosities and their causes among men or other organisms. Variation; science of individuality and the tendencies to divergence from generation to generation.*

† The terms Environment, Heredity, Isolation, Selection and Variation are used more generally in the sense of factors in organic evolution of species or types.

OUTLINE OF SCIENCES

Sciences Chiefly or Wholly Related to Plants

- BOTANY: science of plants.
- Abiogenesis; science of (alleged) spontaneous generation of organisms.
- Agriculture; science (and art) of cultivation of the fields.
- Agrostology; science of grasses.
- Algology; science of seaweeds.
- Arboriculture; science (and art) of tree culture.
- Bacteriology; science of bacteria and microbes.
- Bryology; science of mosses.
- Dendrology; science of trees.
- Diatomology; science of diatoms, minute one-celled plants
- Forestry; science (and art) of care and culture of forests.
- Fungology; science of fungi (toadstools, molds, etc.).
- Horticulture; science (and art) of plant culture.
- Lichenology; science of lichens.
- Limnology; science of swamp-life.
- Paleobotany; science of extinct vegetation.
- Phytogeography; science of the geographical distribution of plants.
- Pteridology; science of ferns.
- Xerophytology; science of desert vegetation.

Sciences Primarily Concerning the Lower Animals or Concerning Man as an Organism

- ZOOLOGY; science of animals.
- Andrology; science of male organisms as such.†
- Animal Psychology; science of nervous impulses and nervous reflexes.
- Carcinology; science of crustaceans (crabs, lobsters).
- Conchology; science of shells.
- Craniology; science of skulls.
- Dermatology; science of the skin and its functions.
- Entomology; science of insects.
- Gastrology; science of the stomach.
- Gynecology; science of female organisms as such.†
- Helminthology; science of worms.
- Herpetology; science of reptiles.
- Ichthyology; science of fishes.
- Laryngology; science of the throat and its functions.†
- Mammalogy; science of mammals.
- Myology; science of muscles.
- Neurology; science (anatomy, physiology, pathology) of nerves.
- Obstetrics; science of the process of birth.†
- Odontology; science of the teeth.
- Oölogy; science of eggs.
- Ophthalmology; science of the eye and its functions.†
- Organography; science of the organs.†
- Ornithology; science of birds.
- Osteology; science of bones.
- Otology; science of the ear and its functions.
- Paleontology; science of extinct organisms.
- Paleozoölogy; science of extinct animals.
- Parasitology; science of parasites.
- Pisciculture; science (and art) of artificial rearing of fishes.
- Protozoölogy; science of protozoans.
- Rhinology; science of the nasal apparatus and its functions.
- Skeletology; science of skeletons.
- Somatology; science of the body.
- Telegony; science of (alleged) effects of the first father on the progeny of a second, by the same mother.
- Therology; science of beasts.
- Thremmatology; the science of selective breeding of domestic animals.
- Trichology; science of the hair.
- Zoögeography; science of geographical distribution of animals.

Sciences Relating Chiefly or Exclusively to Man as a Member of Society

- ANTHROPOLOGY; science of the human species.
- Aëronautics; science (and art) of air flight.
- Æsthetics; science of beauty and of appreciation of beauty.
- Anthology; science of flowers—used chiefly for flowers of expression or choice lyric verse.
- Apologetics; science of truth and falsehood in theological speculation.
- Archæology; science of ancient works of men.
- Archæsthetics; science of the supposed pervading mind preceding the existence of conscious animal life.
- Assyriology; science of ancient relics of Assyrian civilization.
- Astrology; science of the imaginary influences of the stars on human affairs.
- Athletics; science (and art) of bodily exercise.
- Biography; science of individual life records.
- Demonology; science of (supposed) spirits, mostly evil.
- Dialectics; science of argumentation.
- Didactics; science (and art) of instruction.
- Dogmatics; science of asserted truths.
- Doxology; science of belief (commonly used as the name of a brief song of praise).
- Ceramics; science (and art) of pottery and pottery making.
- Chronology; science of time.
- Civics; science of civil relations of man.

Sciences Relating Chiefly or Exclusively to Man as a Member of Society (Continued)

- Cookery; science (and art) of preparing food for man with the aid of heat.
- Criminology; science of crime and criminals.
- Economics; science of property relations of man.
- Education; science (and art) of mental development in man.
- Egyptology; science of ancient Egyptian civilization.
- Epistemology; science of sources of human knowledge.
- Eschatology; science of "doctrines of uttermost things," more especially speculations as to a future state.
- Ethics; science (and art) of human conduct.
- Ethnography; descriptive science of men, races and tribes of men.
- Ethnology; science of the significances of races of men.
- Ethology; science of human behavior.
- Etymology; science of word-derivation.
- Eugenics; science of the conditions of being well born, as regards possibilities of development in the individual life.
- Finance; science of money as a medium of exchange.
- Genealogy; science of lines of descent by heredity.
- Genesis; science of origins.
- Glyptology; science of sculpture.
- Graphics; science of drawing.
- Gymnastics; science (and art) of muscular exertion.
- Hagiology; science of saints and of writings regarded as sacred.
- Harmonics; science of music and of harmony in sound.
- Hellenics; science of Greek culture.
- Hermeneutics; science (or art) of expounding sacred writings.
- Homiletics; science (and art) of teaching by spoken discourse.
- Hymnology; science of hymns or religious poetry.
- Jurisprudence; science of law.
- Linguistics; science of speech.
- Logic; science of proofs in matters of cause and effect.
- Medicine; science (and art) of healing disease.
- Metaphysics; study of matters that transcend physical knowledge.
- Military Science; science of war and of methods of human destruction.
- Mythology; science of myths and legends.
- Papyrography; science (and art) of reading ancient records—on papyrus.
- Pathology; science of disease.
- Pedagogics; science of education in man.
- Pediatrics; science of disorders of childhood.
- Pedology; science of development of the child in man.
- Pharmaceutics; science of drugs.
- Pharmacology; science of the effects of chemical substances on animal organisms.
- Philology; science of words and word evolution.
- Philosophy; a study of that which transcends human experience.
- Phonetics; science of pronunciation of vocal sounds.
- Phonology; science of vocal sounds.
- Politics; science of relations of men as citizens and as groups of citizens; the science of citizenship.
- Psychiatrics; science of nervous disorders.
- Psychology; science of nervous reflexes and mental operations.
- Psychotherapeutics; science of healing agencies operating through the senses (as suggestion, etc.).
- Pugilistics; science (and art) of fist-fighting.
- Sciosophy; study of the shadows cast by imperfections in science.
- Sociology; a group of sciences concerning human society.
- Splanchnology; science of the internal organs or viscera.
- Surgery; science (and art) of healing through cutting diseased or injured tissues or organs.
- Telegraphy; science (and art) of "distance-writing" by the use of the telegraph.
- Telepathy; science of (alleged) transmission of knowledge without the use of sense organs.
- Telephony; science (and art) of "distance-speaking" by means of the telephone.
- Theology; science of deity and of divine control of the universe; also of the opinions entertained by men in regard to these matters.
- Therapeutics; science of healing agencies.
- Toxicology; science of poisons or chemical substances pernicious to animal life.
- Veterinary Medicine; science (and art) of healing disease in domestic animals.

Exact Sciences

- MATHEMATICS; logic applied to space and number.
- Algebra; science of mathematical formulæ.
- Arithmetic; science of numbers.
- Geometry; science of measurements of space.
- Horology; science of measuring time.
- Trigonometry; science of measurement of angles.
- Calculus; science of calculations based on the conception of limit.
- Non-Euclidian Geometry; science of measurements of imaginary space, as space of four dimensions, or, that imagined to have dimensions other than length, breadth and thickness.

† The terms Andrology, Dermatology, Gynecology, Laryngology, Obstetrics, Opthalmology, Organography, and Somatology are applied chiefly to man, constituting branches of medical science.

AERONAUTICS.—The art of sailing in or navigating the air, has occupied the ingenuity of men from the earliest ages. But it was not till the composition of the atmosphere had begun to be ascertained, and that means had been devised of filling vessels with heated air, or other air lighter than atmospheric air, and consequently capable of floating on it, that there came to be a rational prospect of succeeding in the "audacious attempt" of riding in the air.

Balloon.—In 1782, the brothers Montgolfier succeeded in constructing a balloon; and on the 21st of October, 1783, Pilatre de Rozier, a young naturalist, and the Marquis d'Arlandes, ascended from Paris to an elevation of more than 3,000 feet, and alighted safely from their "aërial tour," after describing a circuit of about six miles.

The ascents performed by Gay-Lussac, who attained an elevation of 4½ miles, are memorable for being the first ever undertaken solely for objects of science. In 1862 Mr. Glaisher reached the estimated elevation of 37,000 feet, which was approximated by two German aëronauts at Berlin in 1901. The most daring attempt at an aërial voyage was that of the Swede, Andree, who, with two companions, in 1897 ascended from Spitzbergen in hopes of reaching the north pole, their fate remaining unknown.

The modern balloon is but a slight improvement on that invented by Montgolfier. In place of heated air or hydrogen, common coal gas is now used. This improvement was introduced by Mr. Green, the English aëronaut. As gas expands rapidly as the balloon ascends, and the pressure of the external air is diminished, the neck of the balloon is commonly left open, and the machine is also furnished with a safety valve at the top, which can be opened or shut at pleasure.

Shape. — The balloon is usually a large pear-shaped bag, made of pliable silk cloth, covered with a varnish of caoutchouc, dissolved in oil of turpentine to render it air-tight. The ordinary size may range from 20 to 30 feet in equatorial diameter, with a proportionate height, but balloons of far greater dimensions have been constructed. A car, generally of wicker-work, supported by a network which extends over the balloon, contains the aëronaut; and a valve, usually placed near the top and to which is attached a string reaching the car, gives him the power of allowing the gas to escape, whereby the balloon is lowered at pleasure.

A quantity of sand ballast in small bags is usually taken, and when the balloon tends to descend too far sand is thrown out and it rises again. The guide-rope, a long and heavy rope trailing over the ground, is sometimes used when the country is such that no serious damage will result from its trailing. The principle of this device is that as the balloon tends to rise it must lift more of the rope off the ground, while when the balloon sinks it is relieved of so much weight, and thus it will tend to float at one level above the ground. A *parachute*, a contrivance resembling a huge umbrella, is often used in ballooning, and by its means an aëronaut can leave a balloon and descend slowly to the ground.

Steering.—The problem of how to steer or propel a balloon in a desired horizontal direction can scarcely be said to have been satisfactorily solved, though numerous attempts at producing navigable balloons have lately been made. In a navigable balloon to be propelled through the air by some kind of motor—against the wind if necessary—the familiar balloon shape is departed from as quite unsuitable, and the airship is usually of an elongated form and more or less cylindrical or cigar-shaped. These are floated by gas, and propelled by a screw driven by a dynamo-electric machine, and steered by a large rudder.

Renard and Krebs, two other workers in this field, subsequently built an airship 165 feet long and 127½ feet in diameter, moved by a battery of Renard's invention, a dynamo and a screw 7 feet in diameter. This machine, in 1884, was driven at a speed of 12 to 15 miles an hour in calm weather, and had power enough to contend against a light breeze.

The names of Count Zeppelin and M. Santos-Dumont have recently become well known in connection with such balloons. From 1897 to 1910 the former constructed several huge cylindrical air ships of great length, with paraboloid ends, divided into a number of separate chambers filled with hydrogen gas and these inclosed in an outer air balloon, the whole being braced and made rigid by an aluminum framework, and the means of propulsion being screws driven by Daimler petroleum motors and fixed to the longitudinal axis of the airship.

M. Santos-Dumont has constructed several navigable balloons, and one of them was so successful at Paris in 1901 as to gain a prize of 100,000 francs. On this occasion his airship made the journey from St. Cloud to the Eiffel Tower and back again, a distance of about 9½ miles, in half an hour. In 1907, and since, the British army balloon department made remarkably successful experiments with airships; and successes on the part of Count Zeppelin and others were also reported.

Aviation.—Besides balloons, which are lighter than a corresponding volume of air, and airships depending on the same principle, various apparatus have been constructed for aërial navigation that are heavier than the air. Attempts at navigation by means of such craft is termed *aviation*. Some of these machines are intended more for gliding or soaring through the air than for actual flight, having somewhat the nature of a huge bird with outstretched wings, beneath which a man attached himself, and on springing from a height gradually descends to the bottom.

Aeroplane.—Hence the invention of the *aëroplane*, which shows a large flat surface contrived to float nearly horizontally in the air, but with the front edge very slightly raised, so that in being propelled rapidly along it receives the pressure of the air on the under side, the air thus tending to counteract the force of gravity. Sir H. S. Maxim in 1894 constructed a huge machine with main and several subsidiary aëroplanes, propelled by two large screws driven by steam engines of 300 horsepower, and able to rise with a great weight. As a model, at least, Prof. Langley's *aërodrome* had some success, flying through the air a distance of three-quarters of a mile. It had two rigid pairs of wings about 12 feet in width, with large screw-propellers between them driven by a small steam engine.

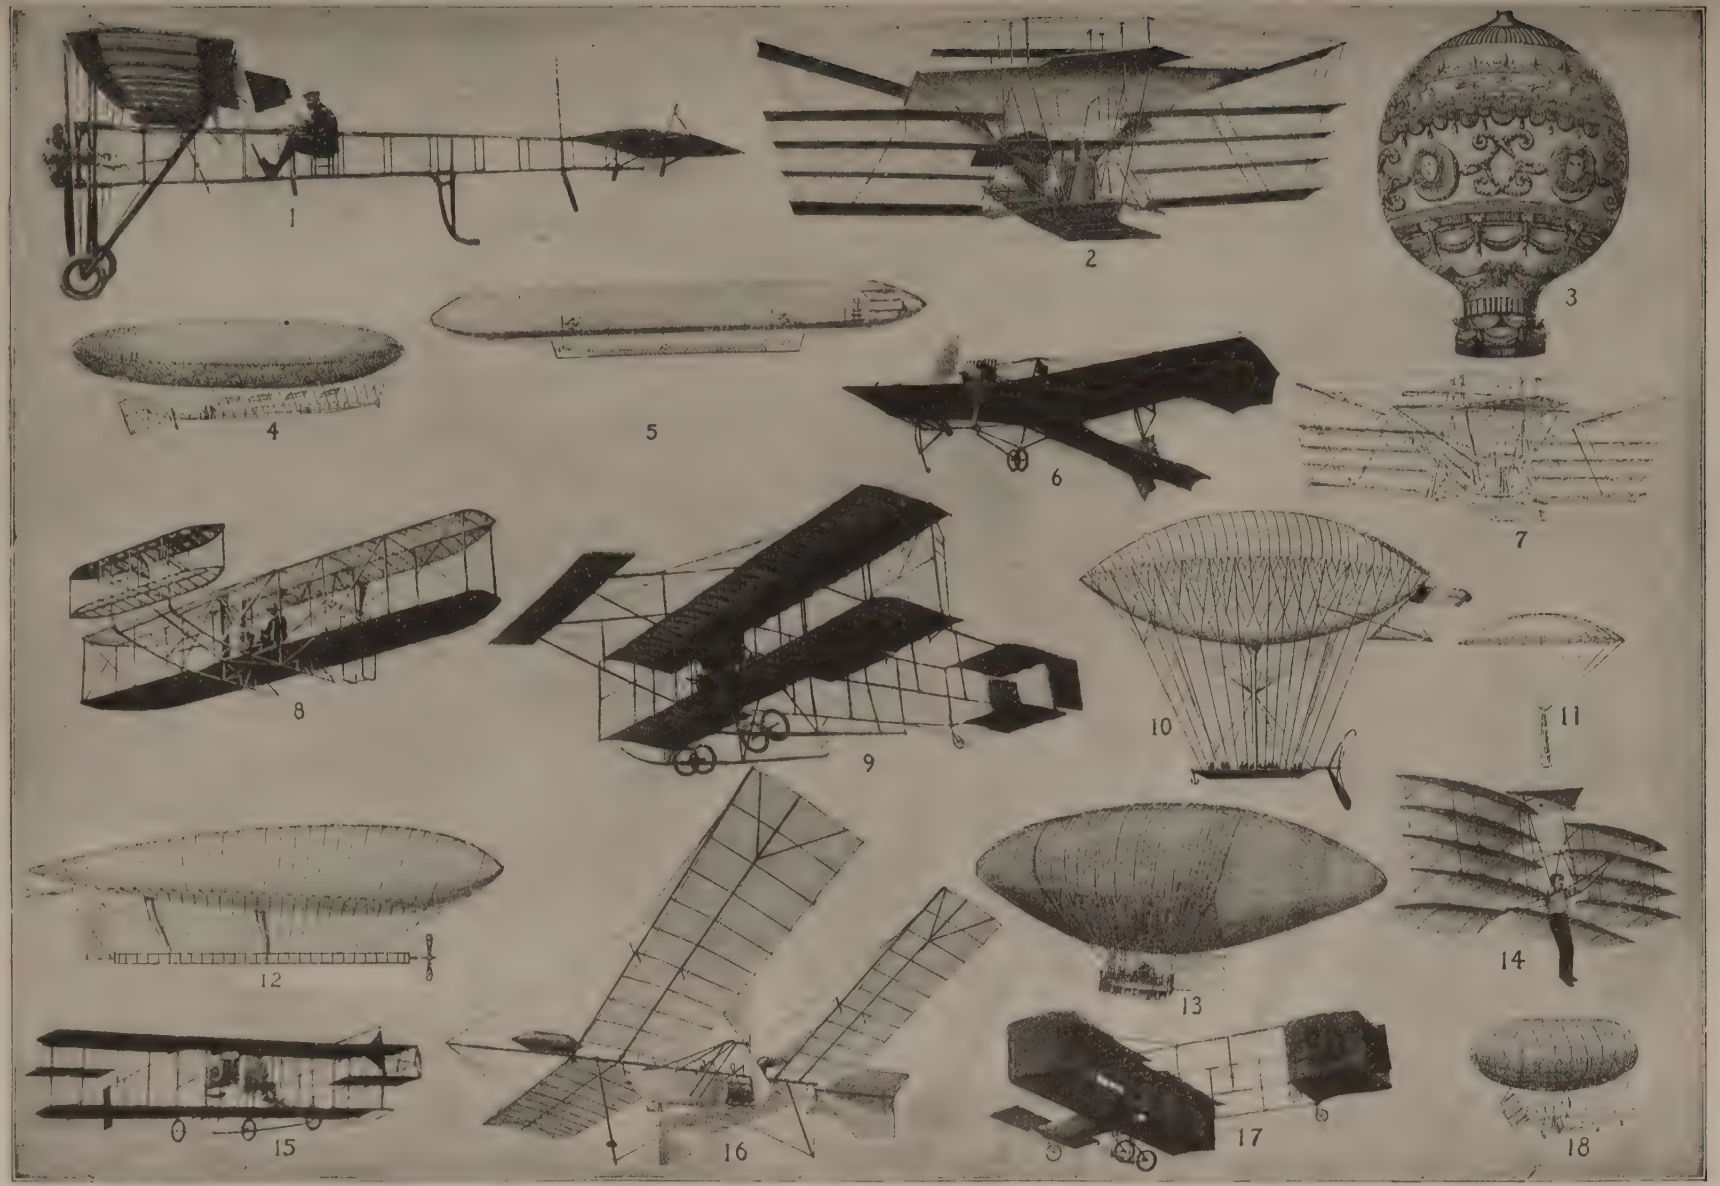
Type of Aeroplane.—Since the first aëroplane types of flying machines, designed by Maxim and Lilienthal, the work of inventors and scientists along the line of motor-driven, heavier-than-air flying machines has shown steady progress. The general and most popular design is that of the simple aëroplane, supported by air, through which it is propelled by detached force. The aëroplane, it should be observed, however, consists of two types—the *monoplane* and the *biplane*. There have been many radical but experimental departures from the aëroplane type, none of which, however, has shown any great degree of success. Among these radical types is the helicopter, the production of Otto Luyties of Baltimore, Md. The design of the machine embraces several pairs of huge wings and two or more upright revolving propellers, the latter operated by a 100-horsepower motor for the purpose of lifting the machine. The entire weight is 1,700 pounds.

Wright Machine.—The first achievement, however, in the form of sustained flight, with power to rise and descend without mishap, and to guide the machine in a circular flight, is confined to the Wright brothers of Dayton, Ohio, one of whom, in 1906, remained in the air thirty-eight minutes and three seconds, making a circular flight of twenty-four and a half miles. The brothers Voison also constructed an aëroplane on lines laid down by M. Octave Chanute, which was driven in a successful flight in November, 1907, at Paris by M. Henry Farman. The aëroplane on the first attempt rose slowly from the ground, and in one minute and fourteen seconds completed a circle.

Officials of the Aëro Club of America, at the international congress held in New York, 1907, admitted that in flights of man-carrying gasless machines the Wright brothers were far ahead of all competitors. What the Wright brothers accomplished in both this country and France, marked a new era in aerial navigation; and the prolonged flights of motor-driven aeroplanes, together with the recent work of Santos Dumont, Voisin brothers, Farman, Bleriot-Levasseur, Curtiss and other aëroplane builders and operators fills the future with great expectations.

NOTABLE EVENTS AND RECORDS OF AVIATION

Aviator	Aeroplane	Date	Place	Time	Distance	Remarks
W. Wright	Biplane	Nov. 9, 1904	Dayton, Ohio	0:04:30	3 miles	Wright brothers made 105 flights in 1904.
W. Wright	Biplane	Oct. 5, 1905	Dayton, Ohio	0:38:00	24 miles	Wright brothers made 49 flights in 1905.
Santos-Dumont	Biplane	Nov. 13, 1906	Bagatelle, France	0:00:21½	722 feet	His best record for 1906.
Delagrange	Biplane	May 30, 1907	Bagatelle, France		656 feet	His best record for 1907.
Farman	Biplane	Oct. 26, 1907	Issy, France		2,530 feet	His best record for 1907.
Bleriot	Monoplane	Dec. 6, 1907	Issy, France		1,978 feet	His best record for 1907.
Pelterie	Monoplane	Jan. 8, 1908	Buc, France		3,960 feet	His best record for 1908.
Farman	Biplane	Jan. 13, 1908	Issy, France	0:01:28	4,921 feet	
Farman	Biplane	Mar. 21, 1908	Issy, France		1.25 miles	



1. Farman's Monoplane.
2. Maxim's Flying Machine.
3. Montgolfier's Balloon.
4. Santos Dumont's Balloon.
5. Zeppelin's Airship.

11. Parachute.
12. Airship of Renard and Krebs.
13. Wolfert's Airship.
14. Chanute's Flying Apparatus.
15. Glen Curtiss' Machine.
16. Langley's Flying Machine.
17. Paulham's Machine.
18. Stanley Spencer's Balloon.

NOTABLE EVENTS AND RECORDS OF AVIATION—Continued

AVIATOR	AEROPLANE	DATE	PLACE	TIME	DISTANCE	REMARKS
Delagrange	Biplane	May 30, 1908	Rome, Italy		7.776 miles	
Delagrange	Biplane	June 22, 1908	Milan, Italy		10.563 miles	
Curtiss	Biplane	July 4, 1908	Hammondsport, N. Y.		3,420 feet	Scientific American cup.
Bleriot	Monoplane	July 4, 1908	Issy, France	0:05:47	3,728 feet	
Farman	Biplane	July 6, 1908	Ghent, France		12.24 miles	
W. Wright	Biplane	Aug. 10, 1908	LeMans, France	0:01:43	1 m. 440 yds.	
W. Wright	Biplane	Aug. 11, 1908	LeMans, France	0:03:41	2 m. 880 yds.	
W. Wright	Biplane	Aug. 12, 1908	LeMans, France	0:06:56	4 miles	
Mengin	Monoplane	Aug. 21, 1908	Issy, France	0:01:30	1 mile	His best record for 1908.
Delagrange	Biplane	Sept. 6, 1908	Issy, France	0:29:53 4-5	15.364 miles	His best record for 1908.
W. Wright	Biplane	Sept. 5, 1908	LeMans, France	0:19:54	16 m. 440 yds.	
O. Wright	Biplane	Sept. 8, 1908	Fort Myer, Va.	1:02:00	40 miles	
O. Wright	Biplane	Sept. 12, 1908	Fort Myer, Va.	1:15:00	50 miles	His longest flight in 1908.
W. Wrigh	Biplane	Sept. 21, 1908	LeMans, France	1:31:25 4-5	41 miles	Made over 100 flights here.
Farman	Biplane	Oct. 2, 1908	Chalons, France	0:44:32	24.854 miles	His best record for 1908.
Bleriot	Monoplane	Oct. 21, 1908	Toury, France		4.34 miles	
Bleriot	Monoplane	Oct. 31, 1908	Toury, France		8.69 miles	
Bleriot	Monoplane	Oct. 31, 1908	Toury, France		17.317 miles	With three stops cross country. His best flight, 1908
W. Wright	Biplane	Dec. 18, 1908	LeMans, France	1:54:53 2-5	62 miles	Rose to 360 feet.
W. Wright	Biplane	Dec. 31, 1908	LeMans, France	2:20:23 1-5	77 miles	Speed about 34 miles per hour. Won Michelin prize. World's record.
Zipfel	Biplane	Dec. 9, 1908	Germany		4,921 feet	His best record in 1908.
Moore-Brabaison	Biplane	Feb. 27, 1909	Issy, France		3.1 miles	
McCurdy	Biplane	Mar. 18, 1909	Baddeck, Nova Scotia		16 miles	His best record in 1908.
Latham	Monoplane	June 5, 1909	Chalons, France	1:07:37		First hour flight by monoplane.
Farman	Biplane	July 19, 1909	Chalons, France	1:23:00	40 miles	
Curtiss	Biplane	July 24, 1909	Garden City, L. I.	0:52:30	25 miles	Won second contest for Scientific American cup.
Gaudart	Biplane	July 27, 1909	Juvisy, France		4.35 miles	
Sommer	Biplane	July 27, 1909	Chalons, France	1:23:30	50 miles	
Sommer	Biplane	Aug. 1, 1909	Chalons, France	1:50:30		
Hansen	Biplane	Aug. 3, 1909	Stockholm, Sweden		3 miles	
Sommer	Biplane	Aug. 4, 1909	Chalons, France	2:00:10		
Paulhan	Biplane	Aug. 7, 1909	Dunkirk, France	1:32:45	23 miles	
Savoia	Biplane	Aug. 7, 1909	Rome, Italy	0:15:00	12 miles	His best record in 1909.
Sommer	Biplane	Aug. 7, 1909	Mourmelon, France	2:27:15		World's record.
Willard	Biplane	Aug. 14, 1909	Garden City, L. I.	0:19:00	12 miles	Cross country flight.
Sommer	Biplane	Aug. 21, 1909	Chalons, France	0:12:00	9 miles	At rate of 45 miles an hour.
Paulhan	Biplane	Aug. 25, 1909	Rheims, France	2:43:24 4-5	81 miles	World's record.
De Lambert	Biplane	Aug. 26, 1909	Rheims, France	1:50:59	68.34 miles	His best record in 1909.
Latham	Monoplane	Aug. 26, 1909	Rheims, France	2:13:09 3-5	96 miles	His best record in 1909.
Latham	Monoplane	Aug. 26, 1909	Rheims, France	2:13:09 2-3	96 miles	At 42 miles an hour.
Latham	Monoplane	Sept. 27, 1909	Germany			Berlin to Johannisthal with the wind; said to have reached a speed of 74½ miles per hour.
Tissandier	Biplane	Aug. 27, 1909	Rheims, France	1:46:52	68.34 miles	His best record for 1909.
Farman	Biplane	Aug. 27, 1909	Rheims, France	3:15:00	112 miles	First man to fly for three hours continuously.
Lefebvre	Biplane	Aug. 28, 1909	Rheims, France		13.4 miles	His best record in 1909.
Bleriot	Monoplane	Aug. 28, 1909	Rheims, France	0:07:47	62.2 miles	
Latham	Monoplane	Aug. 28, 1909	Rheims, France	1:28:17	62.2 miles	
Bleriot	Monoplane	Aug. 28, 1909	Rheims, France	0:07:47 4-5	6.2 miles	
Curtiss	Biplane	Aug. 28, 1909	Rheims, France	0:15:50 3-5	12.4 miles	Wins Gordon Bennett cup.
Curtiss	Biplane	Aug. 29, 1909	Rheims, France	0:23:29	18.6 miles	Wins first prize (speed).
Cody	Biplane	Sept. 8, 1909	Aldershot, England	1:03:00	40 miles	Cross country.
Rougier	Biplane	Sept. 12, 1909	Brescia, Italy	1:10:18	31 miles	Reached 380 feet altitude.
Paulhan	Biplane	Sept. 13, 1909	Tournal, France	1:35:00		Cross country.
Santos-Dumont	Monoplane	Sept. 13, 1909	St. Cyr, France	0:12:00	5 miles	Cross country.
Calderara	Biplane	Sept. 15, 1909	Brescia, Italy		5.6 miles	Won Oldofredi prize.
Santos-Dumont	Monoplane	Sept. 17, 1909	St. Cyr, France	0:16:00	10 miles	Cross country.
O. Wright	Biplane	Sept. 18, 1909	Berlin, Germany	1:35:47		With Capt. Englehardt.
Calderara	Biplane	Sept. 20, 1909	Brescia, Italy	0:50:51	31 miles	Second speed prize.
W. Wright	Biplane	Sept. 25, 1909	New York, U. S. A.			Circled "Liberty."
Latham	Monoplane	Sept. 27, 1909	Berlin, Germany	0:13:00	6.5 miles	Berlin suburbs.
Rougier	Biplane	Sept. 28, 1909	Berlin, Germany	0:45:00	31 miles	Reached 518 feet.
Rougier	Biplane	Oct. 1, 1909	Berlin, Germany	2:38:00	80 miles	First distance prize.
Farman	Biplane	Oct. 3, 1909	Berlin, Germany	1:40:00	62 miles	Third prize.
O. Wright	Biplane	Oct. 4, 1909	Berlin, Germany	0:33:33	21 miles	Reached height 1,600 feet.
W. Wright	Biplane	Oct. 4, 1909	New York, U. S. A.	0:33:33	21 miles	Grant's tomb and back.
De Lambert	Biplane	Oct. 18, 1909	Juvissy, France	0:49:39	31 miles	Eiffel tower and back.
Paulhan	Biplane	Oct. 19, 1909	Blackpool, England	0:32:18	15.75 miles	Third distance prize.
Farman	Biplane	Oct. 20, 1909	Blackpool, England	1:32:16	47 miles	Won $10,000 prize.
Le Blon	Monoplane	Oct. 20, 1909	Doncaster, England			Flight in gale.
Latham	Monoplane	Oct. 22, 1909	Blackpool, England			Flight in gale.
Delagrange	Monoplane	Oct. 26, 1909	Doncaster, England	0:07:36	6 miles	Over 50 miles an hour.
Sommer	Biplane	Oct. 26, 1909	Doncaster, England	0:44:53	29.7 miles	Won Whitworth cup.
Farman	Biplane	Nov. 20, 1909	Mourmelon, France	4:06:25	137.25 miles	Said to be 150 miles.
Paulhan	Biplane	Nov. 20, 1909	Mourmelon, France	0:55:00	37 miles	Cross country at 1,000 feet.
Delagrange	Monoplane	Dec. 30, 1909	Juvisy, France	2:32:00	124 miles	Flew 49.02 miles per hour with 50-h.-p. Gnome motor; had 14-mile wind behind him.
Delagrange	Monoplane	Oct. 26, 1909	Doncaster, England	0:07:36	6 miles	At speed of 49.9 miles per hour.
Paulhan	Biplane	Nov. 1, 1909	Brooklands, England	2:49:20	96 miles	
Farman	Biplane	Nov. 3, 1909	Mourmelon, France	2:00:00	67.64 miles	
Farman	Biplane	Nov. 3, 1909	Mourmelon, France	3:00:00	77 miles	
Farman	Biplane	Nov. 3, 1909	Mourmelon, France	3:42:34	124 miles	
Farman	Biplane	Nov. 3, 1909	Mourmelon, France	4:00:00	133.9 miles	
Farman	Biplane	Nov. 3, 1909	Mourmelon, France	4:06:25	144 miles	
Grahame-White	Monoplane	Nov. 28, 1909	Pau, France			Flew at rate of 70 miles per hour.
Balsan		Feb. 13, 1910	Heliopolis, Egypt	0:03:57	6.2 miles	
Paulhan	Biplane	April 27, 1910	London to Manchester			Won $50,000 prize offered by the London *Daily Mail*.
Paulhan	Biplane	April 18, 1910	Chevilly, France	2:03:00	108 miles in all	Chevilly-Areis-sur-Aube to Chalons in two stages. Record duration and distance flight to date.
Grahame-White	Biplane	April 23, 1910	London, England	2:50:00	117.2 miles	Port Royal, London to Hodemore with stop at Rugby. On April 24 went on to Hardemore. Abandoned flight, which was won by Paulhan, April 27-28.
Paulhan	Biplane	April 28, 1910	London, England	4:12:00	193 miles in all	Flew from London to Manchester, 117 miles; in first stage, Litchfield, 66 miles; second stage, Manchester. Total average speed 44.34 miles an hour.
Labouchere	Monoplane	July 9, 1910	Rheims, France	4:37:00 2-5	211.27 miles	First man to fly 200 miles continuously. World's record.
Olieslaegers	Monoplane	July 10, 1910	Rheims, France	5:03:05 1-5	244.043 miles	First man to fly for five hours continuously. World's record.

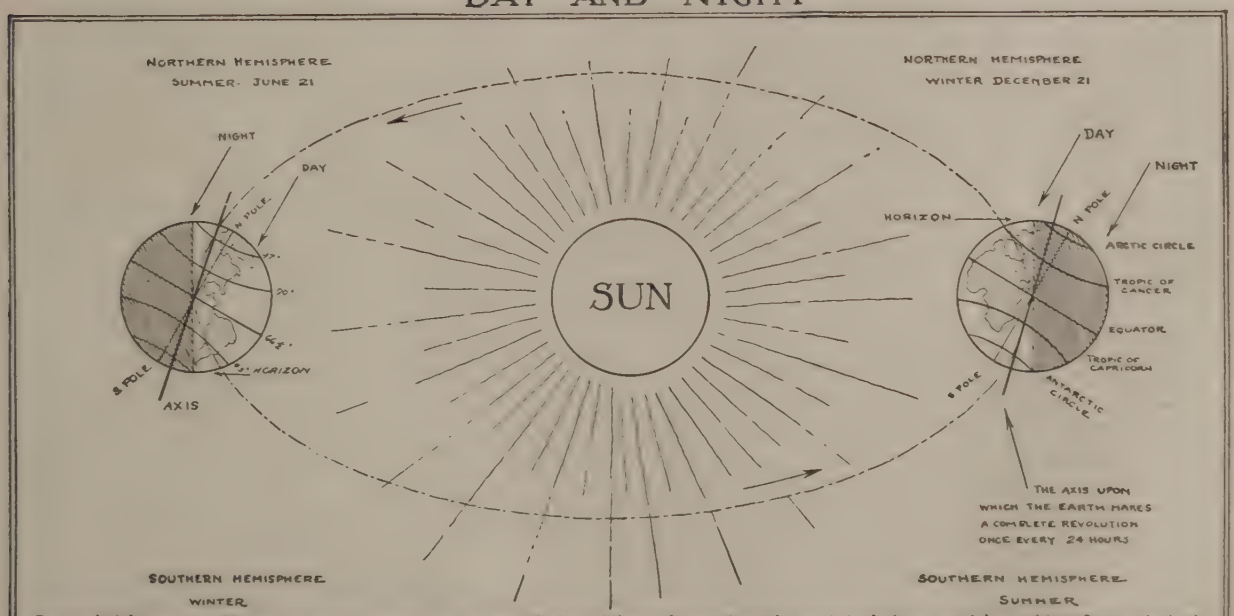
NOTABLE EVENTS AND RECORDS OF AVIATION—Continued

Aviator	Aeroplane	Date	Place	Time	Distance	Remarks
Morane	Monoplane	July 10, 1910	Rheims, France	0:02:48 2-5	3.107 miles	66.417 miles hour. World's record.
Radley	Monoplane	Aug. 10, 1910	Lanark, Scotland	0:00:47 2-5	1 mile	77.6 mi. hr. World's straightaway rec'd.
Le Blanc	Monoplane	Aug. 7-17, 1910	France	10 d. 11 h. 55 m.	485 miles	75 miles one stage. Won first prize.
Aubrun	Monoplane	Aug. 7-17, 1910	France	10 d. 12 h. 15 m.	485 miles	Second prize. 20 minutes later Le Blanc.
Cattaneo	Monoplane	Aug. 13, 1910	Lanark, Scotland	3:18:09 1-5	141 mi. 188 yds.	British record.
Johnstone	Biplane	Sept. 3, 1910	Atlantic, Mass.	3:05:40	101 m. 389 ft.	American record.
Aubrun	Monoplane	Sept. 16, 1910	Bordeaux, France	3:45:30	197 miles	
Brookins	Biplane	Sept. 29, 1910	Chicago, Ill.	5:49:00	192.5 miles	Flew from Chicago to Springfield, Ill.
Hoxsey	Biplane	Oct. 8, 1910	Springfield, Ill.	3:33:00	109 miles	Springfield, Ill., to St. Louis, Mo.
Welsh	Biplane	Oct. 11, 1910	St. Louis, Mo.	3:11:55		
Euler	Biplane	Oct. 25, 1910	Darmstadt, Germany	3:06:11		German record.
Mathieu	Biplane	Oct. 28, 1910	Paris, France		141 miles	Flew within 20 miles of Brussels.
Tabuteau	Biplane	Oct. 28, 1910	Buc, France	6:01:35	289.39 miles	First man to fly six hours continuously.
Moisant	Monoplane	Oct. 30, 1910	Belmont Park, L. I.	0:34:38.84	35 miles (about)	Around Statue of Lbty. $10,000 prize.
Grahame-White	Monoplane	Oct. 30, 1910	Belmont Park, L. I.	0:35:30		
Leganeaux		Dec. 10, 1910	Pau, France			World's high record, reaching 10,500 ft.
Ely		Jan. 18, 1911	San Francisco, Cal.			Alighted on and flew from deck of ship.
Curtiss		Feb. 23, 1911				From land to water and water to land.
Fowler		1912	Jacksonville—San Francisco			First transcontinental flight.
Pegoud		Sept. 1, 1913				First voluntary loop.
	Albatross	July 10, 1914	Johannesthal, Germany			Remained in air 24 hrs. 12 mins.
Oelerich		July 14, 1914	Leipzig, Germany		25,755 ft.	Record altitude flight.
Hawker	Sopwith	1916			24,408 ft.	
Laureati		Aug. 29, 1917	Turin to Naples		920 miles	
	German Dirigible	Nov. 21-25, 1917	Jamboli—East Africa		4,200 miles	
Shroeder	300 hp Wright Mtr.	Sept. 18, 1918	Bristol, England		28,900 feet	
Casale	Spad	1919			31,000 feet	
Read	N.C-4 Plane	May 8-31, 1919	R'k'w'y, L.I.—Ply, Eng.		4,116 miles	Crew 5 men, 1st transAtlantic flight.
Joyce		Jan. 24, 1919	Issondon			300 loops.
Roget & Coll	Breguet Plane	Jan. 26, 1919		5 hours	457 miles	Crossed Mediterranean.
Maynard		Feb. 12, 1919	Romorantin			318 loops.
	Thomas-Morse Scout	Feb. 21, 1919	Ithaca, N. Y.			164 miles per hour.
Macauley	D.H-4	April 16, 1919	Americus,—San Diego	44 hrs. 15 min.		1st round trip transcontinental flight.
White		April 19, 1919	Chicago to New York	106 m. p. h.	727 miles	First non-stop flight.
	U. S. Navy C-5	May 14-15, 1919	Long Isl'd—New Foundl'd		1,115 miles	
Alcock & Brown	Vickers-Vimy	June 14-15, 1919	St. Johns. N.F.—Clifden, Ire.		1,936 miles	First non-stop transAtlantic flight.
Rohlfs	Curtiss "Wasp"	July 30, 1919	Mineola, L. I.		30,700 feet	
	British Dirigible	July, 1919	Gt. Britain—U. S. & return		6,330 miles	First round trip transAtlantic flight.
Shroeder	Liberty Motor	Aug. 2, 1919			18,400 feet	Averaged 137 miles per hour.
Marshall	Thomas-Morse	Aug. 2, 1919	Ithaca, N. Y.		35 miles	Glided.
Goliath		Aug. 11, 1919	Paris to Morocco	16 hrs. 20 min.	1,116 miles	Carried 10 passengers.
Rohlfs	Curtiss "Wasp"	Sept. 18, 1919	Mineola, L. I.		32,450 feet	
Smith	Vickers-Vimy	Nov. 12-Dec. 19, '19	London—Pt. Darwin, Aus.		11,500 miles	
	U. S. Navy Squadron	1920	Philadelphia to Porto Rico	1,192 hrs. 25 m.	12,731 miles	Flew in storms against strong winds.
		1920	Oregon and California	1,995 hours		Fire patrol reported 464 forest fires.
Schroeder	400 hp. Liberty Mtr.	Feb. 26, 1920	McCook Field, Dayton, O.		33,114 feet	Fell 5 miles, recovered, made landing
		Mar. 5, 1920	Calcutta to Bombay	17 hours	1,200 miles	
VanRynev'd & Brand		Mar. 20, 1920	Cape to Cairo			First Cape to Cairo flight.
Knight		Mar. 30, 1920	Chicago to Cleveland	2 hrs. 10 min.	340 miles	Averaged 152 m. p. h., 16,000 letters.
	Handley-Paige	May 4, 1920		1 hr. 20 min.	4,267 meters	Carried load of 1,500 kilograms.
Fronval		June 1, 1920	Villa Coublay, France	3 hrs. 52 min.		Record of 962 loops.
	Farman-Goliath	June 3-4, 1920		24 hr. 19 m. 7 s.	1,915 miles	
Hudson	Curtiss "Wasp"	June 12, 1920	Andes		30,000 ft. ele.	
	Seaplane F-5-L	July 7, 1920	Norfolk		97 miles	Guided by radio to U. S. ship, returned
Street	D.H.-4-B	July 15 to Aug. 24	New York to Alaska	55 hours		First flight to Alaska.
Hamilton	Parachute	Aug. 21, 1920	Carlstrom Field	12 minutes	20,900 feet	
	Two Army Planes	Sept. 5, 1920			75 feet	Var. Pitch props. stop plane 75 ft. from where landing gear 1st touched gr'd.
Lecointe		Oct. 10, 1920	Villa Coublay, France			Speed record of 188 miles per hour.
Mosley	Verville-Packard	Thanksgiving 1920	Garden City, L. I.	44 min. 29.57 s.	132 miles	Average 178 miles per hour.
Kloor, Hinton Farrell	U. S. Balloon	Dec. 24, 1920	New York to Ontario	25 hours	852 miles	
	U. S. Navy Seaplane	Jan. 1, 1921	San Diego—Magdalena Bay	9 hrs. 15 min.	702 miles	Estab. non-stop flight, 6 passengers.
	12 Navy Seaplanes	Jan. 15, 1921	San Diego—Panama Canal	17 days	3,200 miles	Nine stops made.
Chambers	Parachute	Feb. 22, 1921	Fort Sill, Okla.		22,200 feet	Parachute jump.
Coney		Feb. 24, 1921	San Diego to Jacksonville	22 hrs. 27 min.	2,180 miles	Completes transcontinental flight.
Larsen	J-L-6 Monoplane	Mar. 15, 1921	Peace River to Great Slave Lake, Alberta, Can.			Completes long exploring flight.
Hamilton	Parachute	Mar. 23, 1921	Rantoul, Ill.		23,000 feet	Breaks own record jump.
	Curtiss-Wright	Mar. 26, 1921	Belleair, Fla.			Stops within 15 feet.
Macready&Langhan	Biplane	May 6, 1921	McCook Field, Dayton, O.		34,150 feet	Makes two-man altitude record.
Lemon	Parachute	May 28, 1921	El Reno, Okla.		150 feet	Record low altitude parachute jump.
Barrufald		June 10, 1921	Argentine, S. A.		24, 272 feet	South American altitude record.
Klemperer	Glider	Aug. 1, 1921	Wasserkuppe—Gersfeld, G.		5 miles	Arose 400 ft. above starting point.
Armbruster	Balloon	Sept. 17, 1921	Brussels—Lombey Is., Ire.		515.14 miles	Won Int'l Gordon-Bennet balloon race
Lecointle		Sept. 25, 1921	Nieuport, France			Speed of 330 km. p. h. (204.6 m. p. h.)
Macready	Packard-Lepere	Sept. 28, 1921	McCook Field, Dayton, O.		40,800 feet	Makes world's record.
Ramey	D.H-4-B	Oct. 11, 1921	Washington to New York	79 minutes	220 miles	Record flight.
Acosta	Curtiss Navy Racer	Nov. 22, 1921	Curtiss Fld., G'd'n City, L.I.			Speed of 197.8 miles per hour.
	C-7 Navy Blimp	Dec. 1, 1921	Norfolk, Va.			Helium used successfully in first test.
Haynes	D.H.-4 Messenger	Feb. 4, 1922	Dayton, O., to Wash., D. C.	2 hrs. 55 min.		Record non-stop flight, aver. 147 m. p. h.
Trinler	Longren Biplane	Mar. 6, 1922	Topeka, Kan.	140 minutes	17,900 ft. alt.	
Moyer & Fitch	Army Airship C-2	April 6, 1922	Aberdeen Pvg. Grds., Md.		2,000 feet	Made 7 hits out of 8 bombs.
Webster	Flying Yacht	April 17, 1922	Palm Beach, Fla., to N. Y.	9 hrs. 56 min.		Passengers carried, one-stop.
Doolittle & Andrews		Mar. 4, 1922	Kelly Fld., Tex.—Pac. C'st	13 hrs. 25 min.	1,200 miles	Fastest time ever made.
	Aeromarine	May 9, 1922	Havana, Cuba, to New Yk.	17 hrs. 35 min.		Carried nine passengers.
Westover	Balloon	May 31, 1922	Milwaukee, Wis.		866.5 miles	Winner of Nat'l Ballon Race.
Stevens	Martin Bomber	June 12, 1922	McCook Field, Dayton, O.		24,206 feet	Record parachute jump.
	Aeromar'e Flying Bt.	July 21, 1922		82 minutes	117 miles	With 7 passengers estab. speed record.
Hayes & Kolinsky	D.H.-4-B	Aug. 2, 1922	Kelly Fld., Tex.—N. Orl'ns	4 hrs. 30 min.	560 miles	
Wade	Martin Bomber	Aug. 2, 1922	McCook Field, Dayton, O.		23,350 feet	Breaks own record, with 3 passengers.
De Muyter	Free Balloon	Aug. 6, 1922	Geneva, Switzerland		870 miles	Won Gordon-Bennet Int'l balloon race.
Zimmerman	Junker Seaplane	Aug. 7, 1922	Naples, Italy	17 h. 8 m. 5 1/5 s.	1,996.3 km.	Winner of Tyrrhenian Cup.
Biard	Supermarine	Aug. 12, 1922	Naples, Italy	1 h. 34 m. 5 3-5 s.	200 naut. mi.	Won Jacques Schneider Competition.
Hentzen	"Vampire" Glider	Aug. 25, 1922	Rhon, Germany	3 hrs. 10 min.		Record for motorless flying.
Papa		Aug. 29, 1922	Milan, Italy		1 km.	Makes record of 208.5 miles per hour.
Moseley & Coleman	Fokker CO-4	Sept. 1, 1922	Dayton, O., to San Fran.	26 hrs. 15 min.		Fogs and heavy storms no obstacle.
Doolittle		Sept. 5, 1922	Jacksonville to San Diego	21 hrs. 20 min.		1st transcontinental flight under 24 hrs.
Lasne	Biplane	Sept. 30, 1922	Sauvage Airdome, France		186 miles	Won Deutsch de la Meurthe.
Miller		Oct. 2, 1922	San Fran. to Los Angeles	2 hrs. 58 min.		Breaks record by seven minutes.
Gorton	Navy TR-1	Oct. 8, 1922	Detroit, Mich.		257.7 miles	Winner Curtiss-Marine flying race.
Nelson	Martin Transport	Oct. 12, 1922	Mt. Clemens, Mich.		257.7 miles	Won Detroit News Air Mail trophy race.
Mitchell		Oct. 18, 1922				Breaks world's straightaway speed rec.
Kelly & Macready	Fokker Army T-2	Nov. 14, 1922	San Diego to Indianapolis		2,060 miles	Record non-stop flight.
Bossoutrot	Farman F-90	Nov., 1922	France			Winner grand prize of France.

NOTABLE EVENTS AND RECORDS OF AVIATION—Continued

Aviator	Aeroplane	Date	Place	Time	Distance	Remarks
Manyrol	Peyret Glider	Jan. 29, 1923	France	8 h. 4 m. 50.4 s.		Record glider flight.
Pearson	Verville-Sperry	Mar. 29, 1923	McCook Field, Dayton, O.		500 km.	Record 500 km. at 167.8 miles per hour.
Maitland	Curtiss Army Racer	Mar. 29, 1923	Dayton, Ohio			Record speed at 239.95 miles per hour.
Harris	D.H. 4-B	Mar. 29, 1923	Dayton, Ohio		100 km.	World's record for 100 km., 127 m.p.h.
Macready & Kelly	Fokker Army T-2	April 16-17, 1923	Dayton, Ohio	36 h. 4 m. 32 s.		Duration and speed record for 2,500 km.
Macready & Kelly	Fokker Transport	May 2, 1923	N. Y. to San Diego, Cal.	26 hrs. 50 min.	2,516.35 miles	Record non-stop flight.
Smith & Bitcher	D.H. Plane	Aug. 27-28, 1923	San Diego, Cal.	37 h. 15 m. 14 s.		Endurance record.
Williams	Curtiss Navy Racer	Oct. 6, 1923	St. Louis, Mo.			Winner Pulitzer trophy race.
Zimmerman	Flying Boat	Oct. 23, 1923			13,500 feet	Had six other passengers.
Smith & Bitcher	D.H.-4-B Special	Oct. 25, 1923	Canadian—Mexican Border	12 h. 13 m. 40 s.	1,280 miles	Refueled in air three times.
Harris	Barling Bomber	Oct. 29, 1923	Dayton, Ohio	1h.19m.11.8 s.		World's duration rec. with load 3,000 k.
Lecointe	Nieuport Delage	Oct. 30, 1923	Issu-les-Moulineaux, France		36,555 feet	World's Altitude record.
Bonnet	Biplane	Oct. 31, 1923	Paris to Strassburg		745 miles	Winner Lamblin Cup, 122 m. p. h.
Rodgers & Palmer	D.H.-4-B	Nov. 2, 1923	Haiti—San Fran.—Wash.		8,600 miles	Made without a forced landing.
Williams	Curtiss Navy Racer	Nov. 4, 1923	Mitchell Field, L. I.		3 km.	World's speed record, 266.59 m. p. h
Williams	Curtiss Navy Racer	Nov. 6, 1923		1 minute	5,000 feet	World's record.
Laporte	F. B. A. Flying Boat	Nov. 30, 1923	France		19,024 feet	Record Altitude flight.
Chamberlin-Acosta	Monoplane	Apr. 12-14, 1927	Long Island, N. Y.	51 h. 11 m. 25 s.		World's non-stop record.
Lindbergh	Ryan Monoplane	May 21-22, 1927	Long Island, N.Y.—Paris	33 h. 29 m. 30 s.	3,610 miles	World's non-stop record.
Chamberlin-Levine	Bellanca	June 4-5, 1927	N. Y.—Eisleben, Ger.	41 h. 35 m.	3,905 miles	World's non-stop record.
Maitland-Hegenberger	Fokker	June 28-29, 1927	Oakland, Cal.—Hawaii	25 h. 50 m.	2,400 miles	Pacific non-stop record.
Byrd-Acosta-Noville-Balchen	Fokker	June 29-30, 1927	Long Island, N.Y.—Ver-suv Mer, France	39 h. 56 m.	3,435 miles	
Lindbergh	Ryan Monoplane	Dec. 13, 1927, to Feb. 13, 1928	U. S. to Mexico, Central and South Americas	116 flying hrs.	9,060 miles	First non-stop flight, Washington, D. C., to Mexico City. Good will tour.
Chas. Holman		Feb. 12, 1928	Wold-Chamberlain airport, Minneapolis	4 hrs. 47 mins.		World record for 1,093 loops.
Capt. Costes & Lt. Lebrix	Brequet Bi-plane	Oct. 10, 1927, to Feb. 11, 1928	Paris to New York via Africa and South America	Average 107 mi. per hour	23,000 miles	
Haldeman & Stinson	Stinson Monoplane	March 31, 1928	Jacksonville, Fla., U. S.	53 hrs. 36 mins.		New endurance record.
Koehl, Von Huenefeld & Fitzmaurice	Junkers Monoplane	April 12-13, 1928	Berlin to Ireland, to Labrador to U. S.	34 hrs. 32 mins.	2,125 miles	First westward non-stop flight across Atlantic.
Wilkins & Eielson	Lockheed Monoplane	April 15-16, 1928	Pt. Barrow, Alaska, to Svalbard (Spitzbergen)	20½ hours	2,200 miles	Over North Polar Sea.
10 U. S. Army Men	Tri-motor 16-Passenger Ford	April 15, 1928	Chanute Field, Rantoul, Ill.	8.2 mins.		New world's record for successful leaps from airplane.
Kingsford-Smith, Ulm, Lyon & Warner	*Southern Cross*, Fokker Monoplane	May 31, 1928, to June 10, 1928	Oakland, Cal., to Sydney, Australia	11 days	7,800 miles	First flight across Pacific Ocean.
Amelia Earhart, Stultz & Gordon	Fokker Monoplane	June 17, 1928	Newfoundland to Wales	20 hrs. 40 mins.	2,000 miles	First transatlantic flight of a woman.
Maj. Carl Spatz and Associates	*Question Mark*, U. S. Army Fokker Monoplane	Jan. 1 to Jan 7, 1929	Metropolitan Airport, Los Angeles	150 hrs. 40 mins. 15 secs.	Nearly 12,000 miles	Longest flight of any form of aircraft.
Martin Jensen	Bellanca Monoplane	Mar. 27, 1929	Roosevelt Field, L. I., N. Y.	35 hrs. 33 mins. 21 secs.		World's record for non-stop solo flight.

DAY AND NIGHT



Day and night are caused by the turning of the earth on its axis. The half of the earth away from the sun is in darkness or night; and it is day on the half toward the sun. The complete trip of the earth around the sun determines the length of the year.

ASTRONOMY is the science of the heavenly bodies. It has evolved from the ancient astrology which assumed that the relative positions of heavenly bodies, as seen from earth, influenced human life and destiny. Astrology, asserting the ability to ascertain such influence, could predict the future of realms and potentates, even the individual. So it was a useful science, and the earliest astronomers were emperors and princes, who built and maintained observations, and themselves made the observations and all the calculations based on them. The practical needs of astrology, therefore, led to accurate observations of the sun, moon, stars and planets, in order to predict therefrom their future positions. So the astrology of the middle ages merged naturally into the astronomy of the Renaissance. As the fundamentals of astrology were abandoned, the utilities of astronomy were accepted and adopted; and the science of to-day embraces many subdivisions not wholly distinct, and which in many instances blend and overlie.

Chronological Astronomy fixes the exact relations of the time-units of the calendar, and settles disputed dates of ancient battles, reigns of kings and other historic events.

Nautical Astronomy, by observation and calculation, enables the navigator to conduct ships from port to port in safety.

Geodetic Astronomy supplies the basis for

measuring the earth, and mapping all its features accurately.

Spherical Astronomy is the application of spherical trigonometry to the celestial sphere.

Theoretical and Mathematical (formerly called *physical*, or *gravitational*) **Astronomy** unfolds the laws governing the motions of the heavenly bodies, and enables us to calculate their position at any past or future time.

Practical Astronomy is the art of using astronomical instruments, making observations with them, and calculating results therefrom.

Descriptive Astronomy is a systematic presentation of our knowledge of the motions, characteristics, and phenomena of the heavenly bodies.

Physical Astronomy or astrophysics is the science of the physical characteristics and constitution of the heavenly bodies; that is, physics and chemistry applied to astronomy.

Speculative Astronomy includes the cosmogony, planetology, plurality of worlds, habitability of the planets, and other subjects of astronomical investigation where no absolute conclusion is possible.

Astronomical Bodies.—The astronomical philosopher divides the bodies of the visible universe into five general classes:

Nebulae, faint, cloudlike objects, thousands of which are visible in the telescope, widely variant in figure, the most common and probably primordial form being the spiral nebula.

Stars, many millions of which exist, brilliant, self-luminous bodies, and with a single exception (the sun) so vastly remote as to resemble mere glistening points.

Planets, opaque bodies, few in number, far inferior to the stars in size, tributary to and dependent upon the sun, the earth being a planet of medium size.

Comets, peculiar tenants of interplanetary and interstellar space, self-luminous, semi-opaque, and composed of shoals of lesser bodies partly solid and partly gaseous, called meteors.

Meteoric Bodies, fragments of disintegrated comets, made up of elemental combinations similar to terrestrial ones, and scattered everywhere throughout the celestial spaces.

All knowledge of these bodies of the universe is embraced in the astronomy of the present day.

The Solar System is a vast assemblage of many hundred bodies classifiable in five divisions: (1) the sun, central, massive, dominant and self-luminous; (2) about 700 opaque, sun-illumined bodies called planets, of which the earth is one; (3) about 30 bodies called moons, or satellites, revolving around the planets, our moon being one of the largest; (4) many hundred comets, slight in mass but huge in dimension, self-luminous, usually with tails and often spectacular in appearance; (5) innumerable meteors, or shooting stars, fragments of disintegrated comets.

Ptolemaic Theory.—Astronomers of the ancient time taught that the earth was the center of the solar system, and that all the other bodies, even including the sun, traveled around it, each in its own earth-centered sphere of crystal. This false theory is known as the geocentric (that is, earth-centered) or Ptolemaic system, from Ptolemy (A. D. 140) a Greco-Egyptian, perhaps the most eminent of all ancient astronomers, whose chief work is entitled *The Almagest*.

Copernican Theory.—With the dawn of the Renaissance, Copernicus (1473–1543) advocated the true, or heliocentric (that is, sun-centered) system; but many years elapsed before it was accepted. Tycho Brahe (1546-1601) by a lifetime of effort at his famous observatory of Uraniborg, furnished an unparalleled mass of observations of the planets, especially Mars, showing their relative position among the stars.

Kepler's Laws.—Kepler (1571–1630) studied these observations for years, and eventually established three laws of planetary motion: (1) Every planet travels round the sun in an elliptic path, with the sun's center in one focus; (2) the radius vector, or line joining the centers of sun and planet, sweeps over equal areas of the ellipse in equal times; (3) the squares of the planets' times of revolutions around the sun are proportional to the cubes of their average distances from the sun's center.

Law of Gravitation.—Then came Sir Isaac Newton (1642–1727), who combined all three of Kepler's laws into a single one, known as the law of universal gravitation, as follows: Every body in the universe attracts and is attracted by every other body, with a force depending upon their mass, and growing less in exact proportion as the square of the distance between the bodies grows greater. Kepler gave no explanation of his laws, nor did Newton of gravitation, the cause of which remains yet unknown.

Age of Solar System.—The solar system is inconceivably old, but it is believed to have had a beginning, and to be drifting very slowly toward an end. Its entire lifetime is counted in hundreds of millions of years, so that human documents within historic time contain no record of cosmic change, in either the system or the earth itself. Certain it seems, however, that very gradual changes must be taking place. Apparent evidence of this is furnished by close comparative study of the planets. Proctor (1837-88), Flammarion (1842-19—), and Lowell (1855–19—) have devoted much attention to this speculative research.

We may summarize their conclusions briefly by saying that some of the bodies of the solar system (sun, Jupiter, Saturn, Uranus, Neptune) are as yet undeveloped to the life-supporting era, because of intense internal heat; others (earth, Venus, the Galilean moons of Jupiter, and possibly Mars) have a constitution and temperature hospitable to life; while still others (asteroids and lesser satellites, the moon, Mercury, and possibly Mars) have likely been habitable in the remote past, but are no longer capable of sustaining life.

The solar system is not at rest in interstellar space, but the sun with all its planetary freight is voyaging toward the northern constellation Lyra about twelve miles a second. Whether this motion is in a straight line or in a vast orbit around some stellar center is yet unknown.

The Sun is a dense, gaseous sphere, 866,000 miles in diameter, inconceivably hot (perhaps 10,000° F.), and 93,000,000 miles distant from the earth. The sun is exceedingly massive—330,000 planets like the earth fused in one would barely weigh as much as the sun. Gravity at the sun's surface is nearly twenty-eight times greater than here on earth—an average man would weigh a ton there. Slowly round on its axis the sun turns once in 27¼ days.

The Outer Surface of the sun is not solid, but atmospheric; and the phenomena of this surface confirm beyond question the existence of swift, tumultuous currents, not only sidewise but up and down, in the vaporized materials composing the outer layers. Most prominent of these is the photosphere, an unbroken mass of incandescent cloud a few thousand miles in depth. Just outside the photosphere is a vapor-laden atmosphere called the reversing ayer, probably less than a thousand miles deep. It causes the dark absorption lines of the solar spectrum first mapped by Fraunhofer (1787–1826), and named after him. Rising to vastly greater heights than the reversing layer is the chromosphere (color-sphere), chiefly hydrogen, calcium and helium, averaging seven or eight thousand miles in depth. Projected from the chromosphere, sometimes quiescent in form and again violently eruptive, are the scarlet prominences, or protuberances. All these interesting phenomena of the sun's surface are now photographed daily by means of the spectroheliograph of Hale (1868–19—) and Deslanders (1853-19—).

Far outside the chromosphere is a sort of quasi-atmosphere, seen only when the sun itself is totally eclipsed, and called the solar corona—an irregularly filamentous halo of pearly light, whose long streamers often stretch millions of miles into space, with the soft radiance of a comet or a distant searchlight. Its cause and significance are very obscure. In part at least, the corona seems to be an electro-magnetic phenomenon.

Sun Spots.—Spots on the sun are sometimes large enough to be seen without telescopic aid. They are well viewed through a small telescope by projection on a white screen. The largest spots are about 50,000 miles across, and the smallest are mere dark specks 500 miles in breadth. Spots are never permanent, though they sometimes endure for many months. The dark center of a spot (umbra) is surrounded by a less dark, ring-shaped area (penumbra). After many days the umbra usually begins to break up by bridges of penumbral light forming across it, a train of small spots forms, and these gradually fuse into the general surroundings of the photosphere. Schwabe (1789–1875) first discovered that sun spots appear and disappear in a pretty regular period of $11\frac{1}{9}$ years. They were very numerous in 1905 and fewest in 1900 and 1911. Spots are most frequent in solar latitudes 15 degrees north and south.

Students of the sun are not wholly agreed as to the cause and significance of sun spots. The true cause appears to lie in the sun itself; probably the spots are consequent on eruptions. Many of them are hollows, or depressions, in luminous matter ascending as well as descending. Frequently they are cyclonic, as demonstrated by recent photographs of Hale. Epochs of large or numerous spots are nearly always accompanied by displays of the aurora, magnetic disturbances and electric earth-currents, sometimes powerful enough to interfere with the working of telephones and telegraphs.

Whether sun spots, protuberances or corona have any effect upon the weather is not yet sufficiently proven. When spots have been very abundant, the weather (for the earth generally) has been sometimes less rainy, sometimes more so; sometimes warmer, sometimes colder, than the average. So that weather disturbances due to fluctuating conditions on the sun are at best very slight and undetermined. Faculæ, or bright spots, are frequent near the edge, or limb, of the sun, and the spectroheliograph

has proved that they exist everywhere on the sun's surface. Many of them are the tops of incandescent calcium clouds.

Chemical Composition.—Close study of the sun's spectrum for a half century has revealed many terrestrial elements in the sun in the vapor state—aluminium, calcium, carbon, cobalt, copper, hydrogen, iron, magnesium, nickel, oxygen, silicon, silver, sodium, titanium, zinc and many others. Iron, calcium, hydrogen, nickel and sodium are the most strongly indicated. But chlorine, gold, mercury, nitrogen, phosphorus and sulphur are not present.

Light and Heat.—So dazzling is the radiance of the sun that all artificial sources of light pale against it—even the arc light seems black by comparison. Even the spots emit light and are only relatively dark. The sun's total light surpasses that of the full moon 600,000 times. If the sun's heat could be fully utilized, the deck of a steamer on tropical oceans receives enough to maintain it at a ten-knot speed. The sun's light and heat are essentially constant, and their maintenance is satisfactorily explained on the theory of slow but continuous contraction upon itself by its own gravity. A practical method of converting the sun's heat into available mechanical energy will be one of the great discoveries of the future.

The Moon, nearest of all celestial bodies to us (239,000 miles), and brightest of all save the sun, is a solid, opaque sphere of very rough contour, traveling around the earth once in 27⅓ days. The moon's motion easterly from night to night is obvious, if we refer it to the stars; and it passes over its own breadth (about half a degree) every hour. Occasionally a star is hidden behind it (occulted)—a very sudden phenomenon at either disappearance or reappearance. Sometimes a planet suffers occultation; and when the moon occults the sun, a total eclipse takes place. A fortnight earlier (or later) an eclipse of the moon itself is liable; but this is due to the moon's passing through the earth's shadow, so that sunlight is for the time withdrawn from it.

Light.—Half of the moon's sphere is always illuminated by the sun, and it is the amount of this illuminated half turned toward us that causes the moon's phases. Much of the time between new moon and either quarter, the ashy light of the unilluminated part of the moon's disk is faintly visible, called the "old moon in the new moon's arms." It is caused by sunlight reflected from the earth. Eastward progress of the moon makes it rise on the average about three-quarters of an hour later from night to night. The full moons of autumn rise with a daily retardation of less than half this amount; so they are called (in September and October) harvest moon and hunter's moon.

The spectroscope shows that the moon's light and sunlight are identical in composition. We often say the full moon is as bright as day, but a half million full moons would not equal the sun's radiance.

Dimensions.—The diameter of the moon is 2,160 miles, easily ascertained after her distance is found. The distance is not difficult to determine, once we know the size of the earth, and can tell the straight-line distance between two observatories, as Greenwich and Cape Town. This becomes a base-line from which the distance between the earth's center and the moon's can be found by a trigonometric solution. Eighty-one globes like the moon rolled into one would equal the mass, or weight of the earth, and surface gravity is a sixth what it is here. An average man would weigh but 25 pounds there, and an athlete with terrestrial thighs would find a 30-foot standing jump mere exhilaration. The moon turns round on its axis very slowly—only once, in fact, while it is making one complete journey round the earth. So that the half turned toward us is always the same, and no one has ever seen the other side of the moon. Her atmosphere, if the moon has any, must be very slight; and water, if at all, must exist as ice.

Heat.—Lacking an atmosphere to absorb and retain the solar heat, the lunar surface must always be intensely cold. Moon's perigee (least distance) and apogee (greatest distance) cause a slight disturbance of magnetic needles; but the changing phases of the moon, especially the angle of the cusps with the horizon, are not responsible for any weather changes that the critical expert has ever been able to discern.

Surface.—The moon's surface is highly diversified by a wealth of smooth, darkish patches, named *mares* (seas), now regarded as desert plains; a few mountain chains; hundreds of rills or valleys; numerous systems of radiating streaks; and over 30,000 ring mountains of all sizes from a mile in diameter to a breadth sixty times that. All details of the lunar surface are mapped and named. Hevelius (1611-87) of Danzig made the first map of the moon, and Schmidt (1825-84) of Athens the last. The recent photographic atlases of the Lick and the Paris observatories show the lunar surface very satisfactorily, and Ritchey (1864-19—) attained even greater success with the Yerkes telescope. Changes on the moon, if at all, are on a very small scale, too minute for detection with present instruments.

The Planets, in the order of their distance from the sun, are Mercury, Venus, earth, Mars, asteroids (about 700), Jupiter, Saturn, Uranus, and Neptune. No planets have yet been discovered inside of Mercury's orbit, or outside that of Neptune. Venus is the brightest planet, and Jupiter comes next. With Mars, Saturn and Mercury, these are all that are easy to see with the naked eye.

Inferior and Superior.—Mercury and Venus are classified as inferior planets, because their orbits are within the earth's; all the others are superior, that is, outside the earth's. To the naked eye none of the planets have appreciable disks or phases, but with the telescope Mercury and Venus pass through all the phases of the moon. Of the superior planets Mars alone exhibits a considerable phase, being at times gibbous, or like the moon two days from full.

Motion.—The planets are so named because they appear to move among the stars. The general trend of their motion is eastward (direct motion) along the ecliptic, or sun's apparent path. But during a part of each year every planet also travels westward (retrograde motion). When nearest the earth a planet's motion is retrograde; when farthest, direct. The ancients explained this forth and back motion of the planets by means of the epicycle of the Ptolemaic system; whereas it is really due to composition of earth's and planet's own motions around the sun.

Venus is a bright evening star in the western sky in August 1911, March 1913, October 1914, May 1916, December 1917 and August 1919. Mercury and Venus when nearest are at inferior conjunction; superior planets when nearest are at apposition. At inferior conjunction, Mercury and Venus sometimes pass directly between earth and sun, called a transit.

Dates of transits of Mercury are May of 1878, 1891, 1924 and November of 1868, 1881, 1894, 1907, 1914. Transits of Venus are much less frequent—December of 1631, 1639, 1874, 1882 and June of 1761, 1769, 2004, 2012.

For all details of motion of the planets, their distance from earth and sun, and positions in the sky at any time, consult the *Nautical Almanac*, a mathematical work based primarily on what are termed the "elements of the orbits." These technical quantities express with accuracy the size, form and position of the planetary orbits in space.

The Northern Lights (aurora borealis of the northern hemisphere, and aurora australis of the southern) are a phenomenon of the earth's atmosphere. This composite, compressible gas is rather less than one-millionth the earth's weight, is a hundred miles or more in depth, its density increases rapidly downward, and at the bottom of this ocean of air humanity lives and moves and has its being. The atmosphere bends downward the rays of light coming from all celestial bodies, causes the twinkling or scintillation of the stars, and the common phenomena of dawn and twilight. The aurora is another phenomenon of the atmosphere, a soft, vibrating luminosity, streaming upward into the sky, sometimes to the zenith, exhibiting greenish yellow, pale blue and other tints, occasionally with pulsating streamers. The semiperiodic recurrence of the aurora connects it with sun spots and protuberances. The magnetism of the earth as influenced by the condition of the sun appears responsible for the aurora, a species of luminosity in the very rare gases of the upper atmosphere.

Comets nearly a thousand in number have been recorded within historic time. Half have had the paths of their motion in space ascertained. If the orbits of two or more are the same, it is generally true that they are not different comets, but the same body moving in an elliptical track around the sun, which is situated (as in planetary orbits) at one focus of the ellipse.

Halley (1656–1742) first made this important discovery, and the comet which in

Planet's Name	Distance From the Sun		Eccentricity of Orbit	Inclination to Plane of Ecliptic	Time of Revolution Around the Sun	Length of Planet's Day	Diameter of Planet in Miles
	Earth's Equals Unity	In Millions of Miles					
Mercury	0.39	36	0.206	7° 0′	88d.	88d.	3,000
Venus	0.72	67	0.007	3° 24′	225d.	225d.	7,700
Earth	1.00	93	0.017	0° 0′	365¼d.	23h.56m.	7,900
Mars	1.52	142	0.093	1° 51′	687d.	24h.37m.	4,200
Jupiter	5.20	483	0.048	1° 19′	12y.	9h.55m.	87,000
Saturn	9.54	886	0.056	2° 30′	29.5y.	10h.13m.	73,000
Uranus	19.18	1780	0.046	0° 46′	84y.	Unknown	30,000
Neptune	30.06	2790	0.009	1° 47′	165y.	Unknown	30,000

consequence bears his name returns to the sun at intervals of about seventy-six years. Before his time comets were thought to move in straight lines through space. So it seemed quite possible that a comet might collide with the earth and wreak destruction thereon. In such case, however, collision would doubtless destroy the comet.

Description and Development.—If we conceive of a vast congeries of separate particles, varying in size from grains of sand to that of large buildings, these masses not compacted together but loosely related or hundreds of miles apart, traveling in shoals through space, we shall have the modern notion of a comet. During most of the time comets are dark invisible bodies; but, on approaching the sun within 500 million miles, they gradually begin to glow with a self-luminosity, and are visible in the telescope as faint, round patches of cloud-like light. Their true nature is detected by apparent motion among the stars from night to night. Most telescopic comets never develop beyond this simple stage; but the larger ones, on approaching near the sun, form first a nucleus, then a corona, or head with curving envelopes, or sheaths, sometimes opening toward the sun like an unfolding fan. Later follows development of the tail, quite invariably on the side away from the sun. Often it stretches through space many millions of miles, giving the comet a bizarre and spectacular appearance which no other heavenly body possesses.

Comets sometimes have two or more tails; one had six (in 1744). Differences in their curvature are perhaps due to the nature of the volatile gases composing them—the straight tails due to hydrogen, the slightly curving ones to hydrocarbons, and the stubby, sharply curved tails to vapor of iron or chlorine. The showy tail is formed at the expense of the head and its particles never return to the comet again. A slow disintegration thus takes place at every return. When near the sun the head of a comet shines very faintly by reflected solar rays, and the spectroscope shows that the light of comets is mainly due to hydrocarbons, cyanogen and sodium.

The Great Comets and Their Discoverers.—Two French astronomers, Pons (1761–1831) and Messier (1730–1817), are the most famous of all discoverers of comets. In America Swift (1820–19—), Brooks (1844–19—) and Barnard (1857–19—) have been most successful. Discoveries are now sometimes made by photography. Encke's comet moves around the sun in the shortest period (3⅓ years), and is noted also for freaky changes of form. The largest and brightest comet ever seen came in 1843, stretching from horizon to horizon. It approached nearest to the sun of all known comets, and was visible to the naked eye at noon. Probably the outer regions of its head brushed through the streamers of the solar corona. Its velocity at perihelion was more than one and a quarter million miles per hour, and its tail was 150 million miles long. This comet will not return for 500 years. Other very bright and striking comets appeared in 1811, 1858 (Donati's), 1861, 1874 (Coggia's), 1882, 1887, and 1910. In extreme cases comets are visible a year and a half to two years. Occasionally one is discovered during a total eclipse of the sun (as in 1882 and 1893), and never seen again.

Meteors, or shooting stars, are fragments of comets rendered luminous by impact and friction with our atmosphere. Comets have been caught in the act of breaking up, as Biela's in 1845–6, and Brooks' in 1893. Generally, however, disintegration takes place very slowly, and the cometary fragments are thus scattered everywhere along the paths of these bodies. Showers of such fragments come within reach of the earth's attraction every day. For the most part they are dissipated in the upper air; but occasional fragments that reach the earth's surface, called meteorites, are found by chemical analysis to have the same constitution as comets themselves. Meteorites are either stones or irons, the latter yielding a large percentage of nickel. Fine American collections of meteorites are in the museums of Chicago, New York, Washington, Cambridge, New Haven and Amherst.

The Stars are situated at incomprehensible distances in the depths of space. To express these enormous distances, an astronomical unit is employed called the light-year: it is nearly six trillions of miles in length, and is the distance that a light-wave (whose speed is 186,000 miles per second) travels in a whole year. So astronomers have ascertained that Alpha Centauri, the nearest known fixed star, is four light-years away, Sirius is double that, Vega thirty light-years, Polaris seventy, and Castor 120, and so on.

Classification.—The stars are variously classified, first by their apparent magnitudes, or order of brightness. There are about twenty stars of the first magnitude, sixty-five of the second and 200 of the third, proceeding in geometric progression; 5,000 of the sixth, 720,000 of the tenth magnitude, and so on. An average first-magnitude star gives two and a half times more light than one of the second magnitude, and so on, by a nearly constant relation. In a clear, dark sky the average sixth-magnitude star is the faintest visible to the naked eye.

But the telescope reveals stars fainter and fainter, until the seventeenth magnitude is reached, as a *minimum visibile* in a forty-inch lens. Keeping pace with their diminution in brightness, the number of the stars increases, until their total is estimated at 150 millions. Dark or non-luminous stars there are also, and some astronomers think these exceed the luminous ones in number. The total light from all the stars is rather more than a hundredth that of the full moon.

Colors.—Another but less marked classification of the stars is by their colors; still another by their spectra, of which there are not less than five types, by the scheme of Secchi (1818-78):

(I.) *Sirians*, stars with spectra resembling that of Sirius, with broad, dark hydrogen lines.

(II.) *Solars*, with spectra resembling the sun's, with fine, dark metallic lines. Practically all the stars are evenly divisible between types I. and II.; and stars of type II. are least remote from the sun.

(III.) *Dark*, banded spectra, with bands well-defined on the blue-ward side.

(IV.) *Spectra* with dark bands, or flutings, fading out toward the blue. Stars of this type are few, faint, blood-red in hue, and their atmospheres are charged with carbon.

(V.) *Stars* with bright-line spectra.

Classification of stars by their ages, indicated by the character of their spectra, has been attempted. The spectra show that all the stars are self-luminous.

Yet another classification recognizes variable stars, new or temporary stars, double and binary stars, multiple stars, star clusters and nebulæ. About 4,000 stars are variable; that is, their light is subject to fluctuation, regular or irregular. Some of them are like Algol, whose light is for a long time at its brightest, and then faint (minimum) for a relatively brief span. Such fluctuations of brightness are due to temporary occultation by a large, dark star whose orbit lies nearly edgewise to our vision. Others are called Omicron Ceti variables, also after the type star, often called "Mira the Marvelous." Variables are especially numerous in the thick fields of star clusters.

Of double stars more than 10,000 are now catalogued—stars with a near-by companion usually much fainter than the bright component. Burnham is the chief American discoverer of these objects. Hundreds of doubles belong to the class of binaries, whose components revolve around their common center of gravity in an elliptic orbit, generally in a long period of years. These paths are usually very eccentric, and the masses of the stars often nearly equal.

A similar type has been discovered, called the spectroscopic binary. In such the components are so near each other that the telescope unaided is powerless to divide, or separate them; therefore their spectra overlie. Capella, Castor, Polaris and Spica are spectroscopic binaries. Of all the stars so far examined, nearly one-tenth reveal orbital motion. Multiple stars are those with many components: Epsilon Lyræ, near Vega, is a beautiful system of this sort.

Stellar Clusters are either loose, as the Pleiades, with a few scattering bright stars in a region where the photographic plate shows many thousands; or close, like that in Perseus, with thousands of stars compactly aggregated and forming a denser region of the Milky Way. The whole of this marvelous galaxy, stretching all the way around the heavens, is made up of millions of minute stars, each comparable in size and constitution with our sun, and so immensely remote that their effect is that of a continuous sheet of faint luminosity.

The distance of stars can be stated intelligibly in light-years only, and their location around the sun seems nearly central, like the girdle of meteoric masses comprising the ring of Saturn.

The Nebulae are located among the stars, and 12,000 are now known and catalogued. They appear like faint masses of luminous fog, mostly irregular in form and brightness. Many nebulæ are glowing, incandescent gases, mainly hydrogen, as the spectroscope shows. Some, however, are resolvable into separate faint stars, as in the Milky Way; a few are variable; and as a whole the nebulæ appear like the residue of original chaos from which the universe has, through uncounted millions of years, come into its present state.

Classification.—Nebulæ are often classified as (1) annular, or ring-shaped, (2) spiral, (3) planetary, (4) nebular stars, (5) irregular nebulæ, for the most part large, of which the great nebula in Orion is the finest example. Its light emanates from incandescent hydrogen and helium, it is intimately related to the neighboring stars of the constellation, its distance from the sun is increasing eleven miles a second, and this incomparably vast structure of tangled wisps and twisted cloud-shapes has, like nearly all the other nebulæ, persisted for centuries without any certain change of form.

2. The Moon, photographed at Lick Observatory.
3. Star Nebula, Milky Way.
4. Typical Sun-spot.
5. A Comet.
6. Craters of the Moon, highly magnified.

The nebulæ are more thickly scattered toward the poles of the Milky Way, and their existence suggested the famous nebular hypotheses of Kant and Laplace, which form the basis of the cosmogony of the present day.

Cosmogony is the science of the development of the universe. Beyond a shadow of doubt the universe is inconceivably old, and has come to its present being by an orderly process — an evolution through the long-continued action of fixed natural laws, especially the law of universal gravitation. For countless ages the universe existed only potentially; the celestial spaces were tenanted by nebulous masses of gas, "without form and void." Every molecule attracted every other molecule; centers of attraction formed, and as they drew other masses inward upon themselves, the collision of particles and friction upon each other developed heat; the gaseous condensations grew hotter and hotter; thousands upon thousands of nebular nuclei formed; condensation progressed, in some regions more rapidly than others. The sun itself, in its early history, was one of these centers, every star was such a center, or became one, in the slow process of world-building. As the gaseous masses could not usually fall directly toward their centers of attraction, huge nebular whirlpools were set in motion.

No spiral nebulæ were known to Laplace; the first was discovered by Lord Rosse; but thousands were found by Keeler at the Lick Observatory, by means of photography. Next to the star itself, the spiral nebula is the type of object most frequent in the sky. Their existence is in full accord with the principles of dynamics, as pointed out by Chamberlin and Moulton in their planetesimal hypotheses.

Progressive development from a formless nebula tends toward the flat, revolving disk; contraction makes the inner regions whirl more and more rapidly, thus producing the spiral, or whirlpool structure. So the spiral nebula became the fundamental natural form. In great part the stellar systems, then, and probably our planetary system also, had their origin, not from Laplacian rings left behind as the nebular disk contracted, but from condensation into knots of nebulosity, ever and anon detached from the whirling nebulous mass, each knot subsequently condensing into a separate star or planet.

So Keeler's significant discovery of multitudes of spiral nebulæ has greatly strengthened the evidence in general favor of a nebular hypothesis of origin of the stellar and planetary systems throughout the universe.

INSECTS INJURIOUS TO MAN

Bed Bugs.—A very old pest. Mentioned in Roman documents. Decreasing in civilized countries, because of more cleanly habits, and the prevalence of furniture offering fewer hiding places.

The attack of a bed bug is made by a piercing beak, rather than by a "bite".

In many states of South America, bed bugs cause a disease often fatal to children.

Buffalo Gnats.—Cause the disease *pellagra*, accompanied by a distressing rash, sometimes fatal. The insects develop under running water, and the disease is common in various parts of Europe near swiftly flowing streams.

Fleas.—Bubonic plague, the dreaded "black death" of history, is carried by fleas from mice, cats, squirrels, monkeys, but especially from black rats, ship rats. The best preventive of plague is wholesale poisoning of rats.

House Flies.—House flies do not bite but carry disease germs mechanically, especially from diseased excrement to food. Eighty per cent of the deaths in the Spanish American War were from typhoid, thus carried. Infantile diarrhoea, more deadly than typhoid, is carried by house flies, as are inflammation of the eye and tuberculosis. These pests are accused of spreading many other serious diseases, including diphtheria, dysentery, smallpox, plague, parasitic worms, and anthrax. The last named, also called splenic fever, is a deadly disease of cattle and sheep, which sometimes attacks man; carbuncles are an attendant. One fly may carry millions of bacteria.

Stable Flies.—Stable flies are distinguished from house flies by the fact that stable flies bite sharply. Have been proved to carry infantile paralysis to human beings, and to bear a fatal disease from certain water rodents in South America to horses, mules, etc.

Tsetse Flies.—Tsetse flies are of several species, spread sleeping sickness, both mechanically, and by development within their own bodies. The native hosts of this dread disease are the big game of African jungles.

Itch Mites.—Itch mites produce "seven year itch" in human beings, and similar disturbances in many other animals, domestic and wild. Successive generations live on the same host; hence there is no reason to anticipate that the disease will end in even seven years, if the mites are permitted to live on.

Jiggers, Jigger Fleas.—The female burrows in the flesh of the animal she attacks, leaving only the tip of the abdomen exposed, for the laying of eggs. The distension of an egg-laying jigger is very painful to the host attacked.

Head Louse, Body Louse, Crab Louse.—The three forms of lice parasitic on man. Eggs or "nits" are attached to hairs. Lice are much less common than formerly, but must still be suspected in homes of doubtful cleanliness.

Mites.—"Black-heads" in the human skin are caused by a species of mite.

Mosquitoes.—Mosquitoes transmit three diseases, at least: malaria, yellow fever and thread worm disease. All mosquitoes should be suspected though the worst offenders are confined to two species.

Sand Flies.—Sand flies are very small, long-legged, yellowish insects—cause "phlebotamus fever", common on Mediterranean coasts.

Ticks.—All told, ticks are known to produce at least ten diseases of man and live stock. One species cause spotted fever, in the Rocky Mountains, with a mortality running from 5 to 70 per cent in various localities. Ground squirrels, pine squirrels, chipmunks, horses, cattle, mules, goats, bears, are hosts for the developing ticks, but only the adults attack man.

Ticks and Phlebotamus Flies.—These are both known to transmit Verruga—a deadly South American disease contracted in mountain valleys and gorges.

The "tick fever" of Madagascar and East Africa is spreading into the interior of Africa. Ticks live several years, and a tick once infected remains a source of this "relapsing fever" throughout its life.

INSECTS ECONOMICALLY INJURIOUS

Insects are estimated to damage the farm products of the United States at least $1,000,000,000 annually.

Hens are infested by:
18 known species of mites.
8 known species of lice.
2 known species of fleas.
1 known species of bug.
1 known species of tick.
1 known species of fly.

Other domestic fowls bring the total of poultry parasites to 50 species.

Argentine Ants are spreading rapidly in the United States. They are voracious feeders, devouring almost any food stuff they can get at, and even attacking human beings. They eat young garden seeds, and protect plant lice and scale insects, for the sugary and waxy secretions these creatures exude. Argentine ants are suspected of spreading several diseases, including tuberculosis.

The Colorado Beetle or potato bug, in addition to the direct damage it causes by eating leaves, has been pretty clearly shown to carry the bacillus of potato rot.

Bugs and Beetles carry the spores of cucumber wilt and similar fatal diseases attacking garden plants.

Borers.—Several species of beetles attack trees, especially where the trees have been injured in any way. The mature beetle does the boring, and the larvae live on fungus from spores left in the burrow by the mother beetle.

The *Wood Leopard Moth*, *Goat Moth*, *Currant Clear Wing*, and *Apple Clear Wing* are all borers, very destructive, in the larval stage.

Bot Flies pass their early stages as thread worms in the stomach and intestine of the horse. Eggs found attached to hairs near a horse's nose are of the bot fly. The painfulness of the bot fly's bite is obvious enough, but the effects of the larvae are debatable.

Sheep Bot Flies, or nostril flies, cause much irritation in the nasal passages of sheep, where the larval maggots develop.

Cheese Mites produce living young, and their swarming colonies rapidly consume any fresh food material, such as ham, flour, and preferably cheese. When all available food for the colony has been eaten, the old and young mites, and the strong, middle-ages ones go into quiesence until they are carried to some fresh opportunity.

Cicadas live underground for seventeen years—one species for thirteen—fed by the roots of trees. The mature insect lives only four or five weeks, dying after the eggs for the next generation have been produced. These eggs are placed in slits near the ends of small branches and the young drop to the ground very soon after hatching, to begin their long development.

Clothes Moths.—The eggs are very small, and are attached to fabric. The larvae develop within a case, which is enlarged from time to time by the growing creature within.

Cockroaches.—A nocturnal household pest, eating and fouling almost any sort of food they can get at. Suspected as disease carriers, they have the one merit of attacking bed bugs.

Codling Moth.—The larvae are apple worms, which often cause a loss of 40% to 75% of fruit crops in unsprayed orchards. The codling moth raises two broods a season, and has relatively few enemies.

Cotton Boll Worms are the larvae of a moth. They attack also corn, tomatoes,

and tobacco. The boll worm gets 4% of the cotton crop annually.

Cotton Leaf Worms are destructive to cotton, but incidentally they destroy a worse enemy to cotton than themselves, by attacking the bolls in which larvae of the boll-weevil are at work.

Cotton Boll Weevils are small beetles, with the ill reputation of being the most economically destructive insect in America. Their original home appears to have been in Mexico.

Gypsy Moth caterpillars strip the leaves of woods and orchards, notably apples, oaks, willows, and elms. They were accidentally introduced to America by scientific experimenters, and became a public menace before the taxpaying public could be financially awakened.

Scale Insects produce a gum disease on orange and lemon trees, as a result of fungus growth started by these insects.

Hessian Flies are among the most destructive insects in the world. In some parts of the United States they destroy 50% of the cereal crops, totaling $100,000,000 damage a year. The flies themselves are very small—less than 1-10 inch long—and live only a few hours. The larvae do the damage.

Plant Lice consume juices of leaves, and exude a secretion which supports fungoid diseases often fatal. Prunes, plums, and the like are badly damaged in this way.

Locusts, properly speaking, are not grasshoppers, but are closely related to them. They amount to a national menace, at times, in various parts of the world, though their worst attacks are in South Africa.

Mediterranean Fruit Flies attack fresh fruits. Have caused the abandonment of peach, nectarine, and apricot raising in Spain. This fly first appeared in Florida in 1929 proving disastrous to the citrous crop. The pest has now been fought and controlled by federal aid.

Grape Vine Phylloxera.—Native in America. Has destroyed 30,000 acres of vineyards in California. Is most destructive in the form which attacks the roots of vines. Phylloxera was accidentally introduced into France, where in 25 years it killed one-third of the vineyards, and damaged the rest.

San Jose Scale.—Badly infested trees seem covered with ashes. This insect makes a peculiar flush on fruit, due to the color of a circling ring around young scales. The males fly. Females produce living young. Scales live by sucking the juices of the tree. Certain species of lady birds are their effective enemies.

Mites.—A scab mite causes the most serious parasitic disease of sheep.

Termites.—Most species live out of doors, but some enter buildings, where they reduce timbers and wooden furniture to mere hollow shells.

Warble Flies.—The maggots cause great irritation, with pus, in the flesh of cattle, and ruin the hides where they come out.

USEFUL INSECTS

Cochineal is a scale insect native to Mexico. Has the same life history as the lac insect and the San Jose Scale. One pound of cochineal represents the dried bodies of about 70,000 insects. Analine dies are reducing the importance of cochineal.

Lac Insects are scales living on tree branches in India. From their resinous secretion, shellac is made.

INSECTS AS FOOD

Civilized peoples in the occident make little use of insects as food, but orientals and barbarous tribes set great store by them.

Locusts are highly esteemed, bought and sold as food, in parts of Africa, Arabia, and Persia. Moors enjoy locusts fried in butter. American Indians used to consume quantities of Rocky Mountain locusts. Grasshoppers, crickets and ants have been and are eaten extensively. In Italy and Northern Africa, crickets are captured and kept for their song, and for luck. Large female ants are considered great delicacies by certain tribesmen. The egg-filled abdomens are bitten off, one by one, as an American might bite off a strawberry, throwing away the hull.

Bees.—Honey and bumble bees are valuable as honey makers, but their chief service to man is in the cross fertilization of flowers, without which there could be no fruit. Other insects accomplish this service, but commonly at the expense of an equal or greater damage done by larvae, whereas the good work of bees is accomplished with no harm whatever.

Beetles are next to locusts in wide use as food. Both the larvae and the adults are eaten, in the East and West Indies, Egypt, Mexico, and South America.

Cicadas, roasted brown, were a favorite article of diet with American Indians.

Manna, of Old Testament History, was undoubtedly the sugary secretion from a scale insect inhabiting trees near Mt. Sinai. Early in the morning, such manna "fallen from heaven" would have been very edible and nutritious. Later in the day, the heat of the sun made it disappear into the ground.

Moths and their caterpillars are eagerly consumed by Bushmen and native Australians. The Chinese eat the pupae of silk worm moths after removing the silk from the cocoons.

Warble Fly maggots are eaten raw by certain Indians and are said to be as appetizing as goose berries.

INSECT CONTROL

Birds should be studied and protected in the fight against insects, but the chief reliance for checking insect hordes must be placed upon insects themselves. The secret lies in Jonson's old quatrain

"Naturalists observe, a flea
Has smaller fleas that on him prey,
And these have smaller still to bite 'em,
And so proceed, *ad infinitum.*"

Wherever a useful plant has long survived the fierce "struggle for existence," the enemies of that plant are likely to be held in check by enemies in turn. Scientific procedure calls for the discovery, transfer, and fostering of such insect enemies of our insect enemies.

Table of the Economic Values of Wild Birds, with Their Diet Lists Compiled from Publications of the National Geographic Society.

I. Birds Wholly Useful to Man.—

Blue Bird.—Eats grasshoppers, beetles, caterpillars, elderberries.

Butcher Bird (Logger Head Shrike).—Insects, small rodents, lizards.

Turkey Buzzard.—Scavenger, protected in Southern States. Works as far north as central New York.

Chickadee.—30% seeds of pine, poison ivy, weeds; 70% insects, including moths and caterpillars.

Brown Creeper.—Plant lice and tree insects, the year round.

Cuckoo, Yellow Billed.—Black Hairy caterpillars, tent caterpillars, web worms.

Finch, Gold Finch, (Wild Canary).—Seeds throughout year, insects.

Flicker.—50% ants, wild fruits.

Franklin's Gull.—Insects, chiefly grasshoppers and dragon nymphs.

Herring Gull.—Scavenger.

Humming Bird, (Ruby Throat).—Nectar of flowers, small insects.

Junco.—Weed and grass seed.

Killdeer.—Eats myriads of injurious insects, notably mosquitoes and their larvae.

Purple Martin.—Wasps, bugs, beetles, including weevils.

Nighthawk.—A useful insect catcher, very expert in flight.

Nuthatch.—Tree insects.

Barn Owl, (Monkey Faced Owl).—Field mice, house mice, rats. Should be protected.

Partridge, (Ruffed Grouse).—Wild fruits, beech nuts and other seeds of trees, weed seeds, 10% insects, mostly beetles.

Wood Pewee.—A fly catcher.

Upland Plover.—Very useful destroyer of weevils, grasshoppers, and crickets. Deserves complete protection.

Spotted Sand Piper, (Tip Up).—Army worms, squash bugs, cabbage worms, grasshoppers, green flies, craw fishes.

Chipping Sparrow.—58% weed seeds, 42% caterpillars, weevils, ants, wasps, bugs.

Song Sparrow.—Diet three-fourths weed seeds, one-fourth insects.

Vesper Sparrow.—Weed seeds and insects, including alfalfa weevil.

White Throated Sparrow, (Peabody Bird).—Weed seed, insects, including boll weevil in winter.

Barn Swallow.—Beetles and flies caught on wing.

Chimney Swift.—Insects only.

Black Tern.—Consumes many fish eating insects and crustaceans, as well as land and flying insects, along with valueless fishes and minnows.

Thrushes. (Veery, Wood, Hermit, Varied).—Insects and wild fruits.

Vireo.—Wild berries, plant lice, scales, caterpillars.

Warblers.—This great family have been called the saviors of the forests. Diet is three-fourths insects, mostly harmful.

Whip-poor-will.—Insects.

Downy Woodpecker, Hairy Woodpecker.—Diet 76% tree borers. Merit complete protection.

House Wren.—Grasshoppers, beetles, caterpillars, bugs, spiders, cutworms, weevils, ticks, plant lice.

II. Birds with a Favorable Balance in the Economic Ledger.—

Mourning Dove.—64% weed seed, 32% grain seeds, mostly waste after harvest. No insects.

Cardinal.—Potato beetles, cotton worms, weevils, codling moths—at least fifteen times as much good as harm.

Kingbird.—Protects poultry from hawks and crows. Eats 85% harmful insects, and a few honey-bees, mostly drones.

Quail, (Bob White).—Diet one-half weed seeds, one-fourth grain, one-tenth wild fruits, 15% injurious insects. Most of its grain is waste, from stubble.

Meadowlark.—25% beetles, including cotton boll weevil and alfalfa weevil, 24% grain and weed seeds, 11% caterpillars, including cut worm, army worm.

Rose Breasted Grosbeak.—Some garden crops and fruit, but mostly harmful insects. Sometimes called the "potato bug bird." Eats cucumber beetles, scale insects, locusts.

Bullock's Oriole.—Beetles 35%, including many weevils, ants, wasps, olive scale insects, 41% caterpillars, moths, and pupae. Some fruit.

Mocking Bird.—Is protected for its song, rather than for its credit cash balance. One-fourth its diet is insects, chiefly grasshoppers; one-half is fruit.

Brown Thrasher.—60% injurious insects.

III. Birds of Neutral or Doubtful Value to Man.—

Screech Owl.—Has a good credit list of mice, grasshoppers, beetles, caterpillars, but does kill many valuable birds.

Red Tailed Hawk.—(Hen Hawk) 85% animal pests, 15% poultry and game birds.

Blue Heron.—Its picturesqueness deserves preservation. Often adds mice and gophers to a diet of frogs, tadpoles, small fish, and snakes.

Marsh Hawk.—Chiefly rodents. Some poultry and game.

King Fisher.—Exclusively fish.

Robin.—Eats many kinds of insects, 58% fruit. In fruit growing sections is an economic pest. Its enormous consumption of earth worms is of doubtful value, since the earthworm is so notable a soil maker.

Brewer's Black Bird.—Fruit 4%, grain 54%, weed seed 9%, insects 33%.

Cowbird.—A thief and "moral renegade," of doubtful economic value. Lays eggs in other birds' nests.

English Sparrow.—Quarrelsome, untidy, drives out valuable birds, steals nests, kills birdlings, eats fruit and grain. Does destroy some insects; may check alfalfa weevil; is a city scavenger.

Red Headed Woodpecker.—Two-thirds vegetable food. Is a combination of jay, woodpecker, and fly catcher, with much of the jay's destructiveness.

Red Winged Black Bird.—73% seeds, including grain; 27% insects, including grasshoppers and weevils.

Bobolink.—Useful in the north, but an unmitigated pest in the Southern States. Annually destroys one-tenth of the country's rice crop.

Catbird.—Fruit one-half, insects one-half; domestic fruit especially. Doubtful, sometimes worse.

Sparrow Hawk.—One-half insects; one-fourth small rodents; one-fourth birds, snakes, spiders. Does destroy useful birds. Perhaps a balanced account.

Bald Eagle.—Our national emblem is derived from a

bird whose habits are more picturesque than useful. Eats carrion fish, fresh fish stolen from ospreys, water fowl, and any small animals available.

Osprey.—Live fish. Neutral or worse, but interesting.

IV. Birds of Deservedly Ill Reputation.—

Common Crow.—Admittedly a scavenger; kills many large insects; but is so destructive to wild birds and their eggs, and to seedling corn, that his name is anathema.

Magpie.—Western United States. Habits like crow. Eats carrion, young birds, poultry, wild fruits, berries, insects only when necessary. Is an incorrigible thief.

Yellow Bellied Sap Sucker.—Wild fruits, cambium of trees. Very destructive.

Cooper's Hawk, (Blue Darter).—Kills many useful birds, both wild and domestic. A bad actor.

Starling.—Destroys smaller, useful birds. One of our obnoxious importations from Europe.

Great Horned Owl.—(Hoot Owl) Partridges, quail, pheasants, poultry, squirrels, mice, rabbits—only one really useful service in the list, and that a minor one, in this night pirate's account.

Blue Jay.—Very destructive to other bird life. Three-fourths vegetable food—acorns, beech-nuts, etc.; one-fifth noxious insects.

BOTANY.—One of the natural sciences, dealing with plants, as zoology deals with animals. In its widest sense it includes all kinds of inquiries in regard to plants, their structure, activities, distribution, origin, classification and uses. In fact the study of botany in its entirety includes every inquiry that may be made with regard to plants themselves and their relations to man and other living things, although for convenience the economic relations of plants are now more commonly relegated to agriculture, horticulture, forestry and pharmacy, while the more scientific problems are retained in botany.

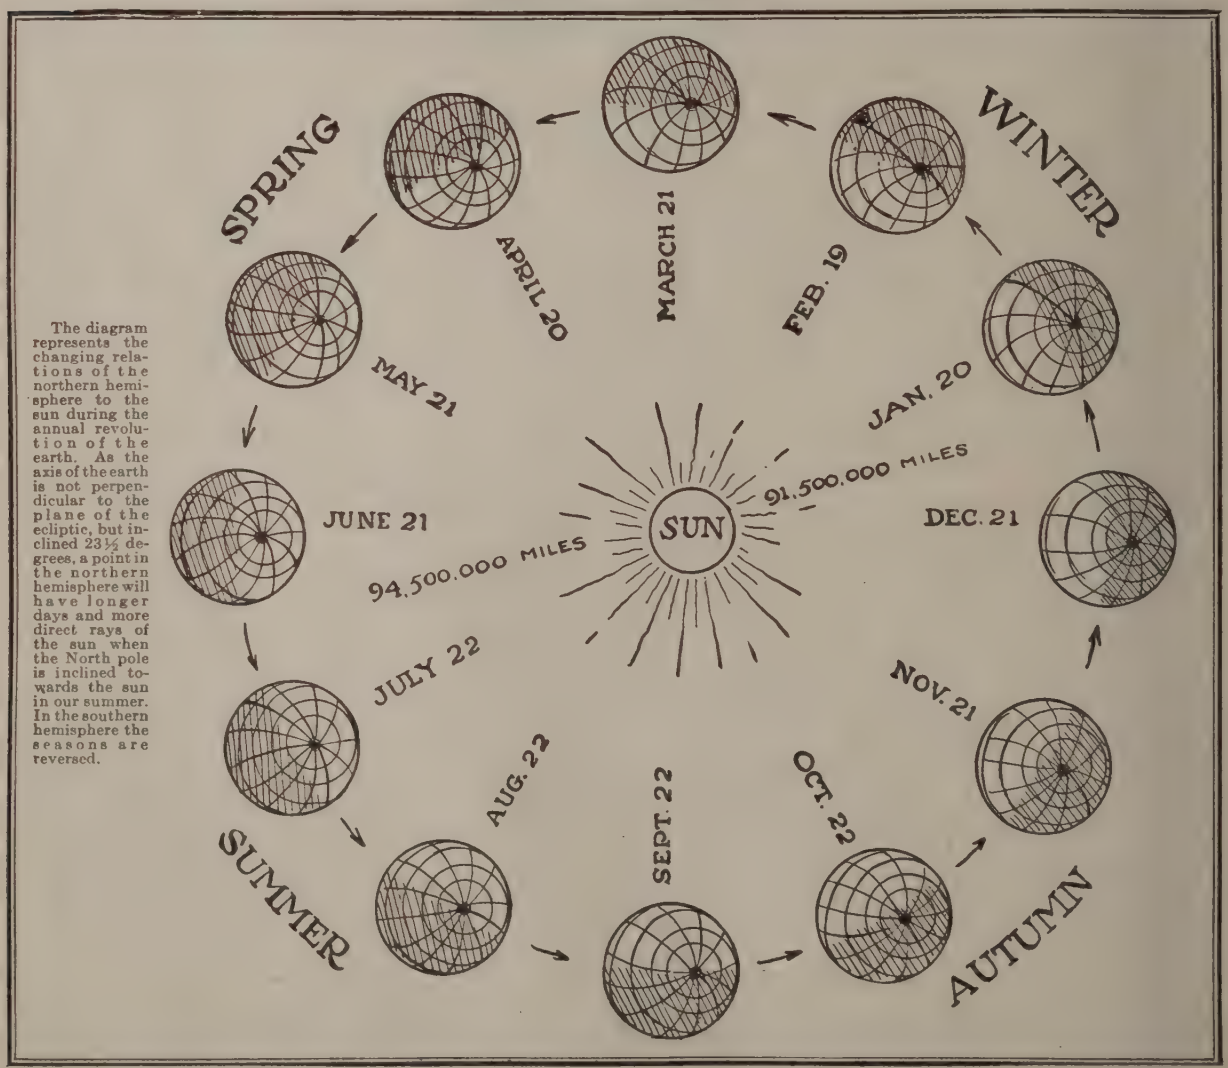
Departments of Modern Botany.—The science may be divided for convenience into about ten departments, although sometimes fewer and again more divisions are recognized. The following is a conservative treatment:

Cytology deals with the minute structure of plants, especially with the *cells,* of which all plants are composed. A typical cell, consists of a minute body of protoplasm (a softish nitrogenous substance) surrounded by a permeable membrane (wall of cellulose). The protoplasm is differentiated into a central denser, roundish part (nucleus), surrounded by a more watery part (cytoplasm). A still further differentiation has been made out for both nucleus and cytoplasm, the protoplasm consisting of a more active granular or fibrillar part (kinoplasm) scattered through the less active, nearly clear part (hyaloplasm). Moreover in the cytoplasm there are generally several (rarely one) rounded bodies of denser cytoplasm (plastids) which are stained by a green pigment.

Cells are the living units, and they produce other cells, and so increase the bulk of the plant. The usual method of the production of new cells is by the division of a cell into two. This is done by the cell itself, and in the process the granular matter of the nucleus (kinoplasm) divides itself very exactly into two equal portions, each of which becomes surrounded by its half of the clear nucleus matter (hyaloplasm); these equal parts of the nucleus now constitute two new nuclei, and each now draws around it its half of the cytoplasm. Thus there are now two cells where there was but one, and these generally build up a partition wall between them.

Histology deals with the *tissues* as made up of different kinds of cells. Here a mass of similar cells constituting a portion of

CHANGE OF SEASONS



The diagram represents the changing relations of the northern hemisphere to the sun during the annual revolution of the earth. As the axis of the earth is not perpendicular to the plane of the ecliptic, but inclined 23½ degrees, a point in the northern hemisphere will have longer days and more direct rays of the sun when the North pole is inclined towards the sun in our summer. In the southern hemisphere the seasons are reversed.

the plant substance is known as a tissue; accordingly tissues may be of as many kinds as there are kinds of cells. A convenient classification of tissues is as follows:

Rudimentary Tissue (meristem) consists of young, thin-walled cells which are still undergoing modification. It constitutes the bulk of all rapidly growing parts of plants.

Soft Tissue (parenchyma) consists of mature, thin-walled, usually short cells which have attained their growth, as the tissue of ripened fruits, the green tissue of leaves, etc.

Thick-Angled Tissue (collenchyma) consists of long prismatic cells with thin walls, but with the longitudinal angles much thickened. It occurs as a strengthening tissue just beneath the epidermis in many stems.

Stone Tissue (sclerenchyma) consists of thick-walled, usually short cells so tightly packed together that they form a hard mass, as in the shells of nuts; *e. g.*, hickory nuts, walnuts, filberts, etc., and in the "stones" of many fruits, as plums, cherries, etc.

Fibrous Tissue consists of thick-walled, elongated cells so tightly packed together that they make up the fibrous part of the wood (wood fibers) and bark (bark fibers) of the stems of most higher plants.

Sieve Tissue consists of elongated, usually large cells, more or less united into tubes, and having only slightly thickened walls. The name is given on account of the fact that the transverse partitions between the cells are perforated in a "sieve-like" pattern, and through these perforations the protoplasm connects from cell to cell. Sieve tissue occurs in the young bark.

Tracheary Tissue, like the preceding, is a tubular tissue, but here the continuity of the cavity is usually more complete. The walls are somewhat thickened, in rings, spirals, or reticulations. When young these tubes contain protoplasm, but eventually they contain air. Tracheary tissue occurs in the woody parts of stems and leaves.

Milk Cells and Tubes (laticiferous tissue) occur singly or in masses in many plants, and are easily recognized by their milky contents, as in the many kinds of milkweeds. The milk (latex) is often very poisonous, while more rarely it is wholesome. In some cases it contains caoutchouc, from which india rubber is manufactured.

Morphology deals with form as applied to the plant as a whole, or to corresponding parts. With respect to the latter it considers especially the correspondence and equivalence of parts of plants.

Plant Body.—Every kind of plant has a "body" of a more or less definite form. In every simple (primitive) plant the body is a single more or less rounded cell. There is no hint of root, stem or leaf. Plants a little higher are unbranched rows of nearly similar cells. Next the body is a row of cells differentiated into base and apex, the former rooting, the latter growing terminally. Branching simple rows rooted basally and growing terminally constitute a higher type.

A still higher type is seen where the rows of cells are not simple, but consist of several parallel cells. From this structure, which is very common in aquatic plants, especially the red seaweeds, the step is an easy one to massive structures, as in the brown seaweeds and the flat plant bodies of many liverworts. Eventually the type of body characteristic of higher plants is reached, in which there are roots, stems, and leaves.

Physiology has to do with the activities of plants, particularly those that relate to nutrition, growth and reproduction.

Absorption.—In the nutrition of plants the first stage is that of absorption of food-matter, which includes the imbibition of water and the solutions held in it, and the absorption of various gases. Naturally those parts of the plant which are normally in contact with the water are those which absorb water, and in like manner those parts which are normally in contact with the air absorb gases, and it is pretty certain that this has come about as an adaptation of each part to its environment.

The method of absorption must be little more than a simple diffusion through the permeable membrane of the cell-wall. It is found that gases and watery substances are absorbed indiscriminately, and that the plant does not have any "power of selection." Thus the plant is supplied with everything gaseous or soluble with which it is in contact. If these are sufficient for its needs, and none is harmful, the plant may thrive, otherwise it will starve.

Ordinary higher plants in their development have accustomed themselves to many of the solutions in common soils, and apparently they are so habituated to these solutions that they languish without them. On the other hand there are solutions that are known to be quite essential; for example, those that contain nitrogen and phosphorus. The gases of importance to plants are carbon dioxide, and oxygen, both of which occur in sufficient quantities in ordinary air.

Synthesis.—The food matters absorbed are subjected to certain synthetic processes by which they are made more available for the plant at large. Thus some of the water and the carbon dioxide are broken up and recombined into carbohydrates of definite composition, which are then available for the use of growing cells.

This particular synthetic process, since it requires light for its accomplishment, is known as photosynthesis. It takes place only in the green cells of plants, and is thus the chief function of the leaves of higher plants. The product of this synthesis is usually a sugar, containing carbon, hydrogen and oxygen (commonly $C_6H_{12}O_6$), which is commonly changed to starch ($C_6H_{10}O_5$).

Growth.—The carbohydrates formed are sooner or later used as proper food for the cells, and here we may use the terms "digestion" for the earlier steps, and "assimilation" for the later steps. The result is that the cells are nourished and increased in substance. This increase in the substance of the cell due to the nourishment by carbohydrates is what we know as growth. Yet in ordinary growth there is usually another factor, namely, the forcible distension and enlargement of the cell by the imbibition of a great amount of water.

And so it is with the growth of tissues, each cell of which increases in substance by the assimilation of carbohydrates (mainly) and increases in size by the distension due to its forcible imbibition of water. Along with this increase in substance and size in tissues there is usually an increase in the number of cells, by cell division as described.

The growth of organs and parts of plants is essentially like that of tissues, but here we have to do with more considerable masses of meristem cells in which cell division is the characteristic feature, especially in the earlier stages, and cell distension of the later stages.

Water Loss.—During the nutrition and growth of plants that grow partly or wholly in the air they are more or less constantly subject to a considerable loss of their water by evaporation, and unless there is a constant supply of water to counterbalance this loss such plants will dry up and die.

Reproduction.—All plants reproduce in some manner. Some merely break into fragments, each of which then grows into a new plant. This simple method is more common with lower, simpler plants, but that it still persists among some of even the higher plants is shown by the ease with which new plants may be grown from "cuttings."

Many lower plants regularly separate certain cells (spores) from particular portions of the plant body, and these on germination give rise to new plants. In many water plants such separated cells are motile by means of cilia, hence called zoöspores. Such production of new plants is known as the asexual (nonsexual) reproduction.

In addition to the asexual modes of reproduction most plants reproduce sexually also. In its simplest form sexual reproduction consists of the union of two free-swimming similar zoöspores (isogametes). The resulting cell sooner or later grows into a plant like that which gave rise to the isogametes. In passing upward we find successively free-swimming but unlike gametes (heterogametes); one free-swimming gamete (sperm), and one motionless gamete (egg); both gametes (sperms and eggs) motionless, and dependent upon other agencies for coming in contact with each other. The latter is the condition in the flowering plants.

Physiologically, sexual reproduction is a special activity of certain cells wherein two fuse into one, thus producing a new cell somewhat different from either. This in its growth produces a plant somewhat different from the plant or plants which produced the sexual cells. Sexual reproduction is thus a mode of growth. It is also a mode of variation.

Pathology considers the diseased or abnormal condition of plants. As physiology has to do with the normal, healthy activities of plants, so pathology has to do with abnormal activities. Diseased conditions of plants are due to many causes, which may be summarized as follows:

Physical Injuries, which may include all kinds of purely mechanical rupture, cutting or puncture of the tissues, due to wind, lightning, hail, or other violence, and the eating by insects, birds, and other animals. The mutilation by such agents interferes with the normal functions of the plant. In this place may be named some of the injuries due to too low temperature (freezing) or too high a temperature (scalding) and probably also the scalding or scorching effect of too intense light.

Errors of Nutrition may include all cases where there is an insufficient amount of any or all of the food substances, including water, solutions, gases, and the carbohydrates and other more complex nutrients. Here the word "starvation" may properly be used. When plants are supplied with too little light they suffer from starvation, there being a deficiency

in carbohydrates. So also plants in too low a temperature are not able to make use of available food substances, and starvation is the result.

Parasitic Injuries may be due to the presence of living animals or plants in the tissues. Under the former the most notable are the nematodes, which are very minute thread-like worms, which seriously injure the parts of the plants that they infest. The nematode disease of sugar beets is a good example, as also the root-knot nematode diseases of many different kinds of plants

Of the plant parasites the most common are bacteria of several kinds which destroy the cells in certain tissues, as in apple blight; external fungi which injure young twigs and leaves, as the powdery mildews; internal fungi which grow through the tissues of stems and leaves, injuring or wholly destroying them, as in rusts, smuts leaf-spot diseases, fruit rots, etc.; flowering plant parasites, as the dodder, mistletoe, etc., which often attack plants and distort or destroy the stems, as clover dodder, pine mistletoe, etc. The number of known disease-producing parasites is very great, and the literature on the subject is very voluminous.

Ecology deals with the relations of plants to their environment. It has been recognized as a distinct part of botanical study for less than twenty years, and is still associated with physiology, of which it is an extension and development. It is sometimes spoken of as out-of-door physiology, and it certainly has led to a closer study of plants in their natural environment than had been the practice in ordinary plant physiology. How plants affect one another, how they come to occupy particular habitats, and how these affect the plants themselves, are among the more common inquiries made by the ecologist.

Phytogeography, or geographical botany, as it is more commonly called, includes all the inquiries that relate to the distribution of plants throughout the world. In its more local inquiries it is identical with ecology, but its scope is much broader in its world-wide application.

Phylogeny and Taxonomy deal respectively with the descent and consequently the relationship of plants, and their natural classification.

Outline of the Taxonomy of Plants.—Botanists are now somewhat acquainted with about 233,000 different kinds of plants, at least they have given names to that many and assigned them to their orders and families.

A careful consideration of this vast mass of plants enables us to recognize a dozen or more rather well-marked groups of related forms. These groups are regarded as the results of definite development along as many evolutionary lines, and to these groups thus understood we now apply the name "phyla." So a phylum is a group of related plants, their relationship being due to the fact that they have had a common origin. Beginning with the lowest the phyla are as follows:

The Blue-Greens (*Myxophyceæ*) are minute water plants of such simplicity of structure that we are warranted in giving them the lowest place in the vegetable kingdom. Their cells for the most part do not have definite nuclei or chromatophores, and their walls are usually soft and more or less gelatinous. The color of the cells is never a bright green, but is blue-green, brown-green or smoky-green. They reproduce by fission, and the production of asexual spores, and there is no sexual reproduction whatever.

About 2,000 species are known, including many "bacteria" which are here regarded as blue-greens that have become hysterophytic and as a consequence have lost their coloring matter.

The Lower Green Algae (*Protophyceæ*) are also minute water plants, but their cells have well developed nuclei and chromatophores, and their walls are usually firm. Their color is a bright green, due to the presence of typical chlorophyll.

Like the preceding, these plants reproduce by fission, but in addition many of them form motile cells (ciliated zoöspores) which swim away and eventually grow into new plants. Some of these zoöspores fuse when two meet, the result being a new cell which then grows into a new plant, this process constituting a simple sexual act. There are above 1,100 species of the lower green algæ now known. The lower members of the phylum are unicellular, but for the most part they are filamentous plants.

The Pond Scums (*Zygophyceæ*) are typically filamentous plants in which a marked sluggishness of habit has entered to such an extent as to have materially modified their structure. Although filamentous, the plants for the most part very easily break into segments, or single cells. Although related to zoöspore-forming plants in the preceding phylum, the pond scums do not form zoöspores, nor do they have free-swimming ciliated gametes; on the contrary the protoplasms of two contiguous cells sluggishly fuse together.

In the treatment here suggested the more filamentous forms are considered more primitive, and those in which the filaments fragment early into single cells or short filaments of few cells are regarded as the later, or derived forms.

All told there are about 7,000 species of the pond scums and of these the diatoms include by far the greater number.

The Tube Algae (*Siphonophyceæ*) show another peculiar modification of the filamentous structure found in the lower green algæ, whereby the filaments instead of forming cross-walls to separate their cells are left partly or wholly tubular. In other respects the tube algæ resemble the lower green algæ, from which phylum they no doubt originated.

There are about 1,260 known species of tube algæ.

The Brown Algae (*Phæophyceæ*) include plants ranging from small filaments to large, massive plants many meters in length. They are peculiar in having a brown-green coloring matter instead of the bright green chlorophyll of ordinary plants. They are here regarded as a marine modification and development from the filamentous lower green algæ.

The brown algæ number somewhat more than 1,000 species.

The Red Algae. (*Carpophyceæ*) are green plants almost wholly marine, whose green color is mostly hidden by an additional red coloring matter which suffuses the protoplasm of the cells. The simpler species are filamentous and often very minute, but many of the higher species are large massive plants of a complex structure.

The red algæ number about 3,050 species, by far the greater part of which are red or purple in color.

The Fungi (*Carpomyceteæ*).—Here are brought together a vast number of hysterophytic plants, apparently related to the plants of the phylum just preceding, but which in becoming dependent have lost their green color, in addition to suffering many other changes.

Structure.—The plant body in all fungi is very simple (no doubt reduced), consisting of slender filaments which creep through the substance or the tissues upon which they feed. In most cases there is an asexual form of reproduction consisting of cells (conidia) that separate from the ends of certain filaments, and on germinating grow into new plants.

This phylum contains an enormous number of species, no less than 63,700 being enumerated in systematic works at the present time (1911), and every year hundreds of additional species are being identified and described.

Classification.—The fungi may be summarily outlined as follows:

1. Class *Ascosporeæ*, the sac fungi, including about fifteen orders and over one hundred families. Here we find the beetle fungi, the powdery mildews, black fungi, black lichens, script lichens, cup fungi, cup lichens, morels, tubers, etc.

2. Class *Teliosporeæ*, the rusts and smuts, including two orders and five families of excessively parasitic plants which live in the tissues of higher plants.

3. Class *Basidiosporeæ*, the basidium fungi, including nine orders and twenty-two families. Here are found the subterranean fungi, stinkhorns, puff-balls, bird-nest fungi, toadstools and mushrooms, pore-fungi, prickle-fungi, shell-fungi, ear-fungi, jelly-fungi, etc., in all of which the structure which we see is the spore-fruit, while the plant itself is the webby mass of filaments from which the spore-fruit grew. Thus the toadstool, with its well-known umbrella-shaped structure, is the fruit of a white filamentous plant growing beneath the surface.

The Mossworts (*Bryophyta*) are green plants of a markedly higher degree of development than any of the preceding phyla. In them we have for the first time a distinct alternation of sexual and asexual generations in the round of life. Thus one generation produces the sperms (in antherids) and eggs (in archegones) and the fertilized egg develops a second generation which does not produce sexual organs, but produces spores, and when the spores germinate they grow into sexual plants, and so on. The two generations are known in science as (a) the gametophyte, that is, the gamete-producing plant, (*i. e.*, the sexual plant), and (b) the sporophyte, that is, the spore-producing plant, (*i. e.*, the asexual plant).

There are all told somewhat more than 16,000 species of mossworts.

1. Class *Hepaticæ*, the liverworts, with mostly bilateral, often thalloid, creeping gametophytes, and globose to elongated, mostly splitting sporophytes, usually with "elaters" mingled with the spores. Here are to be found the crystalworts, horned liverworts, great liverworts and scale-mosses.

2. Class *Musci*, the mosses, with multilateral, mostly erect, leafy-stemmed gametophytes, and more or less elongated, erect sporophytes, which usually dehisce by a circular lid, and are without "elaters." There are more than sixty families of mosses, among which are species of peat mosses, cushion mosses, petticoat mosses, bristle-stalk mosses, ephemeral mosses, wood mosses, hair-cap mosses, humpback mosses, tree mosses, bog mosses.

The Ferns (*Pteridophyta*) are much larger land plants than the mossworts, to

1. Composites: (a) head with rays, (b) ray flower, (c) disk flower, (d) head of tubular flowers.
2. Gagea: flower.
3. Maple (*Acer*): (a) pistillate, (b) staminate flower, (c) fruit.
4. Clove (*Jambosa*): flower section and fruit.
5. Lamium: flower side and front.
6. Orobanche: flower section.
7. Pepper (*capsicum*): flower and fruit.
8. Oenothera: flower section.
9. Aralia: flowers.
10. Cornus: flower.
11. Clover (*Trifolium*): (a) flower, (b) fruit, (c) seed.
12. Beech (*Fagus*): (2) staminate, (3) pistillate flowers.
13. Sage (*Salvia*): flower and section.
14. Oak (*Quercus*): (2) staminate, (3) pistillate flower, (4) acorn.
15. Peach (*Prunus*): flower section.
16. Saxifrage (*Saxifraga*).
17. Ash (*Fraxinus*): apetalous flowers.
18. Grape (*Vitis*): closed, opening and opened flower.
19. Gentian (*Gentiana*): flower section.
20. Cinchona: flower and fruit.
21. Carrot (*Daucus*): flower and fruit.
22. Part of a fern frond.
23. Alfalfa (*Medicago*): (a) flower, (c) seed.

which they are closely allied. They show the same marked alternation of generations, but here the gametophyte is much smaller, sometimes in fact so small as to be actually microscopic, and in all cases it is much shorter lived than the sporophyte. The latter is early provided with roots and leaves, and so becomes quite independent of the gametophyte.

In common ferns the gametophyte is a small, flat, heart-shaped plant, a few millimeters in diameter, and growing attached to the moist soil by the hairs on its lower surface. It bears antherids and archegones on its lower surface, and after the fertilization of an egg in one of the latter, a leafy-stemmed and rooted plant (the sporophyte) develops. The fern as we see it is the sporophyte generation, and eventually it produces spores (in common ferns on the lower surfaces of the leaves) which on germination produce gametophytes again.

There are two great types of ferns, namely, the ancient and the modern, including all told somewhat more than 3,800 species.

The Calamites (*Calamophyta*) represent a phylum once very important but now almost extinct. In these plants the gametophyte is much like that of the ferns, while the sporophyte consists of cylindrical, jointed, often hollow stems, rooted below, and bearing narrow, whorled leaves above.

The spores of calamites are borne in whorled sporangia that compose terminal cones upon the stems. When they germinate they produce the small gametophytes referred to above.

There are only about twenty-four species of living calamites, all belonging to the genus *Equisetum* (horsetails).

The Lycopods (*Lepidophyta*) are represented to-day by about 700 species of small plants.

Here we find such living genera as *Lycopodium* (club-mosses and ground-pines) and *Selaginella* (little club-mosses).

The Cycads (*Cycadophyta*), like the preceding, constitute a phylum from which many types have died out, and what we have left is a mere remnant of a much larger and much more diversified group. In this phylum the gametophytes are very small, so small in fact that they are made out with difficulty even with the aid of the compound microscope, while the sporophyte is large, massive and often of the dimensions of trees. This great difference between the gametophyte and sporophyte generations has obscured the alternation of generations, and this has been emphasized by the fact that the megaspore which gives rise to the archegonial gametophyte does not escape from the sporangium, but remains within it, developing its gametophyte *within the sporangium*. This retention of the megaspore is the most important step that has been taken in the evolution of this part of the vegetable kingdom, resulting as it does in the better nourishment and greater protection of the gametophyte. This retention of the megaspore necessarily results in the formation of the seed, which appears first in this phylum.

Development of the Seed.—The sporangia which produce the microspores are found upon leaf-like structures (microsporophylls, or "stamens") and these are often aggregated into cones (staminate cones). In like manner the sporangia producing megaspores are on similar leaf-like structures (megasporophylls or "carpels"), and these again are often aggregated into cones (carpellary cones). Moreover, since the megasporangia are to retain the megaspores, they develop an external coat of protective tissue (the "seed coat"). When the megaspore is mature it at once develops a minute gametophyte in which several archegones are produced, each containing an egg. While this development is going on in the megasporangium, the microspore falls out from its sporangium and is carried by the wind to the summit of the young seed, where it germinates and produces a very simple, tubular, antheridial gametophyte, which in turn gives rise to two motile sperms, essentially like those in the preceding phyla.

Upon fertilization of an egg by a sperm it grows and rapidly develops into a new plant (young sporophyte) within the protective coats, and a little later the megasporangium, with the embryo plant and the surrounding coat, ripens into a "seed." This falls to the ground, and upon the resumption of growth by the embryo the latter soon splits the seed-coat and escapes, sending its root into the ground and its little leaves into the air, and it is henceforth able to maintain itself independently.

There are four or five known classes of cycads, two of which are wholly extinct, and those remaining are mere remnants of larger groups. The living species number between 125 and 150.

The Conifers (*Strobilophyta*) are related to the cycads, but this is in many respects a more modern group. As in cycads so here the archegonial gametophyte is very small, and permanently inclosed in the young seed. The antheridial gametophyte is tubular but the sperms are not motile. The development of the gametophytes and the fertilization of the eggs and production of the seed are essentially the same in conifers as in cycads. The sporophyte of conifers is much branched, woody, and often developed into enormous trees; the leaves are never large, always simple, and are often narrow or even scale-like, and generally persistent (evergreen). The fact that the megosporophylls and microsporophylls are nearly always in cones (strobili) has given them their common name of "conifers."

About 400 species are known. The principal genera are *Taxodium* (the bald cypress), *Sequoia* (the redwoods), *Araucaria* and *Dammara* (the ancient pines), all of which have many extinct species; *Abies* (the firs), *Picea* (the spruces), *Pinus* (the pines), *Cupressus* (the cypresses), *Thuja* (the arbor vitæ), and *Taxus* (the yew trees).

The Flowering Plants (*Anthophyta*) stand as the highest development reached in the vegetable kingdom. The particular structure which is characteristic of this phylum is the flower. This is a modification of the crude structures found in some ancient cycads, and now is typically composed of an axis on which are borne closed megasporophylls above, microsporophylls next lower, and below these one or more whorls of flower-leaves. More particularly, the megasporophylls are not open and more or less flat, as they are in preceding phyla, but as they grow their edges come together and finally become grown together so that the megasporangia are inclosed in the cavity so formed. This structure is known as a "pistil" in ordinary descriptive botany, and the megasporangia with their one or two coats are the young seeds ("ovules"). The microsporophylls (stamens) are much like those of the two preceding phyla, and the microspores themselves are known as "pollen." The flower leaves are typically two whorls, and then the inner whorl is usually more delicate and colored ("petals" composing the "corolla"), the outer whorl is typically of coarser texture and green ("sepals" composing the "calyx"). The principal modifications of the structure of the flower as here given will be indicated elsewhere.

Fertilization of the Egg.—The ovule develops as in the preceding phyla, but the archegonial gametophyte is delayed and the egg advanced in the sequence of changes, so that the gametophyte is still quite immature when the egg is ready for fertilization, and it is only after fertilization that it completes its development (as the "endosperm" of the seed). Fertilization is effected as follows: The microspore (pollen) falls upon a particular portion of the external surface of the pistil (the "stigma") and there develops a very simple tubular gametophyte which penetrates the soft stigmatic tissues in the direction of the ovule, which it eventually reaches and penetrates. In the end of the tube there are now two motionless sperms, one of which is passed through to the egg. After fusion of sperm and egg the resultant cell (zygote) divides and subdivides until a new plant is formed. At the same time the development of the belated gametophyte (endosperm) is resumed, the ovule tissues become less watery, the seed coat hardens, and the result is the mature seed.

Number of Species.—The flowering plants include an immense number of species, the number now known considerably exceeding 132,000, and with the additions of new species which are constantly being made it is safe to say that the number will eventually reach fully 150,000.

In the development of this vast number some marked modifications of structure have taken place, and these rightly understood give us a clew to the mode and sequence of the evolution, and since taxonomy must follow phylogeny, we have here the key to the classification of these plants.

While it is probable that the embryo plant in the seed of primitive flowering plants had two opposite leaf rudiments, (cotyledons) and hence were dicotyledonous, an early modification appeared in which the embryo had but one leaf rudiment, being monocotyledonous, and this has been adhered to in a group (the monocotyledons) which includes nearly one-fifth of all the flowering plants. These may be briefly arranged as follows:

The Monocotyledons (class *Monocotyledoneæ*) have a single cotyledon, alternate leaves which are parallel-veined, and the fibrovascular bundles of their stems are scattered. There are seven or eight orders and nearly fifty families, beginning with the water plantains and their relatives, *Alisma* (water plantain), *Butomus*, *Potamogeton*, etc., in which the pistils are normally many and separate and the other parts of the flower separate also and normally in whorls of three each.

In the lilies the pistils have been reduced to three and these have fused into a single structure (compound pistil), while the stamens have been reduced to six or three, and the petals and sepals are of three each.

In this central group of the monocotyledons are found such genera as *Lilium* (lily),

1. Cotton (*Gossypium*): fruit and seed.
2. Linden (*Tilia*): flower section.
3. Tamarix: flower section.
4. Morning Glory (*Convolvulus*): flower section, fruit and seed.
5. Willow (*Salix*): 4, 5, 6, 7, 8, 9, 10, flowers and seed.
6. Dammar-pine: leaves, cone, and scale.
7. Magnolia: flower section.
8. Field Horsetail (*Equisetum arvense*): plant form.
9. Arnica: stem, leaf, and flower.
10. Thistle (*Cnicus*): flowers and bristle.
11. Flax (*Linum*): fruit and seed.
12. Monotropa: flower section.
13. Poppy: flower section.
14. Birch (*Betula*): flowers.
15. Melon (*Cucumis*): flower section.
16. Buttercup (*Ranunculus*): section of flower, pistils, stamens, ovals, etc.

Tulipa, (tulip), *Gagea*, *Yucca*, *Asparagus*, *Allium* (onions), *Tradescantia*, *Juncus*, etc.

From the lilies have come at least five other orders by as many modifications of the lily structure. These are the calla lilies, with their crowded, soft, small, lily-like flowers and thick succulent stems and leaves, including *Calla*, *Caladium*, *Calocasia Arisæma* (Indian turnip), *Symplocarpus*, *Acorus*, etc., and the reduced duckweeds (*Lemna*).

Next to these are the palms, with small, firm, lily-like flowers and strong, stiff, spreading leaves upon the summits of woody trunks. Here are the date palms (*Phœnix*), coconuts (*Cocos*), palmettos (*Sabal*), royal palm (*Oreodoxa*), rattan palm (*Calamus*), etc.

Then come the grasses, with their stiff, leafy stems, and reduced, chaffy flowers of the lily type, including also the sedges with three-ranked leaves upon three-angled stems, *Cyperus*, *Scirpus* (rushes), *Carex*, etc. The genuine grasses have two-ranked leaves, borne upon rounded stems.

The genera may be grouped into about a dozen tribes—*viz.*, the bamboos (*Bambusa*), fescues (*Festuca*, *Bromus*, *Poa*, etc.), oats (*Avena*), wheats (*Triticum*, *Hordeum*, *Secale*), grammas (*Bouteloua*, *Buchloe*), red tops (*Agrostis*, *Sporobolus*), canary grasses (*Phalaris*), rices (*Oryza*), panic grasses (*Panicum*, *Setaria*), canes (*Sorghum*, *Saccharum*, *Andropogon*), maize grasses (*Zea*).

In all the foregoing the pistils, whether simple or compound, stand at the summit of the flower axis and are not overgrown or inclosed by any of the other parts of the flower or the petals or sepals (pistil superior), but in the three following orders such overgrowth has taken place and the pistil is said to be "inferior."

The waterworts (*Hydrales*) include a few water plants, as *Vallisneria*, *Hydrocharis*, etc.

The irises include terrestrial, mostly erect plants, with regular and often showy flowers (*Amaryllis*, *Narcissus*, *Agave*, *Iris*, *Ananas* (pineapple), *Musa* (banana), *Zingiber* (ginger), *Canna*.

From this latter order, by the development of "irregularity" in the flower, came the orchids with their odd-shaped flowers adapted to secure the help of insects in the carrying of pollen from flower to flower. Here are *Cypripedium* (lady's slipper), *Orchis*, *Epipactis*, *Vanilla*, *Spiranthes*, etc.

The Dicotyledons (class *Dicotyledoneæ*) have two opposite cotyledons, opposite or alternate leaves which are reticulate veined, and the fibrovascular bundles are arranged in concentric layers in the stem.

The *number of species* of dicotyledons is about four and a half times that of monocotyledons, and accordingly we find more numerous and much greater modifications of structure in this class, and while the dicotyledons probably appeared earlier in time than the monocotyledons, it is true also that they have attained a higher development. In fact, when we consider the flowering plants as a whole, we are led to the conclusion that the dicotyledons are *the typical* flowering plants, and that the monocotyledons constitute a nontypical and much less important modification.

The *flower* of primitive dicotyledons consists of an axis bearing on its terminal portion a considerable number of pistils; below these are whorls of stamens, and still below these the whorls of flower leaves (petals and sepals). Such a flower structure is found in the buttercups and their relatives. From this point of beginning, development has progressed along two main lines, culminating in one case in the mints and in the other in the sunflowers and the dandelions.

First Line.—In the buttercup-mint line there are about fourteen orders and 146 families. The more important orders are as follows:

The buttercups (*Ranales*), with all of the flower parts typically free and distinct from one another. Here are such genera as *Myosurus*, *Ranunculus* (buttercups), *Anemone*, *Magnolia*, *Asimina*, *Berberis*, *Nymphæa* (water lilies), etc.

The crucifers (*Rhoedales*), with the carpels mostly two, and united, as in *Sanguinaria*, *Papaver* (poppy), *Sinapis*, *Brassica* (mustard), *Raphanus* (radish), *Reseda* (mignonette), etc.

The pitcher plants (*Sarraceniales*), *Sarracenia*, *Nepenthes*.

The pinks (*Caryophyllales*), with pistil of three or more united carpels, the petals separate and free, as in *Dianthus* (carnations), *Lychnis*, *Tamarix*, *Salix* (willows), *Populus*, *Portulaca*, *Amaranthus*, *Chenopodium*, *Polygonum*.

The geraniums (*Geraniales*), as in *Geranium Oxalis*, *Linum* (flax), *Ruta*, *Citrus* (orange), *Euphorbia*.

The guttifers (*Guttiferales*), as in *Thea* (tea), *Viola*, *Passiflora*.

The mallows (*Malvales*), as in *Tilia* (linden), *Malva*, *Gossypium* (cotton), *Ulmus* (elm), *Morus*, *Ficus*, *Urtica*, in all of which the petals are free and distinct from one another.

In the following the petals are united (gamopetalous) and there is a gradual reduction in the number of carpels in the compound pistil. The primroses (*Primulales*), as in *Primula Dodecatheon*, *Plantago*.

The heaths (*Ericales*), as in rhododendron, *Kalmia Erica*, *Pirola Monotropa*.

The ebonys (*Ebenales*), as in *Achras*, *Diospyros* (persimmon), *Styrax*.

The phloxes (*Polemoniales*), as in *Gilia*, *Phlox*, *Convolvulus* (morning glories), *Solanum*, *Capsicum*, *Datura*.

The gentians (*Gentianales*), as in *Olea* (olive), *Fraxinus* (ash), *Gentiana*, *Asclepias*.

The figworts (*Scrophulariales*) as in *Verbascum*, *Gerardia*, *Catalpa*, *Orobanche*, *Utricularia*, *Acanthus*.

The mints (*Lamiales*), as in *Verbena*, *Nepeta*, *Lamium*, *Salvia* (sage), *Mentha* (mints).

These plants are at the summit of this line, and represent the highest development attained by plants with gamopetalous flowers whose pistils are superior.

Second Line.—In the rose-sunflower line there are about nine orders and ninety families, the general sequence of which is as follows:

The roses (*Rosales*) are very much like the buttercups, having usually a considerable number of simple pistils, many stamens, and petals and sepals not united. The flower axis has a disk-shaped enlargement at its base, and this appears to be the dominant structure of this line. Here are such genera as *Potentilla*, *Fragaria* (strawberry), *Spiræa*, *Rosa*, *Pirus* (apple), *Prunus*, *Mimosa*, *Gleditsia*, *Trifolium*, *Medicago*, *Vicia*, *Pisum* (pea), *Saxifraga*, *Ribes*, *Crassula*, *Platanus*.

The myrtles (*Myrtales*) have overgrown the compound pistil by the cup-shaped disk, as in *Myrtus*, *Jambosa* (clove), *Eucalyptus*, *Oenothera*, *Fuchsia*.

The cactuses (*Cactales*) have, in addition to myrtle-like flowers, a leafless, fleshy plant body, as in *Opuntia*, *Cereus*, *Cactus*, *Melocactus*, etc.

The loasas (*Loasales*) include such genera with inferior pistils as *Mentzelia*, *Cucurbita* (pumpkins), *Cucumis* (melons), *Citrullus*, *Begonia*.

The buckthorns (*Celastrales*) include *Rhamnus*, *Vitis* (grapes), *Celastrus*, *Ilex* (holly), *Elæagnus*, *Viscum* (mistletoe), etc.

The horse-chestnuts (*Sapindales*), which include a series of trees with more and more simplified flowers, from *Aesculus*, *Acer* (maple) and *Rhus*, to *Juglans* (walnuts), *Betula* (birch), *Corylus*, *Fagus* (beech), *Castanea* (chestnuts), and *Quercus* (oaks).

The umbelworts (*Umbellales*), in which the mostly bicarpellary two-celled pistil is wholly inferior by the adhesion of the disk, and the five stamens and five petals are distinct, while the sepals are small. Here we find *Aralia Hedera* (ivy), *Coriandrum*, *Conium*, *Cicuta*, *Pastinaca*, *Daucus* (carrot), *Cornus*, etc.

The madderworts (*Rubiales*), with the general structure of the umbelworts but with the petals united (gamopetalous), represented by *Galium*, *Coffea Cinchona*, *Sambucus*, *Lonicera* (honeysuckle), etc.

The sunflowers (*Asterales*), with small flowers mostly crowded into heads, the pistil typically bicarpellary but mostly one-seeded and one-celled, the corolla tubular and the calyx reduced to chaff or bristles (pappus) or entirely wanting. Here at the summit of the vegetable kingdom are found the bellworts (*Campanula*) and lobelias (*Lobelia*) and also a vast number of "composites," of which more than 13,000 species are now known. These represent the highest development to be found anywhere in the vegetable kingdom.

The sunflowers proper (species of *Helianthus*) are to be regarded as representing the lower or primitive composites, from which have come the ragweeds (*Ambrosia*), as well as the asters (*Aster*) and golden-rods (*Solidago*) and ironweeds (*Vernonia*) on the one hand, and the chrysanthemums (*Chrysanthemum*) groundsels (*Senecio*, *Arnica*), thistles (*Cnicus*), the chicories (*Cichorium*), the lettuces (*Lactuca*) and the dandelions (*Taraxacum*).

The last-named genus is on many accounts to be regarded as the highest in this group, and, as a consequence, in the vegetable kingdom.

CHEMISTRY is that science which is largely concerned with a study of the different species of matter and of the changes from one species to another. When iron rusts, or when charcoal burns, the products of these chemical changes are species of matter that are different from the original iron or charcoal. The different species or kinds of matter are called *substances.* Granite, and also gunpowder, are mixtures of at least three different substances.

Substances are recognized and identified often by their *physical properties*, such as color, density, boiling point, melting point, and solubility. They can also be recognized by their *chemical properties*, such as combustibility, ease of rusting, or, generally, their *chemical reactions* or behavior toward other substances chosen to test them with.

Pure Substances.—In studying the different kinds of matter (different substances), such as iron, charcoal, salt, sugar, or niter, it is necessary to first prepare them in a pure state. To do this the chemist uses various processes. In *filtration* the insoluble solid matter is retained by a piece of unsized filter-paper, while the liquid passes through the paper and is collected as the *filtrate.* Instead of filter paper, unglazed earthenware may be used to filter drinking water. The pores in this are so small (in Pasteur filters) that even the minute microbes, some of which cause disease, cannot pass through.

In *distillation* a liquid, by raising its temperature, is converted into gas and is so separated from any substances that accompany it which are less *volatile, i. e.*, less easily gasified. In this way, for example, pure drinking water may be obtained on board ship from sea water, which contains difficultly volatile salts, including common salt, dissolved in it. The gaseous water (steam) is *condensed* to water again by passage through a cooled tube. It should be noticed that the changes from water into steam and *vice versa* are classed as *physical changes*, because analysis shows that steam and water consist of the same substance differing only in state, steam being in the gaseous state, water in the liquid, and ice in the solid state.

Sublimation refers to the distillation of solids. Sal-ammoniac, benzoic acid, etc., are purified by sublimation. *Lixiviation* and *leaching* refer to the dissolving out of a soluble substance from its admixture with an insoluble substance.

Physical Properties.—The substance having been obtained in a pure state, a study may be made of its properties. Purity is extremely important; and chemists and physicists alike have in the past often wasted years of their lives in studying substances that were seriously impure and that could not, therefore, be expected to yield constant results.

Solubility.—Among physical properties, *solubility* is one of the most important to the chemist. Liquids dissolve solids, other liquids, and also gases. If common salt be added to water, it dissolves, and, after stirring, the solution is said to be homogeneous because all samples, wherever taken, prove to be identical. Water is here the *solvent* and salt the *solute.* If more and more salt be added by degrees, the temperature remaining constant, a stage is finally reached at which the solution will take up no more salt. The solution is then said to be *saturated*, at that temperature, with common salt.

Its *concentration* may be stated in any one of three ways: (1) Weight of salt contained in such a weight of the solvent; (2) weight of salt contained in such a weight of the solution; (3) weight of salt contained in such a volume of the solution. When the temperature is raised it is found that the solution can take up more salt. Tables of solubilities state the concentration of the saturated solution at a series of different temperatures. It is by making use of their differences in solubility that intimate mixtures of different solids can be separated into their components; for instance, radium bromide is separated from barium bromide by repeated *fractional crystallization.*

Most, but not all, solids are more soluble at higher temperatures than at lower. All substances seem to be slightly soluble in water, although in some cases the saturated solution is an exceedingly dilute one.

That gases dissolve in water is known to every one who has examined *soda-water*, which contains the gas carbon dioxide in solution. If the gas is under pressure, the weight of it that the solvent will dissolve is proportional to the pressure (Henry's law). Since soda-water is *aerated* at several atmospheres' pressure, a portion of the gas tends to escape when the pressure is released. Gases are less soluble the higher the temperature, and can often, though not always, be completely removed by boiling the solvent. By ten minutes' boiling, for example, the gases dissolved from the air by ordinary water may be removed and the water thus rendered flat or insipid to the taste.

Molecular Hypothesis.—In studying the physical properties of substances there is a hypothesis as to the structure of matter—the kinetic-molecular hypothesis—that has proved particularly illuminative. On this hypothesis, each substance is supposed to be built up of minute particles of its own material called *molecules*, all alike and each incapable of finer subdivision if the substance is to remain the same. In the gaseous state of the substance the molecules are at distances apart that are great in comparison with their own diameters, and are moving about in straight lines with great speed, each occasionally colliding with some other molecule or with the walls of the vessel. The miniature bombardment of the walls of the vessel by myriads of molecules is the cause of the pressure of the gas on the walls.

Boyle's Law.—In agreement with this conception is the well-known fact that if a gas be compressed to $\frac{1}{n}$ times its original volume, then its pressure is increased n-fold. For, plainly, the molecules, and therefore their impacts, will now be n-times as many as before. It is also a well-known fact of experiment that the pressure of an inclosed volume of gas varies directly as its absolute temperature, *i. e.*, its temperature measured from the absolute zero, which is −273°C. This is accounted for by considering that the speed of motion of the molecules is increased as the temperature rises, and that the impacts of the molecules are therefore stronger. It is indeed strange that gases should all be precisely alike in conforming to these two laws, for in the case of solids and of liquids the behavior toward pressure and toward change of temperature is different for each substance. Gases must, therefore, all have something in common which liquids and solids have not.

It seems certain that all gases contain, at like temperature and pressure, the same number of molecules in equal volumes. Since this is so, by weighing equal volumes of different gases the relative weights of their molecules can at once be found. The *molecular weights*, compared with the weight of a molecule of oxygen taken as 32, of gases, or of gasifyable substances, are determined in this way.

Vapor Pressure.—In the case of liquids, the crowding together of the molecules is much closer than in gases. If a gas be at a temperature lower than its *critical temperature*, however, it may always be compressed into a liquid. From the surface of a liquid, supposed to be placed, for example, in an empty closed vessel, some of the molecules are constantly escaping into the upper part of the vessel, where they behave like gas molecules, giving rise to a (gaseous) pressure there, known as the *vapor pressure* of the liquid. Some of these are constantly returning to the liquid, in the course of their wanderings, but their places are taken by newcomers from the liquid. The vapor pressure, therefore, remains constant at any temperature. If the temperature is raised, this vapor pressure increases. For this reason, water in such a vessel, if raised sufficiently in temperature, might finally "burst its boiler."

Chemical Analysis.—The chemical properties of pure substances may be studied by testing by experiments their behavior, under different conditions, both alone and toward other substances. In particular it may be discovered, for example, that red lead can be made to furnish the metal lead and the gas oxygen. The processes of finding out what substances or mixtures of substances are made up of are called chemical analyses.

Qualitative Analysis concerns itself with the kinds of matter present, and *quantitative analysis* with the proportions by weight or by volume in which they are present. It has been found that all substances are made up from only about eighty-two different kinds of matter, called *elements*, combined in different ways. Thus sugar, alcohol, acetic acid, cotton and starch, although apparently so different, each contains only the three elements, carbon, hydrogen, and oxygen in different proportions. All compounds containing only oxygen in combination with one other element are called oxides, as calcium oxide (quicklime), lead oxide (litharge). Those compounds containing chlorine in combination with one other element are chlorides, as sodium chloride (common salt), etc. In general, compounds with the termination *ide* contain only the elements named. Those whose names end in *ite* contain, besides, oxygen, as sodium chlorite; those ending

in *ate* more oxygen still, as sodium chlorate, while sodium *per*chlorate contains still more oxygen than sodium chlorate. The majority of the elements are metallic elements (metals), while only about fourteen are nonmetallic elements (carbon, hydrogen, oxygen, nitrogen, sulphur, phosphorus, chlorine, silicon, etc.).

Quantitative Analysis has brought out many of the most remarkable facts of chemistry that were entirely missed by the chemists of antiquity and of the middle ages. It is found, by weighing, that no matter can be destroyed, although one compound may be changed into another. This principle is called the *conservation of matter*. A candle appears to burn to nothing merely because its products of combustion happen to be invisible. If it be allowed to burn in a large closed vessel, there is just as much carbon in the vessel after as before the burning, although it is now in the form of a gas (carbon dioxide) instead of combined as a solid compound with hydrogen.

Quantitative analysis of different samples of the same pure substance brings out the fact that the composition of every pure substance is invariably the same, or, in other words, that the elements combine in definite proportions by weight to form each particular compound. This observed regularity is known as the *law of definite proportions*. By analysis of different compounds made of the same elements, A and B, it is found, further, that the weights of B, which, in the different compounds, are united with the same weight of A, are related to each other in the ratio of small integers. This could not have been anticipated, and, when found, calls for explanation. The accepted explanation is most concrete in terms of the atomic theory.

The Atomic Theory supposes that the molecules of every compound are built up of units, called atoms, of the elements that are present, and that all the atoms of any one element are identical in material and weight. Thus, water consists of molecules each of which contains two atoms of the element hydrogen combined with one atom of the element oxygen.

Symbols are given each element to stand for the weight of its atom compared to the weight of an atom of oxygen, which is taken as 16 (for arbitrary reasons of convenience). The formula for a molecule of water is thus H_2O, signifying that one atomic weight of oxygen (16 parts by weight) is combined with two atomic weights ($2\times1=2$ parts by weight) of hydrogen. The formula for hydrogen peroxide is H_2O_2.

It will be seen upon reflection that this atomic hypothesis accounts perfectly for the experimentally found law of multiple proportions referred to above, as well as for the observed fact (*law of combining weights*) that the proportions by weight in which elements combine to form compounds can always be expressed perfectly by (usually) small integral multiples of particular numbers, one number belonging to each element.

Combustion.—A Christmas candle will burn less than ten seconds in half a pint of air. A kerosene lamp with a good Rochester burner will burn not more than four minutes in an empty flour barrel if tightly covered. The burning of the wax or the oil consumes a portion of the oxygen which constitutes one-fifth of the air, and they cease to burn when one-quarter of the oxygen, or one-twentieth of the air, is used up. Air which contains not more than 15 per cent oxygen will extinguish a fire; it will also extinguish life. Hence a lantern is lowered into old wells to determine whether it would be safe for a man to descend into them. The air which comes from one's lungs is very nearly like that left in the barrel after the lamp had extinguished itself in it. A bottleful of air from the lungs will extinguish a candle flame.

Formation of Compounds.—Fuels in burning unite with the oxygen of the air, forming new compounds. For example, when we burn in an ordinary furnace fifteen tons of coal, the furnace consumes also about thirty-two tons of oxygen from the air, and pours out into the air about forty-four tons of carbon dioxide gas, leaving behind about three tons of ashes. These figures, although not exact, are intended to convey two ideas—first, that combustion is a union of oxygen with fuels; and, second, that the process neither destroys nor creates matter, but merely changes combinations of matter. The oxygen is quite as much fuel as the coal.

In the case of the coal, the kerosene or the candle, water vapor is produced as a product of combustion along with the carbon dioxide. This water vapor is noticed when a cool chimney is first put upon a kerosene lamp.

Fuels and Foods.—Our foods correspond to fuels and we take in also oxygen as a food, or fuel. By a process analogous to combustion we cause oxygen to unite with these foods, producing water vapor, carbon dioxide, and heat for our bodies.

When a bottle of pure oxygen is placed over a burning candle the candle of course burns brighter and longer than it would in a bottle of air, but goes out before all the oxygen is exhausted. The contents of the bottle will now act as a fire extinguisher, although it contains as much oxygen as ever. Part of the oxygen is now bound in chemical union with carbon from the candle, and the oxygen which is free does not constitute a sufficiently large portion of the whole to support combustion.

Rust.—As might be expected, many things burn vigorously in pure oxygen which burn but slowly or not at all in the air, since the air is greatly diluted oxygen. A thin strip of iron may be burned with great vigor in pure oxygen. The black substance which will be found on the bottom of the bottle after the close of this experiment is analogous iron rust. It weighs considerably more than the iron which was burned and the increase in weight represents the oxygen which was burned. Combustion and rusting differ only in the rapidity of the action. Combustion is rapid rusting, and rusting is slow combustion. Both are called oxidation and the products are called oxides. The oxidation of our foods in our bodies is slow—more like rusting than combustion. We cover iron with various things to prevent the oxygen of the air from rusting it. It is covered with tin in the tinware of the kitchen, with zinc in the case of "galvanized" iron, with nickel, with porcelain, with paint, with grease, with vaseline, etc.

Extinguishing Fires.—In fighting a fire at its start, the one thing to do is to make the fire smother itself. An ordinary living room does not contain oxygen enough to burn up five pounds of wood. If the doors and windows are closed perfectly tight, a fire burning in a pile of dry kindlings in such a room will smolder for a time and finally go out precisely as does the candle burning in a bottle.

Most fire extinguishers are devices for producing carbon dioxide gas. With this they smother small fires by pouring into the atmosphere around them enough of the gas to reduce the proportion of oxygen below 15 per cent.

Streams of water, when thrown in sufficient quantity, as by fire engines, extinguish large fires both by cooling the fuel and by diluting the air with steam until the proportion of oxygen falls below 15 per cent.

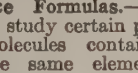
Atomic Weight. — The choice of atomic weights is a matter of some little complexity. The atomic weight of an element is defined to be the smallest of the weights of the element found in the molecular weights of all its volatile compounds. To pick out the correct atomic weight for the element chlorine, for instance, the molecular weights of all the volatile compounds of chlorine must first be found. Next, to find out what part of the molecular weight of each compound is due to chlorine, each of the compounds must be analyzed. Thus a series of numbers is arrived at which might read as follows: 71, 106.5, 71, 35.5, 142, 35.5, 71, etc. From this it is seen that the smallest weight of chlorine occurring in any of these compounds is, on the scale used, 35.5. Since no compound is found to contain in its molecular weight a smaller weight of chlorine than this, 35.5 is adopted as the molecular weight of chlorine. It should be noted that the formula for the gas chlorine is Cl_2, because its molecular weight is found by experiment to be 71, and must therefore contain two atomic weights of chlorine.

The case is more difficult when we have to deal with an element that forms few volatile compounds. In such cases, we are aided by a regularity, or law, first observed by the French chemists Dulong and Petit in 1819, that the numerical product of the atomic weight of an element by its specific heat is usually close to 6.3. When in doubt between several plausible values for the atomic weight of an element, we may, therefore, settle the question by determining its specific heat and then selecting for atomic weight that value which will yield a product near to 6.3 when multiplied by the specific heat observed.

Valence.—If one examines the formulas for a number of different chlorides, as $NaCl$, $MgCl_2$, $AlCl_3$, CCl_4, PCl_5, it is evident that the atoms of sodium, magnesium, etc., seem to differ in their power of holding chlorine atoms. Sodium, as also chlorine, is said to have a valence one, magnesium two, aluminium three, carbon four, and phosphorus five. The valence of oxygen is two, and the formulas for the oxides corresponding to the above chlorides are Na_2O, MgO, Al_2O_3, CO_2, P_2O_5. Thus two atoms of aluminium with their total of six valence "bonds" are found united with three atoms of oxygen, which also have, in all, six valence bonds. Many elements can function, under different conditions, with two or even more valences; thus iron in one series of compounds is dyad or bivalent, as in $FeCl_2$, FeO, etc.; and in another series triad or trivalent, as in $FeCl_3$, Fe_2O_3, etc. Phosphorus is triad in PCl_3, but pentad in PCl_5.

Graphic Formulas.—There are often good reasons for assigning certain arrangements of the atoms within the molecule. This

arrangement is expressed graphically in formulas such as Ba(O–O) basium peroxidate and Pb(O)₂ lead dioxide; or



acetic acid, the simple formula for which is $C_2H_4O_2$.

Space Formulas.—Pasteur was the first to study certain pairs of substances whose molecules contain atoms of precisely the same elements arranged precisely similarly, but with only this difference, that the molecules of the two "enantiomorphous" substances are related to each other as a right-hand glove is to a left-hand glove, or as an object is to its mirror-image. Such molecular arrangements can be imitated accurately by models in space of three dimensions.

Reactions—Chemical reactions are represented by means of equations. Thus, the fact that 56 parts of iron will unite with 32 parts of sulphur to produce 88 parts of ferrous sulphide is written $Fe+S—\ FeS$. Again, the equation $4Al+3O_2—\ 2Al_2O_3$ indicates, if the atomic weights be known, the respective weights of aluminium and of oxygen that react to form a certain weight of aluminium oxide. This is a case of *simple combination*.

A more complex reaction, which takes place in solution, is shown by the equation $AgNO_3+NaCl—\ AgCl+NaNO_3$, where we find the four "radicals" Ag, NO_3, Na and Cl exchanging partners. Such a change is called a *double decomposition*. A group of atoms such as NO_3 that remain together throughout a series of reactions is called a *compound radical*.

Radicals are classified into *positive* and *negative* radicals. In the above example, Ag and Na are each positive, while Cl and NO_3 are negative radicals. A compound containing both kinds of radicals is a *salt*—for example, silver nitrate, silver chloride, sodium nitrate, sodium chloride.

Those salts that have hydrogen for their positive radical are called acids, and their solutions have a sour taste and turn the blue coloring matter litmus red. Those salts that have the group OH for their negative radical are bases, and their solutions have a soapy taste and feel, and turn red litmus blue; example, sodium hydroxide. When an acid is mixed with a base in solution, the radicals H and OH combine to form water HOH, and the remaining positive and negative radicals, on uniting, constitute a salt. If the resulting solution has no action on litmus, the acid and base have "neutralized" each other.

Salts may also be formed in the dry way by the union of an "acidic oxide" such as carbonic anhydride with a "basic oxide" such as calcium oxide, $CO_2+CaO—\ CaCO_3$. The oxides of the nonmetals are acidic, while the lower oxides of the metals are basic. The higher oxides of the metals, *i. e.*, those with more oxygen, are frequently acidic. An acidic oxide yields an acid when it combines with water, while a basic oxide yields a base.

Besides involving changes from one form of matter to another, all chemical reactions are accompanied by some energy change. Heat, light, mechanical or electrical energy may be produced or consumed. The corresponding branches of chemistry that deal with such energy changes are thermochemistry, electrochemistry, photochemistry, etc.

Thermochemistry.—(I.) If the parts taken be grams, the above mentioned reaction between aluminium and oxygen gives rise to 760,400 calories of heat. This is expressed by the thermochemical equation $4Al+3O_2—\ 2Al_2O_3+760{,}400$ cal. This particular reaction has been chosen as an example because of its technical importance. Few other metals in combining with oxygen produce nearly so much heat as aluminium. Thus, for the burning of iron the thermochemical equation is $4Fe+3O_2—\ 2Fe_2O_3+388{,}800$ cal. Now if aluminium filings are mixed with iron oxide and the mixture ignited, the aluminium deprives the iron of its oxygen as shown by the equation $2Al+Fe_2O_3—\ Al_2O_3+2Fe+185{,}300$ cal., and the amount of heat liberated is the difference between the heat supplied by the combination of aluminium with oxygen and that consumed in the decomposition of the iron oxide, *viz.*, $(760{,}400—388{,}800)\div 2=185{,}800$. Since the materials are in close admixture, the reaction proceeds rapidly, and, as no volatile products are formed, no heat is thus carried away. A very high temperature is produced and may be utilized for welding rails, etc. (Goldschmidt process).

(II.) It is sometimes necessary, on the other hand, to produce a very high temperature before a chemical action will take place. In addition to the ordinary types of furnaces, electric furnaces have latterly been used for this purpose, their exceedingly high temperatures rendering possible the manufacture on a commercial scale of calcium carbide, carborundum, silicon, "electrical steel," artificial graphite, etc., thus giving rise to many industries which were not dreamed of before the advent of this type of furnace.

Electrochemistry.—A study of chemical reactions in their relations to electrical energy has developed enormously within the last twenty years.

(I.) Many chemical reactions may be so conducted as to furnish a supply of electricity. Such reactions are allowed to take place in primary batteries, *e. g.*, in the Daniell or Leclanché cells. In a secondary cell, such as a lead accumulator, a chemical action is caused to take place by putting in electrical energy from the dynamo. When this reaction is complete, the cell is "charged"; and whenever the reaction is allowed to reverse itself, electricity will be given out.

(II.) There are many reactions which can be made to occur by the use of electrical energy. For example, salts, whether fused or in solution, may be decomposed by electrolysis. Thus gold, silver, nickel, copper, etc., may be deposited from solution of their salts (*cf.* gold, etc., plating, electrotyping, etc.). Solution of common salt may yield on electrolysis sodium hydroxide, chlorine, sodium hypochlorite and sodium chlorate, all valuable products. Copper is refined electrolytically. The metals sodium, potassium, magnesium, calcium, aluminium, etc., are produced commercially by electrolysis of their molten compounds.

Electrical energy may also be used to produce electric discharges in which such actions as the making of ozone, nitrogen peroxide (and hence nitric acid) may be caused to take place. The latter application may prove of vast importance in the near future, when the world's supply of Chili saltpeter ($NaNO_3$), upon which, as a nitrogenous manure, the wheat supply in part depends, is exhausted.

Photochemistry finds its chief application in the field of photography. The efficiency of various mixtures of the earths ceria and thoria in incandescent gas mantles, or of titanium carbide as a substitute for the carbons of arc-lamps, are really questions of physics, but have obviously a close connection with chemistry.

Physical Chemistry includes, besides the three branches just referred to that deal with the energy changes accompanying chemical reactions, the study of many other topics that are closely related to physics. This side of chemistry has developed in a quite phenomenal degree since the year 1887, in which the ionic theory was first propounded.

Ionic Theory.—According to the ionic theory, when salts are dissolved in water they are largely split up into their radicals, which are then present in the solution carrying electric charges. These charged radicals are called ions. Thus, the ions furnished by common salt in solution are Na˙ and Cl', where the positive and negative charges on the ions are indicated by a ˙ and a ' respectively.

In a solution containing 58 grams of common salt per liter, 68 per cent of the molecules of sodium chloride are considered to be ionized, while the remaining 32 per cent remain in the form of unbroken molecules. It must be remembered that the ion Cl' is not by any means the same substance as the gas chlorine, for, though it is made of the same kind of matter, its energy content is very different. The ions in a solution of sodium sulphate (Na_2SO_4) are Na˙, Na˙, and SO_4".

In alcoholic solution, salts are not so highly ionized as in water; that is, the proportion of un-ionized (or undissociated) molecules is larger. In solution in other liquids, salts are often scarcely ionized at all, and it is found that such solutions do not conduct electricity as aqueous solutions of the same salts do.

The mechanism of the (electrolytic) conductivity of a solution of a salt, acid, or base in water consists, on the ionic hypothesis, in a bodily attracting of the positive ions in the solution by the negatively charged pole, and of the negative ions by the positive pole immersed in the solution. The positive and negative ions, therefore, move or travel toward the electrodes or poles, and finally give up their charges there. In this way electricity is transported through the solution.

In terms of the ionic theory, an acid owes its acid properties to the presence of hydrogen-ion in its solution, while a base owes its basic properties to the presence of hydroxide-ion (OH'). The strongest acids and bases are those that under like circumstances yield the highest concentration of H˙ and OH' respectively.

Subdivisions of Chemistry.—In its treatment of the various forms of matter, chemistry divides itself into the two great branches of inorganic and organic chemistry.

Organic Chemistry.—The latter is so-called because it originally dealt with the substances that are found in the organic vegetable and animal kingdoms. Practically most of these substances contain carbon, so that organic chemistry is nowadays the chemistry of the carbon compounds. As the number of known organic compounds is well over 100,000, the subject is a large one, with a very voluminous literature, increasing year by year in yearly as well as in total volume.

Carbon.—The valence of carbon in most of its compounds is uniformly 4, a regularity which simplifies matters con-

siderably at the outset. Carbon atoms are found to have the faculty of linking themselves together to form chains and rings. In this faculty carbon is exceptional among the elements, and for this reason no other element approaches carbon in the multitude of its compounds, so as to merit the treatment of its compound as a separate branch of chemistry. The attaching of carbon atoms to each other does not utilize all four of the available valences, and the unoccupied valences are therefore able to attach to the molecule such other elements as hydrogen, oxygen, nitrogen, etc.

It is found that the same grouping of elements recurs as part of a complex molecule; and all substances that possess the same group somewhere in their molecule are fortunately found to show the same reactions in virtue of the presence of that group. Thus, all the compounds containing the group $-CH_2OH$ are classed as primary alcohols; those with the group $-CHO$ are aldehydes; those with $-COOH$ are acids;

$$-\overset{O}{\overset{\|}{C}}-$$

those with the group attached to carbon atoms on both sides, are ketones; and so on. The fact that all primary alcohols, all aldehydes, acids, etc., behave chemically more or less alike makes it possible to bring order out of the chaos of organic compounds, since the typical groupings of atoms are comparatively few in number.

Hydrocarbons.— Many important organic compounds contain only the elements carbon and hydrogen. These are called the *hydrocarbons*, and include marsh gas (CH_4), acetylene (C_2H_2), benzene (C_6H_6) and the components of rock oil, which is a mixture of many hydrocarbons.

Carbohydrates.—Another set of organic compounds contains only the three elements carbon, hydrogen and oxygen, the latter two in the same proportion as in water, *viz.*, two atoms of hydrogen to one of oxygen. These are the *carbohydrates*, and include grape and fruit sugars ($C_6H_{12}O_6$), cane, malt and milk sugars ($C_{12}H_{22}O_{11}$), the starches and cellulose $[(C_6H_{10}O_5)_n]$, which last is the structural material of the vegetable world. The fats and oils, common alcohol, glycerine, and acetic, citric and tartaric acids contain only carbon, hydrogen and oxygen.

When to these elements is added nitrogen as a possible constituent of organic substances, the list becomes a very varied one, including nitroglycerine, nitrocellulose or guncotton, aniline and a horde of dyes, and most of the alkaloids—substances of very powerful physiological action that occur in plants. Adding also sulphur, the vastly important proteins are included, some of which (the nucleoproteins) may contain also phosphorus. Other than water, fats and mineral constituents, proteins constitute the building material of the animal body, and are necessary in the diet of animals.

Inorganic Chemistry, deals with over eighty different elements and their compounds, including those of the mineral world. Its extent is in part indicated in the subjoined table of *Chemical Elements*.

The selection and grouping together of the facts and principles of chemistry that bear on some particular topic gives rise to such divisions as "physiological chemistry," "agricultural chemistry," "biochemistry," "immunochemistry," etc. Such titles are, for the most part, self-explanatory.

CHEMICAL ELEMENTS

Tabulation of facts concerning all the known elements.

At. wt., atomic weight; S. G., specific gravity; M. P., melting point; B. P., boiling point; C. T., critical temperature.

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Aluminium. Symbol Al. At. wt. 27.1. Valence III. S. G. 2.6. M. P. 658°.	Occ.—cryolite AlF_3, 3NaF; bauxite, impure $Al(OH)_3$; in feldspars, micas and clay; emery, ruby, sapphire (Al_2O_3). Prep., com'l, by electrolysis of Al_2O_3, from bauxite, dissolved in cryolite, water-power usually furnishing the electrical energy.	Silver-white, ductile, malleable at 120°, tensile strength (wrought) 16 tons per sq. in. A better conductor of electricity, weight for weight, than copper. Molten metal not mobile enough to make castings. It turns badly in the lathe. Acted upon by dil. hydrochloric acid, slowly by sulphuric, but not by nitric or the acids occurring in foods. Soluble in alkaline hydroxides. The tarnishing action of moist air soon comes to an end as the tarnish acts as an *adherent* protective coating.	Used for cooking utensils, boat-building, military accouterments and small articles requiring lightness and strength; for electric leads. The powdered metal is used as a body for paint; and its mixture with ferric oxide, called thermite, is used for producing very high temperatures (up to 3700°C.) for welding rails, etc. Many metals are reduced from their oxides by means of Al, hence its use in casting steel. Aluminium bronze (10% Al), rolled, has tensile strength of 40 tons per sq. in. Its sulphate forms alums, *e. g.*, $KAl(SO_4)_2$, $12H_2O$, common alum.
Antimony. Symbol Sb. At. wt. 120.2. Valence III and V. S. G. 6.7. M. P. 630.7°. B. P. red heat.	Occ.—free, and as stibnite (Sb_2S_3). Prep.—roasting stibnite gives Sb_2O_4, which is then reduced by heating with carbon.	White, brittle, crystalline metal. Its alloys expand on solidification, and therefore give very sharp castings, *e.g.*, for type. It does not tarnish, but may be burned in air, and unites directly with the halogens.	The metal is a constituent of the alloys type metal, Britannia metal and Babbitt metal (used for bearings). Its oxide (Sb_2O_3) is both basic and acidic. The trichloride, butter of antimony ($SbCl_3$), is easily hydrolyzed. Tartar emetic ($SbOKC_4H_4O_6$) is used in medicine and in dyeing.
Argon. Symbol A. At. wt. 39.86. Valence nil. Density 39.9 (oxygen =32). B. P. —186°. M. P. —190°.	Present in the air 0.94% by volume. To isolate, air is freed from CO_2 by soda-lime, water by P_2O_5, oxygen by red-hot copper, nitrogen by magnesium and calcium. From the residual mixture argon is obtained by fractional distillation.	Is a monatomic gas and is identified by its characteristic spectrum seen by examining the light emitted when the gas is placed in a vacuum tube at low pressure and sparked. More soluble in water than nitrogen, 100 vols. water dissolving 4 vols. argon under ordinary conditions.	Forms no compounds, hence its name—does no work.
Arsenic. Symbol As. At. wt. 74.96. Valence III and V. S. G. 5.7. B. P. 450° (sublimes) M. P. 480° (under pressure).	Occ.—free, as arsenical pyrites (FeSAs), as orpiment (As_2S_3) and as realgar (As_2S_2). Prep.—by heating arsenical pyrites, FeSAs — FeS+As.	A steel-gray, dully-metallic and crystalline element classed as a metalloid because intermediate between metals and nonmetals. Its vapor has a density corresponding to As_4 at 644°, and to As_2 at 1700°. It burns in air and unites directly with the halogens, sulphur and with many metals.	Used for hardening lead for shot. All its compounds are poisonous. White arsenic (As_2O_3) is partly basic, forming a chloride and partly acidic, forming arsenites. Scheele's green ($CuHAsO_3$) is a pigment dangerous in wallpapers. Traces of arsenic are detected by Marsh's test, in which the intensely poisonous arsine (AsH_3) is formed.
Barium. Symbol Ba. At. wt. 137.37. Valence II. S. G. 3.6. M. P. red heat.	Occ.—as barytes or heavy-spar ($BaSO_4$), and as witherite ($BaCO_3$). Prep.—by electrolysis of the fused chloride.	A silver-white, lustrous, malleable metal harder than lead. Like calcium, it acts slowly on water to give barium hydroxide and hydrogen. The vapors of its compounds impart a green color to the Bunsen flame.	The peroxide (BaO_2) is used in the manufacture of oxygen and of hydrogen peroxide. The nitrate and chlorate is pyrotechny to give green fires. The sulphate as the body for a permanent white paint and for filling glazed paper. All soluble compounds are poisonous.
Bismuth. Symbol Bi. At. wt. 208.0. Valence III (and V). S. G. 9.9. M. P. 266.5°. B. P. ca. 1200°.	Occ.—free and as trioxide (Bi_2O_3) and trisulphide (Bi_2S_3). Prep.—the ore is roasted and then heated with charcoal and metallic iron (to remove traces of sulphur).	An exceedingly brittle, crystalline shining metal, white with a tinge of pink. Bismuth expands on solidification. It does not tarnish, but can be burnt in air. Dissolves in oxygen acids.	Used for making fusible alloys, *e.g.*, Wood's metal, M.P. 60.5°, which are used in plugs of fire sprinklers and boiler safety valves, and for taking casts. The oxynitrate is used in medicine and as a cosmetic.
Boron. Symbol B. At. wt. 11.0. Valence III. S.G. (amorph.) 2.4; (cryst.) 2.5. B.P. 3500° (sublimes)	Occ.—as boric acid (H_3BO_3), borax ($Na_2B_4O_7,10H_2O$), colemanite ($Ca_2B_6O_{11},5H_2O$). Prep.—amorphous boron by reducing B_2O_3 with Mg. Impure cryst. boron by reducing B_2O_3 with excess of Al.	Amorphous boron is a greenish black powder that burns in air at 700°, forming B_2O_3 and also BN. It is oxidized, by hot conc. sulphuric or nitric acids, to boric acid.	The compounds are analogous to those of silicon. Borax is used as a flux, and, in solution, as a mild alkali on account of its hydrolysis. Boric acid is used as a weak antiseptic and preservative.

CHEMICAL ELEMENTS—Continued

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Bromine. Symbol Br. At. wt. 79.92. Valence I. S. G. 3.2. B. P. 59°. M. P. —7.3°.	Occ.—in seawater as alkali bromide, and in the upper layers of salt deposits as sodium and magnesium bromide. Prep.—by treatment of the brines with sulphuric acid and manganese dioxide, or else with chlorine.	A dark red liquid, smelling like chlorine, whose vapor irritates eyes, throat and nose. Dissolves in thirty parts of water (bromine water). Combines directly with most other elements, but less vigorously than chlorine.	Potassium bromide is used in medicine, silver bromide in photography. Bromine is used in course of the preparation of organic dyes.
Cadmium. Symbol Cd. At. wt. 112.40. Valence II. S. G. 8.6. M. P. 321.7. B. P. 770°.	Occ.—in association with the zinc ores, as carbonate and sulphide. Prep.—in the distillation of impure zinc, the cadmium comes over in the first portions.	A silver-white metal, more ductile and malleable than zinc. It burns in air, and is attacked by dilute acids.	All the compounds are poisonous, and little ionized. The sulphide (CdS) is the basis of "cadmium yellow." The iodide is used in medicine.
Cæsium. Symbol Cs. At. wt. 132.81. Valence I. S. G. 2.4. M. P. 26.3°. B. P. 670°.	Occ.—in certain micas, and in the ashes of certain plants. Prep.—by heating the hydroxide (CsOH) with magnesium.	A white silvery metal resembling potassium. It is one of the most active of metals, and decomposes water violently.	The compounds are characterized by giving, especially, two bright lines in the blue of the spectrum (*cæsius* sky-blue).
Calcium. Symbol Ca. At. wt. 40.09. Valence II. S. G. 1.54. M. P. 760°.	Occ.—as carbonate (Iceland spar, calcite, aragonite, marble, chalk, limestone), sulphate (gypsum), phosphate (apatite), fluoride (fluor spar), and as complex silicates in great variety (feldspars, pyroxenes, amphiboles, etc.). Prep.—by electrolysis of the fused chloride.	A white crystalline metal, harder than lead, that can be cut, drawn, rolled and tunned. It attacks water, and burns in the air at a red heat, forming the oxide (CaO) and the nitride (Ca_3N_2). It unites with hydrogen to CaH_2, whose action on water is a source of hydrogen for balloons.	Calcium oxide (quicklime) is used for mortar and to remove hair from hides. The hydroxide [$Ca(OH)_2$] mixed with sand forms mortar; its solution is limewater. Plaster of paris, a less hydrated sulphate, takes up water on setting to form $CaSO_4,2H_2O$. The phosphates are fertilizers. Bleaching powder is CaClOCl and calcium carbide is CaC_2. Common glass contains silicates of calcium and sodium.
Carbon. Symbol C. At. wt. 12.00. Valence IV. S. G. diamond 3.5; graphite 2.3; amorphous 1.9 M. P.—not realized.	Occ.—as diamond and graphite, in the free state; in combination with hydrogen as petroleum, with oxygen as carbon dioxide in the air, with these and other elements as coal, and in plant and animal tissues; and as many carbonates. Prep.—by dry distillation of wood or coal, yielding charcoal and coke respectively.	Diamond is crystalline and the hardest of minerals, the dark-colored "bort" being used for cutting and grinding. Graphite has a black metallic luster, is crystalline and may be scratched by the finger-nail. Charcoal is amorphous, and possesses the power of absorbing gases and also coloring matters. All three forms burn in oxygen to produce carbon dioxide.	The carbon compounds form the subject of "Organic Chemistry." Carbon dioxide results from the burning of coal, coke, wood, oil or illuminating gas, from fermentation and decay, which are slow burnings, and is exhaled in the breath. Carbon monoxide, arising from recently-stoked fires, is an exceedingly poisonous gas.
Cerium. Symbol Ce. At. wt. 140.25. Valence III, IV (and VI). S. G 7.0; M. P. 623°.	Occ.—as silicate in cerite, along with Nd, Pr and La; also in monazite sand. Prep.—by electrolysis of the fused chloride.	A metal with the color and luster of iron, like tin in hardness, and very ductile and malleable. Burns in air more easily and brightly than magnesium.	Welsbach incandescent gas mantles contain one per cent of cerium dioxide CeO_2.
Chlorine. Symbol Cl. At. wt. 35.46. Valence I (and VII). S. G. (liquid) 1.3. M. P. —102°. B. P. —33.6°. C. T. +146°.	Occ.—in seawater as chlorides of the alkalis and alkaline earths, and as like compounds in salt deposits. Prep.—by electrolysis of alkali chloride, fused or in solution; or by the action of manganese dioxide on hydrochloric acid.	A greenish-yellow gas of characteristic odor, with a violent action on the respiratory tract. Unites directly with all elements save oxygen, nitrogen and the argon family. Displaces bromine and iodine from bromides and iodides, and substitutes hydrogen in organic compounds.	The gas is used in extracting gold and in preparing bleaching and disinfecting agents. In presence of water it bleaches many coloring matters. Forms chlorides (as NaCl, HCl, $CaCl_2$), hypochlorites [as solution of $Ca(OCl)_2$], chlorates (as $KClO_3$, used for matches and in pyrotechny), and perchlorates (as $KClO_4$).
Chromium. Symbol Cr. At. wt. 52.0. Valence II, III and VI. S. G. 6.9. M. P. 1515°.	Occ.—as chromite [$Fe(CrO_2)_2$]. Prep.—by reducing Cr_2O_3 with aluminium filings.	A steel-gray, lustrous, brittle and very hard metal. At high temperatures it burns in air to green Cr_2O_3. It is attacked by dilute sulphuric or hydrochloric acid, but not by nitric acid.	The alloy ferrochromium is used in steelmaking. Chrome green, the pigment, is Cr_2O_3. Chrome yellow is $PbCrO_4$. Bichromates (as $K_2Cr_2O_7$) are used in photoprocesses, tanning and dyeing and as oxidizing agents, *e. g.*, in batteries.
Cobalt. Symbol Co. At. wt. 58.97. Valence II and III. S. G. 8.5. M. P. 1500°.	Occ.—as smaltite ($CoAs_2$) and cobaltite CoAsS. Prep.—by igniting the oxide in hydrogen.	A white magnetic malleable metal, less tenacious than iron. By exposure it turns pinkish. It is less active chemically than iron.	Its intensely blue silicates are used in coloring porcelain and constitute the pigment smalt.
Columbium (Niobium) Symbol Cb. At. wt. 93.5. Valence I, II, IV and V. S. G. 12.7; M. P. 1950°	Occ.—in the mineral columbite. Prep.—by reduction of CbO_2 by paraffin.	A light-gray malleable and ductile metal, as hard as wrought iron, which is not affected by acids, even by aqua regia.	The hydride (CbH) burns in air. The compounds occur with those of tantalum, which they closely resemble.
Copper. Symbol Cu. At. wt. 63.57. Valence I and II. S. G. 8.9. M. P. 1084.1. B. P. 2100°.	Occ.—free, as cuprite (Cu_2O), copper glance (Cu_2S), chalcopyrite (Cu_2S,Fe_2S_3), malachite [$CuCO_3,Cu(OH)_2$]. Prep.—after removal of iron and sulphur, the oxide is reduced by heating with carbon. It is refined electrolytically.	A red, lustrous, very ductile and malleable metal of tensile strength 14 tons per sq. in., second only to silver in electrical conductivity. In ordinary air it gradually becomes coated with basic carbonate. In absence of air, nitric acid alone among the dilute acids attacks it, but in presence of air even the acids found in foodstuffs can dissolve it.	The metal is used for coins, electroplating, electric leads, roofing, cooking vessels and for making alloys, such as brass, bell and gun metals, German silver and the bronzes. The soluble compounds are poisonous, and are therefore used as germicides in agriculture. Blue vitriol is $CuSO_4,5H_2O$; the basic acetate is verdigris.
Dysprosium. Symbol Dy. At. wt. 162.5. Valence III.	Occ.—in monazite, gadolinite, etc. Prep.—not yet isolated.	The oxide dysprosia, along with three other rare earths, constitutes erbia.	The salts are green or yellow in color and show characteristic absorption bands.
Erbium. Symbol Er. At. wt. 167.4. Valence III.	Occ.—same as for dysprosium. Prep.—not yet isolated pure.	Crude erbia has been separated into erbia, holmia, thulia, and dysprosia.	The salts are rose-colored, and show characteristic absorption spectra.
Europium. Symbol Eu. At. wt. 152.0. Valence III.	Occ.—in monazite and other rare minerals. Prep.—not yet isolated.	This element so closely resembles samarium that the analytical separation of the two is difficult.	The salts are pinkish and show a faint absorption spectrum.
Fluorine. Symbol F. At. wt. 19.0. Valence I. S. G. (liquid) 1.14 at —187°. M. P. —223°. B. P. —187°.	Occ.—as cryolite ($AlF_3,3NaF$), fluor spar (CaF_2) and very widely elsewhere in small quantities. Prep.—by electrolysis of dry hydrogen fluoride at —23°.	A pale yellowish-green gas that unites with every element excepting oxygen and the argon family. It rapidly displaces oxygen from water or chlorine from hydrogen chloride.	Hydrogen fluoride is used for etching glass and in silicate analysis. Silver fluoride is soluble and calcium fluoride insoluble, in contrast with the other halides of these metals.
Gadolinium. Symbol Gd. At. wt. 157.3. Valence III.	Occ.—in gadolinite and samarskite. Prep.—not yet isolated.	This element closely resembles terbium in its compounds.	The salts are colorless and show no absorption bands.

CHEMICAL ELEMENTS—Continued

Name With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Gallium. Symbol Ga. At. wt. 69.9. Valence III. S.G. 5.9. M.P. 30.1°.	Occ.—in zinc blende and in bauxite. Prep.—by electrolysis of a suitable solution of its salts.	A bluish-white tough metal that may be cut with a knife. Like aluminium, it is soluble in hydrochloric acid and in caustic alkali, but not in nitric acid.	It forms two chlorides ($GaCl_2$ and $GaCl_3$) which yield spark spectra very characteristic of gallium.
Germanium. Symbol Ge. At. wt. 72.5. Valence II and IV. S.G. 5.5. M.P. 900°.	Occ.—in the rare mineral argyrodite. Prep.—by the reduction of the dioxide ($Ge\ O_2$) by carbon.	A grayish-white, brittle, lustrous metal, insoluble in hydrochloric acid. It combines directly with the halogens.	The close relation of this element to carbon and silicon is shown in the compound germanium chloroform ($GeHCl_3$).
Glucinum (or Beryllium). Symbol Gl. At. wt. 9.1. Valence II. S.G.1.8. M.P. below 960°.	Occ.—in beryl [$Al_2Gl_2(SiO_3)_6$]. Prep.—by electrolysis of the fused double fluoride $GlF_2,2KF$.	A hard white metal that tarnishes when heated in air, and is soluble in dilute acids when powdered.	Its hydroxide [$Gl(OH)_2$] is feebly acidic as well as basic, thus resembling the hydroxide of zinc. Emerald is beryl colored green by chromium.
Gold. Symbol Au. At. wt. 197.2. Valence I. and III. S. G. 19.32. M. P. 1062.4°.	Occ.—chiefly free, but also as telluride; many specimens of iron pyrites are auriferous. Prep.—from gold-bearing sands by washing away the lighter material, and dissolving the gold from the residue by mercury, which is subsequently separated from the gold by distillation. Quartz ores are pulverized in stamping mills, and the powder is then carried by water over amalgamated copper plates on which the gold collects.	A soft bright-yellow metal, easily scratched by the knife, an excellent conductor of heat and of electricity. The most ductile and the most malleable of all the metals. Chemically, gold is rather inert, and is not attacked by the oxygen of the air, by hydrogen sulphide, nor, indeed, by any single one of the common acids. It is attacked by fused alkalis, yielding aurates, and by aqua regia, yielding chlorauric acid ($HAuCl_4$).	Pure gold is called 24-carat gold. American, French and German gold coins are 21.6 carat, while British sovereigns are 22 carat, the balance in all these cases being copper. Jewelry is made in 18, 14, 9, etc., carat gold, the addition of copper increasing the hardness and rigidity. Sodium chlorаurate ($NaAuCl_4$) is used for "toning" in photography, while potassium auricyanide [$KAu(CN)_4$] is used in electro-gilding.
Helium. Symbol He. At. wt. 3.99. Valence 0. S. G. (liquid) 0.15. B. P. —268.7°.	Occ.—in air to the extent of 1 to 2 volumes per million; also occluded in certain minerals. Prep.—neon and helium are boiled off crude argon, and the neon solidified by cooling.	The lightest gas after hydrogen, transparent, odorless and colorless, very inert, forming no compounds with other elements.	It is one of the decomposition products of certain other (radio-active) elements.
Hydrogen. Symbol H. At. wt. 1.008. Valence I. S. G. (liquid) 0.07. M. P. —259°. B. P. —252.5°.	Occ.—in air to the extent of 1 vol. per 20,000 vols. air; combined, in water (11.19% by wt.) natural gas, petroleum and all animal and vegetable bodies. Prep.—by treating zinc with hydrochloric or sulphuric acid; by electrolysis of water.	The lightest gas, transparent, odorless and colorless, soluble in water (2 vols. in 100 vols. water under everyday conditions), in platinum, in palladium (502 vols. in 1 of pd). Burns in air and in chlorine, and unites with many of the other elements.	Its two oxides are water (H_2O) and hydrogen peroxide (H_2O_2), the latter of which is used in solution as a bleaching agent. Every acid contains hydrogen as an essential constituent. Its compounds with carbon and other elements number over 100,000. Hydrogen gas is used for the oxyhydrogen flame and for filling balloons.
Indium. Symbol In. At. wt. 114.8. Valence III and I. S. G. 7.4. M. P. 176°.	Occ.—in zinc blende (ZnS). Prep.—electrolytically from solutions of its salts.	A white metal, malleable and softer than lead.	Its compounds color the nonluminous gas flame blue and show a characteristic blue line in the spectrum.
Iodine. Symbol I. At. wt. 126.92. Valence I, V and VII. S. G. 4.95. M. P. 114°. B. P. 184°.	Occ.—in the ocean, in certain seaweeds, and in Chili saltpeter, always in the combined state. Prep.—from iodides by displacement of their iodine by chlorine.	A dark gray brittle solid with a metallic luster. Its vapor is violet, as are its solutions in chloroform and in carbon bisulphide. It requires over 5,000 parts of water for its solution. Combines directly with many elements, but is much less active than chlorine and bromine.	Its tincture is used in medicine as a counter-irritant. Potassium iodide (KI) and iodoform (CHI_3) likewise find application in medicine. The alkyl iodides (*e. g.*, $C_2\ H_5I$) are much used in synthetic organic chemistry.
Iridium. Symbol Ir. At. wt. 193.1. Valence III and IV. S. G. 22.42. M. P. 1950°.	Occ.—along with platinum. Prep.—by a complex series of operations from platinum ores.	A white metal, brittle when cold, and very hard. It is attacked by fused alkalies, but not by aqua regia.	It is used for pointing gold pens. Its alloy with 9 parts of platinum is used for standard meter bars on account of its inalterability.
Iron. Symbol Fe. At. wt. 55.85. Valence II and III. S. G. 7.86; pig, 7.03 to 7.73. M. P. 1804°. wrought 1600°. steel 1375°. gray pig 1275°. white pig 1075°.	Occ.—as magnetic oxide (Fe_3O_4), hematite (Fe_2O_3), limonite ($2Fe_2O_3,3H_2O$), siderite (Fe_2CO_3), which are important ores; iron pyrites (FeS_2); in rocks as complex silicates, and in plants and animals. Prep.—pig iron is prepared in the blast furnace y reduction of the ore by means of carbon monoxide in presence of a suitable flux. From pig iron, wrought iron is obtained by puddling, and steel by the Bessemer, Siemens-Martin or other process.	A white, malleable, ductile, magnetic metal, unchanged in dry air or air-free water, but rusting in moist air. Easily attacked by dilute acids, but not by fused alkalies. Cast iron contains 2 to 5% of carbon and other impurities, and is hard and brittle. Wrought iron contains less than 0.2% of carbon, and is softer and tougher, with a tensile strength of 22 to 25 tons per sq. in. Steel contains from 0.2 to 1.5% of carbon, is permanently magnetic, may be tempered, and possesses tensile strength up to 100 tons per sq. in.	The metal is used as a structural material, for rails, machinery, tools, etc. Jeweler's rouge and Venetian red consist of the oxide (Fe_2O_3). Rust is chiefly the hydrated oxide (FeO,OH). Hammer scale and lodestone have the composition Fe_3O_4. Ferric chloride ($FeCl_3$), ferrous iodide (FeI_2) and other iron compounds are used in medicine. Green vitriol ($FeSO_4,7H_2O$) is used in making ink, and in dyeing. Potassium ferrocyanide [$K_4Fe(CN)_6$] is used for making Prussian blue, potassium cyanide, etc.
Krypton. Symbol Kr. At. wt. 82.9. Valence 0. M. P. —169° B. P. —152°.	Occ.—in minute quantity in the air. Prep.—from crude argon by fractional distillation.	An inert, colorless, odorless gas, resembling, but denser than, argon.	It forms no compounds, and is identified by its characteristic spectrum.
Lanthanum. Symbol La. At. wt. 13[illegible].0. Valence II and V. S. G. 6.15.	Occ.—as lanthanite [$La_2(CO_3)_3,8H_2O$]. Prep.—by electrolysis of fused $LaCl_3$.	An iron-gray metal tarnishing in air to steel-blue; malleable and ductile. Attacked slowly even by cold water.	When heated in air it forms oxide (La_2O_3) and nitride (LaN).
Lead. Symbol Pb. At. wt. 207.10. Valence II, IV. S. G. 11.4. M. P. 326°.	Occ.—as galena (PbS), and in silver ores. Prep.—by calcination of partially roasted galena. Purification is effected by Parkes process.	A soft gray metal, malleable, but of low tensile strength. In presence of air, water acts on lead to produce the hydroxide, which, being slightly soluble, may cause lead poisoning if present in water supplies. When heated in air it is oxidized to litharge (PbO), and, under suitable conditions, to minium (Pb_3O_4).	The metal is used for water pipes, roofs and gutters and storage batteries. For shot it is alloyed with 0.4% of arsenic. Typemetal contains 20% of antimony. Babbitt metal, for bearings, contains over 70% of lead. Solder and pewter are alloys of lead and tin. The basic carbonate [$Pb(OH)_2,2PbCO_3$], "white lead," is the basis of most oil paints.

CHEMICAL ELEMENTS—Continued

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Lithium. Symbol Li. At. wt. 6.94. Valence I. S. G. 0.53. M. P. 186°. B. P. above 1400°.	Occ.—as a mixed fluoride with aluminium in amblygonite. Prep.—by electrolysis of the fused chloride.	A silver-white metal, softer than lead, that tarnishes quickly in air, and is easily acted upon by water. When heated, it unites vigorously with nitrogen.	The carbonate [$Li_2(CO_3)$] is used in medicine as a solvent for uric acid, lithium urate being soluble. The lithium salts give a carmine flame coloration.
Lutecium. Symbol Lu. At. wt. 174.0.	Occ.—in euxenite. Prep.—it has not been isolated.		Its compounds resemble those of ytterbium.
Magnesium. Symbol Mg. At. wt. 24.32. Valence II. S. G. 1.75. M. P. 633°. B. P. 1100°.	Occ.—as magnesite ($MgCO_3$), dolomite ($MgCO_3,CaCO_3$), carnallite ($MgCl_2$, KCl, $6H_2O$) and in very many complex silicates. Prep.—by electrolysis of dried, fused carnallite.	A silver-white metal, ductile when hot. It tarnishes in air, and acts slowly upon water, rapidly on steam. Burns in air to the oxide MgO, emitting a very bright light used in photography. It unites directly with nitrogen.	The sulphate ($MgSO_4,7N_2O$)is known as epsom salts and is used in medicine, as are the oxide (magnesia), the carbonates and citrate. Magnalium is a light, hard alloy with aluminium.
Manganese. Symbol Mn. At. wt. 54.93. Valence II, III, IV, VI, VII. S. G. 8.0. M. P. ca. 1300°.	Occ.—as pyrolusite (MnO_2), beaunite (Mn_2O_3), hausmannite (Mn_3O_4) and manganese spar ($MnCO_3$). Prep.—by heating Mn_3O_4 with aluminium filings.	A steel-gray, hard, brittle metal with a pinkish tinge. It rusts in moist air and is attacked by dilute acids.	Ferromanganese and spiegeleisen are alloys with iron, used in steel making. With copper it forms the hard, tough manganese bronzes, with tensile strength up to 30 tons per sq. in. Impure sodium permanganate ($NaMnO_4$) is used in disinfecting as Condy's fluid.
Mercury. Symbol Hg. At. wt. 200.0. Valence I and II. S. G. 13.6. M. P.—39.5°. B. P. 356.95°.	Occ.—free and as cinnabar (HgS). Prep.—by roasting cinnabar $HgS+O_2$——$Hg+SO_2$.	A silver-white mobile liquid with a vapor pressure at 0° of 0.0002 mm. It tarnishes but slowly in air and is attacked only by dilute nitric among the dilute acids. The vapor is monatomic.	It is used for filling thermometers and barometers. Its alloys are called amalgams, some of which are used in dentistry. Calomel (HgCl) is administered internally in medicine; corrosive sublimate ($HgCl_2$) forms a solution with very powerful germicidal properties.
Molybdenum. Symbol Mo. At. wt. 96.0. Valence III, IV, V, (VI. S. G. 9.0. M. P. 2110°.	Occ.—as molybdenite (MoS_2) and wulfenite ($PbMoO_4$). Prep.—by reducing the oxides with aluminium powder.	A white metal, as malleable as iron, that will not scratch glass. Insoluble in hydrochloric or dilute sulphuric acid.	The ferromolybdenum alloys are used in the manufacture of special steels.
Neodymium. Symbol Nd. At. wt. 144.3. Valence III and IV. S. G. 6.9. M. P. 840°.	Occ.—with cerium and lanthanum. Prep.—by electrolysis of the fused chloride.	A yellowish metal, tarnishing in air.	The salts are rose-violet in color, and their solutions show characteristic absorption spectra.
Neon. Symbol Ne. At. wt. 20.2. Valence 0. B. P. ca. —243°.	Occ.—in minute quantity in the atmosphere. Prep.—neon and helium are boiled out of crude argon, and the neon separated from helium by cooling with liquid hydrogen.	A colorless, transparent, odorless, inert gas, resembling argon.	It forms no compounds, and is recognised by its characteristic spectrum.
Nickel. Symbol Ni. At. wt. 58.68. Valence II and III. S. G. 8.9. M. P. ca. 1485°.	Occ.—as nicollite (NiAs) and nickel glance (NiAsS). Prep.—by igniting the oxalate in hydrogen.	A white, very hard, lustrous metal, malleable, ductile and tenacious. It rusts but slowly in air, and is attacked easily by only nitric acid.	The metal furnishes a protective coating when plated on iron. German silver is an alloy of nickel, copper and zinc. Nickel steel is used for armor plates. Manganin, containing nickel, copper and manganese, is used for electrical resistances.
Nitrogen. Symbol N. At. wt. 14.01. Valence III and V. M. P. —214°. B. P. —194°.	Occ.—free nitrogen forms about four-fifths of air by volume. As Bengal saltpeter (KNO_3), Chili saltpeter ($NaNO_3$); and as an essential constituent of vegetable and animal protoplasm. Prep.—by heating ammonium nitrite, by oxidation of ammonia, etc.	A colorless, odorless, transparent gas, rather inactive chemically. At ordinary temperature and pressure, 100 volumes of water dissolve 1.5 volumes of nitrogen. It unites directly with strongly heated boron, lithium, calcium and magnesium.	Nitrous oxide (N_2O), or laughing gas, is used, by dentists. Nitric acid (HNO_3) has many applications in technical chemistry. Ammonia (NH_3) is a very soluble gas. Ammonium sulphate [$(NH_4)_2SO_4$] and Chili saltpeter are used as nitrogenous manures. Nitrogen is a constituent of the anilinedyes, the proteins and many other important classes of organic substances.
Osmium. Symbol Os. At. wt. 190.9. Valence II, III, IV, VI, VIII. S. G. 22.477. M. P. ca. 2400°.	Occ.—along with platinum. Prep.—by reducing OsO_4.	A gray metal, harder than glass, the heaviest of known bodies.	Its alloy with iridium is used in tipping gold pens. Osmium tetroxide (OsO_4) is used as a microscopic stain for fat.
Oxygen. Symbol O. At. wt. 16.00. Valence II. S. G. (liquid at b.p.) 1.13. M. P. —227°. B. P. —182.5°.	Occ.—free oxygen forms about one-fifth of air by volume. Water contains 88.88% of oxygen. The rocks of the earth's crust contain about 45% in combination, chiefly as silicates. Prep.—in the laboratory, by heating potassium chlorate ($KClO_3$). Commercially, from the air.	A colorless, odorless, tasteless, transparent gas, slightly heavier than air. At ordinary temperature and pressure, 100 volumes of water dissolve 3 volumes of oxygen. It is very active chemically, combining directly with all but a few of the other elements to form oxides. Sulphur, phosphorus, etc., burn much more vigorously in oxygen than in air. Liquid oxygen is magnetic.	The gas is sold compressed in mild steel cylinders, and is used for the oxyhydrogen blowpipe and in medicine, besides for chemical purposes. It is necessary to support animal respiration and to sustain ordinary combustion. It enters as a constituent into all oxides, most salts and many organic compounds.
Palladium. Symbol Pd. At. wt. 106.7. Valence II and IV. S. G. 11.9. M. P. ca. 1535°.	Occ.—along with platinum, and with gold in Brazil. Prep.—by a complex series of processes from platinum ores.	A silvery, malleable and ductile metal, related to platinum, unlike which, however, it is attacked by nitric acid. Under suitable conditions it can take up over 900 volumes of hydrogen.	Since it does not tarnish, it is used for coating silver goods, and by dentists as a substitute for gold.
Phosphorus. Symbol P. At. wt. 31.04. Valence III and V. S. G. white, 1.82. red, 2.25. M. P. white, 44°. B. P. 269°.	Occ.—as phosphates, such as apatite [$Ca_5F(PO_4)_3$]; in bones, teeth, brain and seeds of plants. Prep.—by reduction of calcium phosphate by carbon in the electric furnace in presence of a suitable flux.	Phosphorus exists in two allotropic modifications: white phosphorus is waxy in consistency, soluble in carbon bisulphide, evil smelling and poisonous; red phosphorus is a solid, insoluble in carbon bisulphide, odorless and not poisonous. White phosphorus has a low ignition temperature, hence its former use in matches.	Red phosphorus is used in the manufacture of matches, as also is the compound P_4S_3. In the form of superphosphate of lime [$Ca_2H_4(PO_4)_2$] phosphorus is an important artificial manure. The chlorides (PCl_3 and PCl_5) are much used in organic chemistry.
Platinum. Symbol Pt. At. wt. 195.2. Valence II and IV. S. G. 21.48. M. P. 1753°.	Occ.—free, alloyed with the platinum metals, as nuggets in alluvial sands in the Urals, California, etc. Prep.—it is freed from the metals with which it is alloyed by a complex series of processes.	A silvery, tenacious, ductile and malleable metal, unaltered in moist air and unattacked by any single common acid. Aqua regia, fused alkalies, alkali nitrates and cyanides attack it, however. Platinum "sponge" and "black" are finely divided forms.	On account of its resistance to acids, platinum is much used for chemical vessels. Since platinum has a coefficient of expansion very close to that of glass, platinum wires can be fused through glass without danger of breakage on cooling. The salts are used in photography.

CHEMICAL ELEMENTS—Continued

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Potassium. Symbol K. At. wt. 39.10. Valence I. S. G. 0.86. M. P. 62.5°. B. P. 667°.	Occ.—as sylvite (KCl), carnallite (KCl, $MgCl_2,6H_2O$); in plant and animal ashes, and in many complex silicates. Prep.—by reduction or by electrolysis of fused potassium hydroxide (KOH).	A silver-white lustrous metal, as soft as wax, tarnishing instantly in moist air. Chemically it is a very active metal, decomposing water in the cold and uniting violently with the halogens, sulphur and oxygen.	An alloy with sodium is used in filling high-temperature thermometers. Bengal saltpeter is the nitrate and is used in pyrotechny, for gunpowder and as a preservative. The iodide (KI) is used in medicine. The chlorate, like the nitrate, is used as a source of oxygen in pyrotechny and for match heads. Caustic potash (KOH) has many chemical applications. The cyanide (KCN) is used in gold extraction.
Praseodymium. Symbol Pr. At. wt. 140.6. Valence III and IV. S. G. 6.47. M. P. 940°.	Occ.—with cerium and lanthanum. Prep.—by electrolysis of the fused chloride.	A yellowish metal, remaining untarnished in air.	The salts are leek-green in color, and their solutions have characteristic absorption spectra.
Radium. Symbol Ra. At. wt. 226.4. Valence II.	Occ.—in minute quantity in pitchblende and other uranium minerals. Prep.—the metal has recently been isolated; the bromide is separated from the barium bromide prepared from pitchblende by fractional crystallization.	In all of its compounds, the metal has the power of emitting certain radiations. These can pass through matter that is opaque to light, render air a conductor, affect a photographic plate and cause a zinc-sulphide screen to fluoresce visibly.	The rays from radium compounds (such as $RaBr_2$, $RaCl_2$, $RaCO_3$) act destructively on living tissues and on bacteria. One gram of radium in any of its compounds gives off about 100 calories of heat per hour.
Rhodium. Symbol Rh. At. wt. 102.9. Valence II, III, and IV. S. G. 12.1. M. P. above 2000°.	Occ.—in the ores of platinum. Prep.—by a complex series of processes from platinum ores.	A silvery, malleable and ductile metal, not tarnishing in air and not attacked by aqua regia.	The red chloride ($RhCl_3$) is formed by the action of chlorine upon the metal.
Rubidium. Symbol Rb. At. wt. 85.45. Valence I, III, and V. S. G. 1.52. M. P. 38.5°. B. P. 696°.	Occ.—the salts are associated with salts of potassium. Prep.—similar to that of potassium.	A silver-white metal resembling potassium, like which it attacks water vigorously.	The compounds show characteristic flame-spectra, and were recognized as those of a new element spectroscopically by Bunsen.
Ruthenium. Symbol Ru. At. wt. 101.7. Valence III, IV, VI, VII, and VIII. S. G. 12.1. M. P. above 2000°.	Occ.—in the ores of platinum. Prep.—by a complex series of processes from platinum ores.	A hard, white, brittle metal, oxidized when heated in air, scarcely attacked by aqua regia.	The following oxides are known: Ru_2O_3, RuO_2, RuO_4, as well as salts corresponding to RuO_3 and Ru_2O_7.
Samarium. Symbol Sa. At. wt. 150.4. Valence II and III. S. G. ca. 7.7. M. P. 1300 to 1400°.	Occ.—in the mineral samarskite. Prep.—by electrolysis of the chloride.	A whitish-gray metal, tarnishing in air.	The salts are topaz-yellow in color, and are similar to those of lanthanum.
Scandium. Symbol Sc. At. wt. 44.1. Valence III.	Occ.—in the minerals euxenite and gadolinite. Prep.—the metal has not been isolated.	The existence of this element, whose oxide was discovered in 1879, was predicted by Mendeléeff in 1869.	The chloride ($ScCl_3$) shows a characteristic spark spectrum.
Selenium. Symbol Se. At. wt. 79.2. Valence II, IV. and VI. S. G. amorphous 4.27. monoclinic 4.47. hexagonal 4.8. M. P. amorphous 50°. monoclinic 170 to 180°. hexagonal 217°. B. P. 690°.	Occ.—free in some specimens of sulphur, and in combination with lead, iron and other metals, as in pyrites. Prep.—(amorphous) by reducing selenious acid (H_2SiO_3) by sulphur dioxide.	Three varieties are known: (1) red amorphous, soluble in carbon bisulphide, from which it is d posited as (2) red translucent monoclinic crystals, soluble in carbon bisulphide, (3) blue-gray metallic selenium, insoluble in carbon bisulphide. This last form conducts electricity many times better when exposed to light, and the better the brighter the light.	Selenium cells are used as indicators of intensity of illumination. The compounds strongly resemble those of sulphur. Hydrogen selenide is an evil-smelling inflammable gas. Selenic acid (H_2SeO_4) is a more powerful oxidizer than sulphuric acid, and dissolves gold.
Silicon. Symbol Si. At. wt. 28.3. Valence IV. S. G. amorphous 2.0. crystalline 24.9. M. P. 1200°. B. P. ca. 3500°.	Occ.—silicon dioxide (SiO_2) occurs as flint, quartz, quartz sand, etc. The igneous rocks are composed largely of silicates, and this element constitutes over 25% of the earth's crust. Prep.—by reducing sand with coke in the electric furnace.	Amorphous silicon is a brown powder that burns when heated in air. Crystalline silicon forms black needles. It is less active than the amorphous variety and is attacked only slowly by a mixture of hydrofluoric and nitric acids. It unites with fluorine, however, at ordinary temperatures.	The "pigs" of silicon made at Niagara are used in steel-making. The ornamental varieties of quartz find uses as gemstones, as do several natural silicates. Silicon carbide, "carborundum" (SiC), is used as an abrasive. Sodium silicate solution is "waterglass," used to protect sandstone and to preserve eggs. Common glass is a mixture of sodium and calcium silicates.
Silver Symbol Ag. At. wt. 107.88. Valence I. S. G. 10.53. M. P. 960°. B. P. 2050°.	Occ.—native, as sulphide (Ag_2S) often associated with galena; chloride (AgCl), etc. Prep.—from lead by the Pattinson or the Parkes process; from the ores by the Mexican and other processes.	A white, highly lustrous, tough, very ductile and malleable metal, the best conductor of heat and electricity known. Liquid silver dissolves oxygen. It is unaffected by the oxygen of moist air, and its tarnishing is due to the action of hydrogen sulphide. It dissolves in dilute nitric and in concentrated hot sulphuric acid.	It is employed for articles of use and of ornament and for coinage. U. S. sterling silver contains 90% silver with 10% copper. Lunar caustic is silver nitrate. This salt and the halides of silver are extensively used in photography. For electroplating, a bath of potassium argenticyanide [$KAg(CN)_2$] is used.
Sodium. Symbol Na. At. wt. 23.00. Valence I. S. G. 0.97. M. P. 95.6°. B. P. 742°.	Occ.—in the sea as chloride (NaCl); in salt deposits as chloride, borate, nitrate; in many complex silicates in rocks. Prep.—by electrolysis of fused sodium hydroxide (NaOH).	A silver-white metal, as soft as wax, that may be welded at ordinary temperature. Like potassium it is very active, uniting directly with many other elements, and attacking water vigorously in the cold.	The metal is used in the manufacture of several chemicals. Sodium chloride (NaCl) is a necessity of life to most animals; and is used in the manufacture of hydrochloric acid, chlorine and sodium compounds. Sodium carbonate ($NaCO_3$, $10H_2O$) or washing soda, and sodium hydroxide (NaOH) are used for cleaning, and in the manufacture of soap and chemicals. Baking soda is sodium bicarbonate ($NaHCO_3$). The sulphate (Na_2SO_4, $10H_2O$) is known as Glauber's salt; the thiosulphate, by photographers, as "hypo."
Strontium. Symbol Sr. At. wt. 87.63. Valence II. S. G. 2.55. M. P. ca. 800°.	Occ.—as strontianite ($SrCO_3$) and celestine ($SrSO_4$). Prep.—by electrolysis of the fused chloride.	A white metal, softer than calcium and harder than sodium, tarnishing to a yellow tint. Like calcium, it is active enough to attack water vigorously in the cold.	The nitrate and chlorate are used in pyrotechny for red fire. All volatile compounds color the Bunsen flame red.

CHEMICAL ELEMENTS—Continued

Name, With Certain Data	Occurrence and Preparation	Properties	Chief Compounds and Uses
Sulphur. Symbol S. At. wt. 32.07. Valence II, IV and VI. S. G. rhombic 2.06. monoclinic 1.96. M. P. rhombic 112.4°. monoclinic 119°. B. P. 444.9°.	Occ.—native, in combination with most metals as sulphides, and with some metals as sulphates. Prep.—by melting the free sulphur away from the rocky matrix, and subsequent purification by distillation.	Natural sulphur is rhombic in crystalline form, yellow, brittle, of vitreous luster, and a poor conductor of heat and electricity. This and the monoclinic variety are soluble in carbon bisulphide, while amorphous sulphur is not. When heated, sulphur unites directly with most of the other elements.	Sulphur is used to prepare sulphur dioxide (SO_2), which is used in making sulphuric acid and sulphites, and for bleaching; also for vulcanizing rubber and in the manufacture of black gunpowder, fireworks and matches. Sulphuric acid (H_2SO_4) is to chemical industry what iron is to engineering.
Tantalum. Symbol Ta. At. wt. 181.0. Valence II, IV and V. S. G. 16.6 M. P. bet. 2250° and 2300°.	Occ.—in tantalite and many other rare minerals. Prep.—by the action of sodium on sodium tantalofluoride (Na_2TaF_7).	A hard silver-white metal, ductile and malleable when hot, of very high tensile strength. The hot metal can absorb 740 volumes of hydrogen. It is not attacked by aqua regia.	The metal is used for filaments for electric lamps, which possess twice the efficiency of the carbon filament lamp.
Tellurium. Symbol Te. At. wt. 127.5. Valence II, IV and VI. S. G. cryst. 6.3. M. P. cryst. 455°. B. P. 1400°.	Occ.—free and as tellurides. Prep.—by reducing tellurious acid (H_2TeO_3) by means of sulphur dioxide.	The crystalline variety is white, has metallic luster, and conducts heat and electricity. The precipitated variety is black and of lower density. The element is related to sulphur but is more metallic in character.	The compounds find few applications. Telluric acid (H_6TeO_6) has basic as well as acid characters, in keeping with the position of the element between metals and nonmetals.
Terbium. Symbol Tb. At. wt. 159.2. Valence III.	Occ.—in gadolinite, samarskite, and other rare minerals. Prep.—the metal has not been prepared.		The salts show no absorption spectrum.
Thallium. Symbol Tl. At. wt. 204.0. Valence I and II. S. G. 11.8. M. P. 303.	Occ.—in crookesite, and in small quantities in many samples of iron pyrites. Prep.—it is precipitated by zinc from a solution obtained by suitable treatment of the flue dust from sulphuric acid works.	A bluish-white lead-like metal, rather soft, malleable, but of low tensile strength. It decomposes water rapidly at red heat, and dissolves in dilute acids.	It forms two sets of salts, the thallous (*e. g.*, TlCl) and the thallic (*e. g.*, $TlCl_3$). All the compounds show a characteristic green line in the spectrum.
Thorium. Symbol Th. At. wt. 232.0. Valence IV. S. G. 11.0.	Occ.—in monazite sand. Prep.—by reducing potassium thorium chloride with sodium, or by electrolysis of the chloride in a mixture of fused potassium and sodium chlorides.	A metal with the color of nickel, that can be burnt in air. Hydrochloric acid attacks it but slowly.	The nitrate $[Th(NO_3)_4.6H_2O]$ is used in making Welsbach incandescent mantles, which consist of 99% of ThO_2. All the compounds are radio-active.
Thulium. Symbol Tm. At. wt. 168.5. Valence III. M. P. 1700°.	Occ.—in gadolinite and other yttrium minerals.		The salts are of a pale bluish color which is destroyed very easily by minute quantities of erbium.
Tin. Symbol Sn. At. wt. 119.0. Valence II and IV. S. G. 7.3. M. P. 232°. B. P. ca. 1600°.	Occ.—as cassiterite (SnO_2). Prep.—after roasting, the ore is reduced by heating with carbon.	A silver-white, rather soft, very malleable and ductile metal, practically unchanged in air. When heated, it may be burned in air. Dilute nitric acid is the only dilute acid that attacks it rapidly. When kept long at temperatures below zero C., ordinary tin changes to a brittle gray powdery modification. This form is the stable one below 20°.	Large quantities of tin are used in the tinning of iron for tinplate. It is a constituent of the alloys Britannia metal, pewter, solder, bronze, etc. Tin forms two sets of salts, stannous (*e. g.*, $SnCl_2$) and stannic (*e. g.*, $SnCl_4$). "Pink salt" $[(NH_4)_2SnCl_6]$ is used in dyeing. "Mosaic gold" is SnS_2.
Titanium. Symbol Ti. At. wt. 48.1. Valence II, III and IV. S. G. 4.5. M. P. below 1850°.	Occ.—as rutile (TiO_2) and in titanic iron ore ($FeTiO_3$). Prep.—by reducing the chloride ($TiCl_4$) by means of sodium.	A hard, brittle metal, resembling polished steel in appearance, that may be forged at a low red heat. It dissolves in dilute sulphuric acid, and decomposes steam at 800°. It unites easily with nitrogen.	The element is very widely disseminated, though in small quantity. It is contained in the ashes of all plants.
Tungsten. Symbol W. At. wt. 184.0. Valence II, IV, V and VI. S. G. 19.3. M. P. ca. 2800°.	Occ.—as wolfram ($FeWO_4$) and as scheelite ($CaWO_4$). Prep.—by reducing tungstic acid (H_2WO_4) by carbon at a high temperature.	A hard, brittle, gray metal, attacked by chlorine only at 250°, although it can be caused to burn in air. It is slowly acted upon by dilute acids and even by water.	The metal is used for the filaments of incandescent electric lamps, giving an efficiency of 1.3 watts per candle power. Tungsten steel has 5% W. Sodium tungstates are used as mordants in dyeing.
Uranium. Symbol U. At. wt. 238.5. Valence III, IV, V and VIII. S. G. 18.7. M. P. ca. 1500°.	Occ.—as pitchblende, which contains U_3O_8. Prep.—by reducing the oxides with aluminium.	A white lustrous metal, tarnishing in air and attacking water slowly in the cold. It combines directly with many of the other elements.	All the compounds of uranium are radio-active in proportion to their uranium content. Glass to which uranium compounds have been added shows a greenish-yellow fluorescence.
Vanadium. Symbol V. At. wt. 51.06. Valence II, III, IV and V. S. G. 5.5.	Occ.—in a few rather rare minerals. Prep.—by reduction of the dichloride (VCl_2) in hydrogen.	A silver-white lustrous metal harder than quartz. It does not tarnish nor attack water at ordinary temperatures, but can be burnt in oxygen.	Vanadium added to steel in even small quantity (0.2%) increases the tenacity and elastic limit without reducing the ductility.
Xenon. Symbol Xe. At. wt. 130.2. Valence 0. B. P. 109°.	Occ.—in minute quantity in the air, less than one volume in 100 million. Prep.—by fractionation of liquid argon.	A transparent, colorless and odorless gas, very inert like its congener argon. It is the densest of the argon family.	It forms no compounds.
Ytterbium. (Neoytterbium). Symbol Yb. At. wt. 172.0. Valence III.	Occ.—in gadolinite, euxenite and other rare minerals. Prep.—the metal has not been isolated.		The compounds show a characteristic spark spectrum.
Yttrium. Symbol Y. At. wt. 89.0. Valence III.	Occ.—in gadolinite, euxenite and other rare minerals. Prep.—by electrolysis of sodium yttrium chloride.	A gray lustrous metal.	The chloride yields a characteristic, though complex, spectrum.
Zinc. Symbol Zn. At. wt. 65.37. Valence II. S. G. 6.9 to 7.2. M. P. 418.2°. B. P. 920°.	Occ.—as zinc blende (ZnS), calamine ($ZnCO_3$), zincite (ZnO), etc. Prep.—after roasting, the ore is reduced by coal, the metal distilling off.	A bluish-white, lustrous, brittle metal, that is malleable and ductile at 120°. It tarnishes in moist air, attacking water slowly in the cold and rapidly when heated in steam. It dissolves in dilute acids and in sodium hydroxide solution.	Sheet zinc is used for roofs and gutters. Iron is galvanized by dipping it in molten zinc, and so protected from rusting. Zinc is used for galvanic batteries and, alloyed with copper, to make brass. The salts are used in medicine; the chloride and sulphate yield antiseptic solutions.
Zirconium. Symbol Zr. At. wt. 90.6. Valence IV. S. G. 4.1.	Occ.—as zircon ($ZrSiO_4$). Prep.—by reducing the oxide (ZrO_2) with carbon in the electric furnace.	A hard gray metal, remaining bright in air and only slowly oxidized at a white heat. It is dissolved by aqua regia and by caustic potash solution.	The oxide is contained in some incandescent gas mantles.

THE CHEMISTRY OF FOODS.—Food is anything which, taken into the alimentary canal, furnishes heat and energy to the system, repairs waste and builds tissue.

The common idea of food is confined to solid or semisolid foods having the above properties. Liquid foods are usually spoken of as drinks or beverages. Condimental substances, such as salt, pepper, spices, etc., are generally segregated from the ordinary classification of foods. There is a legal definition of foods found in the act of Congress of June 30, 1906, which is as follows:

"The term 'food,' as used herein, shall include all articles used for food, drink, confectionery, or condiment by man or other animals, whether simple, mixed, or compound." This comprehensive definition will be followed in this article.

Kinds of Foods.—According to their predominant characteristics for nutritive purposes, foods are recognized as of the following kinds:

Nitrogenous.—Food material containing nitrogen as a distinctive element. The common name *proteid* or *protein* is applied to this class of foods. Most of the true proteid foods also contain sulphur as an essential ingredient. Examples of characteristic proteid foods are found in lean meat, white of egg, gliadin of wheat, hordein of barley, zein of maize, etc. Among the liquid foods, milk contains casein, which is a most important ingredient, and albumen, a proteid food soluble in cold water. Other forms of protein are insoluble in cold water but are soluble in salt solutions, alcohol, etc. By means of these various solvents proteid matter can be separated into different classes. Proteid food is often described as a tissue builder, but this is not a strictly correct classification. Only certain tissues of the body, such as the muscle, the nerve and the brain, are composed largely of proteid. Tissues such as fat and bone are composed largely of other substances.

Starch and Sugar.—Carbohydrates form by far the largest bulk of human foods. They are typically represented by starch and sugar. There are many carbohydrates in foods, however, which are more or less useful but not important as regards quantity or digestibility. The so-called woody tissues and fiber in foods are composed of carbohydrates, but these are of more importance for the nourishment of domesticated animals than for man. For practical purposes the term *carbohydrates* applied to human foods embraces only starch and sugar. These substances in a pure state are characterized by being free of both nitrogen and sulphur, which are, as above stated, the most distinctive constituents of proteid. They consist solely of carbon, oxygen and hydrogen, the oxygen and hydrogen existing in the proportions to form water.

Kinds of Sugars.—Sugars are of various kinds, the most important for human nourishment being the substance known as cane sugar, which has the composition of $C_{12}H_{22}O_{11}$. Sugar is an abundant product of almost every plant. It is stored especially, however, in some certain plants in such a manner as to become available for extraction. The principal sugar producing plants are the sugar cane, sugar beet, the maple, and the sugar palm. Practically all the sugar of commerce comes from the sugar cane and the sugar beet. The amounts made from other sources are insignificant. In addition to cane sugar there are other varieties of sugar derived from starch. Among these perhaps the most important for dietetic purposes is maltose. Maltose is a sugar derived from starch in the process of the sprouting of the grains containing starch, or by acting upon starch by sprouted barley (malt). The starch of cereal grains is largely converted into maltose by the ferments of the malt. Starch is also converted into sugar by the ferments of the digestive organism. The saliva begins this conversion and it is completed in the intestinal tract, especially in the small intestine. Starch is also converted into sugar by the action of a dilute acid at a high temperature, and the sugar thus formed is known as dextrose. Glucose, cane sugar, maltose and dextrose are all valuable foods, furnishing particularly heat and energy. Starch, as such, is not available for nutritive purposes, being insoluble and incapable of assimilation. There are many other forms of sugar or sugar-forming substances found in plants, among them levulose, the companion of dextrose, found as levulon particularly in the dahlia, artichoke and certain cacti. When cane sugar is eaten or when it is treated with a dilute acid it is converted into a mixture of equal parts of dextrose and levulose. Honey is sugar exuded by the blossoms of plants and collected and stored by bees, and consists chiefly of cane sugar which has been converted as described above by nature or the bees and hence is a mixture of approximately equal parts of dextrose and levulose.

Glycerides.—Fats are also important foods, furnishing weight for weight a larger quantity of heat and energy than any other food product. Fats exist in various forms. When they are solid or semisolid at ordinary temperatures they are called fats; when they are liquid at ordinary temperatures they are called oils. Among the fats some of the most important for food purposes are butter, lard and tallow; among the oils, olive, cotton-seed, peanut and sesame. The fats are chemically known as glycerides, being a compound produced by the union of a fat acid and glycerine. In the fresh, pure state they contain but little free acid, but on standing for a long time larger quantities of free acid are found. The rancidity of the fat, however, does not depend solely upon its quantity of free acid, but upon other conditions due probably to bacterial or enzymic action. Warmth and light tend to render fats and oils rancid, while keeping them cool and in the dark tends to preserve them from rancidity.

Minerals.—The fourth class of foods are those of a mineral character, namely, foods which are essentially composed of mineral substances. Among the most important of the mineral foods in the nutrition of man are phosphorus and lime. These two bodies go to make up the greater part of bone tissue and are found as essential ingredients in many parts of the body. Phosphorus and lime are not usually found in any concentrated form in food products, but are distributed in small quantities in nearly all foods. The phosphorus which nourishes the body is ingested usually in an organic combination and not as phosphoric acid. Certain food products, as, for instance, cereals and eggs, are particularly rich in organic phosphorus. Lime is found in nearly all food products and especially in cereals and water.

Mineral substances other than phosphorus and lime are also useful to some extent in nutrition, as, for instance, iron, potash, and soda, the latter being valuable more for their incidental properties than because of their occurrence in the tissues of the body. In other words, it may be said that the blood in order to perform its functions must have a certain saline content, without which its circulation and the carrying of food to all parts of the body would be impossible. These saline materials, although not entering into the tissues of the body, must be regarded as essential parts of our food.

Condimentals.—Condiments are useful more for their effect on palatability than for purposes of pure nutrition. Palatability, however, has important relations to digestion, and hence condiments are properly classed as foods. Most condimental substances have some nutritive properties, containing as they do more or less starch, sugar, proteid and fats. Vinegar, of which the most important ingredient is acetic acid, furnishes a certain degree of heat and energy, inasmuch as all the acetic acid is burned in the body, the products being water and carbon dioxide. Salt does not enter into the tissues of the body but affords hydrochloric acid, which is essential to digestion. On the other hand, wood smoke, a valuable condiment, does not have any food value.

Manner in Which Food Performs Its Functions.—All food products ingested in the alimentary canal, if not already in a condition suitable for digestion, are prepared by previous mastication. The importance of the mastication of the food is shown by two facts: (1) The food in order to be digested must be properly subdivided; (2) the mixing of saliva with starchy foods is an important adjunct to digestion. In so far as meat foods are concerned, the admixture of saliva is perhaps of no importance in digestion, and the need of complete mastication is not so evident. The chief functions of food have been noted in the original definition. All foods taken into the body, with the possible exception of water and wood smoke, undergo profound modifications. The process of digestion is essentially a chemical one, and consists in the thorough destruction of the ingested forms of matter and the building up of entirely new combinations. Attention may be called, for instance, to the fact that the fat of the human body does not consist of any particles of the fat ingested in the food, but is a substance which is generated by combinations of particles of matter in the processes of digestion and assimilation. The tissues of the body, under a selective influence which is not fully understood, cull out from the current of circulating blood those particular particles of matter which go to build them up and reject those which are of no use.

Metabolism.—The building of tissue, especially in the growing animal, is one of the chief functions of foods. When an animal has reached maturity it remains in practically the same condition for a number of years. In this condition the building of new tissues ceases and nature is satisfied with restoring those which are destroyed and excreted. This process of repairing waste keeps the adult body in a state of equilibrium for a given time, but as old age comes on the repair does not keep pace with the waste and the natural decadence of age ensues. The sum of changes which food undergoes from its entry into the body until excreta are voided is called metabolism.

Foods as Fuel.—The next most important function of the food is to furnish heat

and energy. The human body is a pure machine and its functions depend upon a supply of heat and energy just as much as a boiler or an engine. Foods furnish heat in varying quantities as already indicated. Starch and sugar furnish about 4,000 units of heat per unit of weight; proteid matter, if completely burned, furnishes about 5,500 units of heat per unit of weight; fats, when completely burned, furnish about 9,300 units of heat per unit of weight. In point of fact, however, proteid matter is not completely burned in the body, and a considerable amount of nitrogen is excreted without being reduced to the last state of oxidation. Hence, proteid matter does not furnish any more heat during the process of digestion and assimilation than an equal amount of carbohydrates, so that the heat value of a proteid, in so far as the human machine is concerned, is practically the same as that of a sugar or a starch, while the value of a particle of fat is two and a quarter times greater than that of either a proteid or a carbohydrate.

The Calorimeter.—A simple method of calculation is pursued in measuring heat value. A particle of food is inclosed in a strong steel vessel, called a *bomb*, and into this vessel oxygen is pumped under high pressure. The apparatus is so arranged that by means of platinum wire, or other appropriate device, the food substance may be ignited in the atmosphere of oxygen and burned completely into final forms of oxidation, producing water, carbon dioxide, nitric, phosphoric and sulphuric acids, according to the relative quantities of the various constituents present. Before igniting the particle of food, the whole apparatus is set in a measured quantity of water at a known temperature and the rise of temperature attained is carefully noted by a standard thermometer. This apparatus is called a calorimeter. In this manner the accurate data which have been mentioned are obtained.

The Body a Furnace.—An exactly similar process goes on in the human organism, though slowly, and experiments have shown that the data obtained by the calorimeter are entirely comparable with those obtained in the organism. This has been proved by inclosing a human being in a tight compartment by means of which all the heat and all the products of combustion which are produced in his organism are measured. This experiment shows how complete a machine the human organism is.

COMPARATIVE VALUES OF FOOD IN CALORIES PER POUND

Barley, pearled	1650	Beans, kidney, canned	480	Lamb, leg	1130
Buckwheat flour	1620	Beans, string, canned	95	Lamb, shoulder	1265
Corn meal	1645	Corn, canned	455	Mutton, leg	900
Hominy, dry	1650	Peas, green, canned	255	Mutton, loin	1575
Macaroni, etc.	1665	Pumpkin, canned	150	Mutton, shoulder	975
Oats, rolled	1850	Squash, canned	235	Pork, ham	1520
Rice	1630	Tomatoes, canned	105	Pork, salt	3555
Wheat (average)	1710	Beans, dried	1605	Pork, bacon, smoked	2685
Entire wheat flour	1675	Beans, lima, canned	1625	Pork, loin chops	1340
Graham flour	1670	Buttermilk	165	Pork, tenderloin	900
Patent flour	1650	Cheese, cheddar	2145	Chicken, broiler	295
Brown bread	1050	Cheese, cottage	510	Fowls	775
Crackers	1910	Cheese, cream	910	Goose	1505
Graham	1955	Hens' eggs	635	Turkey	1075
Oatmeal	1970	Lentils	1620	Bass, fresh	255
Saltines	2005	Milk, condensed	780	Catfish	915
Cake (not fruit)	1675	Milk, skimmed	170	Cod and Haddock	220
Cookies	1910	Milk, whole	325	Halibut	470
Corn	1205	Nuts, almond	1660	Herring, mackerel	375
Doughnuts	2000	Nuts, Brazil	1655	Perch	275
Apple pie	1270	Nuts, butternuts	430	Pickerel	190
Cream pie	1515	Nuts, chestnuts	945	Pike, gray	135
Custard pie	830	Nuts, cocoanut	1413	Salmon	660
Lemon pie	1190	Nuts, filberts	1575	Sturgeon	350
Mince pie	1335	Nuts, hickory	1265	Trout, brook	230
Raisin pie	1410	Nuts, peanuts	1935	White fish	325
Rye and graham	1180	Nuts, pecans	1846	Cod, canned	315
White	1215	Nuts, walnuts	885	Haddock, smoked	510
Whole wheat	1140	Apples, fresh	220	Halibut, smoked	950
Zwieback	1970	Bananas, fresh	300	Herring, smoked	750
Asparagus, fresh	105	Blackberries, fresh	270	Mackerel, salt	730
Beans:		Cherries, fresh	345	Salmon, canned	915
Butter, green	370	Figs, fresh	380	Sturgeon, dried	870
Lima, fresh	225	Grapes, fresh	335	Sardines	950
String	180	Lemons, fresh	140	Tuna	575
Beets, fresh	170	Oranges, fresh	170	Clams, lobsters	140
Cabbage	125	Peaches, fresh	155	Crabs in shell	195
Carrots, fresh	160	Pears, fresh	260	Oysters in shell	45
Cauliflower	140	Plums, fresh	370	Solid	230
Celery	90	Prunes	335	Clams, Canned	275
Corn, green	180	Strawberries, fresh	175	Crabs "	370
Cucumbers	70	Raspberries, red	255	Lobster "	145
Greens, beet	245	Raspberries, black	310	Oysters "	335
Dandelion	285	Apples, dried	1350	Shrimp "	520
Lettuce	75	Apricots, dried	1275	Miscellaneous:	
Onions	205	Figs, dried	1475	Gelatin	1705
Parsnips	240	Pears, dried	1635	Butter	3605
Peas, green	255	Prunes dried	1190	Lard, refined	4220
Potatoes	310	Raspberries, dried	1705	Cottolene	4220
Sweet	460	Beef, corn	1271	Oleomargarine	3525
Pumpkin	60	Beef, flank	1185	Chocolate	2860
Radishes	95	Beef, porterhouse	1110	Cocoa	2320
Spinach, fresh	110	Beef, round	890	Honey	1520
Squash	105	Beef, ribs	1110	Starch, corn	1675
Tomatoes, fresh	105	Beef, rump	1065	Tapioca	1650
Turnips	125	Beef, sirloin	985	Sugar, brown	1765
Asparagus, canned	85	Veal, breast	745	Sugar, maple	1540
Beans, baked, canned	600	Veal, cutlets	695	Sugar, granulated	1860
Beans, lime, canned	360	Veal, leg	625		

Balanced Ration.—Experience has shown that man eats from choice certain quantities of the kinds of food mentioned, and in a certain definite proportion. While the dietaries of different nations differ, it may be stated that men in the same ranks of life, having practically the same means of obtaining subsistence, live in a uniform manner the world over. It is possible, therefore, by experience and study to determine the normal diet of man. The total quantity of food which a man eats is usually determined by the heat units mentioned and known as *calories*. The average man eats an amount of food which produces a quantity of heat recognized by the expression *three thousand calories*. That is, if the food which the average man eats were burned, it would raise a unit volume of water from zero to a temperature of three thousand degrees. As water could not bear such a temperature, however, a better expression is that the food of an average man per day would raise the temperature of three thousand unit weights of water one degree.

A study of these data show that not only is the human organism a machine but it is the most economical machine known. This is true of the animal organism in general and not of the human system in particular.

A balanced ration may be regarded as that quantity of food which will furnish three thousand units of heat, and so distributed among the various kinds of foods as to secure the proper proportions of protein, carbohydrates, minerals, condiments, and fats. This quantity of food, if deprived entirely of its water, represents about one per cent of the weight of the individual eating it. In other words, a man weighing 150 pounds in ordinary circumstances, and at light physical employment, eats one per cent of his weight of dry food a day, that is, one and a half pounds of dry food. As the ordinary foods used, however, contain about three times as much water as they do of dry substance, the total weight of food, including water, used by the average man of 150 pounds, is from four to five pounds per day.

Average Distribution of the Dry Food.—Assuming that the average man eats one and a half pounds of dry food per day, experience has shown that this is distributed in about the following proportions:

Proteid	0.25 lb.
Fat	0.2 lb.
Carbohydrates	1.0 lb.
Mineral matter, etc	0.05 of a lb.

The above data are to be considered only as approximate expressions in round numbers of the general distribution of the diet of an ordinary person.

Adulteration of Food.—Adulteration of food has been largely practiced for the purpose of commercial gain. In so far as nutrition and palatability are concerned, and from the common point of view of the consumer, there is no possible excuse for adulteration of any kind. The sole purpose of the practice of adulteration is to secure unearned profit for the manufacturer and dealer. Adulteration of food is practiced in various ways, the most common of which are as follows:

(a) *The abstraction of some valuable ingredient.* This is illustrated in the skimming of milk and the sale of the product as a whole milk.

(b) *The addition of some agent which dilutes or weakens the product.* This is shown in the addition of water to milk;

of chicory to coffee; of ground shells to pepper and other spices, etc.

(c) *The concealing of inferiority of a product.* This is done chiefly by coloring or bleaching, as for instance, the use of color in a distilled vinegar to make it appear like cider vinegar; the addition of an artificial flavor to an extract to make it resemble the genuine article; the bleaching of flour to make it look like high-grade patent flour, etc.

(d) *The addition of a substance to a food product which may render it injurious to health.* This is practiced chiefly for the purpose of preserving foods, though some of the coloring matters employed are undoubtedly injurious to health, such as sulphate of copper and many coal-tar dyes. Many authorities on hygiene are of the opinion that any kind of a preservative drug added to a food product is injurious. The reason for this belief is that a preservative only acts by destroying or paralyzing germ life and a preservative is only effective when enough of it is added to secure this effect. It is a very common opinion among experts, especially those charged with the protection of the public health, that all such practices are objectionable. On the other hand, there are experts, also eminent in their professions, who maintain that the use of preservatives is not deleterious. All nations that have food laws have either forbidden or restricted the use of these preservative materials, and this shows that the feeling of the community is decidedly opposed to them. When it is further considered that every kind of food which is suitable for human consumption may be perfectly preserved in some unobjectionable way without the use of preservatives, it is evident that their employment is wholly unnecessary and, therefore, always objectionable.

Misbranding of Food Products.—Almost as objectionable as adulteration is the practice of misbranding. As in the case of adulteration, this is done solely to secure undeserved profits on the part of the manufacturer or dealer. From the consumer's point of view there can be no excuse offered for the misbranding of foods. This misbranding takes various forms of which the following are some examples:

(a) *Misbranding* as to the state or country in which the food is produced, as, for instance, representing a domestic wine as of foreign manufacture, either by name or other device.

(b) *The giving of a false or fictitious name of manufacturer.* This is a very common practice among those who make different grades of products. Their own names are placed on the high grades and the names of fictitious firms on the low grades.

(c) *The calling of adulterated food by the name of the real article.* This is probably the most common form of misbranding, and is illustrated in the sale of milk which has been skimmed and watered as milk; a buckwheat flour which has been mixed with other materials as buckwheat flour, and maple sirup mixed with other sweets as maple sirup.

(d) *The misrepresentation of the qualities of a food product is another form of misbranding.* It is not uncommon to see advertisements calling attention to "superior qualities" which the article does not possess, such as "the most wholesome," "best made," "entire substitute for," etc. A most dangerous practice, and one which threatens health and often life, is found in the claims made for certain varieties of infants' and invalids' food. Another very common form of misbranding is where long stored foods are advertised as fresh—a form of misbranding which is now receiving attention in all the countries of the world, and regulations are being made looking to the minimizing of this evil. Infants' and invalids' foods of all others, should be pure, wholesome and free from misbranding and adulteration.

ENTOMOLOGY.—The branch of zoölogy which treats of the insects. The true insects are those animals of the division *Arthropoda* or *Articulata* distinguished from the other classes of the division by the fact that the three divisions of the body—the head, thorax, and abdomen—are always distinct from one another.

There are never more than three pairs of legs in the perfect insect, and these are all borne upon the thorax. The wings are expansions of the sides of the second and third sections of the thorax, and are attached by slender tubes called *nervures*. In the beetles the anterior pair of wings becomes hardened so as to form protective cases for the posterior membranous wings, and are called in this condition *elytra* or *wing-cases*. The head is composed of several segments amalgamated together, and carries a pair of feelers or *antennae*, a pair of eyes, usually compound, and the appendages of the mouth. The thorax is composed of three segments, also amalgamated, but generally pretty easily recognized.

The organs of the mouth take collectively two typical forms, the masticatory and the suctorial, the former exemplified by the beetles, the latter by the butterflies, in which the mouth is purely for suction.

Generally the young are very different from the full-grown insect, and pass through a *metamorphosis* before attaining the mature stage. When the metamorphosis is complete it exhibits three stages—that of the larva, caterpillar, or grub, that of the pupa or chrysalis, and that of the imago or perfect winged insect.

Classification.—Insects have been divided into three sections — *Ametabola*, *Hemimetabola*, and *Holometabola*, according as they undergo no metamorphosis, an incomplete one, or a complete one.

Ametabola.—The young of the Ametabola differ from the adult only in size. They are all destitute of wings; the eyes are simple and sometimes wanting. This section is divided into three orders—*Anoplura* (lice), *Mallophaga* (bird-lice), and *Thysanura* (springtails).

Hemimetabloa undergo an incomplete metamorphosis, the larva differing from the inago chiefly in the absence of wings and in size. The pupa is usually active, or if quiescent capable of movement. The section Hemimetabola comprises the orders *Hemipetra* (cicades, bugs, plant-lice, etc.), *Orthopetra* (cockroaches, crickets, grasshoppers, locusts, earwigs, etc.), and *Neuropetra* (dragon-flies, May flies, white ants, etc.).

In the Holometabola the metamorphosis is complete, the larva, pupa, and imago differing greatly from one another in external appearance and habits. The larva is wormlike and the pupa quiescent. The Holometabola comprises the orders *Aphaniptera* (fleas), *Diptera* (gnats, botflies, gadflies, mosquitos, house flies, etc.), *Lepidoptera* (butterflies and moths), *Hymenoptera* (bees, wasps, and ants), *Strepsiptera* (stylops, minute and parasites), and *Coleoptera* (lady-birds, glow-worms, cockchafers, weevils, and all of the beetle tribe). (See Dictionary of Animals.)

ETHNOLOGY.—Anthropology is that science which studies man. Taken in its most comprehensive significance it includes so great and such diversified material that it is necessary to subdivide it. Four main divisions are usually recognized—somatology, ethnology, ethnography, culture history. Somatology, sometimes called physical anthropology, considers man as a living organizm, in himself and in his relations to other animal forms. It involves, anatomy, physiology, psychology. Ethnology and ethnography deal with races; the former is a philosophical, the latter a descriptive science. The difference between them is the same as that between geology and geography.

Place Among Sciences.—Ethnology is based on somatology; it defines the different races of mankind; it studies the great questions of origin, variation and distribution. Ethnography describes the different populations of mankind; it aims to give a definite picture of the life and culture of each and every division of the human race; it deals little in theories, much in facts. Culture history studies the development of culture from lowest savagery to highest civilization; it is constructed from the facts supplied by ethnography.

The Scope and Field of ethnology may be briefly indicated. The philosophical study of the human race involves investigation of the origin of mankind; it attempts to reconstruct the primitive type of man; it aims to locate man's first home; it defines the definite types and varieties of the human species; it seeks to follow the movements of mankind from its first home, and to present the facts of the present distribution of human varieties.

Origin of Man.—The theory of evolution is as follows: Man is commonly recognized as no exception to the general rule. He is a part of animate creation, and is related by genuine ties of blood with other animals. His closest relatives are the various species of anthropoid apes living to-day in Africa, in southeastern Asia, and the adjacent islands. There are four types which so much resemble man as to deserve the name of anthropoid apes—the gorilla, chimpanzee, orang-utan, and gibbon. The gorilla and chimpanzee live in tropical Africa; the orang-utan and the gibbon live in the islands southeast from Asia, and in the neighboring portions of the continent. The gorilla is the largest of the four types, the different gibbons the smallest; all resemble man, but perhaps the nearest approach is in the chimpanzee and the orang-utan. Neither Darwin nor his followers have claimed that man is descended from any of the living types of anthropoids; they and he alike have descended from a common ancestor; they are collateral relatives.

Unity of Mankind.—The old question of monogenism is no longer one of serious importance. Monogenism is the doctrine that all men have descended from a single stock; that all are of one blood. The counterproposition that the different races of man have absolutely different origins, that they are different in blood, that all men are not brothers, is called polygenism.

In the early days of ethnology the battle between these two views was bitter. Naturalists held the fixity of plant and animal species. It was recognized that within the range of a single species there might be

variation, and varieties of species were recognized and clearly defined. But the idea that a species itself was temporary, and that one might go over to another through modification and by selection, was not recognized.

The question, then, was whether man formed a single species with several varieties or whether there were several human species. Certain criteria of species had been determined. The two of most significance were these:

(1) *Between the different individuals of a species the resemblance must be great and the variation limited.*

(2) *There must be fertility between varieties.*

The scientific consideration as to whether man is of *one* or of *several* species clearly belongs to the naturalist (the biologist). As regards degree of resemblance it is certain that the different human races present less striking differences than those within the range of pigeons and domestic dogs. Whether the different races of mankind really breed well together and give rise to fertile offspring was much discussed, but, on the whole, may be assumed. Mose of the old students, then, decided that mankind formed a single species with a number of varieties.

To-day, however, the old question has little meaning. Biology no longer holds to fixity of species. All existing forms of life are believed to have been derived from previously existing forms through variation and selection. Under evolutionistic teaching, all types of man will eventually trace back to some single form, however different may be the present types of race. The question whether we shall speak of one or several species depends only at what point we choose to pass the plane which cuts across the twigs diverging from the parent branch. On the whole, the evolutionist of to-day chooses to assume a single species of mankind, but if he does so, he believes that variation early took place within the species and recognizes that the fundamental race types are old and have undergone comparatively little change in recent times.

Original Type of Man.—Various attempts have been made to reconstruct the primitive type of man. Years ago, de Quatrefages, on the basis of individual peculiarities occurring within the limits of all human races, peculiarities which he believed might be considered reversive, suggested that the first men were probably yellow of skin, red-haired, and green-eyed. While his view has been rarely accepted *in toto* it has perhaps some elements of truth. It is possible to make a guss as to the structure of the earliest human occupants of western Europe, where various remains have been found in ancient deposits. Each fragment of human skeleton that has been found in glacial gravels or in cave-earth has given rise to bitter controversy. The number of pieces which have stood the test of critical examination and are unquestionably old is small. Among the most interesting of these remains are the skull-cap of Neanderthal and the skulls of Spy. Within a few years past, several discoveries of extraordinary importance have been made, and the list of authentic ancient pieces is double what it was a few years since. Rutot has recently summarized the whole discussion and we present a table based upon his evidence.

Table of Ancient Human Remains from European Quaternary

Drawn from Rutot; abbreviated.

European Quarternary Division	Nature of Piece and Locality	Type
Mindelian Glaciation.	Jaw-bone *Mauer.*	Neanderthaloid.
	Skeleton. *Galley Hill.*	Transition (doubtful authenticity).
Interglacial.		?
Rissian Glaciation.	Skull. *Denise.*	Transition?
Interglacial.	Skeleton. *Tilbury.*	Neanderthaloid.
	Skull. *Bury St. Edmunds.*	
	Skeleton. *Moustier.*	Neanderthal.
	Skeleton (fem.) "	Transition.
	Skeleton. *La Perassie.*	Neanderthal.
	Skeleton. *Chapelle-aux-Saints.*	Neanderthal.
	Skeleton. *Combe-Capelle.*	Transition.
	Skeletons. *Spy.*	Neanderthal.
	Skeleton. *Duruthy.*	Cro-Magnon.
	Skeletons. *Mentone.*	Negroid.
	Remains. *Hastière.*	Transition.
	Remains. *Crapina.*	Neanderthaloid.
	Jaw-bone. *Grotto des Fées.*	Transition?
	Jaw-bone. *Malarnaud.*	Transition?
	Jaw-bone. *La Naulette.*	Neanderthal.
	Skull-cap. *Neanderthal.*	Neanderthal.
	Skeletons. *Cro-Magnon.*	Cro-Magnon.
	Skeletons. *Mentone.*	Cro-Magnon.
	Skeleton. *Brünn.*	Transition.
	Skull. *Brünn-Rotenberg.*	Transition.
	Skeletons. *Predmost.*	Transition?
	Remains. *Trou Magrite.*	?
Wurmian Glaciation	Jaw-bones. *Goyet.*	Cro-Magnon?
	Skeleton. *Laugerie-Basse.*	Cro-Magnon.
	Skeleton. *Chancelade.*	Cro-Magnon.
	Skeleton. *Duruthy.*	Cro-Magnon.
	Skulls. *Placard.*	Cro-Magnon.
	Skeletons. *Solutre.*	Cro-Magnon.
	Skeleton. *Grotto des Hoteaux.*	Cro-Magnon.
	Skulls, and bones *Furfoos.*	Furfoos.
	Remains. *Schweizersbild.*	Pygmy.

It is still too early to attempt a complete restoration of early man from these fragments. We may, however, say that even at that early time there were already variations. The type of Neanderthal presents many interesting points of resemblance to the anthropoid apes and suggests a being of low intelligence. At the same time, however, there existed forms with a far higher development.

Man's First Home.—It is possible that the discussion as to man's first home has been tinged by a survival of religious bias. The Garden of Eden of the Jewish scriptures was located in southwestern Asia. Most writers have, when they discussed the matter from the point of view of science, looked for man's home in the Asiatic continent. De Quatrefages claimed that it was natural to locate the place of man's appearance where his three great races—yellow, black and white—came into contact; where the different types of language also met. For him, the first home of man was in southern Asia, and from there migration started. Later writers looked farther south. Keane, for instance, believes that man originated on a land mass now disappeared, the old Indo-African continent, the existence of which has been proved by recent geological studies.

A hint as to the place of man's appearance comes from studying the range, past and present, of the anthropoid apes. We have already stated that the living species of anthropoids are confined to Africa and the Asiatic islands. It is probable that no forms strikingly resembling man have existed very far outside of the extreme range of living species. The much discussed and interesting "missing link" of Dubois, *Pithecanthropus erectus*, lives in Java. It may be fairly assumed that the place of man's origination was somewhere within the anthropoid range thus suggested. It may also be quite safely claimed that a species like man, little adapted by nature to withstand a rigorous climate, originated in a region of mild temperature.

Migrations.—From the center of his original appearance man early started on migrations, which have been continued until, to-day, it may practically be said that he has penetrated every land area upon the globe. This is a fact without parallel. No other mammalian species can compare with man in its travels. The only approximation is the dog, which, as his friend and companion, has accompanied man upon his wanderings. It is legitimate study for the ethnologist to investigate the lines of migration, but a most difficult task. The present distribution of mankind, however, is a far more simple matter. The ethnological map of the world has been constructed with a fair degree of accuracy.

Races of Man.—How many and what are the races of mankind? Authors differ greatly in their answers. At first sight this wide divergence of opinion between authors seems a serious matter; one feels as if the whole subject were in uncertainty and doubt; he is inclined to ask whether ethnology is actually a science. Huxley recognized two races; some other writers carried the number up to nearly forty. Cuvier, and French ethnologists generally, recognized three great races.

Blumenbach, who has profoundly influenced the general public and whose classification is that usually found in geographies and school text-books, defined five—Ethiopian, Mongolian, Malay, American, and Caucasian. His terminology has largely affected subsequent workers, even when they differed from him in their schemes.

The present tendency, as exemplified in three or four recent writers of repute, is toward the recognition of four main races. Thus Keane recognizes *Homo ethiopicus*, *Homo mongolicus*, *Homo americanus*, *Homo caucasicus*.

While this diversity between authors is to some degree a matter of regret, it need cause no serious distrust. The object of classification is convenience in study and the bringing together of things which are

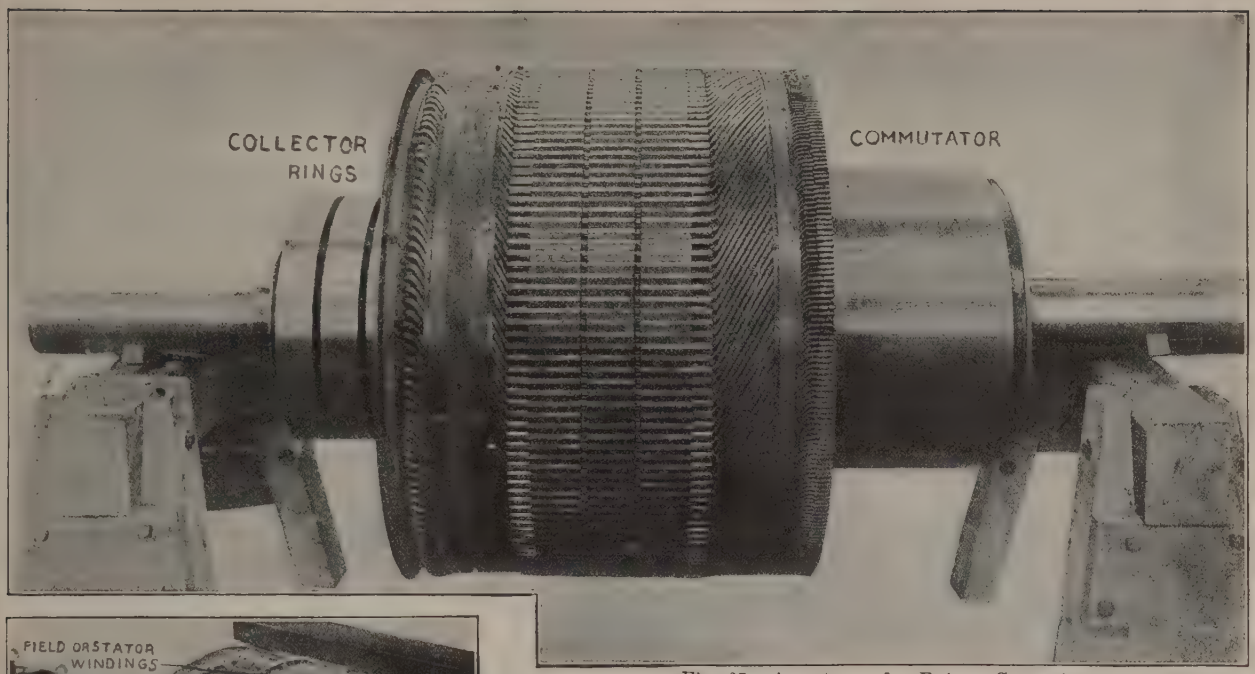


Fig. 37. Armature of a Rotary Converter

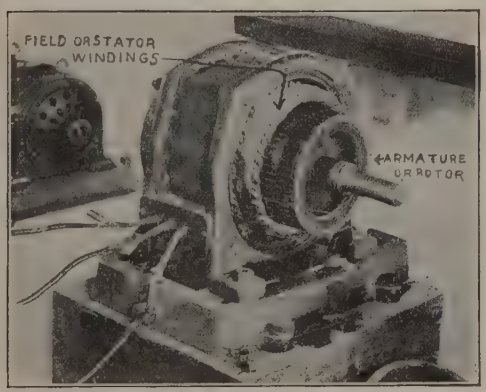

Fig. 34. Three-Phase Induction Motor

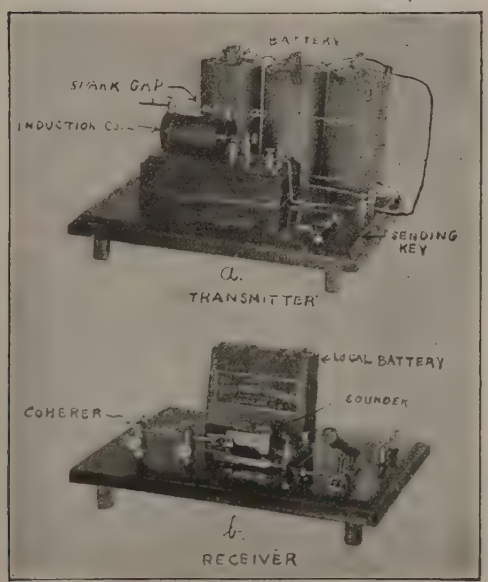

Fig. 41. Wireless Telegraph Apparatus

Fig. 42. A Radiograph

alike. When we compare the different ethnological schemes with one another, we usually find that they meet both these ends with fair success. All bring together groups which are alike, and but rarely do natural relationships of peoples seem to be disjointed.

We shall recognize the same differences that Keane does, but shall apply to them the terms Ethiopic, Mongolic, American, and Caucasic races.

Characters of Race.—Topinard attempted to define the race types of the world. His study was the most careful and precise undertaken to that time. He based his types of races absolutely upon physical characters and made five features fundamental. These were the stature, head form, nose, hair, and color.

Stature.—In stature, man ranges from the tall Patagonian, with an average of six feet or more, to the pygmies of central Africa and the Negrito of the Asiatic archipelago. Among all races there is a sex difference in stature, and, in general, it may be said that the female will average one-sixteenth less than the male. In stating that any race or people is of a given stature it is meant that the average of stature in adult males is to be understood. The average stature of mankind is perhaps 1.65 meters.

The term *pygmy* is applied to the populations of smallest stature and the French writers have agreed to call all populations *pygmy* where the average stature of adult males does not exceed 1,500 millimeters. Sir William Flower set the limit for pygmy stature in English measure at 5 feet, which is practically the same thing. The ethnologist divides people on the basis of stature into tall tribes (1,700 mm. and up) medium (1,600 to 1,699 mm.) and short (below 1,600 mm.).

The Head Form is difficult to define in words. To convey it to the mind, certain measures are taken and a numerical statement made. The two most important head measures are the length and breadth. Actual length and actual breadth, however, have but little value, and it is common to compare the two, expressing the ratio between them in what is known as an index.

Two head indices are commonly employed, one of which expresses the relation between the length and breadth of the skull and the other the relation of length and breadth upon the living subject. To the former the name cranial index is given; to the latter that of cephalic index. These indices are found by the same method, which is to divide the breadth by the length and drop the decimal point. Thus, if a skull measured eight inches in length and six inches in breadth, the cranial index would be 75. If,on a living head, the length were seven and one half inches and the breadth five inches, the cephalic index would be 66⅔. There are no normal skulls with an index so low as 50 or so high as 100; *i. e*, there are no normal skulls which are twice as long as they are broad, or which are as broad as they are long.

The indices are constantly employed in the defining of human races. The actual range as found in the averages of races is 69.4 to 88.7. Special terms are used to indicate the head form. Thus brachycephalic (85.3 and up), mesocephalic (85.2 to 77), dolichocephalic (below 77). The Armenians are for the most part brachycephalic with an index of 85.6; the Eskimo are dolichocephalic (76.8).

Nose.—The form of nose is one of the best distinguishing characters of race. Here again, an index is calculated from two measurements—height and breadth. The nasal index is found by dividing the breadth of the nose by the height and dropping the decimal point. The range is from 60.4 to 107.9. A nose as wide as it was high would have a nasal index of 100; one which was half as broad as high an index of 50. Individuals with an index of 100 or more are not uncommon among negroes.

On the whole, the white peoples of Caucasic race have the narrowest and most prominent of noses. Three terms are used in connection with the nasal index—leptorrhinian (below 70), mesorrhinian (70 to 84.9), platyrrhinian (85 and up). The northern type of European is leptorrhinian, the Negrito of the Philippines is platyrrhinian,

Hair is one of the most distinctive marks of race. Huxley made it fundamental in his classification, and recognized two main divisions of mankind—the straight haired and the woolly haired. Various points should be observed regarding it. As regards its general form, hair may be straight, wavy, curly, crinkly or woolly. In cross section, it may be circular, oval or elliptical, or flattened. White peoples, generally, have hair oval or elliptical in cross section; yellow peoples have hair with circular cross section; and blacks have distinctly flattened hair.

Hair differs racially in diameter, texture, abundance, distribution and angle of emergence. There are marked differences between races in the matter of calvity (baldness) and canity (graying). There are notable differences also in distribution and in the quantity and development of face hair. In color, race differences of hair lead to the employment of the terms black, brown, medium, light and blond. Red hair is found exceptionally among all races, but is typical of some sub-types. There are actually two types of red hair, one of which is blond, the other a variety of black.

Skin Color.—The color of the skin varies with race. Its differences are so striking that they have attracted universal attention and in many attempts at classification the color basis is fundamental. It is difficult to suggest a serviceable series of color terms. There are no actual black populations and no truly white ones. For a careful discrimination, color scales are necessary, and ethnologists quite generally use a series of fixed color samples which they match with the skin of the subjects studied. The best known chromatic scale for use in race study is that of Broca, where some thirty-four shades are discriminated. In ordinary practice a list of half a dozen terms is employed.

Four Great Races.—The four great races may be characterized as follows:

Ethiopic.—Color, from brown to almost black; generally dolichocephalic; forehead, frequently retreating with heavy arches over the orbits; prognathic—*i. e.*, the lower part of the face notably projecting; the cheek bones do not project notably forward and anteriorly; the nose is broad and flattened, platyrrhinian; the eyes are large and prominent and lustrous, dark brown or black in color; the hair is black, frizzly or woolly, and presents a flattened cross section; the stature is above the average of mankind at 5 feet 10 inches. The pygmy populations differ from the normal Ethiopic type in stature, in head form,tending toward brachycephaly, and in hair color, frequently a reddish brown.

Mongolic.—Color, a lighter or darker yellow; brachycephalic; the forehead fairly developed and without conspicuous orbital arches; the general impression given by the face is flatness and broadness with prominent forward development of the cheek bones; the nose is generally small and mesorrhine; the eyes black, with narrow almond-shaped opening, which appears to be oblique on account of a fold of skin at the inner edge; hair black, lank, coarse, circular in cross section; stature below the average at 5 feet 4 inches.

American.—Color, brown with a reddish or yellowish tinge; mesaticephalic; large, coarse features; forehead well developed and usually slight prognathism; cheek bones are prominent; nose mesorrhine, prominent, large, often aquiline; eyes small, round, straight, sunken, black; hair, black, lank coarse, long, round; the face is usually beardless and there is little body hair; stature above the average at 5 feet 8 inches.

Caucasic.—Color, ranging from white to almost black and presenting in white peoples distinctly fair and dark varieties; both types of head form occur, combined with both fair and dark colors; the face usually harmonizes in its form with the head form; prognathism rare; cheek bones not projecting; leptorrhine; eyes straight, rather large, and varying in color from light gray or blue to dark brown or black; hair, wavy, oval or elliptical in cross section, varying from flaxen to black; beard usually developed and body hair abundant; stature variable from tall to average.

The Ethiopic Race may be divided into continental and island divisions. The continental blacks occupy Africa from the Sahara desert southward. The insular group is found in Melanesia and it is customary to add the native population of Australia to this race. Both on the continent and in the islands, two sharply contrasted types are found—the large negroes and the small, or pygmy, populations.

Pygmies.—The pygmies present the typical hair, features and general characters of the race, but in the average of adult males fall below 5 feet in stature. In central Africa they occur in little groups scattered over a wide area in the midst of large black peoples. They have practically no agriculture and depend on the chase for food, representing the culture stage of savagery. Their hair is frequently of a reddish or grayish brown. They are not to be considered a dwarfed or degenerate population, but a well-developed and active people of a type among the oldest known.

A curious condition of commensalism usually exists between these little people and their large neighbors. The populations among whom they live are settled agricultural peoples, living in large and well-built villages. The pygmy settlements are usually at the edges of these towns, and a constant trade exists between the two groups; the little people bring fresh meat, ivory, honey and other natural products and receive in trade field products, cloth, and iron.

To the little blacks of the island world, of whom those living in the Philippines

are typical, the name "Negrito" is usually applied. They present the same physical peculiarities, stage of culture, and mode of living. They live in practically the same relations with the neighboring Malays that the pygmies do with their large neighbors.

Bushmen.—It is customary to group the Bushmen of southern Africa with the pygmies. They present some interesting points of difference. Their skin has a distinct yellowish tinge; they live in little wandering groups, taking refuge in caves and rock-shelters; they are hunters, but there is no distinct commensalism between them and their Bantu neighbors; they delight to mark their cavern walls with crude but lively representations of the animals they pursue. These peculiarities, to a less degree, mark the pygmies of central Africa. They are also found in the Hottentots, neighbors of the Bushmen, usually considered to be the result of intermarriage between them and the Bantu of the region.

Negroes.—The large continental blacks have reached the stage of barbarism in culture, and live in good towns, depend upon the product of the fields (cultivated by women), or, especially toward the south, upon herds of cattle. Two great divisions are recognized—the true negro of the Soudan district and the Bantu populations farther south.

In the true negro the characteristics of the race already mentioned are carried to their fullest development; blackness, coarseness of features, flatness of nose, prognathism with accompanying thickness of lips, and dolichocephaly are emphasized in them. The Bantu present a fine, chocolate brown tint, more regular and, to the eye, pleasing features; prognathism is rarely pronounced and the head is by no means markedly dolichocephalic.

Melanesians.—In the islands, the large blacks include the Papuans of New Guinea and the Melanesians of Fiji, New Caledonia, the Solomons and other island groups. Their life is interesting and has been the subject of much study. Dark colored, woolly haired, dolichocephalic, platyrrhine and of good stature, they are actually comparable with the big blacks of Africa.

The Mongolic Race is the most populous of the divisions of mankind. There is reason to believe that of the great races it perhaps nearest approaches the primitive stock of humanity. It is vigorous, hardy, and expansive. Its primitive home is the great continent of Asia, which is still chiefly occupied by it. The race presents two chief divisions to which Keane gives the names Mongolo-Tatar and Tibeto-Indo-Chinese.

The Mongolo-Tatar is the northern in position. It has spread from Asia across northern Europe and occupies to-day the north of Russia and a considerable area in Scandinavia. To it belong the great wandering hordes of Siberia—Mongols, Kalmucks, Buriats, Tungus, Yakuts and the like; to it also belongs the great Finno-Tatar group—with Tatars, Turki, and Ugrians. To this belong the Finns, Magyars and Bulgarians. In the far north are the Samoyeds and Lapps, the latter a people of small stature, who raise reindeer in the north of Sweden and Norway. To the great Mongolo-Tatar mass also belong the Koreans and the Japanese, relatives in blood and language. The Koreans are relatively pure Mongols, the Japanese much mixed with other elements, as we shall later see.

The Tibeto-Indo-Chinese division includes the Tibetans, the Chinese proper and the great mass of people in Indo-China and southeastern Asia, such as the Siamese, Burmese and the people of Anam. They are sedentary peoples, depending upon agriculture, with towns and cities, a dense population with distinctive culture, a true civilization. Linguistically, the southern group differs profoundly from the Mongolo-Tatar. Chinese and Japanese represent totally different types of language.

Eskimo.—Besides the two great divisions mentioned, the Mongolic race includes two interesting extra-continental groups—the Eskimo and the Oceanic Mongols, or Malays. Taxonomically, the Eskimo present a difficult problem. In color, face, features, stature—in fact, in the whole general impression—they are clearly Mongolic. But they are at the same time dolichocephalic; the Eskimo skull is one of the most sharply marked; it is long and narrow, has square jaws and ridged vault to the degree that, viewed directly from in front, it gives a distinct pentagonal outline.

The Eskimo occupy the whole arctic coast of North America from south and western Greenland to the western end of Alaska and overlap into eastern Asia. Throughout this enormous range of thousands of miles they present remarkable uniformity in type, language, and mode of life. The area occupied is chiefly American, not Asian; and the bulk of Eskimo population is found in the new world.

Malays.—The Oceanic Mongols, or Malays, occupy the islands of Malaysia, the Malay peninsula and a part of the great island of Madagascar off the east coast of Africa. Blumenbach considered the Malay one of the fundamental populations of mankind. It presents a fairly well-marked type, which, however, may be included in the Mongolic. The Malays and the Malayan peoples (for the word "Malay" proper is used chiefly in ethnology for those in the peninsula) are good seamen.

The American Race.—Keane refuses to recognize the Malays as distinct, but insists upon separating the American type from the Mongolic. For him they are an offshoot, but one of ancient date, which has had ample chance to develop peculiar characters in the American area. Contrasted with the other great races it presents a notable degree of physical uniformity. Writers have often said: "When you have seen one American Indian you have seen all"; "The American Indian presents the same type from the cold waters of the Arctic to the cold waters of Cape Horn."

This uniformity is striking but not absolute. Careful study shows tall and short tribes of American Indians, from the Patagonians, who are perhaps the giants of mankind, to Otomi, who almost touch the limit of pygmy height. There are long headed and short headed tribes, light and dark—from almost black to almost white; there are tribes with large faces and coarse features, like the Sioux, and tribes with soft and mild faces and delicate features, like the Chinantecs.

The American Indians present a notable uniformity in culture and it may be said that as a whole they are in barbarism. They represent every degree of barbaric culture from the lowest to the highest, and it may almost be said that not a single tribe of the many hundreds of American Indians represents either savagery or civilization. The rudest Athabaskans of British America had reached lower barbarism and the Aztecs and Mayas of Mexico fall just short of civilization. While writers usually have claimed a single origin for the American peoples, it seems more reasonable to assume that immigrants have come by many routes from many regions. Within the new environment the fragments of old populations have approximated to each other until we have the present condition of relative uniformity.

The Caucasic Race.—The continent of Europe is chiefly occupied by people of Caucasic race. Light whites and dark whites are readily distinguished. No section of the world has presented more serious problems to the ethnologist and no race is more difficult of satisfactory discussion than the Caucasic.

So far as Europe is concerned, Ripley recognizes three races: the northern, which is fair, tall, dolichocephalic; the Alpine, which is short, dark, and broad headed; the southern or Mediterranean, which is short, dark and long headed. This classification is attractive for its simplicity. It seems indeed to be too simple, and with its acceptance, points of importance are lost from sight and real distinctions fail to be recognized. Deniker recognizes ten types of European whites speaking Aryan tongues, which he groups under six races and four sub-races. His characterization of these types is as follows:

I. Northern.—Very lofty stature (1.73m.); dolichocephalic (76-79); fair; wavy hair, sometimes reddish; light eyes, usually blue; ruddy white skin; long face; prominent, straight nose; *e. g.*, Swedes.

A. *Sub-Northern.* Tall; mesocephalic; fair; straight hair; angular face; turned-up nose. *e. g.*, Letto-Lithuanians.

II. Eastern.—Short (1.63 m.); moderately round-headed (82-83); fair; straight light-yellow or flaxen hair; square-cut face; eyes blue or gray; nose frequently turned up; *e. g.*, Russians.

A. *Vistulian.*—Very short; mesocephalic; fair; *e. g.*, some Poles.

III. Ibero-Insular.—Short (1.61 - 1.62 m.); dolichocephalic (73-76); dark; hair black, often curly; very dark eyes; tawny skin; straight or turned-up nose; *e. g.*, Spaniards.

IV. Western, or **Cevenole.** — Short (1.63-1.64 m.); very rounded skull (85-87); dark; brown or black hair; light or dark brown eyes; rounded face; thick-set figure; *e. g.*, central French.

V. Littoral, or **Atlanto-Mediterranean.**—Tall (1.66 m.); moderately dolichocephalic or mesocephalic (79-80); dark; hair and eyes very dark colored. Always near the Mediterranean coast.

A. *Northwestern.*—Tall; sub-dolichocephalic; chesnut hair, often brown; *e. g.*, Welsh.,

VI. Adriatic, or **Dinaric.**—Tall (1.68 - 1.72 m.); brachycephalic (85-86); dark; brown or black wavy hair; dark eyes; straight eyebrows; elongated face; delicate, straight or aquiline nose; slightly tawny skin; *e. g.*, Montenegrins.

A. *Sub-Adriatic.*—Less tall (1.66 m.); less brachycephalic (82-85); lighter hair and eyes; *e. g.*, Luxemburgers.

These are all truly European types, speaking related languages.

Non-Aryan Whites.—There are however other Caucasic peoples; thus, in the region of the Caucasus itself, a district of extraordinary mixture and ethnic confusion, are many interesting peoples. It is from this district of Georgians and Circassians that the name applied to th whole great race was drawn. The Basques of the Pyrennean district, divided politically into French and Spanish Basques, are white men, Caucasian, European, but not included in Deniker's types, being unrelated in language to the races of Aryan Europeans.

The whole of north Africa is occupied by peoples who are neither Ethiopic nor Mongolic, and who, though dark in skin for the most part, are regularly classed in the Caucasic race. Although, in their entirety, the general name Hamitic is given to them, some of them have been profoundly

influenced by Semitic peoples and languages.

Many fine types occur within this area, which, of course, includes the Egyptians, past and present, the Libyans and the Berbers. While these peoples are for the most part dark, some remarkable groups of notably blond types occur among them. That these blond types are ancient is clearly shown by the wall-paintings of old Egypt, where the Libyan is regularly represented as blond. To the Caucasic race belongs also the brunette populations, ancient and modern, who speak the pure and typical Semitic languages—Hebrews, the modern Arabs and their neighbors. With them, we enter Asia.

Asiatic Caucasians.—In Asia, also, are Caucasic peoples, some of them speaking Aryan languages, in Persia, Afghanistan, and parts of India. Caucasic elements in Asia date far back, and there is good evidence of their existence and influence even in that section of the great continent which is occupied by Mongolo-Tatar populations.

The Ainu of Yeso and Saghalien are a Caucasic people. They are the remnant of the aboriginal population of Japan. Perhaps they occupied the entire archipelago before the coming of the Japanese from the continent by way of Korea. They are dirty white in color, have abundant wavy hair, elliptical in cross section, horizontal, large expressive eyes, almost European features, abundant body hair and heavy beards. They are mild in disposition and in culture are almost in savagery. Their language differs notably from Japanese in structure and lexicon.

In India are the Todas, whom Keane considers Caucasic. In face, features, hair and heavy beards, in yielding character, they present considerable analogy to the Ainu. They are, however, cattle raisers, and their whole life is wrapped up in the care of their animals. There are in other parts of Asia scattered fragments of populations which one and another writer have suggested are Caucasic and it is not impossible that continuous populations of inoffensive and weak Caucasic type once occupied the whole of eastern Asia and that they have been broken and separated by the flood of Mongolics coming from the west. The present tendency is to recognize the existence of Caucasic people in the island world.

Indonesians.—The term "Indonesian" is much used for certain people of Malaysia who do not present the true ("Malay") Mongolic type. It is assumed by those who use the term that these Indonesians are in large part Caucasic, modified by Malay or other island blood. The Polynesians, too, are largely claimed at present as Caucasic. These peoples present a handsome, attractive type; of good stature, well built, with faces of regular features, they are beautiful, by our standards.

Geographical Distribution.—In general, each continent has a distinct type of mankind. Asia has its Mongolic type; Europe and northern Africa its Caucasic type; south Africa its Ethiopic type; and the double continent of America its American type. Even Australia has a definite race type. While this is true, there has been so much of movement, interpenetration, and admixture that the population of no great land area is now uniform.

European Peoples.—Europe, with northern Africa, is the true home of the Caucasic race, but contains Mongolic peoples as well. In the accompanying table of European peoples by countries the main or fundamental population is given in one column, the more important secondary elements in another.

Asiatic Peoples.—Asia is the continental home of the Mongolic race, which still forms the greater part of its population, but a large Caucasic element has been present since ancient times and there is local mixture of Ethiopic blood. Deniker recognizes eleven physical types, which have intermingled to produce the Asiatic peoples of to-day. Five of them are peculiar to Asia—Dravidian, Assyroid, Indo-Afghan, Ainu, Mongolian; six occur elsewhere — Negrito, Indonesian, Arab, Ugrian, Turkish and Eskimo. Six of these are Caucasic—Dravidian, Assyroid, Indo-Afghan, Ainu, Indonesian, Arab; four are Mongolic—Mongolian (Tibeto-Indo-Chinese), Ugrian (Mongolo-Tatar), Turkish (Mongolo-Tatar), Eskimo; one is Ethiopic—Negrito.

Dravidian applies to the brown aboriginals of southern India, who are short of stature, dolichocephalic and with curly or wavy hair. Peschel made of them a great race type. Their position among races has been disputed, but in our four-race classification they must be called Caucasic.

Assyroid is so called because the type is common in the wall sculptures of old Assyria. It is well characterized, with tawny-white skin, narrow hooked nose with thick lips, brachycephalic, hair wavy or curly. It is the Armenian type and the oft-mentioned "Jewish" type is fundamentally Assyroid. In our scheme it is Asiatic Caucasic. So, too, is Indo-Afghan, the type of the invading conquerors of part of India. It has clear brown skin, black wavy hair, narrow straight or convex nose, dolichocephaly, tall stature.

The Arab, typical Semite — though the word Semitic is properly linguistic, not ethnic—is dark, with black wavy hair, dark eyes, long elliptical face, dolichocephalic head, aquiline nose, prominent occiput.

Jew.—This term should be used in only a religious sense; in so far as it has ethnic application it is fundamentally Assyroid or Arab or both; but it is everywhere mixed and approximates the people of the surrounding populations. Jews, of course, exist the world over. The Jews heretofore world-wanderers, are gathering in Palestine to form a Jewish nation.

African Peoples.—To draw up similar tables of the population of other continents would be more difficult and less satisfactory. The population of Africa falls into two well-marked divisions. Northern Africa to the Sudan must be ethnically joined to Europe. Brinton emphasized this fact by making one continent of the two land masses, to which he gave the name Eurafrica. Its population is Caucasic, though many of its peoples are dark of skin. In features, head-shape, hair nose, they are clearly related to European peoples. Among them are Berbers, Libyans, Egyptians, Nubians, Abyssinians, Collectively these north-African peoples are called Hamitic but they have been

Table of Peoples of European Countries

Country	Chief or Foundation Peoples	Subordinate or Local
Austria.	Northern.	Western. In south, Adriatic.
Belgium.	Northern (Flemish). Western (Walloon).	Northwestern.
British Isles.	Northern, Subnorthern.	Northwestern; in Wales and Ireland.
Bulgaria.	Bulgars. (Mong.—Turko-Finn.)	Mixed with Slav elements.
Denmark.	Northern.	Along coast, Western.
France.	Western or Cevenole, in highlands.	Northwestern, in northern lowlands. Littoral in south. Adriatic. Ibero-Insular.
Germany.	Northern, in lowlands.	Sub-Adriatic. Western.
Greece.	Diversified and uncertain.	
Italy.	Adriatic in north. Ibero-Insular in south.	Littoral. Western.
Montenegro.	Adriatic.	
Netherlands.	Northern. Subnorthern.	
Norway.	Northern. Lapps, etc., (Mong.) in north.	Sub-Northern and Northwestern, along coasts.
Portugal.	Ibero-Insular.	Northwestern.
Roumania.	Turki (Mong.). Western elements.	
Russia.	(Cauc.) Northern. Sub-Northern. Eastern. (Mong.) Lapps. Finns, Samoyeds.	Vistulian (Poles). Adriatic.
Servia.	Adriatic.	
Spain.	Ibero-Insular.	Western, north coast; Littoral, south coast.
Sweden.	Northern. Lapps and Finns (Mong.)	Sub-Northern and Northwestern along coasts.
Switzerland.	Cevenole, or Western.	Adriatic. Sub-Adriatic.
Turkey.	Turki (Mong.).	

Table of Peoples of Asiatic Countries

Country	Chief or Subordinate Peoples	Subordinate or Local
Afghanistan.	Indo-Afghan (Cauc. of Aryan speech).	Assyroid (Cauc.).
Arabia.	Arabs. Syrians (Cauc.—Semites).	
Baluchistan.	Baluchi (Cauc.—Indo-Afghan)	Arab. (Cauc.—Semitic). Negroid.
Burma.	Burmese.	(See Indo-China).
China.	Chinese. (Mong.—T.-I.-C.).	Lolos, Mantse. (perhaps Cauc.). Other fragments of aboriginal peoples.
India.	In north, Mongolic.	In Punjab-Deccan; brachycephal Cauc.?
	Ganges and Indus valleys, Aryo-Dravidians.	Ceylon; Veddahs, aborigines (Cauc.?).
	In south; Dravidians.	
Indo-China.	Cambodians. Annamese. Burmese. Thai. (Shans. Laotians. Siamese.)	(Aboriginal "Indonesians" mixed with incoming Mongolic peoples.) Negrito.
Japan.	Japanese (Mong.—K.-J.).	Ainu (Cauc.). Much Malay influence.
Korea.	Koreans (Mong.—K.-J.).	Trace of Caucasic elements.
Persia.	Persians (Cauc. of Aryan speech).	Semites (Cauc.). Turki (Mong.—M.-T.).
Siam.	Siamese (Mong.—T.-I.-C.).	(See Indo-China).
Siberia.	Mongols, Tungus, Tatars, Yakuts, etc.	
Tibet.	Tibetans (Mong.—T.-I.-C.).	
Turkey.	Turki (Mong.—M.-T.).	Assyroid (Cauc.).

strongly influenced by Arab (Semitic) hordes which have swept over the area.

On the southern border there is much mixture with negro blood. To the rest of Africa, Brinton applies the name Aust-Africa. It is divided between true negroes in the north and the Bantu peoples of central and south Africa. Bantu is a linguistic term, and the division between the two masses of population is primarily linguistic. But there are physical differences also. Scattered amid the big blacks of central Africa are the pygmy groups, and in the Kalihari desert region of the south live Bushmen.

American Peoples.—The great double continent, America, was occupied solely by the American race, except along the northern coast, where Eskimo live. American Indians have never been seriously classified upon the basis of physical types, due to the uniformity already mentioned.

Language is the basis generally employed in dividing the race into study groups. There are hundreds of languages spoken among them, and even language families, or independent stocks, number scores. Powell recognized fifty-eight linguistic families in North America north of Mexico. Brinton divides the double continent into five geographical regions—North Pacific, North Atlantic, Isthmian, South Pacific, South Atlantic. North Pacific, North Atlantic and Isthmian make up North America; the other two regions constitute South America.

While this division is geographical, Brinton emphasizes the fact that these regions are really culture areas as well. In such an article as this further detail would but confuse by introducing a multitude of tribal names.

Oceanic Peoples.—The Island World is not a unit ethnologically. It includes four well-marked, clearly characterized, areas—Malaysia, Melanesia, Australasia and Polynesia.

Australasia.—These may be separated into the Australian and the Tasmanian types. The latter seems more primitive and approaches, perhaps, the Melanesian. The Australians are fundamentally blacks, Ethiopic, but have been influenced by Dravidian or other elements until they have lost the woolly hair. With chocolate brown skin, broad nose, dolichocephaly, and medium stature they present a fairly uniform type, which some authors class among the great races.

Melanesia includes New Guinea or Papua and a number of groups of smaller islands. The true Papuan shows a fairly distinct type, but he is usually included with the rest under the general term Melanesian, which includes all the large Oceanic negroes, Ethiopic in race.

Malaysia extends from Madagascar to Melanesia, thus lying west of the two areas just considered. It includes the great islands of Sumatra, Java and Borneo; also Celebes, the Philippines, and many smaller islands; Formosa, ethnically, is Malayan. Malays form the chief population, but Melanesians have had local influence, and negritos, little blacks, occur at many points.

The most interesting portion of Malaysia is the Philippine archipelago. Its ethnology is complicated. After making the first serious study of it, Blumentritt suggested the following theoretical explanation: Four populations occur—(1) the aboriginal Negritos; (2) a great list of tribes representing an early Malayan immigration, tribes like the Igorot, Ifugao, etc.; (3) a second Malayan immigration of people much further advanced in culture, represented by the civilized "Cristiano" populations, which form the bulk of the Philippine peoples to-day, Tagals, Visayans, Ilocano, etc.; (4) a third Malayan immigration, Mohammedans, the "Moros" of Mindanao and the Sulu islands. This immigration was just well under way when the Spaniards appeared in the sixteenth century and checked it. It seems to have been a northward streaming of Malayans from the Philippines and Formosa that carried Malay blood and influence into Japan. The Japanese are not pure Mongols, but owe much to Malays.

Polynesia is singularly uniform in population. There are local mixtures, of course, where the area touches Melanesia.

The recent streaming out of white men into all parts of the world has had a remarkable influence on race vitality and characteristics. To-day in America and Australia, in Polynesia, and even in Africa, the original populations are disappearing or subordinated.

OUTLINES OF GEOLOGY.—Geology is the science which treats of the development of the earth.

Departments or Phases.—**Astronomic or Cosmic Geology** treats of the influence that the sun, moon, and other heavenly bodies have upon the earth.

Chemical Geology is that branch of dynamic geology in which are discussed the chemicals and chemical processes active in the creation or modification of earth conditions.

Crystallography is that branch of mineralogy which is concerned with the investigation and recognition of the regular geometrical forms that many minerals assume when free to do so at the time of their formation.

Dynamic or Philosophic Geology is a discussion of the agencies and forces involved in the development of the earth.

Economic Geology is that branch of geology which treats of the occurrence, the distribution, and the laws governing the formation of the economically important earth constituents.

Geognosy is a study of the form and constituents of the earth, and of the structure or arrangement of the earth's components.

Geotectonic or Structural Geology is that branch of geognosy in which the structural arrangement of the constituents of the earth is discussed.

Glacial Geology is that branch of physiography which treats of the modifications of the earth's surface produced by masses of ice.

Historical Geology is a presentation of the sequence of events in the history of the earth and its inhabitants.

Lithology is that branch of geognosy which is concerned with the study of rocks without the aid of the compound microscope.

Mineralogy is that branch of geognosy which treats of the nature, appearance, occurrence, and value of minerals.

Mining Geology is that branch of geognosy in which are discussed the principles applicable to the solution of mining problems.

Palaeontology is that branch of historical geology which deals with extinct or fossil fauna (animals) and flora (plants).

Petrology is that branch of geognosy which is concerned with the study of thin sections of rocks by means of the compound microscope.

Physiography, or Physical Geography, is that branch of dynamic geology which treats of the surface configuration of the earth, the forces which modify this, and the changes which thus result.

Stratigraphical Geology is that branch of geognosy in which stratification and the features found in, or connected with, stratified rocks are discussed.

Geological Agencies or Forces.—All features of the external form and accessible internal structure of the earth are due to the action of either air, water, or heat produced by pressure or chemical activity, and these are known, respectively, as the atmospheric, aqueous, and igneous geological agencies. These three great agencies have been active throughout geological time, their effects in past ages being essentially similar to those they now produce.

THE ATMOSPHERE AS A GEOLOGICAL AGENT

The work and functions of the atmosphere are suggested by the following outline:

I. Acts as a protective thermal blanket for the earth.

II. Sustains life.

III. Chemical work.
- Through evaporation, precipitates substances from solution in water.
- Oxidizes surface materials. } Tend to disintegrate surface and form soils.
- Forms carbonates from surface materials. } Tend to disintegrate surface and form soils.
- Forms hydrates from surface materials. } Tend to disintegrate surface and form soils.
- Unusual vapors and gases, often the products of volcanic activity, attack and change the nature of surface materials.

IV. Mechanical work.
- Wind removes loose surface material.
- Wind generates water waves and currents.
- Wind uproots trees and thus breaks up the soil.
- Wind transports seeds and small organisms.
- Wind transports and deposits sand as dunes.
- Wind transports and deposits fine material as loess.
- Wind aids in holding dust in suspension in the atmosphere, thus affecting the temperature and aiding condensation.

V. Thermal work.
- Changing temperatures tend to rupture rocks as a result of sudden contraction and expansion. } Form soils.
- Freezing of water in cracks involves expansion and tends to rupture rocks. } Form soils.

VI. Electrical work.
- Rocks may be ruptured by lightning, thus hastening their disintegration and aiding the formation of soils.
- Rocks may be fused by lightning and their mechanical or chemical disintegration be thus retarded.

VII. Is a medium for the evaporation and precipitation of water, forming clouds, fog, rain, snow, hail, and cloudbursts.

WATER AS A GEOLOGICAL AGENT

The work of water, outside of its influence upon the condition of the atmosphere, may be thus outlined:

I. Moving surface water

Mechanical work
- Erosion. Cuts all types of valleys and tends to remove, ultimately, all hills and mountains, thus reducing the inequalities on the earth's surface.
- Transportation. Eroded fragments are carried great or small distances, depending upon their size and the velocity of the current.
- Deposition. Flood-plain deposits and deltas of rivers are formed when a decrease in the velocity of the current causes the deposition of transported fragments, which are usually well rounded.

Chemical work
- Solution. Dissolves soluble portions of rocks.

WATER AS A GEOLOGICAL AGENT—Continued

II. Standing water.	**Mechanical work.**	EROSION. Waves and currents cut into shores and tend to enlarge the area of lakes and seas. TRANSPORTATION. Fragments derived from erosion by waves and currents are carried in suspension by currents. DEPOSITION. Transported fragments are deposited, mostly near shore, forming sedimentary or stratified deposits.
	Chemical work.	SOLUTION. Soluble portions of shore are dissolved. PRECAPITATION. Soluble substances derived from tributary streams or the shore are deposited by evaporation or by the interaction of one on another, forming deposits of rock-salt, gypsum, limestone, borax, alkaline carbonates, etc.
III. Underground water.	**Mechanical work.**	EROSION. Unimportant, but may form caves. TRANSPORTATION. Relatively unimportant. DEPOSITION. Relatively unimportant.
	Chemical work.	SOLUTION. Soluble materials with which the water comes in contact are dissolved, forming caves, particularly in limestone, and making "mineral water." PRECAPITATION. Substances in solution are deposited due to relief of pressure, lowering of temperature, or chemical interaction, forming mineral veins and spring deposits, partially or wholly filling cavities encountered, or acting as a cement for loose earth material.
IV. Ice Mechanical work.		EROSION. Alpine or valley glaciers partially shape amphitheatres or cirques, where snow accumulates and hardens into ice. They also form U-shaped valleys leading downward therefrom, and included rock fragments groove or "glaciate" the bedrock beneath. Great continental glaciers strip off the mantle of softened, altered waste or soil, as well as some of the solid rock below, which is also grooved or glaciated by included rock fragments. TRANSPORTATION. Material that falls upon a glacier is carried on the surface, either in the middle (medial moraine) or along the sides (lateral moraine), or works its way down into the ice and forms a part of the englacial drift, while that eroded beneath the glacier is dragged along in the bottom of the ice or between the glacier and the solid rock below (ground moraine). All the material transported by a glacier is apt to be unaltered and rather angular, although the edges of the fragments that form the ground moraine may be somewhat rounded, and they may be glaciated on one or more faces. DEPOSITION. The melting of a glacier causes the deposition of the material in or on the ice, that which accumulates at the end forming a terminal moraine, while that along the sides forms lateral moraines. Medial moraines are apt to be washed away by the melting ice. Beneath continental glaciers, the ground moraine is often heaped into low, smoothly rounded hills, called drumlins, while overloaded, subglacial streams, flowing in cracks in, or tunnels beneath, the ice, deposit long, winding, steep-sided ridges called eskers. The rounded hills or hummocks in terminal moraines are called kames.

HEAT AS A GEOLOGICAL AGENT

The internal heat of the earth is conducted slowly outward to the surface through the cool outward portion, and is also carried rapidly upward through the medium of ascending molten material. The effects of such transference of heat from one position to another may be thus outlined:

I. Effects of the gradual outward conduction of heat, and consequent differential expansion and contraction of different portions of the so-called "crust."
- a. Formation of mountains accompanied by folding of the materials involved.
- b. Changes in the character (metamorphism) of the earth materials involved in such movements.
- c. Production of cracks or fissures with or without the slipping of one side relative to the other.
- d. Occurrence of earthquakes as a result of such fracturing or slipping.
- e. Elevation or depression of considerable areas.

II. Effects of ascending molten material, and the consequent differential expansion and contraction of different portions of the crust.
- a and b. Same as c and d above.
- c. Elevation or depression of relatively small areas.

III. Effects of ascending molten material and the consequent displacement of solid material in the crust.
- a and b. Same as c and d under I in first column.
- c. Elevation of small to large areas depending upon the size of the intrusion.

IV. Effects of ascending molten material resulting from the cooling of the molten material itself.
- a. Formation of igneous rocks.
- b. Changes in the composition, texture, or hardness (metamorpnism) of the solid rocks with which the molten material comes in contact.

V. Additional effects of ascending molten material resulting from its extrusion upon, or intrusion close to, the surface.
- a. Explosive volcanic eruptions and the formation of volcanoes.
- b. Opening of fissures and the quiet extrusion of extensive surface lava which flows therefrom.
- —— Formation of hot springs and geysers. (The heat involved in these phenomena may be either the product of chemical activity or of radiation from hot igneous rocks near the surface of the earth.)

MINERALOGY.—The science which treats of the properties of mineral substances, and teaches us to characterize, distinguish, and class them according to their properties. Geology, or geognosy, was formerly included in the science of mineralogy, but this term has more recently become restricted to the study of the individual minerals, their aggregation into rocks and their relations to each other forming an important section of the science of geology. The science of mineralogy, however, is not confined to the study of the external characters of mineral substances, their chemical composition being equally important.

Classification.—Minerals may be described and classified either in accordance with their chemical composition, their crystallographic forms, or their physical properties of hardness, fracture, color, luster, etc., or a combination of all, and thus various systems of classification have been adopted. Most minerals crystallize in definite forms, and this form is one of the chief characteristics of many mineral species. There are not a few, however, which are not distinctly crystalline, but are earthy or occur in masses; the latter exhibiting important varieties of structure, as *laminated*, *fibrous*, *granular*, *reniform*, *botryoidal*, etc. Other distinctive characteristics are *color*, which, however, varies even in the same mineral; *luster*, the character of the light reflected from the surface, and described as *adamantine*, *vitreous*, *nacreous*, *greasy*, *silky*, etc.; *fracture*, or the character of the freshly-broken surface; *streak*, or the appearance and color of a furrow made in the mineral by a hard-tempered knife or file; and *hardness*, which is now determined by what is called Moh's scale.

In this scale certain minerals are represented by numbers from 1 to 10, *viz.*—

(1) *Talc*, common laminated light-green variety.

(2) *Gypsum*, a crystallized variety; (2.5) *mica*.

(3) *Calcite*, transparent variety.

(4) *Fluor spar*, crystalline variety.

(5) *Apatite*, transparent variety. (5.5) *scapolite*, crystalline variety.

(6) *Potash feldspar*, white cleavable variety.

(7) *Quartz*, transparent.

(8) *Topaz*, transparent.

(9) *Corundum*.

(10) *Diamond*.

To determine the hardness of a mineral, it is ascertained by experiment which of these it will scratch and which will scratch it; thus if a mineral will scratch fluor spar but not apatite, while the latter will scratch it, its hardness is between 4 and 5. Diaphaneity, refraction, polarization, electric properties, etc., are all distinguishing marks.

Precious Stones are those which, because of their beauty, hardness, and rarity, are prized for use in ornamentation, especially in jewelry. The diamond, ruby, sapphire, and emerald are the only stones which are, strictly speaking, entitled to be called "precious" in this sense; but the opal, on account of its beauty, is often classed with the precious stones; as is also the pearl, which is really not a stone, but a secretion of a shellfish.

Agate.—A semipellucid, uncrystallized variety of quartz, presenting various tints in the same specimen. Its colors are delicately arranged in stripes or bands, or blended in clouds.

Alexandrite.—A variety of chrysoberyl found in the mica slate of the Ural mountains. It is of a rich garnet color by artificial light, by daylight of a dark moss green. It is the only stone that so changes. The finest specimens of alexandrite are nearly as valuable as diamonds.

Almandine.—A common maroon-red variety of garnet.

Amethyst.—A variety of crystallized quartz, of a purple or bluish-violet color, of different shades. It is much used as a jeweler's stone. The lighter colored ones come from Brazil, the deep purple ones from Siberia. In value they are about the same as the garnet.

Aquamarine.—A transparent, sea-green variety of beryl, used as a gem.

Aventurine.—A variety of translucent quartz spangled throughout with scales of yellow mica.

Beryl.—A very hard mineral of much beauty when transparent. It comes in hexagonal prisms, commonly of a green or bluish-green color, but also yellow, pink, and white. It is a silicate of aluminium and glucinum. Beryls are very rich in colors. Their value is about four dollars per carat.

Cameo.—A figure cut in stone or shell that is composed of different colored layers. The value depends on the artistic merit of the engraved figure.

Bloodstone.—A green siliceous stone sprinkled with red jasper, whence the name.

Carbuncle.—A beautiful gem of a deep red color (with a mixture of scarlet), found in the East Indies. When held up to the sun it loses its deep tinge, and becomes of the color of a burning coal. The carbuncle of the ancients is believed to have been a garnet. The name is now given also to the ruby, sapphire, and the red spinel. The ordinary carbuncle is a garnet cut *en cabochon*, and is worth about one dollar a carat.

Carnelian.—A variety of chalcedony, of a clear, deep red, flesh-red, or reddish-white color. It is moderately hard, capable of a good polish, and often used for seals. It is now used but little.

Cat's-eye.—A variety of quartz or chalcedony exhibiting opalescent reflections from within, like the eye of a cat. The name is given to other gems affording like effects, especially the chrysoberyl. A fine specimen about three-eighths of an inch across would be worth from two to three hundred dollars.

Chalcedony.—A cryptocrystalline, translucent variety of quartz, having usually a whitish color, and a luster nearly like wax.

Chrysolite.—A mineral, composed of silica, magnesia, and iron, of a yellow to green color. It is little used.

Chrysoprase.—An appel-green variety of chalcedony. Its color is due to nickel contained in its composition.

Dendrite.—A stone or mineral in which are branching figures, resembling shrubs or trees, produced by a foreign mineral, usually by an oxide of manganese, as in the moss agate.

Diamond.—A precious stone or gem excelling in brilliancy and beautiful play of prismatic colors, and remarkable for extreme hardness. It is found in many hues—green, rose, straw, yellow, etc.—but the straw-colored ones are the most common. The diamond is a native carbon occurring in isometric crystals, often octahedrons, with rounded edges. It is the hardest substance known. Diamonds are said to be of the *first* water when very transparent, and of the *second* and *third* water as the transparency decreases.

Diopside.—A crystallized variety of pyroxene (a silicate of lime and magnesia), of a clear, grayish-green color; also called *mussite.*

Emerald.—A precious stone of a rich green color; it is the most valuable variety of beryl. (See beryl.)

Epidote.—A mineral, commonly of a yellowish-green color, occurring granular, massive, columnar, and in crystals. It is a silicate of alumina, lime, and oxide of iron, or manganese.

Essonite.—Cinnamon stone. A variety of garnet. It is not much used.

Fire opal.—(See opal.)

Fluorite.—Calcium fluoride, a mineral of many different colors, white, yellow, purple, red, etc., often very beautiful. When crystallized it is commonly in cubes with perfect octahedral cleavage. Some varieties are used for ornamental vessels. Also called *fluor spar*, or simply *fluor.* The colored varieties are often called *false ruby, false emerald, false topaz, false sapphire,* and *false amethyst.* For jewelry purposes the chief value of the stone is the expense of cutting and mounting.

Flint.—A massive, somewhat impure variety of quartz, in color usually of a gray to brown or nearly black, breaking with a conchoidal fracture and a sharp edge. (See quartz.)

Fluor spar.—Same as fluorite.

Garnet.—A mineral having many varieties, differing in color and in their constituents, but with the same general chemical formula. The commonest color is red; the luster is vitreous, or glassy; and the hardness is greater than that of quartz, about half as hard as the diamond.

The common crystal forms are the dodecahedron and trapezohedron. Besides the red varieties there are also white, green, yellow, brown, and black ones.

The garnet is a silicate with various bases, such as alumina-lime (grossularite essonite or cinnamon stone), alumina-magnesia (pyrope), alumina-manganese (spessartite), and chromium-lime (ouvarovite, color emerald green). The transparent red varieties are used as gems The garnet was the carbuncle of the ancients. Garnet is a very common mineral in gneiss and mica slate.

The finest specimens of red garnets come from Arizona and a single carat stone is worth about two dollars. A green variety that comes from Russia is worth about half as much as the diamond.

Golden beryl.—(See beryl.)

Heliotrope or *bloodstone.*—A green siliceous stone sprinkled with jasper, as if with blood, whence the name.

Hematite.—An important ore of iron, the sesquioxide, so called because of its red color when in the form of powder. It occurs in splendent rhombohedral crystals, and in massive and earthy forms, the last being called red ocher. It is now seldom used in jewelry.

Hyacinth.—A red variety of zircon, sometimes used as a gem. It resembles closely a dark Spanish topaz, and is worth a little more than the garnet.

Idiocrase.—A mineral occurring in tetragonal crystals and also massive, of a brown to green color, rarely sulphur yellow or blue. It is a silicate of alumina and lime, with some iron and magnesia. It is common at Mt. Vesuvius. It is little used.

Indicolite.—A variety of tourmaline of an indigo-blue color.

Iolite.—A silicate of alumina, iron, and magnesia, having a bright blue color and a vitreous or glassy luster. It is remarkable for its dichroism, and is also called *dichroite.*

Jacinth.—Same as hyacinth.

Jade.—A stone commonly of a pale to dark green color, but sometimes whitish. It is hard and very tough, capable of a fine polish, and is used for ornamental purposes and for implements, especially in eastern countries and among many primitive peoples.

Jasper.—An opaque, impure variety of quartz, of red, yellow, and other dull colors, breaking with a smooth surface. (See quartz.)

Kyanite.—A mineral occurring in thin-bladed crystals and crystalline aggregates, of a sky-blue color. It is a silicate of aluminium. It is little used for jewelry.

Labradorite.—A kind of feldspar, commonly showing a beautiful play of bluish-gray colors, and, hence, much used for ornamental purposes. The finest specimens come from Labrador.

Lapis-lazuli or *lazuli.*—A mineral of a fine azure-blue color, usually occurring in small rounded masses. It is essentially a silicate of alumina, lime, and soda, with some sodium sulphide. It is often marked by yellow spots or veins of sulphide of iron, and is much valued for ornamental work.

Moonstone.—A nearly pellucid variety of feldspar, showing pearly or opaline reflections from within. The best specimens come from Ceylon. Their value is not much more than the expense of cutting.

Nephrite.—A hard, compact mineral, of a dark green color, formerly worn as remedy for diseases of the kidneys, whence its name *kidney stone.*

Obsidian.—A kind of glass produced by volcanoes. It is usually of a black color and opaque, except in thin splinters.

Olivine.—A common name of the yellowish-green mineral chrysolite, especially of the variety occurring in eruptive rocks. (See chrysolite.)

Onyx.—Chalcedony in parallel layers of different shades of color. It is used for making cameos, the figure being cut in one layer with the next layer as a background (see cameo). It is stained black and used to make a mourning jewelry.

Opal.—A mineral consisting, like quartz, of silica, but inferior to quartz in hardness and specific gravity. The precious opal shows a peculiar play of colors of delicate tints and it is highly esteemed as a gem. One kind, with a varied play of colors in a reddish ground, is called *harlequin opal.* The *fire opal* (which comes from Mexico) has colors like the red and yellow of flame. This is not the cheap variety commonly called Mexican opal. A spherical opal about three-eighths of an inch in diameter, or an oval flat opal about half an inch long, would be worth about sixty dollars. A Mexican opal of the same size would be worth about fifteen dollars.

Pearl.—A shelly concretion, usually rounded, having a brilliant luster, with varying tints, formed in the mantle, or between the mantle and shell, of certain bivalve mollusks (especially in the pearl oysters and river mussels) and sometimes in certain univalves. Its substance is the same as nacre or mother-of-pearl. Pearls which are round, or nearly round, and of fine luster, are highly prized as jewels. They are sold by carat grains instead of carats.

Pyrope.—A variety of garnet of a poppy-red or blood-red color, frequently with a tint of orange. It is used as a gem.

Rhodonite.—Manganese spar, or silicate of manganese, a mineral occurring crystallized and in rose-red masses. It is almost entirely used for ornamental purposes, in slabs, blocks, etc.

Rock crystal or *mountain crystal.*—Any transparent crystal of quartz, particularly of limpid or colorless quartz. A sphere of rock crystal of absolutely perfect clearness, about five inches in diameter, is worth at least twenty thousand dollars.

Rose quartz.—A variety of quartz which is pinkish red.

Rubellite.—A variety of tourmaline varying in color from a pale rose-red to a deep ruby, and containing lithium. It is a little more valuable than the garnet.

Ruby.—A precious stone of a carmine-red color, sometimes verging to violet, or intermediate between carmine and hyacinth red. It is a crystallized variety of corundum. The ruby from Siam is of a dark color and is called oxblood ruby. It has about the same value as the diamond. The ruby from Burma, called the pigeon-blood ruby, is of a lighter color and several times more valuable than the oxblood ruby. A fine pigeon-blood ruby of two carats would be worth upward of six thousand dollars.

Rutile.—A mineral, usually of a reddish-brown color and brilliant, metallic, adamantine luster, occurring in tetragonal crystals.

Sapphire.—A variety of native corundum or aluminium sesquioxide. As the name of a gem the term is restricted to the transparent varieties of blue, pink, yellow, and other colors. The best specimens of the blue variety are nearly as valuable as the diamond. The sapphire is next to the diamond in hardness.

Sard.—A variety of carnelian, of a reddish-yellow or brownish color.

Sardonyx.—A variety of onyx consisting of sard and white chalcedony in alternate layers. (See onyx.)

Spinel.—A mineral occurring in octahedrons of great hardness and various colors, as red, green, blue, brown, and black, the red variety being the gem *spinel ruby.* It consists essentially of aluminium magnesium, but commonly contains iron and sometimes also chromium. The fine specimens of spinel ruby are worth rather more than half as much as the diamond.

Sunstone.—Aventurine feldspar; aventurine.

Topaz.—A mineral occurring in rhombic prisms, generally yellowish and pellucid, also colorless, and of greenish, bluish, or brownish shades. It sometimes occurs massive and opaque. It is fluosilicate of aluminium, and is used as a gem. It is but little more valuable than the garnet, except occasional unusually fine specimens.

Tourmaline.—A mineral occurring in three-sided prisms. Black tourmaline is the most common variety, but there are also other varieties, as the blue (*indicolite*), red (*rubellite*); also green, brown, and white. The red and green varieties, when transparent, are valued as jewels. The finest ones come from Maine, and are worth four or five times as much as garnets.

Turquoise.—A hydrous phosphate of alumina containing a little copper. It has a blue, or bluish-green color, and usually occurs in kidney-shaped masses with a nodular surface like that of a bunch of grapes. The fine specimens are worth nearly half as much as diamonds.

Unio-pearl.—A single large pearl.

Uralian emerald.—A precious stone of a rich green color, a variety of beryl.

Verd antique.—A mottled-green, serpentine marble. Also a green porphyry, which is called *oriental verd antique.*

Zircon.—A mineral occurring in tetragonal crystals, usually of a brown or gray color. It consists of silicon and zirconium, and is harder than the garnet. The transparent varieties are used as gems. The red variety is called *Hyacinth;* a colorless, pale yellow, or smoky-brown variety from Ceylon is called *jargon.*

ORNITHOLOGY.— The science which teaches the natural history and arrangement of birds; or, to use the definition of Cuvier, of vertebrated oviparous animals, with a double circulation and respiration, organized for flight.

Classification.—Many systems for the classification of birds have been proposed. A common division is into seven orders, to which an eighth, the *Saururae* of Huxley, is often added, to include the extinct archæopteryx. These orders are:

Order I.—Raptores or *Accipitres.* Birds of prey, as eagles, vultures, hawks, and owls. Beak strong and curved, sharp at the edges. Feet adapted for seizing and destroying other animals. Claws sharp, much hooked, and retractile. Hind toe on the same level with the others. Wings well developed.

Order II.—Insessores, *Passeres,* or perching birds, by far the most numerous order. It includes all the singing birds, and indeed, excluding the birds of prey, most birds which live habitually among trees. Feet formed for grasping and perching, claws moderately curved and not retractile. Hind toe on the same level as the rest. This order is usually divided into four *tribes* or suborders—*Conirostres* (cone-billed); *Dentirostres* (tooth-billed); *Tenuirostres* (slender-billed); *Fissirostres* (cleft-billed).

Order III.—Scansores or *Zygodactyli.* Climbing birds, as the parrots, wood-peckers, cuckoos, toucans, etc. Feet formed for climbing, two of the toes directed forward and two backward; powers of flight not in general great; bill variously shaped.

Order IV.—Rasores or *Gallinae.* Domestic fowls, pheasants, pigeons, etc. Legs large and strong. Feet with the hind toe situated above the heel, suited for scratching. Bill short, thick, and arched above.

Order V.—Cursores or *Struthionidae.* Running birds, as the ostrich, emu, cassowary, etc. Wings rudimentary and quite useless for flight; legs long and strong; hind toe wanting or merely rudimentary; breastbone without a ridge or keel.

Order VI.—Grallatores or *Grallae.* Waders, as the cranes, herons, snipes, sandpipers, etc. Legs long, bare of feathers from above the knee; toes often half-webbed. Bill in general long and slender.

Order VII.—Natatores or *Palmipedes.* Swimmers; web-footed birds, as ducks, geese, gulls, etc. Feet formed for swimming, in general webbed, that is, the toes connected by a membrane. Hind toe elevated above the plane of the others. Bill various, mostly flattened. (See Dictionary of Animals).

PHYSICS, or Natural Philosophy, is the science, or rather group of sciences, relating to the phenomena of the material world, or of the laws and properties of matter; more restrictedly it treats of the properties of bodies as bodies, and of the phenomena produced by the action of the various forces on matter in the mass. Its chief branches are *mechanics, heat, light, sound, electricity* and *magnetism.*

Electricity is the name given to the unknown cause of certain effects of very various kinds which are found to be closely connected one with another. They include two distinct kinds of attraction and repulsion—*electrostatic* and *electrodynamic* —the magnetization of iron, the deflection of magnetic needles, the production of heat and light in certain circumstances, the separation of certain chemical compounds into their constituents, and spasmodic actions on the nervous and muscular systems of animals.

The name is derived from the Greek *electron* (amber), the fact that amber when rubbed attracts light particles, such as small pieces of paper, having been known to the ancient Greeks. Friction was the only artificial source of electricity employed until Galvani, near the close of the eighteenth century, accidentally obtained it by the contact of two metals with the limbs of a frog; and Volta, developed Galvani's discovery and invented the first galvanic or voltaic battery. Electricity produced by friction is called *frictional electricity;* that produced by chemical action on metals *voltaic electricity.*

Conductors and Nonconductors.—All substances which, like amber, can be made to show electrical attraction by rubbing them, are called nonconductors. They include glass, sulphur, shellac, resin, silk, flannel, etc. Bodies which are not susceptible of excitation by friction are called conductors.

Electricity can be excited by the friction of a conductor against a nonconductor, and is, in fact, so excited in the ordinary electrical machine, in which glass rubs against an amalgam spread on a cushion. A metallic rod furnished with a glass handle can be electrified by rubbing it with flannel, the glass preventing the electricity from being conducted away through the hand. Substances thus electrified exhibit two opposite kinds of electricity, known respectively as *positive* and *negative.* Bodies charged with the same kind of electricity repel each other; those charged with opposite kinds attract each other. An instrument for indicating the presence of electricity is called an *electroscope.*

Electric Conduction.—All solid and liquid substances allow electricity to pass through them to some extent, but the differences of degrees are enormous. The best conductors are the metals, especially gold, silver, and copper. Perfectly pure copper conducts about seven times as well as iron. Substances which have excessively small conducting power are not called conductors, but *insulators,* so that a good insulator is another name for an excessively bad conductor.

Among the best insulators may be mentioned glass, paraffin (the wax, not the oil), ebonite, shellac, mica, india-rubber, and gutta-percha.

The word *resistance* is used in the opposite sense to conducting power; a good insulator is said to have high resistance, and a good conductor to have low resistance.

Electrostatics is that branch of the general science of electricity which treats of the repulsions between like and the attractions between unlike kinds of electricity. The fundamental law of electrostatics is that if *e* and *e* denote two quantities of electricity collected in two spaces very small in comparison with the distance between them, the mutual force which they exert upon each other is directly as the product *ee,* and inversely as the square of the distance. If the two quantities *ee* are both positive, or both negative, the force is a repulsion; but if one is positive and the other negative, it is an attraction.

Electric Discharge.—The rapid escape of electricity from a charged body is an electric discharge. When the discharge takes place through a conductor it is called *continuous,* and when it takes place through a nonconductor (for example, through air) it is called a *disruptive discharge.* The name "electric discharge" is especially applied to cases in which the escaping electricity produces luminosity.

Three kinds of such discharge have been distinguished—the *spark,* the *brush,* and the *glow.* The spark is accompanied by a sound which varies from a faint crack to a loud bang. In nature it is seen on the largest scale in the case of lighting, which is a discharge of atmospheric electricity.

The *brush* discharge is only faintly luminous. It occurs especially at sharp

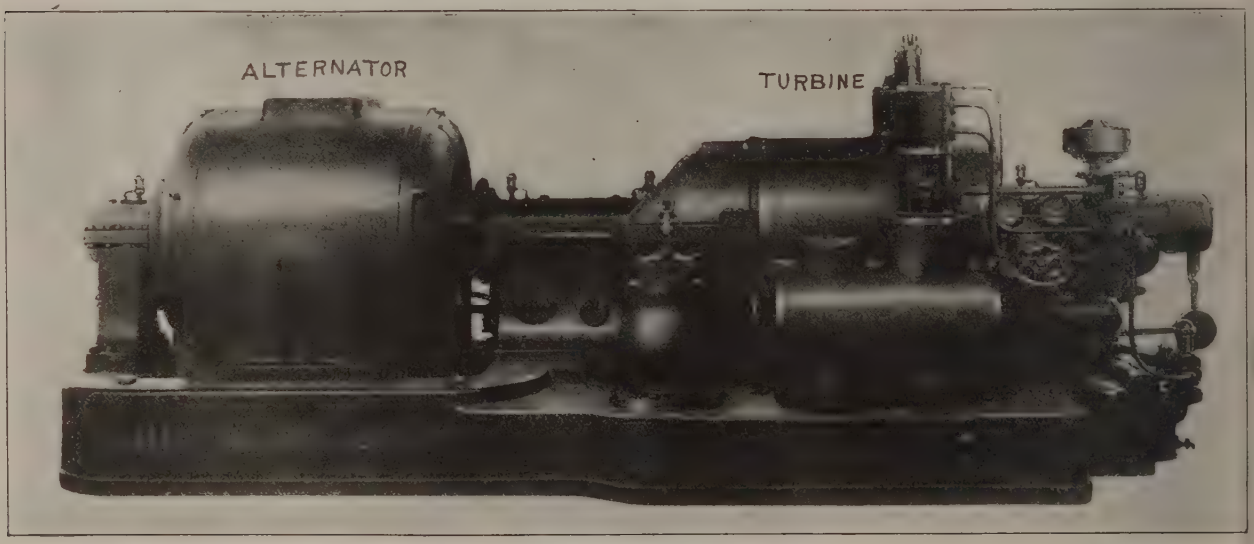

Fig. 26. Large Modern Three-Phase Alternator

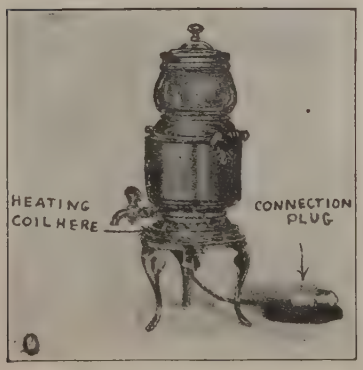

Fig. 40. Electric Cooking Utensil.

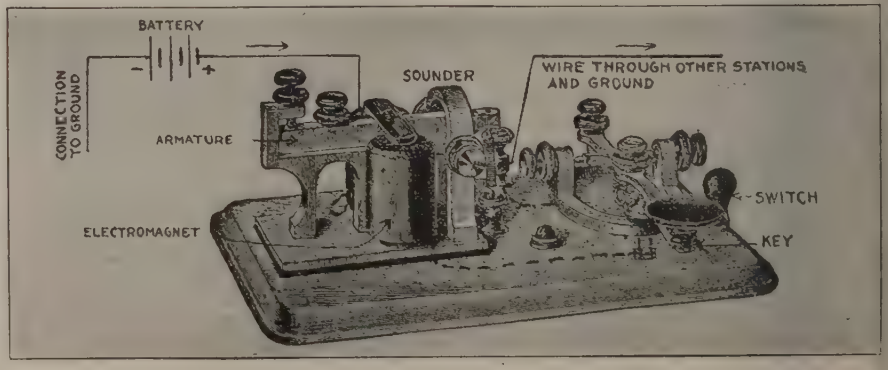

Fig. 30. Telegraph Set and Line

points and edges of highly-charged bodies. It is barely visible by daylight, and its appearance in the dark is that of a luminous halo. It projects only a small distance into the air surrounding the body from which the charge is escaping.

The *glow* discharge simply renders the surface of the body luminous, and does not extend into the air at all. In some modern electric apparatus beautiful effects of electric discharge are shown.

Electric Currents.—What is known as an electric current is a peculiar condition of a wire or other conductor of electricity, in virtue of which it deflects magnetic needles in its neighborhood, magnetizes a piece of soft iron around which it is coiled, has its own temperature raised, and exhibits various other effects. What is conventionally called the direction of the current is the direction in which the positive electricity may be regarded as flowing. The "strength" of a current denotes the quantity of electricity that passes through the wire in the unit of time.

Instruments for measuring the strengths of currents by chemical decomposition are called *voltmeters*, and instruments for measuring them by the deflection of magnetic needles are called *galvanometers*. The currents by which telegraphs are worked are usually obtained from galvanic batteries; but the far stronger currents required for other purposes are usually produced by machines called *dynamos* driven by steam or water power. The currents in such machines are due to magnetic-electric induction.

Electro-Dynamics is that branch of electrical science which treats of the attractions and repulsions exhibited between wires or other conductors through which currents are passing. If two wires are parallel, they will attract each other when currents are passing the same way through them both, and will repel each other when the currents are opposite. If the wires are inclined to each other at any angle, there is not only an attraction or repulsion, but a still more marked tendency to rotation, which is not satisfied till the wires have become parallel and the currents flow in the same direction through them both. When there are only two straight wires these forces are feeble and require delicate apparatus for their exhibition; but by employing coils of wire the forces are multiplied, and an instrument constructed on this principle called the *electro-dynamometer* has been much employed for the measurement of currents. The whole science of electro-dynamics is due to Ampere, who discovered its main facts, and reduced them by ingenious experiments, combined with very abstruse reasoning, to a single mathematical formula which includes them all.

Velocity of Electricity.—Daily experience with the electric telegraph shows that electric action is propagated with great rapidity. Electricity has not a definite velocity like light or sound. It is rather comparable to waves on water, which travel with very various speeds according to their length and the depth of the water. The highest speed ever observed in the transmission of electric effects was that obtained by Wheatstone, at the rate of 230,000 miles per second, a velocity greater than that of light, which is between 185,000 and 186,000 miles per second.

The Electric Transmission of Power is the transmission of power to a distance by electricity, effected by employing the source of power to drive the *dynamo*, which generates an electric current. This current is conveyed by a copper conductor insulated from the earth to the distant station, where it passes through a machine called an *electro-motor*, one part of which (called the *armature*) is thereby made to revolve, and imparts its motion to the machinery which is to be driven.

This is the simplest arrangement, and is that which is commonly employed when the original currents are not of such high tension as to be dangerous to life in the case of accidental shocks. When the original currents are alternating they are made to generate induced currents by means of an instrument called a *transformer*, which is similar in principle to an ordinary Ruhmkorff coil, with the important difference that the primary wire is long and thin, and the secondary wire short and thick.

These methods of transmission and transformation are employed not only for giving out mechanical power, but also for electric lighting.

Distribution of Electricity means the supplying of strong currents of electricity from central stations where they are generated, to houses, streets lamps, etc., in their vicinity. The central station contains a few powerful dynamo machines, driven usually by steam-power. The positive and negative terminals of the dynamo are put in connection with the positive and negative main conductors which are to supply the district, and from these mains smaller conductors branch off to the houses or lamps. In some systems of distribution, instead of the two main conductors being one positive and the other negative, each is positive and negative alternately, the reversals taking place some hundreds of times per second. The currents are then said to be *alternating*. When such reversals do not take place, the currents are said to be *direct*.

Sources of Electric Energy.—The chief sources of energy in practical use are coal, petroleum, wood, water at a height, and wind. Of these coal is by far the most important; water power comes perhaps next in importance; while the power of the wind is as yet almost undeveloped.

Applied Electricity.—The principal applications of electric energy are the lighting of streets and houses, the driving of machinery, the propelling of trains, street-cars, carriages, and boats, the heating of rooms, the heating of electric forges and furnaces, electro-chemical processes, various signaling operations, etc.

The Dynamo.—The dynamo is the most effective means for generating electricity. It costs about fifty times less to produce electricity by it than by batteries. It consists of nothing else than iron and copper wire, and when generating electricity some portion of the machine must be in rapid rotation.

The following characteristics of arrangement are to be noted:

(1) An outer iron ring which remains stationary. Portions of this are wound with many turns of insulated copper wire. Its purpose is to furnish a strong magnetic field, and it is generally, though not always, called *"the field."*

(2) An inner mass of iron, arranged for rapid rotation. Portions of this also are wound with insulated copper wire. This is called *the armature*, while the other is called the field.

(3) A commutator, if the machine is to send out a *continuous current*. This consists of the ends of the conductors in the moving armature arranged in a circle so that the two line conductors may be brought in contact with them, each serially, by brushes rubbing over them as the armature rotates. If the machine has no commutator, it must send out an *alternating* current.

Before the days of the dynamo, electricity although well known was of little use. The dynamo has made practicable the following: (1) Electric lighting and heating. (2) Electric traction. (3) Electric motors for the manifold applications of power. (4) A large number of chemical industries which depend upon large electric currents for producing chemical changes; such, for example, as extracting aluminium from clay. (5) Storage batteries. (6) Electric welding. (7) The dynamo is rapidly displacing batteries for telephoning, telegraphing, operating clocks, bells, etc.

Mechanics.—Is that branch of physics which treats of forces and their applications. The tendency of force acting upon matter is to produce motion, but two such tendencies may oppose one another, as the direction of the motions which they seek to produce may differ. When two do not completely counteract one another, it is possible that three or four or any number of forces—so many of them acting in one general direction and so many in another, so many for instance trying to produce motion eastward, and so many motion westward—may produce no motion whatever. From the application of any number of forces there may be rest produced, and it is quite evident that there may be motion.

Mechanics treat these two cases, embracing in its sphere the theory, as well as practice, of motion and equilibrium, both with and without the aid of machinery. The theory of mechanics properly comprehends (1) dynamics; (2) the motion of projectiles; (3) the theory of simple machines, or the mechanical forces; (4) the theory of compound machines, and their maximum effects; (5) the doctrine of the center of gravity; (6) the doctrine of the center of oscillation, gyration, etc.; (7) the collision of bodies; (8) the theory of rotation; (9) the theory of torsion; (10) the strength of materials; (11) and lastly, the equilibrium of arches and domes.

The elementary machines, or mechanical powers, properly speaking, are six in number, and may be thus enumerated —the *lever*, the *wheel* and *axle*, the *pulley*, the *inclined plane*, the *wedge*, and the *screw*.

Applied Mechanics is the practical application of the laws of matter and motion to the construction of machinery, etc.

Heat.—Heat is sometimes called invisible light. It is conceived to be an ether vibration of a little longer wave length than light. When these waves strike against any substance they cause its molecules to vibrate rapidly, and as a result the substance expands, and sometimes melts, or perhaps evaporates, or, under the influence of the waves, it may undergo chemical change, either resolving itself into simpler substances or uniting with other substances to make more complex ones. These molecular motions may stimulate motions among the molecules of other substances at a distance through the intervention of ether waves. These ether waves impinging upon our bodies give us the sensation of heat.

Absorption.—Substances whose molecules most readily respond to the heat vibrations of the ether are called good

absorbers of heat. The barefoot boy walking about a field has plenty of evidence that although the sun may shine alike on all substances, some of them get much hotter than others. The New York subway is much of it built underneath the streets with a comparatively thin roof of concrete over it. This concrete is a particularly good absorber of the sun's radiation and keeps the subway hot as a garret in summer.

Applied Heat.—Heating a stove oven is a good deal like lighting it. The walls of the oven send heat rays to the bread. If two loaves of bread set side by side in the oven each is in the shadow of the other and must be turned around occasionally to bake uniformly. The oven would bake quite as well without air as with it. Like light rays, heat rays pass better through a vacuum than through air. The most economical way of heating a house is by radiators, although this method is objectionable on the score of ventilation. Proper ventilation necessitates a wasteful method of heating our dwellings and public buildings.

Air is a particularly poor absorber, carrier, and radiator of heat. In our common thought we have given it far too much credit in the distribution of heat. When the walls, furniture, etc., of a room get warm, we may displace all the warm air in it by cold air—even freezing cold air—without its perceptibly affecting the thermometer.

Conductors.—There are no very good conductors of heat. With very great loss we do conduct electricity several miles by copper wires, but there is nothing which will conduct heat as many inches. The mystery is that copper wires should conduct or give direction to electric waves at all.

Ice must absorb a very large amount of heat radiation before it can change to water, hence its usefulness in the ice box. Vast volumes of air may pass through the ice box without melting the ice, since air has so little capacity for heat radiation. Salt strangely assists ice in absorbing heat rays; hence ice which cannot freeze the cream alone, may, if mixed with salt, absorb the heat radiation from the cream quickly—changing itself to brine and reducing the temperature of the cream many degrees below freezing.

Water in changing to vapor absorbs a large quantity of heat radiation, hence boiling water in the double boiler may prevent the hottest flame from raising the temperature in the inner boiler above 212 degrees.

Temperature.—Changes of temperature are best measured by the expansion and contraction of a column of mercury in a glass tube. An arbitrary scale is attached to this. Freezing temperature is in this country indicated by 32 degrees. The temperature of boiling is 212 degrees. The temperature of the inner portion of the human body is 98 degrees The proper temperature of a living room is about 64 degrees to 68 degrees. It seems to be necessary to our welfare that the internal heat of our bodies should be about 30 degrees above our surroundings when we are not exercising. Chemical action within raises the temperature and evaporation of moisture from the skin reduces the temperature. The balance is kept very constant amid a great variety of surroundings.

Volatile liquids, such as alcohol and gasoline, feel cold because they absorb our heat in changing their state from liquid to gas. In the fall of the year, when the nights begin to be cold, paper tied over plants may keep them from freezing. Just as a paper shade may be put over a lamp to cut off its rays of light, so paper over the plant cuts off the heat radiation from the plant and prevents its getting cold enough to freeze.

Light.—It is now a quite universally accepted theory that light is a wave motion in the ether which pervades all space. A microscopic examination of the interior of the eye shows that, like the ear, it is adapted to respond to wave motions of extreme rapidity. The highest tone which the human ear is capable of responding to is produced by about forty thousand air waves per second coming in upon it, but the human eye responds to nothing short of four hundred trillion ether waves per second.

Color. — As sound has tones of various pitch, so light has various colors. The sensation which we get from the tone called middle C on the piano is produced by 256 air waves each 4 feet long beating upon the ear each second. 512 air waves each 2 feet long (that is, twice the number each half as long) beating upon the ear each second will give the sensation of the tone called C, one octave above middle C.

Red.—So the eye is stimulated to the sensation of *red* by having 400 trillion ether waves each [about $\frac{3}{100,000}$ of an inch in length borne in upon it each second, while twice that number of ether waves per second each of half the length will give the eye the sensation of violet at the other end of the spectrum. The sensation of heat is produced by ether waves longer than the red, and ether waves shorter than the violet produce chemical change, such as tanning the skin, fading our garments, fogging the photographic plate, making the green material in plants, etc.

Reflection.—Light waves are reflected from all objects in the same manner that sound waves are, or indeed as water waves are. All objects which we see are either themselves stirring up waves in the ether or are reflecting ether waves which have been sent out from other sources. When six amperes of electricity are sent through a piece of number 24 iron wire, the wire sends forth in great abundance those ether waves which we call heat, but no light waves. Seven amperes of the electric current will cause it to send forth those ether waves which will affect the eye with red light and we call it red hot. Eight amperes will cause it to send forth violet ether waves, which, mingled with the red, will produce white light, and we say the iron wire is white hot.

Refraction.—Light waves pass through glass much more readily than heat waves do. Hence a glass screen before an open fire allows one to see the fire without having his face scorched. Glass, however, offers some resistance to the passage of light waves and hence when these waves strike upon a disk of glass which is thicker at the center than at the edges (such a piece of glass is called a lens), the waves are retarded at the center and the outer portions of the waves are turned inward so that they are concentrated at a point, or focus, on the other side of the lens. This bending of the waves is called *refraction*.

A large size lens, sometimes called a burning glass, serves in this way to concentrate the sun's light and heat waves to an intensely bright and hot point which may cause wood or paper to burn. The red light waves being akin to heat waves are retarded more than violet waves in passing through glass.

Spectrum. — Thus in passing white light, which is a combination of all colors, through a glass prism, the red waves are turned from their course more than any of the other colors and the violet is refracted least.

Prismatic Colors.—The colors thus shown are usually said to be seven—red, orange, yellow, green, blue, indigo, violet; although in reality there is an enormous, if not an infinite, number of perfectly distinct colors in light. The seven colors are frequently called the primary colors, and other tints and shades are producible by mixing them; but in a stricter sense the primary colors are three in number, namely, red, green, and violet (or blue). These three colors or kinds of light cannot be resolved into any other.

In the scientific sense of the word white and black are not considered colors, a white body reflecting, and a black body absorbing, all the rays of light without separating them, whereas the colors proper are due to separation of the rays of light by partial absorption and reflection or by refraction. If a body absorbs every other kind of light and reflects or transmits red light only, it will appear of a red color; if it absorbs every kind except blue rays, it will appear blue; and so on. If more than one kind of light be transmitted or reflected, the object will appear of a color compounded of these different rays of light.

In Painting, the term color is applied to that combination or modification of tints which produces a particular and desired effect. The colors of the spectrum have to be distinguished from colors used in reference to *pigments*.

Primary Colors.—The pigments red, blue, and yellow, regarded in the arts as the primary colors, produce effects, when mixed, very different from those produced by admixture of the corresponding spectrum colors. These three pigment colors form other colors thus; Red and yellow make orange, yellow and blue make green, and red and blue make purple; but red, blue, and yellow cannot be produced by any combination of the other colors.

Local Colors are those which are natural to a particular object in a picture, and by which it is distinguished from other objects.

Neutral Colors are those in which the hue is broken by partaking of the reflected colors of the objects which surround them.

Positive Colors are those which are unbroken by such accidents as affect neutral objects.

Complementary Colors are colors which together make white; thus any of the primary colors is complementary to the other two.

Subjective or *Accidental Colors* are the imaginary complementary colors seen after fixing the eye for a short time on a bright-colored object, and then turning it suddenly to a white or light-colored surface.

In Heraldry, the colors used are generally red, blue, black, green, and purple; which are called gules, azure, sable, vert or sinople, and purpure. Tenne or tawny, and sanguine or blood-color, sometimes occur, but they are not common. Yellow and white, again, are not colors in the heraldic sense, but metals; they are called or and argent, and are always represented by gold and silver. It is a fundamental and invariable rule in blazon not to put color upon color, or metal upon metal; thus, if the field be of a metal, the bearing must be of color, and *vice versa*.

Radio Telephony.—Radio communication, or wireless, is simply a matter of flashing intelligence through space without wires, cables, or other conductors between sender and receiver. A transmitter generates and propagates the radio waves that serve as a vehicle for the message causing delicate electrical disturbances in the distant receiver, in perfect harmony with the frequency, or wave length, of the transmitter. If we break these radio waves into long and short impulses with interspersed spaces, we have radio telegraphy; and if we permit the waves to flow continuously from transmitter to receiver, but mould or modulate them so that they carry an impress of the latent sound values of speech or music, we have radio telephony. In both cases, the basic principles are the same, although the technique is necessarily different.

The brilliant Italian youth, Guglielmo Marconi, invented the spark transmitter, sending the dots and dashes of the Morse Code through ether.

In 1900, however, an English physicist, W. Duddell, demonstrated that an ordinary electric arc could be made to generate high-frequency energy, and that it actually sang in response to this phenomenon. Accordingly, the device which he evolved was called the Duddell Musical Arc. Following this discovery, the possibilities of the electric arc as a generator of continuous waves needed either for radio telephony or radio telegraphy, became apparent to experimenters in all parts of the world. It was Vladmir Poulsen, a Danish engineer, who actually harnessed the singing arc to a radio transmitting circuit and a microphone, thus producing the first wireless telephone. By 1904, Poulsen was transmitting the human voice over considerable distances. Many other systems, utilizing this method, speedily appeared. But the electric arc, with its carbon rods and sputtering flame was untrustworthy. There was no suitable means of coupling the sensitive carbon microphone, such as we use in connection with our telephones, with the powerful wireless transmitter.

Nor was this all. For years the wireless telephone labored under an unlucky star. Instead of being permitted to develop in the research laboratory, it was taken out into the world and exploited by unscrupulous stock promoters. Members of the oily-tongued gentry there were who claimed that the wireless telephone would soon displace the conventional wire telephone, and that in no time at all, everyone would be carrying about a portable wireless telephone which would permit ready communication with any other person. And all this without paying so much as one cent for a telephone bill! Yet it was all too apparent, to those who actually knew, that the wireless telephone of that time was little more than a toy of the laboratory.

There came in due course that marvelous device, the vacuum-tube, which is virtually the foundation upon which radio, and its kindred arts, rest. It was in 1907 that Dr. Lee DeForest introduced the third element, or grid—that tiny lattice work between the flowing filament and the cylindrical plate of the original Flemming valve or two-element vacuum-tube. Almost overnight, the electrical fraternity found itself in possession of a mechanism of untold possibilities. Here was a generator capable of producing current of any desired frequency; here was an electrical relay, or repeater, which could control a powerful current with a very weak one; here was a magnifier, or amplifier, that might build up sounds to an astounding degree.

While the exploiters of the early wireless telephone were vainly striving to displace the time-honored wire telephone, that instrument was struggling with the problem of extending the scope of its service over a greater area. Due to the lack of better repeater facilities, a span of some 1,200 miles, from New York City to Council Bluffs, Iowa, was the physical limit of its long-distance service. The attenuated currents in the long telephone lines had to be reinforced at frequent intervals, and in those days of Pupin repeaters, the limit had been reached.

In the vacuum-tube, the telephone engineers saw the ideal repeater which they had been seeking these many years. Indeed, in 1915, with the aid of the vacuum-tube amplifier, a trans-continental telephone line was inaugurated between New York City and San Francisco. Sensing the possibilities of the vacuum-tube in really practical wireless telephony, these engineers undertook a series of experiments between Arlington, Virginia, and the Eiffel Tower in Paris. Success crowned their efforts. More than this, the human voice was projected to Pearl Harbor, in Hawaii, a distance of more than 7,000 miles! Thus, the possibilities of the vacuum-tube in wireless telephony were established. Only the necessary engineering and technical refinements were now lacking.

Then came the World War. The imperative need of a rapid means of flashing the reports of aerial observers back to their batteries, led to the rapid development of the radio telephone. It has truly been said that, as a result of the imperative demands of modern warfare, the radio art achieved ten years of progress in about as many months. In consequence of this, the radio telephone emerged from the War a thoroughly modernized and refined form of communication.

In the months that followed the War, various amateurs and experimenters throughout the country engaged in radio telephony work. For the most part, however, they were primarily interested in the technique itself, even though they did transmit phonographic music and, on occasion, the efforts of amateur talent, in return for the interest of far-flung listeners who reported back to them concerning the success of the transmissions. Although up to this time the idea had been to develop wireless telephony as a means of private, individual, point-to-point communication, many listeners participated enthusiastically in these demonstrations. Then, too, at this juncture, a radio telephone link, as part of the usual telephone system, was established between Long Beach, California, and Avalon, on Catalina Island, for the purpose of replacing the costly and troublesome submarine cable. It was immediately apparent, however, that the radio telephone carried no guarantee of privacy, and so the long-cherished idea of a radio link was speedily abandoned. Nevertheless, it must be remembered that today the radio telephone has found its niche in the trans-atlantic telephone service, and, in this field, it is without rival.

Frank Conrad, an engineer of the Westinghouse Electric and Manufacturing Company of East Pittsburgh, Pa., was one of the first to experiment with a wireless telephone transmitter installed in a garage in the rear of his home. Each evening he sent out crude programs, featuring phonograph records in addition to the usual voice transmission. His impromptu concerts covered a wide range and were enthusiastically received by the mere handful of persons equipped with broadcast receivers whose main function, heretofore, had been the interception of the dot-dash messages of radio telegraph traffic.

The popularity of these radio telephone programs was such that Conrad's audience grew by leaps and bounds. Soon some of his friends suggested that he take his transmitter over to the Westinghouse plant and start a bonafide broadcasting station. There was started the first regular broadcast service.

A limited but thoroughly astonished public received the news of Harding's triumph out of the air on the night of November 2nd, 1920, there was born that station which has become internationally famous as "KDKA, the Pioneer Broadcasting Station of the World."

The growth of broadcasting was little short of phenomenal. In 1921, the Westinghouse organization opened a second experimental broadcasting station at Newark, N. J. A small shack, erected on the roof of a factory for the purpose of housing a 500-watt transmitter, became the cradle of that station which, today, is known to millions of Americans as WJZ. A dis-used cloak-room, measuring a scant thirty by fifteen feet, was furnished with a nondescript collection of chairs and tables, a rented piano, and a phonograph. This was the forerunner of WJZ's present luxuriously appointed group of studios located in the National Broadcasting Company Building at 711 Fifth Avenue in New York City.

About a year later, or in July of 1922, the American Telephone and Telegraph Company, desirous of studying the possibilities of broadcasting as a means of mass communication, just as it had previously studied those of radio telephony as a means of point-to-point communication, established WEAF in New York City, inaugurating the first of a ceaseless stream of programs which have since made that station a really national institution.

Following in the footsteps of these three pioneers, broadcasting stations sprang up in all sections of the land. Without rhyme or reason, newspapers, manufacturing organizations, retail houses, universities, municipalities, State governments, and even private individuals clamored for their place in the ether. There seemed to be no limit to the number of those who felt themselves divinely called to assume the mantle of broadcaster. At one time, the Western Electric Company, as one of the leading producers of radio telephone transmitting apparatus in the United States, found itself in receipt of more than 700 applications for transmitting equipment.

As one broadcasting station after another took its place on the air, one family after another joined the ever-growing radio audience through the installation of a broadcast receiver. A definite cycle of development soon became established, with the broadcaster sending out programs, and the audience expressing its interest and support by equipping its individual homes with receiving apparatus. Thus broadcasters begot listeners, and listeners, in turn, begot broadcasters, in a never-ending circle. By August of 1924, there were no fewer than 1,105 licensed broadcasting stations in the United States, and the radio audience had assumed fantastic proportions in point of numbers.

With broadcasters still operating on a primarily experimental basis, with an alarming scarcity of good program material in the smaller centers, with the radio audience growing more discriminating with each passing day, and with the financial requirements of broadcasting increased to almost prohibitive figures, it was all too clear that something not only had to be done, but that it had to be done immediately.

It was at this point that the three organizations most interested in the future of broadcasting, the General Electric Company, the Westinghouse Electric and Manufacturing Company, and the Radio Corporation of America, decided to take a bold step. With their commercial interests at stake, and with a sincere sense of their obligation to a public which had invested literally millions of dollars in radio equipment on the assumption that broadcasting was a permanent institution, these three great concerns united in the formation of the National Broadcasting Company in September, 1926. It was in order to meet the two obvious necessities of advanced broadcasting that this company was formed. These were: First, adequate financial strength, with ultimate independence as the goal; and second, ample program material, suitably co-ordinated and presented.

The problem of financing elaborate broadcasting programs, has been solved by using these for advertising.

Today, the sponsored program is virtually the foundation upon which the institution of broadcasting rests, and it is a perpetual guarantee that the programs of the future will never lack for interest. The radio advertisers are fully aware of the fact that they can be assured of an audience only in the event that their programs are intrinsically worth while, and surely they are not going to fly in the face of Providence by destroying their best medium of good-will through inferior presentations.

CHART OF COLOR HARMONIES

In Decoration, Dress and Ornamentations

	Blue	Brown	Cream	Green	Gray	Helio	Lavender	Maroon	Myrtle	Navy	Nile	Olive	Orange	Purple	Red	Salmon	Sky Blue	Tan	Wine	Yellow

Sound and Musical Instruments.—The most noticeable thing about instruments for producing sound is that they are all devices for causing the air to vibrate, and the most interesting thing about the inner ear is that it is evidently a mechanism for receiving and responding to air vibrations. If no air intervenes between the ear and the sounding body no sound can be heard. This is shown to be true by operating an alarm clock or an electric bell in a closed vessel from which the air has been exhausted.

Intensity.—Most instruments for producing sound have some sort of device for reënforcing or intensifying the sound. The jewsharp is a simple reed, or steel spring fastened to a convenient handle. When this reed is made to vibrate, by plucking it with a finger, it emits a faint sound. This sound is intensified by holding it between the lips before the cavity of one's mouth.

Pitch. — Close attention will reveal the fact that the shorter reeds vibrate faster, and hence the pitch of a tone is related to the rapidity of the vibrations which produce it. The short tuning forks vibrate faster than the long forks and produce tones of higher pitch. These tones are heard only faintly until they are reënforced. This may be done by holding the fork, while it is vibrating, before the mouth of a suitable sized bottle, or by pressing the stem of the fork upon a table, or, better, upon a thin wooden box of certain dimensions which will act, like the body of a violin, as a resonator.

One type of music box has a steel comb with teeth of various length. A cylinder with teeth revolves so as to pluck the various teeth of the comb and produce sounds of various pitch.

Reeds. — The harmonica has brass reeds of various length. The mouth of the operator both causes the reeds to vibrate by forcing streams of air over them and furnishes a cavity which reënforces the sound. The mouth moves from right to left to bring into operation the reeds of different length. An accordion is an harmonica with bellows attached to be worked by the hands. This leaves the mouth of the player free to sing to the accompaniment of his instrument if he chooses. Keys are provided by means of which the player may direct streams of air to whichever of the reeds he chooses. A reed or cabinet organ, is the next step in the evolution of this instrument. In this the bellows are worked by the feet, leaving the hands more free to play the keys.

Strings.—The harp has strings to produce air waves, long strings to vibrate more slowly and produce the low tones and short strings to vibrate faster and produce the high tones. The high-toned strings are likewise thinner and tighter than those which produce the low tones. It is generally true of all stringed instruments that high tones are produced by *short, thin, tight* strings, while those which produce the lower tones are relatively *longer, thicker and looser.*

A piano is like a harp with a "sounding board" attached. This sounding board acts like the body of a violin to intensify the sound. The player upon a harp causes the strings to vibrate by plucking them with his fingers, while the strings of a piano are made to vibrate by hammers which the player operates by means of the keys.

Violins, violas, guitars, mandolins, banjos, violoncellos, and bass viols, etc., all have thin and tight strings for the high tones and thick, loose strings for the low tones, but the player changes the length, and hence the pitch, of each by fingering it. Some strings are wound with wire to make them thicker and heavier and hence vibrate more slowly.

Tones.—When a player puts his finger at the middle point of the string it vibrates in two separate sections, each section vibrating twice as fast as before and the pitch of its tone is raised one octave. By skillful manipulation a string may be made to vibrate in halves, in thirds, in quarters, in fifths, and in sixths, and the vibrations of these various sections will be two, three, four, five, and six times as rapid as those of the whole string. The most curious fact is that a string may vibrate in all these ways at once.

Classes of Tones.—The tone produced by the string vibrating as a whole is called its fundamental and the tones produced by its various segments are called overtones. The most pleasing sounds are those in which the greatest number of overtones abound. The most famous players are those who are most skilled in producing overtones and the most highly valued instruments are those most capable of yielding rich combinations of overtones.

An interesting relationship exists between a series of overtones and their fundamental. If we take, for example, a string whose length, tension and thickness are such that when it vibrates as a whole it gives the tone designated as C,—the middle C of the piano—produced by 256 vibrations per second, the relationship of its overtone is shown by the following table:

Fundamental C, in the middle of the piano 256 vibrations per second.

1st overtone, C, 1 octave above C (2×256) = 512 vibrations per second.

2d overtone, G, 1½ octaves above C (3×256) = 768 vibrations per second.

3d overtone, C, 2 octaves above C (4×256) = 1,024 vibrations per second.

4th overtone, E, 2¼ octaves above C (5×256) = 1,280 vibrations per second.

5th overtone, C, 2½ octaves above C (6×256) = 1,536 vibrations per second.

Wind Instruments.—The so-called wind instruments, such as the pipe organ, the various horns, etc., are devices for producing air waves without the intervention of reeds or strings. A strong wind blowing across the top of a chimney causes the column of air within to vibrate until the chimney roars. In like manner the column of air in an organ pipe is made to vibrate by a stream of air blowing, not through the pipe but across one end of the column. The flutist blows, not into his flute but across one end of it.

Relation of Pitch to Length of Pipe.—A two-foot open pipe produces middle C, the tone of 256 vibrations per second. A similar pipe one foot long produces C′,, one octave above middle C. While one four feet long produces C,, an octave below middle C. This is true whether the pipes are straight, as in the case of most organ pipes, or curled up as in the case of most horns. A French horn with eight feet of pipe coiled up will produce C,,, two octaves below middle C. The trombone has sliding joints for changing the length of the tube and thus giving a variety of tones. The flute has holes along its sides which have the effect of changing the length of the air waves, and hence the tones produced. The cornet has three extra loops of pipe, each of which may be added to the whole length of tube by pressing down a key.

This would account for a few extra tones, but how can a pipe with only three keys produce, say, thirty tones? The answer is that these instruments are the most marvelous devices for bringing out overtones. The player, by slightly changing the shape of his lips and varying slightly the wind pressure may make the air column in the instrument vibrate as a whole or in halves, or thirds, or fourths, or fifths or sixths. The scale for a French horn eight feet long whose fundamental is C,, is shown in the following table (read from the bottom upward):

	0	2	1	3	2 and 3	1 and 3	1, 2 and 3
384 vibrations per second	G						
		F†					
			F				
320 vibrations per second	E			E			
		D†			D†		
			D			D	
					C†		C†
256 vibrations per second	C				C		
		B,				B,	
			A†,				A†,
				A,,			
					G†,		
192 vibrations per second	G,					G,	
		F†,					F†,
			F,				
				E,			
					D†,		
						D,	
							C†,
128 vibrations per second	C,						
		B,,					
			A†,,				
				A,,			
					G†,,		
						G	
							F†
64 vibrations per second	C,,						
		B,,,					
			A†,,,				
				A,,,			
					G†,,,	G	
							F†,,,

† Sharp.

The column headed 0 shows the fundamental and overtones which may be produced when none of the keys are pressed. The second column shows the series of tones which may be produced when the second key is pressed. This lengthens the tube sufficiently to depress each note in the series half a tone. The next column shows the series produced when the first key is pressed. The next the series obtained by using the third key, and the remaining columns by combinations of the second and third, first and third, and finally the first, second and third keys.

It will be noticed from this table that the player upon a horn with only three keys is able to produce every tone and half-tone in something over two octaves and that he has two different ways of getting nine of these tones.

Conversational Tones.—The tones which men use most frequently in conversation fall within an octave of C,—128 vibrations; while the tones most frequently heard in female conversation are near to middle C—256 vibrations.

One might sing by waving his hand in the air if he could wave it fast enough. He might fill a large hall with his music by waving his hand at the mouth of a suitable sized bottle as resonator. He might even fill the hall with people if he could wave his hand skillfully enough to produce a rich combination of overtones.

Speed of Sounds.—All sounds, whether high or low, loud or soft, travel at the same rate of speed through the air, else the music of the band would not sound well in the distance. One may see a steamship blow its whistle two miles distant and count ten seconds before hearing its sound. The sound waves travel a mile in five seconds, or 720 miles an hour. In rifle practice one, standing near the target, may hear the bullet hit the target before he hears the discharge of the gun, and frequently he hears the same sound waves several seconds later reflected back to him from the distant hills in echo.

Terrific explosions upon the sun send light waves to us through the ether in eight minutes, but there is no air to bring the sound tones. If there were air and if the sound could come to us without loss it would require fifteen years for the journey.

Range of Tones.—The range of the tones of a piano is usually from 26⅔ vibrations per second to 4,096 vibrations per second. Between these limits are all the tones which may be called musical. Many persons who hear perfectly well tones within the range of the piano are totally deaf to a tone one octave above the highest tone on the piano, and all persons are incapable of hearing sounds whose pitch is higher than three octaves above the piano. It requires other apparatus than the human ear to detect them.

ZOÖLOGY is that half of biology, or the science which treats of life and living things, that deals with animals. It is impossible to frame a definition of *animal*, for although we can distinguish between a cow and a cabbage, the simpler forms of animals grade into the plants. Indeed, there are forms which at one period of their life would be classed with the animals, at another with the plants.

Animals may be studied from many standpoints and there have thus arisen different subdivisions of zoölogy, each of which has its own name. Thus *anatomy* deals with the gross structure, *histology* with the minute anatomy, *embryology* or *ontogeny* with the development from the egg, *physiology* with the way in which the parts perform their functions. The term zoölogy is usually restricted to the recent animals, the fossils forming the province of paleontology. or, better, paleozoölogy.

The classification of animals, or taxonomy, is based upon structure and development (morphology), the attempt being made to arrange the species into groups of different grades so as to show their actual relationships which are the results of their lines of descent (phylogeny). Then there is the subject of geographical distribution, while the special study of several groups has been dignified by special names, like ornithology (birds), ichthyology (fishes), entomology (insects), and malacology (mollusks).

Classification.—The animal kingdom is divided into groups of different values, the series beginning with phyla and ending with species or varieties, the relative rank of these being:

Phylum, divided into classes.
Class, divided into orders.
Order, divided into families.
Family, divided into genera.
Genus, divided into species.
Species, represented by individuals.

There are besides, intermediate grades like super and sub families, suborders, legions, etc. Each of these divisions has its name in Latin form, those of the orders frequently ending in *oidea*, those

of families in *idae*. These groups are not readily defined. We say that a species consists of those individuals which are very closely alike and which will interbreed, while the genus is based on more general characters.

Each animal has a double name, in Latin form, the first word representing the genus, the second the species. Thus all cat-like animals are included in the genus *Felis*, while the species name indicates the kind of cat. Thus the lion is *Felis leo*; the tiger, *Felis tigris*; the wildcat, *Felis catus* and the domestic cat is *Felis domesticus*. These names enable naturalists in all countries to understand exactly what form is meant, and to a certain extent they indicate the relationships of the animals.

All animals are divided, at first, into two great groups of subkingdoms, the *Protozoa*, in which the whole animal consists of but a single cell, and the *Metazoa*, in which the body is composed of multitudes of cells.

Protozoa.—As the *Protozoa* are single-celled animals they are all small, only a few being visible to the naked eye. All of the functions of life are carried on by the one cell, and hence these animals have great interest for the student, as they show the simplest kind of organization and also the great variety of shapes possible in a single cell, for thousands of these forms have been described. Most of the *Protozoa* reproduce by dividing into two, but there are some in which the body breaks up into great numbers of small particles or *spores*, each of which is capable of growing into an animal like the parent.

Porifera.—The sponges, the lowest of the *Metazoa*, bear this name because the surface of the animal is covered with numerous pores. These are the openings to canals by which water and food pass into numbers of small sacs which act as stomachs and from which one or more larger canals carry the water and the waste to the exterior. The familiar bath sponge is only the skeleton from which the flesh has been washed away, but it is always possible in this to recognize the outgoing canals. The best of the commercial sponges come from the Mediterranean, those of Florida and the West Indies being of a coarser character.

Coelenterata.—This phylum consists of the hydroids, jellyfishes, sea anemones and corals, in all of which the cells of the body are arranged in two layers, one forming the external skin, the other the lining of the digestive tract. There is but a single opening into the body and this serves as both mouth and vent. There is but a single cavity inside the body and this is at once digestive and circulatory.

The Hydrozoa have an interesting life history. There is one stage in which the animals are fixed to some submerged object, and by a process of budding they develop into large colonies of individuals connected together by a common stalk. Each individual has tentacles armed with nettle cells around the mouth, by means of which it kills its prey. The digestive cavity is continued through the stalk, connecting all of the individuals. At certain places, varying with the species, other buds are formed. These resemble a bell in shape and have a mouth at the end of the tongue. Each of these bells soon separates from the parent and swims away as an independent animal.

The description above applies to the subclass *Hydroidea;* in the *Siphonophora* we have colonies of jellyfish, connected by a hollow stem, and the fixed stage is absent. Most of the *Hydrozoa* are small, the individuals of the colony usually measuring but a fraction of an inch in length, while the medusæ are rarely an inch across.

The Scyphozoa, also include fixed and free forms. The fixed forms, called *Actinozoa*, are cylindrical animals, attached by one end and bearing a circle of tentacles around the mouth at the other. Internally there is but a single cavity, but this is divided by radial partitions into a series of chambers, thus greatly increasing the digestive surface.

The *sea anemones*, which are usually brightly colored, form no hard parts, and each individual is usually distinct.

In the *corals* there are some forms which are solitary, but usually the coral individuals reproduce by partial division, so that large colonies (sometimes several feet across) may occur. In these the base and usually the sides of each animal secrete a skeleton of carbonate of lime, the secretions of the adjacent individuals joining, so that large masses of coral result. In most of the species this skeleton is porous, but in the precious corals (occurring mostly in the Mediterranean and in Japan) it is dense and takes a high polish. Its color ranges from white to deep red.

The scyphozoan jellyfishes may attain a distance across of six feet, with tentacles a hundred feet in length. All pass through a fixed stage, like a sea anemone, which becomes cut across, each portion forming a jellyfish.

The Ctenophora are distantly related to the other jellyfish. Most of them are spherical and all have eight rows of swimming organs, arranged like the meridians on a globe. Each row consists of plates of vibratile hairs, each plate roughly resembling a comb, whence the name *Ctenophores*, which means comb-bearers. These forms are very voracious, holding the prey by means of numerous adhesive bodies which replace the nettle cells of the other *Cœlenterates*.

The Platodes (flatworms) have elongate flattened bodies, and with the exception of the *Nemertines*, have but a single opening (mouth) to the alimentary canal, which is the only eavity in the body. (In a few of the *Turbellarians* and in all of the *Cestodes* there is no digestive cavity.)

The Turbellaria are small forms occurring in both fresh and salt water, only a few being semiparasites on other animals. The *Trematoda* on the other hand are all parasites, some living on the outside, others in the interior of other animals, sometimes causing severe disturbances and even death. Some of the internal parasites have strange life-histories, the immature stages being passed in the bodies of mollusks, the adults occurring in the organs of vertebrates. The life history is best known of the liver fluke of the sheep, which killed a million and a half of sheep in England in a single year. Other species may attack man, especially in warm climates.

The Cestoda, commonly called tapeworms, are all internal parasites, and this method of life in the intestine of other animals has resulted in a complete loss of the digestive canal, nourishment being absorbed through the surface of the body. Usually these animals pass through two different hosts, the common tapeworms of man passing the immature stages in the pig or cow; less common is one which lives a part of its life in fishes. The immature stages of these are taken with uncooked flesh into the human stomach, where they are set free and then they attach themselves to the lining of the intestines and gradually grow into the adult, becoming divided into a series of joints, each of which is composed almost exclusively of reproductive organs.

The Nemertini are nonparasitic forms occurring in salt and fresh water. They differ from the other *Platodes* in having a vent to the digestive tract. They have little interest except for the student.

The Rotatoria (rotifers or wheel animalcules) are microscopic animals occurring in the water, in which a circle of cilia around the mouth is in constant vibration, giving the impression of a wheel in rapid rotation.

The Coelhelmonthes include worms in which there is a well-developed body cavity surrounding the digestive tract, which always has both mouth and vent.

The Nematoda (round or thread worms) are cylindrical and have no jointing of the body. Some live in moist earth or in the water, but the great majority are parasites in man and other animals, some of them causing severe disturbances or even death. The human parasites longest known are the stomach and pin worms (*Ascaris*). Much more serious is the *Trichina*, not over a sixth of an inch in length, which man obtains from raw pork and which is frequently fatal when occurring in large numbers. Another *Nematode* is *Ankylostomam*, the so-called lazy worm which occurs in the Southern states, while many less known forms attack man in the tropics. All of these, as well as the *Trematodes* and *Cestodes* obtain entrance to the body with food or water; hence the rule should be not to eat flesh (*e. g.*, ham) in the uncooked condition. Salads are also a frequent source of infection.

The Annelida are worms in which the body is divided into a series of rings or segments, one or more of the anterior rings being differentiated into a head, usually bearing eyes and other sense organs. It also contains the mouth, which may be provided with jaws. Among these *Annelids* are the earthworms, of great use in working over the soil, and a number of small forms living in fresh water. But the great majority of the *Annelids* live in the sea, some of them brilliantly colored. The earthworms have no appendages, but many of the marine species have a pair of fleshy appendages which serve as oars on each segment of the body. None of the *Annelids* are parasitic and none have much economic importance.

The Polyzoa (*Bryozoa*) are minute colonial forms whose relationship to the other *Cœlhelmonthes* can only be recognized by careful study. Only a few live in fresh water, the great majority being marine.

Echinoderma.—The members of the phylum *Echinoderma* also have a large body cavity. They derive their name (which means spiny skin) from the fact that the skin contains numerous calcareous plates, an dusually these plates bear numerous spines which protect the animal. There is a complete alimentary canal, with mouth and vent, and the other parts of the body are arranged on the plan of five, radiating from the axis

connecting mouth and vent. Around the mouth is a ring canal filled with fluid, which gives off branches to each of the radii of the body, and connected with these radial canals are peculiar structures, the tube feet, used in locomotion. All of the *Echinoderma* are marine.

Asteroidea (or starfish) have a central disk, with the mouth on the lower side, and radiating from this, like the spokes of a wheel, are the arms with the tube feet on the lower surface. Starfish feed largely on mollusks and prove great enemies to oyster beds. They have great powers of regeneration and lost arms are rapidly replaced.

The Ophiuroidea (brittle or serpent stars) differ from the other starfish in the more slender arms and in the sharper line between arms and disk.

Crinoidea (or sea lilies) have both arms and disk and are attached to the sea bottom by a stalk arising from the disk on the side opposite the mouth. Thus they live with the mouth uppermost, the branched arms forming a funnel, conveying food to the mouth. There are only a few species of *Crinoids* living, but their skeletons are very abundant in the older rocks, where there also occur two related groups, the *Cystoidea* and *Blastoidea*, now extinct.

The Echinoidea include the sea urchins. These are usually spherical, with the parts arranged as if the arms of a starfish had been folded up over the back, the rays being still distinguishable, each bearing its row of tube feet. The body wall is very strong and the spines are moveable, aiding in locomotion. Several species are eaten in Europe. Other species, like the sand dollars, are flattened, and still others are heart shaped, with a marked bilaterality.

The Holothuroidea include the sea cucumbers, which may be compared to a sea urchin, long drawn out between mouth and vent, so that the body is cylindrical. Spines are rare. In the eastern seas some species are taken, dried, and, under the name of trepand, are sent to China, where they are used as a basis for soups.

The Mollusca derive their name from the fact that the body is soft, a matter of little importance. The clams, oysters, snails and squids forming the group have the body cavity greatly reduced; they lack a segmentation to the body; on the lower surface is a projecting part, the foot, while on either side is a fleshy lobe called the mantle, which usually has the power of secreting a shell. This shell, in some forms belonging to several groups, has such a structure that it has an iridescent appearance, and is called mother of pearl. Such mollusks have also the power of forming true pearls, but the majority of pears come from the pearl oyster of tropical seas.

The Amphineura include the *Chitons* of the seashore, in which the foot is a broad, creeping disk, while the shell consists of eight overlapping plates on the back.

The Acephala have a bivalve shell, the two halves being right and left. Just inside the mantle are two pairs of leaf-like gills, while the foot is a muscular organ projecting from the ventral surface and is used in boring, creeping, and in a few even for leaping. Here belong several forms of economic importance, including the shipworm or *Teredo* (which does great damage to submerged wood), and the oysters, clams, scallops and mussels which serve for food. Of the scallops the part eaten is the muscle which closes the two halves of the shell. There are two edible clams on our eastern coast. The oyster is found to-day in the Gulf of St. Lawrence and from Cape Cod south, but not in the intermediate region. The fresh-water mussels (*Unios*) have a pearly shell, and large numbers (65,000 tons a year) are used in the Mississippi valley in the manufacture of pearl buttons.

The Scaphopoda (or tooth shells) are shaped like an elephant's tusk. All are marine and none is of any economic importance.

The Gasteropoda have a broad creeping foot on the lower surface and a single shell, usually coiled in a spiral. (In a few the shell has been lost.) There is usually a single gill; a few have two; while in the land snails the gills have been lost, their place being taken by a so-called lung. Few of the group have any economic value. A few are eaten; some of the land snails destroy vegetation and some of the marine species eat oysters and other shellfish. Some shells are used for cameo engraving and one of the cowries passes as money in some parts of Africa. In a few species there are glands, the secretions of which become red or purple on exposure to the air. The celebrated Tyrian purple of the ancients was derived from one of the *Gasteropods*. The *Heteropods* and *Oteropods*, often given as distinct groups, are really aberrant *Gasteropods*.

The Cephalopoda have a circle of eight or ten (in *Nautilus* about a hundred) tentacles, usually bearing suckers, around the mouth. They have a saccular mantle and either a single external shell or a rudimentary one concealed within the body. The cuttle bone fed to cage birds is the internal shell of the form known as the cuttlefish. Another feature common to the group is the ink sac which secretes the ink, a colored fluid used in clouding the water when the animals wish to escape from some enemy. This ink of one species forms the pigment sepia. All of the *Cephalopoda* are marine. In the seas of Newfoundland and Japan there are immense species, one measuring twenty feet in length, with tentacles thirty-five feet long. Chambered shells, belonging to extinct species (*Ammonites*, *Goniatites*, *Orthoceras*, etc.), are common in the rocks.

Arthropoda.—The members of this phylum differ from the *Annelida* chiefly in the reduced body cavity, the differentiation of the segments into regions (usually head, thorax and abdomen), and in having jointed appendages, specialized for sensory purposes, for eating, for locomotion and for reproductive and protective purposes. All have the segmented body and the presence of compound eyes is common.

The Crustacea are mostly aquatic, breathing by means of gills attached to some of the appendages. Usually the head and thorax are united in a cephalothorax, but the abdomen is distinct and two pairs of appendages are in front of the mouth. Here belong the barnacles (*Cirripedia*) of our shores, the minute *Copepoda* which occur in such enormous numbers in fresh water and in the sea as to be an important food supply for fishes; and the *Decapoda*. This last division, characterized by having five pairs of walking feet, contains the lobster and crabs, important elements in our food supply.

The Acerata have only six pairs of appendages attached to the cephalothorax. The class includes the horseshoe crabs of the ocean and the spiders and scorpions of the land. The scorpions of the warmer climates have a poison sting at the end of the abdomen which is rarely if ever fatal to man. The spiders are celebrated for their spinning powers, the silk coming out of two or three pairs of glands at the end of the abdomen, each species spinning its peculiar type of web. The first pair of appendages of the spiders contain the poison glands. Allied to the spiders are the mites, common on plants, and the ticks, which are a pest in warm climates.

The Malacopoda include a few tropical animals (*Peripatus*) which are interesting to naturalists from their primitive structure, as they show many resemblances to *Annelida*.

The Insecta breathe by air tubes (tracheæ) which open on the sides of the body and ramify the interior. They have a head with four pairs of appendages, only one pair, the antennæ or feelers, being in front of the mouth, the others being subservient to eating. These latter, the mouth-parts, may be adapted for biting or they may be arranged to form a tube suited for piercing and sucking, as in the case of the mosquito. The *Insecta* include the *Hexapoda* and the *Chilopoda*. (See *Entomology*.)

The Chordata, the highest phylum of the animal kingdom, include animals of very different appearance, but all of them, in either the young or the adult, have the following features: There is an early axial skeleton, the notochord, lying between the digestive canal and the central nervous system, there are gill slits extending from the pharynx to the exterior, and the central nervous system is confined to one side of the alimentary canal. There are four great divisions of subphyla—*Leptocardii*, *Tunicata*, *Enteropneusti*, and *Vertebrata*.

The Leptocardii include a few fish-like forms (*Amphioxus*) in the sea in which the notochord is the only skeleton, even a skull being absent. They are of great interest to naturalists from their simple structure.

The Tunicata are also marine. In the young stages they are tadpole shaped, but when they become adult, they are saccular attached forms, commonly called sea squirts, from the way in which they eject water from the two openings in the body wall. In some the animals reproduce by budding, so that colonies of many individuals result.

The Enteropneusti are worm-like forms with no interest except for the zoölogist.

The Vertebrata have a backbone composed of vetebræ formed around the notochord; the brain is inclosed in a skull, and has five regions, and usually there are two pairs of appendages. In the lowest vertebrates, the *Cyclostomes* (lampreys and hagfish), there are no jaws nor paired fins. All other vetebrates have true jaws and hence are called *Gnathostomes*.

The Pisces (or fishes) are aquatic, breathing throughout life by gills. Their appendages are fins and they have a two-chambered heart. Here belong the sharks (*Elasmobranchs*) the *Ganoids* or garpikes and sturgeon, the bony fishes or *Teleosts*, including all of the common fishes, and the lung fishes (*Dipnoi*), in which besides gills, lungs are developed.

The Amphibia include the salamanders, newts, frogs and toads. These breathe by means of the gills in the young stages, while in the adult they have lungs and usually the gills are absorbed. Except the *Cæcilians*, they have legs in the place

of fins. All live on the earth or in fresh water, not a single species occurring in the sea.

The Cyclostomes, fishes and *Amphibians* are grouped together as *Ichthyopsida* (fish-like), as they breathe by gills for at least a part of their lives. The remaining groups of vertebrates are included under the head of *Amniota* from the fact that they have a peculiar envelope, the amnion, which appears in the development.

The Sauropsida include the reptiles and the birds which agree in having scales on the whole body or upon the legs (birds) and in a number of peculiarities of the skeleton. The *Reptilia*, besides the scales, have a heart with three chambers (one partially divided in the crocodiles) and are cold blooded, or, better, have a blood of the same temperature as the surroundings. Of recent forms there are the groups of turtles (*Chelonia*), snakes (*Ophidia*), lizards (*Lacertilia*), and crocodiles and alligators (*Crocodilia*). In geologic time there were several other groups, some including enormous animals (*Dinosaurs*) and some that were capable of flight (*Pterodactyls*). The birds or *Aves* are marked off from all other animals by the feathers. All of them lay eggs and all have a four-chambered heart and the blood is always of the same temperature (warm blood), no matter what the surroundings. About twelve thousand different species of birds are known, nine hundred in North America.

The Mammalia are as sharply marked off by the presence of hair and by the presence of milk glands, by the secretion of which the young are nourished. They also have a four-chambered heart and blood of a constant temperature. The lowest group (*Monotremata*), occurring only in the Australian region, lay eggs, but all other mammals bring forth living young.

The *Marsupials*, represented in America by the opossums, in Australia by the kangaroos, wombat, and a number of other forms, have a pouch (marsupium) on the ventral surface in which the young are carried for some time after birth.

Placentalia.—All other mammals have a peculiar structure in their early development, known as the placenta, and hence they are grouped as the *Placentalia*. There are twelve orders of these.

(1) The *Edentates*, in which the teeth are poorly developed or are lacking and the toes are clawed. Here belong the ant-eaters, sloths, etc.

(2) *The Insectivora* are small animals (shrews, moles, hedgehogs) which largely feed upon insects.

(3) The *Chiroptera* (or bats) have the fingers greatly elongated and connected by membrane, the whole forming a wing. Most species are insect feeders, but some are fruit eaters in the tropics of the old world.

(4) The *Rodentia* (or gnawers) have two or four chisel-like teeth in each jaw, and clawed feet. Here belong the rats, mice, squirrels, beaver, porcupines, rabbits and hares.

(5) The *Ungulata* have hoofs on the tips of the toes and are herbivorous. They are subdivided accordingly as the feet have an odd or an even number of toes. To the odd-toed group belong the tapirs, rhinoceroses and horses. The even-toed group includes the hippopotamus, pigs and camels, as well as a large number of species grouped as *Ruminants* because they chew the cud. The giraffes, deer, elk, cattle, buffalo, sheep, goats, and antelopes belong here. As will readily be seen, the *Ungulata* is the most important group of mammals from the standpoint of human interest.

(6) The *Proboscidia* includes the elephants, of which two species are now alive. In these the nose is drawn out into the well-known trunk and the upper incisors grow into the familiar tusks. In former times the group was larger, including the mammoths and mastodons, much like the elephants, and the dinotherium, in which the tusks were in the lower jaw.

(7) The *Hyracoidea* include a few species from the old world, one of which is supposed to be the coney of the bible.

(8) The *Sirenia* are aquatic mammals with the fore limbs fin-like and the hinder ones lacking. The manatee and the dugong represent the group.

(9) The whales, or *Cetacea* externally resemble the *Sirenians*, but they are separated by several anatomical points. The whales are the most aquatic of all mammals and have almost entirely lost the hair, one species having only a scanty mustache in the young stage. The tail is flattened into a caudal fin which differs from that of any fish in being horizontal.

There are two great groups of *Cetacea*, the one having teeth, the other lacking them. To the toothed group belong the dolphins, blackfish, sperm whales and the narwhal. The sperm whales have an enormous mass of a peculiar fat (spermaceti) on the upper side of the head; the narwhal has a single tooth drawn out into a long twisted spine projecting from the front of the head. The toothless whales have a peculiar series of horny plates developed from the roof of the mouth. These form a strainer by means of which the animals are able to strain the minute life on which they feed from the water. This is the whalebone so important in woman's apparel.

(10) The *Carnivora* are the flesh eaters which prey on all other mammals. They have clawed feet and teeth adapted to a diet of flesh. Most of the species are terrestrial, and here may be mentioned the hyænas, raccoon, mink and weasel, ermine, otters, dogs, foxes, bears, and all of the cat tribe. Some of the *Carnivores* have taken to the water and have become almost as aquatic as the whales. These are the seals, sea lions and walruses. As will be seen, the group of *Carnivores* is possibly the most important source of furs, the *Rodentia* only approaching it.

(11) The *Prosimiæ* (or lemurs) include, a few species of monkey-like animals from Madagascar and India.

THE PRINCIPAL GROUPS OF THE ANIMAL KINGDOM

Protozoa.—One-celled animals of microscopic size.		Rhizopoda. Flagellata. Ciliata. Sporozoa.	**Metazoa.**—Cont.	**Arthropoda.**—Jointed animals with distinct feet and hard external skeleton.	Crustacea.—Trilobitæ, trilobites (fossil). Phyllopoda, fairy shrimp. Copepoda. Ostracoda. Cirripedia, barnacles. Malacostraca, crabs, lobsters, shrimp, beach fleas, sowbugs.
Metazoa.—Many-celled animals.	**Porifera.**—Sponges.	Calcispongiæ. Silicispongiæ.			Acerata.—Gigantostraca, horseshoe crabs. Arachnida, spiders, scorpions, mites.
	Coelenterata.—Corals, jellyfish, etc.	Hydrozoa.—Hydroidea, hydroids, jellyfish. Siphonophora, tubular jellyfish. Scyphozoa.—Actinozoa, sea anemones, corals. Scyphomedusæ, larger jellyfish. Ctenophora.—Comb-bearing jellyfish.			Malacopoda.—Peripatus. Insecta.—Chilopoda, centipedes. Hexapoda, true insects. Apterygota, bristle tails, spring tails. Pseudoneuroptera, white ants, dragon flies. Orthoptera, locusts, grasshoppers, roaches. Neuroptera, May flies, dobsons. Coleoptera, beetles. Hymenoptera, bees, wasps, ants, sawflies. Diptera, true flies. Lepidoptera, butterflies, moths. Diplopoda, thousand legs.
	Platodes.—Flatworms.	Turbellaria.—Nonparasitic. Trematoda.—Flukeworms, etc. Cestoda.—Tapeworms. Nemertini.			
	Rotatoria. **Coelhelmonthes.**—Worms with body cavity.	Rotifera.—Wheel animalcules. Nematoda.—Round worms. Annelida.—Jointed worms, earthworms, etc. Polyzoa.—Moss animals. Brachiopoda.—Lamp shells.	**Chordata.**	**Leptocardii.**—Lancelets. **Tunicata**—Seasquirts, sea peaches etc. **Enteropneusta.**—Whale's tongue, "worm" vertebrate, backboned animals.	
	Echinoderma.—Starfish, sea urchins, etc.	Asteroidea.—Starfish. Ophiuroidea.—Brittle stars. Crinoidea.—Sea lilies. Echinoidea.—Sea urchins. Holothuroidea.—Sea cucumbers.		**Ichthyopsida.**	Cyclostomata.—Lampreys, hagfish. Pisces.—Fishes. Elasmobranchii, sharks, skates. Ganoids, sturgeon, garpike. Teleostei, ordinary fishes. Dipnoi, lung fishes. Amphibia.—Urodela, newts, salamanders. Anura, frogs, toads.
	Mollusca.—Mollusks, usually with a calcareous shell.	Amphineura.—Chitons. Acephala, bivave mollusks, clams, oysters. Scaphopoda.—Tooth shells. Gasteropoda.—Univalve mollusks, snails. Cephalopoda.—Squid, cuttlefish.		**Amniota**	Sauropsida.—Reptilia, snakes, lizards, turtles, alligators. Aves, birds.
			Mammalia.	Mammals.

DICTIONARY OF ANIMALS

Aard-vark.—The *Orycteropus capensis*, an insectivorous animal which partakes of the nature both of the ant-eater and the armadillo; agreeing with the former in its general habits, but, although entirely destitute of scaly armor, more resembling the latter as to its anatomical structure. It measures about five feet to the end of the tail; its skin is thick, coarse, and covered with stiff hair; limbs short, thick, and very muscular. This animal is very common in South Africa, and has received its popular name from its habit of burrowing (which its taper head and powerful claws are admirably adapted for), as well as from its fancied resemblance to a small pig.

Aard-wolf.—The *Proteles lalandii*, a singular carnivorous animal. It forms the connecting link between three genera widely separated from each other, having externally the appearance and bone-structure of the hyæna united to the head and feet of the fox, with the intestines of the civet. Its size is about that of a full-grown fox, which it resembles in both its habits and manners, being nocturnal, and constructing a subterraneous abode.

Abou-hannes.—An African bird, considered by some naturalists to be identical with the ancient ibis. Although solitary in its habits, it is sometimes seen in small bands of from six to ten, and is capable of a lofty and powerful flight.

Acanthurus (or surgeon-fish), chiefly distinguished by the sharp and lancet-like spines with which it is armed on each side of the tail. They abound in the tropical seas, where they are generally seen in large shoals of two or three hundred each, swimming with great strength, and feeding principally on different kinds of seaweed. The genus contains a large number of species, many of which are extremely beautiful, both in form and color.

Adder.—A viper (*Pelias berus*), widely distributed throughout Europe, the only British venomous snake. It attains a length of over two feet, is brown, with a black zigzag line down the back, feeds chiefly upon mice, and is viviparous. Its bite rarely proves fatal, unless to very weak persons and children. In the United States the term is applied to some poisonous snakes without rattles, as the moccasin, or "water-adder," and the copperhead, or "red adder," and also to the harmless hognose, which resembles in appearance and assumes the defensive attitude of a viper when it is disturbed.

Agouara (or crab-eater).—A carnivorous animal, allied to the raccoons, a native of South America. It equals in size an ordinary fox, to which it bears a slight external resemblance. It derives its name of crab-eater from its habit of feeding on all kinds of crustacea and mollusks, whether marine or terrestrial.

Agouti.—A South American animal belonging to the *Rodentia*. The agoutis live for the most part upon the surface of the ground, not climbing nor digging to any depth; and they commonly sit upon their haunches, when at rest, holding their food between their forepaws, in the manner of squirrels. By eating the roots of the sugar-cane, they are often the cause of great injury to the planters.

Albatross.—A genus of birds of the family *Procellaridæ*. The species are the largest of all aquatic birds, the wings, when extended, measuring sometimes fifteen feet, and weight often exceeding twenty pounds. Its plumage is white, with some black bands on the wings and back. It has a strong, hard, long beak, of a pale-yellow color; the feet, flesh-colored, are short and webbed, and the wings are long, strong, and narrow. It preys on the wing, and is very voracious. Many are continually met with in the Southern ocean, and are also seen in immense flocks about Behring strait in the early part of summer, attracted thither by the vast shoals of fish whose migrations they follow. Their powers of flight are prodigious.

Alligator.—A genus of very formidable and ferocious reptiles, found in the tropical regions of America, and closely resembling the crocodile. They differ from the true crocodiles in having a shorter and flatter head, cavities or pits in the upper jaw, into which the long canine teeth of the under jaw fit, and feet much less webbed. Their habits are less perfectly aquatic. The largest grows to the length of seventeen or eighteen feet. The female lays her eggs in the sand, to be hatched by the heat of the sun.

Alpaca.—The *Peruvian sheep*, a variety of the guanaco or llama. It inhabits the more elevated parts of the mountain ranges, living almost on the border of perpetual snow. The Peruvians keep vast flocks of them for the sake of the silky luster and fineness of their wool, which furnishes material for the best of fabrics.

Anaconda.—The popular name of two of the largest species of the serpent tribe, *viz.*, a Ceylonese species of the genus *Python tigris*, said to have been met with thirty-three feet long; and *Eunectes murinus*, a native of tropical America, allied to the boa-constrictor, and the largest of the serpent tribe, attaining the length of forty feet. They frequent swamps and rivers, are destitute of poison fangs, and kill their victims by constriction.

Anas.—A genus of birds of the subfamily *Anatinæ*, distinguished by a bill broad, depressed, larger than the head, and a pointed tail. The common wild duck or mallard, *Anas boschas* is the original stock of our tame or domesticated duck. The flesh of the wild duck is highly esteemed as an article of food. The widgeon (*Mareca penelope*), a species of the same genus, is a migratory bird, bred in the morasses of the north, which they quit on the approach of winter, spreading themselves along the shores, and over the marshes and lakes in various parts of the United States. They are easily domesticated in places where there is plenty of water, and are much admired for their beauty and sprightliness.

Anchovy.—The *Engraulis encrasicolus*, a well-known small fish of the herring family, abounding in many parts of the Mediterranean, particularly on the coasts of Italy, Greece, Spain, and France. It is about four inches long, of a bluish-brown color on the back, and silvery-white on the belly. They were known to the ancients, and were used both by the Greeks and Romans as a pickle or sauce under the name of *garum*.

Angora goat.—The *Capra angorensis* is by far the most important of all the varieties of the goat, and is a native of Angora, a small district of Asia Minor, remarkable for producing not only this peculiar race of goats, but also sheep, cats, rabbits, etc., with hair of uncommon fineness. The goat of Angora is generally of a beautiful milk-white color, short-legged, with black, spreading, spirally-twisted horns, and pendulous ears. Its chief and distinguishing excellence, however, is the wool, which covers the whole body in long pendent spiral ringlets; and it is from the hair of this animal that the finest camlets are made. To the same genus belongs the cashmere goat, so highly prized for its fleece; it is descended from the goat of Tibet, which pastures on the Himalayas. It is smaller than the common domestic goat, and has long, fine, silky wool. These goats are now acclimatized in the United States, both pure and crossed with the native goat. Far from deteriorating by the transfer, as had been predicted, it is found that in some parts of the country even the unmixed breed of the imported goats has shown evident signs of improvement resulting from the change.

Ant.—The common name of hymenopterous (or membranous-winged) insects of various genera, of the family *Formicidæ*, found in most temperate and tropical regions. They are small but powerful insects, and have long been noted for their remarkable intelligence and interesting habits. They live in communities regulated by definite laws, each member of the society bearing a well-defined and separate part in the work of the colony. Each community consists of males; of females much larger than the males; and of barren females, otherwise called neuters, workers, or nurses. The neuters are wingless, and the males and females only acquire wings for their "nuptial flight," after which the males perish, and the few females which escape the pursuit of their numerous enemies divest themselves of their wings, and either return to established nests, or become the foundresses of new colonies. The neuters perform all the labors of the ant-hill or abode of the community; they excavate the galleries, procure food, and feed the larvæ or young ants, which are destitute of organs of motion. In fine weather they carefully convey them to the surface for the benefit of the sun's heat, and as attentively carry them to a place of safety either when bad weather is threatened or the ant-hill is disturbed. In like manner they watch over the safety of the nymphs, or pupæ, about to acquire their perfect growth. Some communities possess a special type of neuters, known as "soldiers," from the duties that specially fall upon them, and from their powerful biting jaws. There is a very considerable variety in the materials, size, and form of ant-hills, or nests, according to the peculiar nature or instinct of the species. Some ants live on animal food, very quickly picking quite clean the skeleton of any dead animal they may light on. Others live on saccharine matter, being very fond of the sweet substance, called honey-dew, which exudes from the bodies of aphides, or plant lice. These they sometimes keep in their nests, and sometimes tend on the plants where they feed; sometimes they even superintend their breeding. By stroking the aphides with their antennæ they cause them to emit the sweet fluid, which the ants then greedily sip up. Various other insects are looked after by ants in a similar manner, or are found in their nests. It has been observed that some species, like the red ant (*Formica sanguinea*), resort to violence to obtain working ants of other species for their own use, plundering the nests of suitable kinds of their larvæ and pupæ, which they carry off to their own nests to be carefully reared and kept as slaves. In temperate countries male and female ants survive, at most, till autumn, or to the commencement of cool weather, though a very large proportion of them cease to exist long prior to that time. The neuters pass the winter in a state of torpor, and of course require no food. The only time when they require food is during the season of activity, when they have a vast number of young to feed. Some species have stings as weapons, others only their powerful mandibles, or an acrid and pungent fluid (formic acid) which they can emit.

Ant-eater.—A genus of the family *Armadillo*, order *Edentata*. The ant-eaters have no grinders, have the body covered with rather long hair, an elongated slender head, with very long exsertile tongue, and walk on the sides of their feet with the claws incurved. The great ant-eater, *Myrmecophaga jubata*, is a native of Brazil and Guiana, and is much the largest of all the ant-eaters. It is covered with long, coarse, shaggy hair, and has a remarkably large tail, with which, when at repose, it can wrap itself up so as to be effectually protected from heat or rain. It is a powerful animal, and specimens often occur which measure more than eight feet in length from the extremity of the nose to the end of the tail. It lives exclusively on ants, and procures these insects in abundance by tearing open their hills with its hooked claws, and then drawing its long tongue, which is covered with glutinous saliva, over the swarms which flock from all quarters to defend their dwelling.

Antelope.—A division of the large family *Cavicornia*, or hollow-horned ruminants, and of graceful and symmetrical proportions; of a restless and timid disposition; extremely watchful, of great vivacity, and remarkably swift and agile. Externally, they very much resemble deer, from which, however, they are to be distinguished by various points of structure, such as the horns, which in the deer are solid and branched, and by the absence of front teeth in the upper jaw. Generally speaking, antelopes are gregarious, and unite in large flocks or herds. Africa may be considered the head-quarters of the antelope. The species are numerous, and include the springbok, hartbeest, gnu, eland, and gazelle, among others. There are two European antelopes, the chamois, which inhabits the Alps, and the saiga from eastern Russia.

Ape.—The name of a quadrumanous family of mammalian animals, *Simiadæ*, which embraces the most highly developed forms of the monkeys. They are all of them inhabitants of the old world. The nostrils are divided by a narrow septum; they possess opposite thumbs on their fore and hind feet; the callosities on the rumps are generally naked. Some of the species only are furnished with cheek-pouches. The species are divided into two groups—1. The tailless, or apes, comprising the chimpanzee, the gorilla and the orang-outang; 2. The tailed monkeys, including all the true monkeys of the old world.

Ant-lion.—The larva of a neuropterous insect (*Myrmeleon formicarius*), which in its perfect state greatly resembles a dragon-fly; curious on account of its ingenious method of catching the insects—chiefly ants—on which it feeds. It digs a funnel-shaped hole in the driest and finest sand it can find, and when the pit is deep enough, and the sides are quite smooth and sloping, it buries itself at the bottom with only its formidable mandibles projecting, and waits till some luckless insect stumbles over the edge, when it is immediately seized, its juices sucked, and the dead body jerked out. It inhabits southern Europe.

Argonaut.—A molluscous animal of the genus *Argonauta*, belonging to the two-gilled cuttle-fishes, distinguished by the females possessing a single-chambered external shell not organically connected with the body of the animal. The males have no shell and are of much smaller size than the females. The shell is fragile, translucent, and boat-like in shape; it serves as the receptacle of the ova or eggs of the female, which sits in it with the respiratory tube or "funnel" turned toward the carina or "keel." This famed mollusk swims only by ejecting water from its funnel, and it can crawl in a reversed position, carrying its shell over its back like a snail. The argonaut, or *paper-nautilus*, must be carefully distinguished from the *pearly-nautilus* or nautilus proper

Argus pheasant (*Argus giganteus*).—A large, beautiful, and very singular species of pheasant, found native in the southeast of Asia, more especially in Sumatra and some of the other islands. The males measure from five to six feet from the tip of the beak to the extremity of the tail, which has two greatly elongated central feathers. The plumage is exceedingly beautiful, the secondary quills of the wings, which are longer than the primary feathers, being each adorned with a series of ocellated or eye-like spots of brilliant metallic hues. The general body plumage is brown.

Armadillo (genus *Dasypus*).—A mammal peculiar to South America, consisting of various species, belonging to a family intermediate between the sloths and ant-eaters. They are covered with a hard bony shell, divided into belts, composed of small separate plates like a coat of mail, flexible everywhere except on the forehead, shoulders, and haunches, where it is not movable. The belts are connected by a membrane, which enables the animal to roll itself up like a hedgehog. These animals burrow in the earth, where they lie during the daytime, seldom going abroad except at night. They are of different sizes: the largest, *Dasypus gigas*, being three feet in length without the tail, and the smallest only ten inches. They subsist chiefly on fruits and roots, sometimes on insects and flesh. They are inoffensive, and their flesh is esteemed good food.

Asp (*Naja*, or *Vipera, haje*).—A species of viper found in Egypt, resembling the *cobra da capello*, or spectacle-serpent, of the East Indies, and having

a very venomous bite. When approached or disturbed it elevates its head and body, swells out its neck, and appears to stand erect to attack the aggressor. Hence the ancient Egyptians believed that the asps were guardians of the spots they inhabited, and the figure of this reptile was adopted as an emblem of the protecting genius of the world. The balancing motions made by it in the endeavor to maintain the erect attitude have led to the employment of the asp as a dancing serpent by the African jugglers.

Ass (*Equus asinus*).—A species of the horse genus, supposed by Darwin to have sprung from the wild variety (*Asinus tæniopus*) found in Abyssinia; by some writers to be a descendant of the *onager*, or wild ass, inhabiting the mountainous desert of Tartary, etc.; and by others to have descended from the kiang of southwestern Asia. Both in color and size the ass is exceedingly variable, ranging from dark gray and reddish brown to white, and from the size of a Newfoundland dog in northern India to that of a good-sized horse. In the southwestern countries of Asia and in Egypt, in some districts of southern Europe, as in Spain, and in Kentucky and Peru, great attention has been paid to selection and interbreeding, with a result no less remarkable than in the case of the horse. Thus in Syria there appear to be four distinct breeds—a light and graceful animal used by ladies, an Arab breed reserved for the saddle, an ass of heavier build in use for plowing and draft purposes, and the large Damascus breed.

The *mule* is a hybrid between the horse and the ass, differing in size, strength, and beauty, according to the predominance of its parental species; those between a male ass and a mare being far superior to the progeny of a she-ass with a horse. In mountainous countries mules are highly serviceable; no beast of burden being either so sure-footed, or so capable of enduring fatigue; but in beauty of form they fall far short of that noble quadruped, the horse; the mule having a large, clumsy head, long erect ears, a short mane, and a thin tail.

Auk.—A name of certain swimming birds (family *Alcidæ*), including the great auk, the little auk, the puffin, etc. The genus *Alca*, or auks proper, contains only two species, the great auk (*Alca impennis*), and the razor-bill (*Alca torda*). The great auk or gair-fowl, a bird about three feet in length, is now extinct.

Avoset.—A bird about the size of a lapwing, of the snipe family. The bill is long, slender, elastic, and bent upward toward the tip, the legs long, the feet webbed, and the plumage variegated with black and white. The bird feeds on worms and other small animals, which it scoops up from the mud of the marshes and fens that it frequents. It is found in Europe, Asia, Africa, and America; but the American species is slightly different from the others.

Axolotl (*Amblystoma maculatum*). — A curious Mexican amphibian, not unlike a newt, from eight to ten inches in length, with gills formed of three long ramified or branchlike processes floating on each side of the neck. It reproduces by laying eggs, and was for some time regarded as a perfect animal with permanent gills. It is said, however, that they frequently lose their gills like the other members of the genus. The axolotl is esteemed a luxury by the Mexicans. There are a number of species in North America.

Baboon.—A common name applied to a division of old-world quadrumana (apes and monkeys), comprehending the genera *Cynocephalus* and *Papio*. They have elongated abrupt muzzles like a dog, strong tusks or canine teeth, usually short tails, cheek-pouches, small deep eyes with large eyebrows, and naked callosities on the buttock. Their hind and fore feet are well proportioned, so that they run easily on all fours, but they do not maintain themselves in an upright posture with facility. They are generally of the size of a moderately large dog, but the largest, the mandrill, is, when erect, nearly of the height of a man. They are almost all African, ugly, sullen, fierce, lascivious, and gregarious, defending themselves by throwing stones, dirt, etc. They live on fruits and roots, eggs and insects. They include the chacma, drill, common baboon, and mandrill. The chacma, or pig-tailed baboon, (*Cynocephalus porcarius*) is found in considerable numbers in parts of South Africa. The common baboon (*C. babouin*) inhabits a large part of Africa farther to the north. It is of a brownish-yellow color, while the chacma is grayish black, or in parts black. The hamadryas (*C. hamadryas*) of Abyssinia is characterized by long hair, forming a sort of shoulder cape. The black baboon (*C. niger*) is found in Celebes.

Babyroussa.—A species of wild hog (*Sus* or *Porcus babyrussa*), a native of the Indian archipelago. From the outside of the upper jaw spring two teeth twelve inches long, curving upward and backward like horns, and almost touching the forehead. The tusks of the lower jaw also appear externally, though they are not so long as those of the upper jaw. Along the back are some weak bristles, and on the rest of the body only a sort of wool. These animals live in herds, feed on herbage, are sometimes tamed, and their flesh is well flavored.

Badger.—A quadruped of which there are several species, comprising the genus *Taxidea*, family *Mustelidæ*. It is generally regarded as a solitary, stupid animal, that seeks refuge in the most sequestered places, and shuns the light of day. It has very short legs and a broad flat body; the head is long and pointed, the eyes small, and the tail remarkably short. Its prevailing color is a kind of mottled gray; the face is white, and along each side of the head runs a long pyramidal band of black, including the eyes and ears. With its powerful claws it constructs a deep and commodious burrow. It lives chiefly on roots, fruits, insects, and frogs. It is about 2½ feet long. The flesh of the badger is reckoned a delicacy, and may be cured into hams and bacon.

Barbary ape.—A species of ape, or tailless monkey, with greenish-brown hair, of the size of a large cat, remarkable for docility; also called the *magot*. It is common in Barbary and other parts of Africa, and some used to live formerly on Gibraltar rock, being the only European monkey, though probably not indigenous. It has been the "showman's ape" from time immemorial.

Barbets.—A family of climbing birds with a thick, conical beak, having tufts of bristles at its base. Their wings are short and their flight somewhat heavy. They have been divided into three subgenera—the barbicans, inhabiting India and Africa, and feeding chiefly on fruit; the barbets proper, found in Africa and America, and nearly related to the wookpeckers; and the puff-birds, inhabiting America, and feeding on insects.

Barnacle.—The name of a family of marine crustaceous animals, order *Cirripedia*. They are enveloped by a mantle and shell, composed of five principal valves and several smaller pieces, joined together by a membrane attached to their circumference; and they are furnished with a long, flexible, fleshy stalk or peduncle, provided with muscles, by which they attach themselves to ship's bottoms, submerged timber, etc. They feed on small marine animals, brought within their reach by the water and secured by their tentacula. Some of the larger species are edible.

Basilisk.—The animal now recognized by that name is a reptile, family *Iguanidæ*, of a very singular shape, being distinguished by a long and broad wing-like process or expansion along the back and upper part of the tail, and furnished at certain distances with interval radii analogous to those in the wings of the *draco*, or flying lizard. This process is capable of being either dilated or contracted at the pleasure of the animal; and the occiput, or hind part of the head, is elevated into a very conspicuous pointed hood or hollow crest. Notwithstanding its formidable appearance, however, the basilisk is a perfectly harmless reptile, residing principally among trees, where it feeds on insects, etc. The general color of this animal is a pale cinereous brown, slightly varied on the back and sides with different shades of brown and blue, and silvery-white on the belly. It is possessed of great activity, and from its peculiar structure can adapt itself to the watery element without inconvenience. It is most common in the tropical parts of South America.

Bass.—A genus of fishes, distinguished by scaly opercula terminating in two spines, and by a rough tongue. The striped bass is a salt-water fish which keeps near the land, ascending fresh-water streams in the spring to breed. It is from one to four feet long, brown above, silvery beneath, and is very common on the coast of New England. Some specimens weigh seventy-five pounds each. It readily bites at the hook, and is taken in large quantities with the seine.

Bat.—One of the group of wing-handed, flying mammals having the fore-limb peculiarly modified so as to serve for flight, and constituting the order *Cheiroptera*. Bats are animals of the twilight and darkness, and are common in temperate and warm regions, but are most numerous and largest in the tropics. All European bats are small, and have a mouse-like skin. The body of the largest British species, (*Vespertilio noctuula,*) is smaller than that of a mouse, but its wings stretch about fifteen inches. During the day it remains in caverns, in the crevices of ruins, hollow trees, and such-like lurking-places, and flits out at evening in search of food, which consists of insects. Several species of the same genus are common in North America. Many bats are remarkable for having a singular nasal cutaneous appendage, bearing in some cases a fancied resemblance to a horseshoe. Two of these horseshoe bats occur in Britain. Bats may be conveniently divided into two sections—the insectivorous or carnivorous, comprising all European and most African and American species; and the fruit-eating, belonging to tropical Asia and Australia, with several African forms. An Australian fruit-eating bat, commonly known as the kalong or flying-fox, is the largest of all the bats; it does much mischief in orchards. At least two species of South America bats are known to suck the blood of other mammals, and hence are called "vampire-bats." The best known is the *Desmodus rufus* of Brazil, Chili, etc. As winter approaches, in cold climates bats seek shelter in caverns, vaults, ruinous and deserted buildings, and similar retreats, where they cling together in large clusters, hanging head downward by the feet, and remain in a torpid condition until the returning spring recalls them to active exertions.

Batrachia (from the Gr. *batrachos*, a frog). — An order of amphibious animals which includes the frogs and toads; it is also designated by the name of *Anoura*, or "tailless" amphibians. In the batrachia, the adult is destitute of gills and tail, and the two pairs of limbs are always present; there are no ribs, and the skin is soft; the mouth is sometimes without teeth, but the upper jaw is usually provided with teeth, and, more rarely, both jaws; the hind-limbs usually have the toes webbed for swimming, and are much larger than the fore-limbs. In the adult batrachia the breathing is carried on by means of lungs; but, as there are no movable ribs, the process of breathing is somewhat peculiar—in fact, it is one of swallowing, and it is possible to suffocate a frog simply by holding its mouth open. The moist and delicate skin, however, also performs an important part in respiration. The young, or larvæ, of frogs and toads are familiarly known as "tadpoles." The eggs are deposited in masses in water, and the young, when hatched, are fishlike in form, with a broad, rounded head and a compressed tail. There are at first two sets of gills, one external and the other internal; but the outer ones disappear very shortly after birth, and the inner ones are subsequently replaced by lungs. The hind-limbs first make their appearance, and are followed by the fore-limbs; and as the limbs become fully developed the tail gradually disappears. In both the common frog and the toad the tongue is fixed to the front of the mouth, while it is free behind, so that it can be protruded for some distance from the mouth. The tree frogs have the toes of all the feet furnished with terminal suckers, by the help of which they climb with ease; they are mostly found in America, but one species is European. The Surinam toads (found in Surinam and also in Brazil) rarely have teeth, and the mouth is destitute of a tongue.

Beagle.—A small hound or hunting-dog formerly much used in coursing hares, and more remarkable for perseverance than speed. Beagles were formerly distinguished as the *rough* and the *smooth*. The rough wire-haired or *terrier* beagle is now seldom met with, though it was a hardy and altogether a vermin-loving breed, and very strongly formed. The North England beagle is a nimble and vigorous hound.

Bear.—The name of several large plantigrade carnivorous mammals of the genus *Ursus*. The teeth are forty-two in number, as in the dog, but there is no carnassial or sectorial tooth, and the molars have a more tubercular character than in other carnivores. The eyes have a nictitating membrane, the nose is prominent and mobile, and the tail very short. The true bears are about ten in number, natives chiefly of Europe, Asia, and North America. They generally lie dormant in their den during the winter months. The brown or black bear of Europe is the *Ursus arctos*. It is a native of almost all the northern parts of Europe and Asia, and was at one time common in the British islands. It feeds on fruits, roots, honey, ants, and, in case of need, on mammals. It sometimes reaches the length of seven feet, the largest specimens being found farthest to the north. It lives solitarily. The American black bear is the *Ursus americanus*, with black shining hair, and rarely above five feet in length. It is a great climber, is less dangerous than the brown bear, and is hunted for its fur and flesh. It is very amusing in captivity. The grizzly bear (*Ursus ferox* or *horribilis*) is an inhabitant of the Rocky mountains; it is a ferocious animal, sometimes nine feet in length, and has a bulky and unwieldy form, but is nevertheless capable of great rapidity of motion. The extinct cave bear (*Ursus spelæus*) seems to have been closely akin to the grizzly. The Siberian bear (*Ursus collaris*) is perhaps a variety of the brown bear. The polar or white bear (*Ursus maritimus*) is characterized by its flat head and comparatively long neck.

Beaver.—A quadruped of the order *Rodentia*, or gnawers, the only species of its genus. It is very widely distributed, being found in the northern parts of Europe, Asia, and America, nowadays most abundantly in the northern and thinly peopled parts of North America, dwelling in communities on the banks of rivers and lakes. At one time immense numbers of these animals were killed for their fur, which was largely used in making hats.

Bee.—A well known family of insects, belonging to the order *Hymenoptera*, an order which also includes the wasps, ants, and gall-flies. Man appears from the very earliest ages to have known the value of bees, and to have taken advantage of their produce. The bible makes mention of honey-bees, and the Latin poet Vergil has celebrated them in the fourth book of his *Georgics*, where he has summed up all that the ancients knew about them. During the greater part of the year the population of our hives is composed exclusively of two sorts of individuals, namely, the female or mother bee, called also the *queen bee*, and the working bees or neuters, which are, properly speaking, females imperfectly developed. A third kind of individuals, the males, called also *drones*, are generally not met with except from May to July. The working bees constitute essentially the bee community; they are recognized by their small size, reddish-brown color, and, above all, by the palettes and brushes with which the hing legs are furnished. The three pairs of legs, which are inserted in the thorax, or chest, of the bee, are its tool. The two hind legs are longer

than the other pairs, and present on the exterior a triangular depression, resembling a *palette*, which is surrounded by stiff hairs, forming the borders of a sort of basket in which the insect deposits the pollen of flowers. To each of these hind legs is jointed a square expanded piece, which might be termed the ankle, smooth on the exterior, but having hairs on its interior surface which has caused it to be named the *brush*, and which is employed in collecting the pollen. The other tools of the working bee consist of a pair of movable mandibles, which close the mouth on its two sides, and of a trunk, or proboscis, which may be considered as a sort of tongue; this latter organ has a hairy surface, to which the honey of flowers adheres, whence it is conveyed to the mouth, and from it to the stomach, to be subsequently disgorged. The males, or drones, are larger and more hairy than the working bees; they emit a buzzing sound, have no palettes, and no sting. The female, or queen, has a longer body than the workers, and the wings shorter in proportion. The only part she has to play is that of laying eggs, and so she has no palettes or brushes. Only one queen lives in each hive, of which she is perfect sovereign, all the workers submissively obeying her. The number of males is scarcely one-tenth that of the working bees, and they live only about three months. The wax of which the cells of the honeycomb are constructed is supposed to be secreted by an organ situated in the abdomen, or belly, of the bee; but, in addition to wax, another substance, much resembling it, but not identical, called *propolis*, is elaborated from the juices of certain plants, and employed to line the inner surface of the hive. The cells are hexagonal in shape, that is, having six equal sides—the most economical form as regards space—and are of two kinds, namely, store-cells, which are filled with honey, as a reserve store of food, and cradle-cells, in which the eggs are deposited. At a certain time of the year the queen leaves the hive, accompanied by the drones, and takes what is called her "nuptial flight" through the air. About forty-eight hours after her return to the hive she begins laying her eggs, at the rate of about two hundred a day. The eggs which are destined to develop into workers are first laid, then those which are to produce males, and lastly those which give birth to females. The eggs are not long in being hatched, and the *larvæ*, or caterpillars, which emerge from them are tended by the workers, and fed by them on a peculiar paste, which is apparently a preparation of pollen. In five or six days the larvæ pass into the condition of *pupa*, or chrysalis, and in about seven or eight days after this the perfect insect is hatched.

Beetle.—A name often used as synonymous with the term *Coleoptera*, but restricted by others to include all those insects that have their wings protected by hard cases or sheaths, called elytra. Beetles vary in size from a mere point to the bulk of a man's fist, the largest, the elephant beetle of South America, being four inches long. The so-called "black beetles" of kitchens and cellars are not properly beetles at all, but cockroaches, and of the order *Orthoptera*.

Bird-catching spider.—A name applied to gigantic spiders of the genera *Mygale* and *Epeira*, more especially to the *Mygale avicularia*, a native of Surinam and elsewhere, which preys upon insects and small birds, which it hunts for and pounces on. It is about two inches long, very hairy, and almost black; its feet when spread out occupy a surface of nearly a foot in diameter.

Bird of paradise.—The name for members of a family of birds of splendid plumage allied to the crows, inhabiting New Guinea and the adjacent islands. The family includes eleven or twelve genera and a number of species, some of them remarkably beautiful. The largest species is over two feet in length. The king bird of paradise (*Paradisea regia*) is possibly the most beautiful species, but is rare. It has a magnificent plume of feathers, of a delicate yellow color, coming up from under the wings, and falling over the back like a jet of water. The feathers of the *Paradisea major* and *Paradisea minor* are those chiefly worn in plumes. These splendid ornaments are confined to the male bird.

Bison.—The name applied to two species of ox. One of these, the European bison, or aurochs, (*Bos bison* or *Bison europæus*), is now nearly extinct, being found only in the forests of Lithuania and the Caucasus. The other, or American bison, improperly termed buffalo (*Bison americanus*), is found only in the region lying north and south between the Great Slave lake and the Yellowstone river, and is rapidly becoming extinct in the wild state, though formerly to be met with in immense herds. The two species closely resemble each other, the American bison, however, being for the most part smaller, and with shorter and weaker hind-quarters. The bison is remarkable for the great hump or projection over its fore-shoulders, at which point the adult male is almost six feet in height; and for the long, shaggy rust-colored hair over the head, neck, and forepart of the body. In summer, from the shoulders backward, the surface is covered with a very short fine hair, smooth and soft as velvet. The tail is short and tufted at the end. The American bison used to be much hunted for sport as well as for its flesh and skin. Its flesh is rather coarser grained than that of the domestic ox, but was considered by hunters and travelers as superior in tenderness and flavor. The hump is highly celebrated for its richness and delicacy. Their skins, especially that of the cow, dressed in the Indian fashion, with the hair on, make admirable defenses against the cold, and are known as *buffalo robes;* the wool has been manufactured into hats, and a coarse cloth. The American bison has been found to breed readily with the common ox, the issue being fertile among themselves.

Bittern.—The name of several grallatorial birds, family *Ardeidæ* or herons, genus *Botaurus*. There are two British species, the common bittern (*Botaurus stellaris*) and the little bittern (*Botaurus minutus*), a native of the south, and only a summer visitor to Britain. Both, however, are becoming rare from the reclamation of the marshy grounds that form their favorite haunt. The common bittern is about twenty-eight inches in length, about forty-four in extent of wing; general color, dull yellowish-brown, with spots and bars of black or dark brown; feathers on the breast long and loose; tail short; bill about four inches long. It is remarkable for its curious booming or bellowing cry, from which come the provincial names of *miredrum* and *butter-bump*, etc. The eggs (greenish-brown) are four or five in number. The little bittern is not more than fifteen inches in length. The American bittern (*Botaurus lentiginosus*) has some resemblance to the common European bittern, but is smaller.

Blackbird (*Turdus merula*), called also the *merle*, a well-known species of thrush, common in Britain and throughout Europe. It is larger than the common thrush, its length being about eleven inches. The color of the male is a uniform deep black, the bill being an orange-yellow; the female is of a brown color, with blackish-brown bill. The nest is usually in a thick bush, and is built of grass, roots, twigs, etc., strengthened with clay. The eggs, generally four or five in number, are of a greenish-blue, spotted with various shades of brown. The song is rich, mellow, and flute-like, but of no great variety or compass. Its food is insects, worms, snails, fruits, etc. The blackbirds, or crow-blackbirds, of America are quite different from the European blackbird, and are more nearly allied to the starlings and crows. The red-winged blackbird (*Argelaius phœniceus*), belonging to the starling family, is a familiar American bird that congregates in great flocks.

Bloodhound.—A variety of dog with long, smooth and pendulous ears, remarkable for the acuteness of its smell, and employed to recover game or prey which has escaped wounded from the hunter, tracing the lost animal by the blood it has spilled; whence the name of the dog. There are several varieties of this animal, as the English, the Cuban, and the African bloodhounds. In former times bloodhounds were not only trained to the pursuit of game, but also to the chase of man. In America they used to be employed in hunting fugitive slaves.

Bluebird.—A small dentirostral, insessorial bird, the *Erythaca*, or *Sialis wilsonii*, very common in the United States. The upper part of the body is blue, and the throat and breast of a dirty red. It makes its nest in the hole of a tree or in the box that is so commonly provided for its use by the friendly farmer. The bluebird is the harbinger of spring to the Americans; its song is cheerful, continuing with little interruption from March to October, but is most frequently heard in the serene days of the spring. It is also called *blue robin* or *blue redbreast*, and is regarded with the same sort of sentiments as the robin of Europe.

Bluefish (*Temnodon* or *Pomatomus saltator*).—A fish common on the eastern coasts of America, allied to the mackerel, but larger, growing to the length of three feet or more, and much esteemed for the table. It is very destructive to other fishes. It is also called horse-mackerel, greenfish, skip-jack, etc.

Boa.—A genus of serpents, family *Boidæ*, having the jaws so constructed that these animals can dilate the mouth sufficiently to swallow bodies thicker than themselves. They are also distinguished by having a hook on each side of the vent; the tail prehensile; the body compressed and largest in the middle, and with small scales, at least on the posterior part of the head. The genus includes some of the largest species of serpents, reptiles endowed with immense muscular power. They seize sheep, deer, etc., and crush them in their folds, after which they swallow the animal whole. The boas are peculiar to the hot parts of South America. The *boa constrictor* is not one of the largest members of the genus, rarely exceeding twenty feet in length; but the name boa or boa constrictor is often given popularly to any of the large serpents of similar habits, and so as to include the pythons of the old world and the anaconda and other large serpents of America.

Bony pike (or garfish).—A remarkable genus of fishes inhabiting North American lakes and rivers, and one of the few living forms that now represent the order of ganoid fishes so largely developed in previous geological epochs. The body is covered with smooth enameled scales, so hard that it is impossible to pierce them with a spear. The common garfish attains a length of five feet, and is easily distinguished by the great length of its jaws.

Bower birds.—Certain birds of Australia and New Guinea which have the habit of building bowers. These are constructed on the ground, usually in some retired part of the forest under overhanging branches, and are decorated with feathers, shells, stones, bones, etc. The bowers are not nests but are resorts, and are especially used at the mating season.

Buffalo.—A name of certain wild cattle of the warmer parts of the old world, living in marshy places. Some of them have been domesticated and are used much as oxen with us. The name was transferred by the early explorers to the bison of North America, a very different kind of animal. When first discovered America had the buffalo as far east as Ohio, while farther west they occurred in enormous herds. With the opening of the transcontinental railroads these herds were quickly killed off, so that now there are only a few protected herds. The attempt has been made, with some success, of crossing them with domestic cattle.

Bugs.—A name loosely applied to any insect, but rightly belonging to insects of the order *Hemiptera*, which have sucking mouthparts and the wings partly hardened, partly membranous. Most of them feed on the juices of plants which they suck by means of the beak, but a few prey upon other animals, the bedbug attacking man. Most of the group are pests, like the squash bug, the plant lice and the scale insects, but a few are of value, like the lac insects and the cochineal, the one furnishing the shellac, the other the carmine.

Bulldog.—A variety of the common dog, remarkable for its short, broad muzzle, and the projection of its lower jaw, which causes the lower front teeth to protrude beyond the upper. The head is massive and broad; the lips are thick and pendulous; the ears pendent at the extremity; the neck robust and short; the body long and stout; and the legs short and thick. The bulldog is a slow-motioned, ferocious animal, better suited for savage combat than for any purpose requiring activity and intelligence. For this reason he is often employed as a watchdog. It was formerly used—as its name implies—for the barbarous sport of bull-baiting. The *bull terrier* was originally from a cross between the bulldog and the terrier. It is smaller than the bulldog, lively, docile, and very courageous.

Bullfrog.—The largest species of frog. It occurs through a large part of the United States and has its name from the loud croak which somewhat resembles the low roar of a bull. It is a dusky brown above, yellowish-green beneath, and is spotted with black.

Bullhead.—A common name for several species of fish. In the United States the name is given to some species of catfish or horned pout; in England to a smaller fish, allied to our miller's thumb, but belonging to a different group from the catfish.

Bustards.—Birds of the order *Grallæ*, restricted to the old world, and somewhat closely related to the snipe and plovers. The great bustard, about the size of a turkey, is the largest bird in Europe, and ranges east to Tartary. The little bustard is common in southern Europe. Other species occur in Asia, Africa and Australia. They are vegetable feeders and all are strong runners, and though they are slow to take wing, they fly well.

Butterflies.—A group of insects with broad wings belonging to the order of *Lepidoptera*, which is easily distinguished from the moths by their habit of flying in the daytime and by having the antennæ or feelers at the end of the head ending in a club, and never tapering or feathered. Like many other insects these hatch from the egg with a shape like a worm, the larva or caterpillar. This eats mostly vegetable matter, grows rapidly, molts its skin several times, and at last changes into a resting stage, the pupa or chrysalis, which usually passes the winter. Then the chrysalis case splits down the back and from the opening the butterfly comes out, to lead a short life, in which it lays the eggs which are to go through the same history. There are several thousand species of butterflies known, the majority being inhabitants of the tropics.

Buzzard.—A name applied to several diurnal birds of prey closely resembling the hawks, our common hen hawk being a buzzard. These birds feed on mice, moles, small birds, insects, etc., and on the whole are a benefit to the agriculturist. The common buzzard is spread over the whole of Europe and America. The carrion buzzards feed on decaying animal matter, the bee buzzards or honey buzzards of the old world feed on honey and on the larvæ of bees and wasps.

Camel.—The family of camels includes a few forms of animals that chew the cud but are without horns. In the warmer parts of the old world are two species which have been domesticated by man and serve as beasts of burden. One, the dromedary, has a single hump of fat, etc., upon the back; the Bactrian camel has two humps. There is much exaggeration in the common accounts of their endurance and of their ability to go for a long time without water. Their hair is used in weaving cloth. In Peru and adjacent parts of South America are four members of the family, two of

which, the llama and the alpaca, have been domesticated.

Camelopard.—See giraffe.

Cameo shells.—Certain snail shells from the sea, in which the shell consists of a white and a brown layer which makes these of value for cameos. The manufacture of these is mostly carried on in Genoa and Naples.

Canary.—One of the finches, originally coming from the Canary islands, but domesticated for three hundred years. From their powers of song they are favorites with many, and the best songsters bring high prices. While the usual color in cage birds is canary yellow, the wild birds are a dull green.

Canvasback duck.—An American duck, breeding in the far north and shot in numbers on its migrations. In the Chesapeake they feed on the roots of the *Vallisneria* (wild celery), a marsh plant which gives the flesh a peculiar flavor, and makes these the most esteemed of game birds.

Cardinal bird.—One of the finches, also known as the redbird. It is a native of North America and is a good singer. Its common name is due to the bright red plumage.

Carp.—A group of fishes without spines in the fins. The true carp originated in China and was introduced into Europe three hundred years ago, and much later into America. It has little value as a food supply, aside from the fact that it is readily reared in confinement. The carp has numerous varieties, among them the familiar gold and silver fishes. Less known in America are the leather carp, in which the scales have been lost, and the mirror carp, with only a single row of very large scales on either side of the body.

Carpet beetle.—A small beetle of inconspicuous colors which originally fed upon flowers, but which has taken to animal food, and especially to woolen goods. It is the larva which does the damage.

Catbird.—A well-known species of American thrush, which, during the summer, is found throughout the Middle and New England states. The plumage is a deep slate color above and lighter below, and it is about nine inches in length. In habit it is lively, familiar, and unsuspicious; the song is largely imitative of those of other birds, but it also has the cat-like note which gives it its common name. During the winter it inhabits the extreme south of the United States, and is found also in Mexico and Central America.

Cats.—A large family of animals, including the lion, tiger, panther, leopard, lynx, puma, and a number of other forms, among them our domestic pussy. All have retractile claws, cutting molar teeth and elongate pupils to the eyes. The common cat is probably a native of Egypt. Certain it is that it was domesticated there and that it was an object of worship and was frequently mummied. It was not known to the ancient Greeks and Romans, its place as a destroyer of rats and mice being taken by domesticated martens. The domestic cats are cleanly animals, more attached to places than to persons, and like many domesticated animals, are very variable in color. Besides the ordinary kinds, there are common the tailless Manx cats (coming from the Crimea as well as from the island of Man) and the Angora or Persian cats, with long silky fur. The coon cats are merely a race of the latter. The original of the domestic cat was probably marked with black bar on a ground of tawny and white, these colors rendering them inconspicuous among the grasses and shrubbery where they ranged.

Centipedes.—A group of jointed animals belonging to the order of *Myriapods*, characterized by having numerous segments to the body, each with a pair of walking feet. The head is very like that of an insect, but the remaining segments of the body are not divided into regions. The legs of the first segment behind the head contain a poison gland, and its secretion is forced into the wound made by the sharp tip of the leg. Most of the species are small, but in the tropics are species ten inches in length. The bite of these larger forms causes considerable pain, but authenticated cases of death following the bite are at least rare.

Cephalopods.—A group of mollusks in which the mouth is surrounded by a number of arms, each usually bearing a number of suckers, well developed eyes, a sack enveloping the body, and a shell which may be either external or internal. The group includes the squid, cuttlefish, pearly nautilus and many other forms without common names.

Chameleon.—A genus of lizards, natives of parts of Asia, Africa, and the south of Europe. The best-known species has a naked body six or seven inches long, with a prehensile tail of about five inches, and feet suitable for grasping branches. The skin contains small grains of a bluish-gray color in the shade, but in the light of the sun all parts of the body become of a grayish-brown or tawny color. It possesses the curious faculty of changing its color, either in accordance with its environment, or with its temper when disturbed, the change being due to the presence of clear or pigment-bearing contractile cells placed at various depths in the skin, their contractions and dilations being under the influence of the nervous system. Other lizards have the same power of changing color and the name has been also applied to them. Their power of fasting and habit of inflating themselves gave rise to the fable that they lived on air, but they are in reality insectivorous, taking their prey by rapid movements of a long viscid tongue. In general habit they are dull and torpid.

Chamois.—A species of goat-like antelope inhabiting high inaccessible mountains in Europe and western Asia. Its horns, which are about six or seven inches long, are round, almost smooth, perpendicular and straight until near the tip, where they suddenly terminate in a hook directed backward and downward. Its hair is brown in winter, brown fawn color in summer, and grayish in spring. The head is pale yellow with a black band from the nose to the ears and surrounding the eyes; the tail is black. Its agility, the nature of its haunts, and its powers of smell, render its pursuit an exceedingly difficult and hazardous occupation.

Chimpanzee.—The native Guinea name of a large West and Central African ape belonging to the anthropoid or man-like monkeys, and to the same genus as the gorilla. When full grown it is sometimes about five feet high, with black hair, and is not so large and powerful as the gorilla. It walks erect better than most of the apes. It feeds on fruits, often robs the gardens of the natives, and constructs a sort of nest among the branches. It is common in menageries, where it shows much intelligence and docility.

Chinchilla.—A small animal, about nine inches long, occurring on the west slope of the Andes, and hunted for its beautiful fur. The chinchillas are near relatives of the guinea pigs.

Clams.—Bivalve mollusks which form a considerable element in the food supply. The name is loosely used. On our Atlantic coast it is applied to the quahog, with a heavy shell capable of closing completely, and to the long clam, with lighter shell. The latter buries itself in the sand, sending two long tubes up to the surface, and through these it obtains the food and water necessary for its existence.

Cochineal.—A bug allied to the plant lice, which feeds upon the cactuses in Mexico, and which, when dried and treated with alum, and the extract is dried, gives the brilliant red dye, carmine.

Cockroaches.—Insects of the order *Orthoptera*, some small, others two inches long, which feed upon decaying vegetable matter. Several species have taken up their abode with man, and prove most unwelcome boarders. Many methods have been advocated for their extermination, but none is very satisfactory except the killing of every individual seen, and a continuation of this for months.

Codfish.—A species of marine fishes with barbels about the mouth and with three fins upon the back and all fins without spines. This is probably the most important food fish and is taken in enormous numbers on the coasts of Europe and of eastern North America. It occurs in the northern Pacific as well. It feeds upon other fishes as well as on shellfish, and large specimens weigh over one hundred pounds. Allied to the cod are the haddock, pollack, hake and cusk.

Condor.—A South American bird, one of the largest of the vultures. It resembles the common vultures, differing from them mainly in the large cartilaginous caruncle which surmounts its beak, and in the large size of its oval and longitudinal nostrils. Despite stories of its gigantic proportions, Humboldt met with no specimens whose wings exceeded nine feet in expanse, though it has been known to expand to fourteen feet. It is found in the Andes chain, frequenting regions from 10,000 to 15,000 feet above the level of the sea. They only descend to the plains under stress of hunger, when they attack sheep, goats, deer, and bullocks. They prefer carrion, however.

Coney.—A small animal mentioned in the bible and supposed to be the *Hyrax* of science. Its home is around the eastern end of the Mediterranean, extending down into Africa. The animal is without near relatives.

Coral.—The limy skeleton of certain low animals allied to the sea anemones and grouped by zoölogists as *Cœlenterates*. The coral is secreted by the outer surface of the body and usually shows something of the radiate structure of the animal. As the animals usually form colonies of hundreds of thousands of individuals, the coral may show little cups in which each individual was seated. When the animals die these coral masses are left behind, and so abundant are they in the tropics that coral reefs and islands are formed by them. The precious coral of the Mediterranean and of Japan is very solid and takes a high polish. The price is dependent upon the color and size of the pieces, the pale pink commanding the highest price. Purchasers should be on the lookout for counterfeits, made of marble, and for dyed coral.

Crab.—The common name of a large number of *Crustaceans* in which the abdomen is small and folded under the anterior part of the body—the cephalothorax. Over two thousand species are known, differing greatly in size, shape, and in other respects. The great majority are marine, but there are a few which spend their entire life on land, only going to the water once a year to lay their eggs. The largest is the great spider crab of Japan, whose legs may stretch out a dozen feet. Like all crustaceans, the crabs molt their shell at intervals, and after the molt, their skin is soft. One species on the Atlantic coast is taken at this time in great numbers and forms the favorite soft-shell crab of the table. The hermit crabs have the abdomen soft, and to protect this vulnerable part, they insert it in the shell of some dead snail, and carry this about with them wherever they go.

Crane.—A genus of birds belonging to the order *Grallæ*, remarkable for their long migrations, in which they usually fly in large flocks led by a single leader, the whole assemblage assuming a V form, and the leadership is continually changed. The common crane breeds in the north of Europe and in Siberia, and migrates southward at the approach of winter. It attains nearly five feet in height; with the exception of the neck, which is black, the body is of a uniform ashy-gray; it has a graceful carriage. It frequents large plains and marshes, and feeds on fish, reptiles, frogs, mollusks, worms, insects, and even small mammals. At the breeding season the birds pair for reproduction and rearing the young. The games and dances in which they indulge are interesting. They form groups in various fashions, advance toward one another, make a kind of salutation, and adopt the strangest postures. Two species occur in America, the whooping crane being noticeable for the convolutions of the trachea within the breast bone.

Crayfish.—The common name of the small crustaceans of fresh water which resemble the lobsters in appearance. They usually live in burrows in the banks or bottoms of streams and feed on decaying animal matter. In Europe they form a considerable element in the food supply and are bred in ponds. A large number of species occur in the United States, and in the larger markets they are always to be found.

Crocodile.—A genus, family, and order comprising the largest living reptiles. The characters of the order *Crocodilia* are as follows: The skin is covered with square, bony plates; the tail is long and compressed. The feet are short, and there are five toes on each fore-foot, and four on each hind-foot, the latter more or less webbed. The jaws are long and their gape enormous. The nostrils are at the extremity of the snout, and capable of being closed to prevent ingress of water. The heart is four-chambered. The families now existing are the alligators, crocodiles, and gavials. The alligators are all new world forms. The gavial proper is confined to the East Indies. The crocodile of the Nile is the best-known member of the order; another species is met with in southern Asia, and a third in tropical America. The crocodile is formidable from its great size and strength. It is exclusively carnivorous, and always prefers its food in a state of putrefaction. In Egypt it is no longer found except in the upper or more southern parts. It grows sometimes to a length of thirty feet, and apparently lives to a vast age.

Crow.—The family, widely diffused over the world, includes the common crow, the raven, the fish-crow, the rook, the jay and the magpie. The common crow of North America is remarkable for its gregarious and predatory habits, as well as for its intelligence and cunning. They pair in March; the old repair their nests, the young frame new ones; but they are such thieves that while the one is fetching materials the other must keep watch to prevent the rising fabric from being plundered by their neighbors. As soon as the nest is finished and the eggs produced (five, bluish-green, with dark blotches), the male takes upon himself the care of providing for his mate, which he continues during the whole period of incubation. They frequent the same rookeries for years, but allow no intruders into their community. They feed chiefly on worms and the larvæ of insects; they also eat grain and seeds, whence they have sometimes been supposed injurious to the farmer; but they amply repay him for what they take by destroying the vermin in his fields.

Crustacea.—One of the great groups of animals with external skeleton and jointed feet, including the lobster, crab, barnacle, shrimp, etc. They are characterized by having two pairs of feelers (antennæ) in front of the mouth, by breathing by gills attached to some of the legs, and a ladder-like nervous system. As they have a hard, unyielding external skeleton, they can only increase in size by shedding the external skin at irregular intervals. Several thousand species are known.

Cuttlefish.—One of the mollusks belonging to the class of *Cephalopods*, in which there are ten arms around the mouth. The internal shell is calcified and is used as a supply of lime for cage birds. They have also an ink bag, the secretion of which furnishes the pigment sepia. Cuttlefish are an important article of food in southern Europe.

Deer.—A group of ruminant quadrupeds constituting the family *Cervidæ*, animals of graceful form, combining much compactness and strength with slenderness of limb and fleetness. They use their horns for weapons of defense and offense; but in general they trust to flight for their safety. They have a long neck, a small head, which they carry high, large ears, and large, full eyes. Many have scent glands, usually beneath the eyes, which serve as sexual attractions. Deer are distinguished from all other ruminants by their branching horns (antlers), which in most species exist in the male only; they are solid, fall off annually, and are renewed with increase of size.

and number of branches, according to the kind, until the animal has reached old age. Deer are found in almost all parts of the globe except Australia and the south of Africa, their place in the latter region being supplied by antelopes; the greater number inhabit the warmer temperate countries, and they are chiefly found in wide plains and hills of moderate height. The flesh (venison) of most kinds of deer is highly esteemed for the table, and they have long been regarded as among the noblest objects of the chase. Only one species, the reindeer, can be said to have been fully domesticated.

Dodo.—A large flightless pigeon formerly living in the Mascarene islands in the Indian Ocean. It was larger than a turkey and was killed off by man, the last individual disappearing before 1700.

Dog.—An animal well known for its attachment to mankind, and remarkable for the almost infinite varieties, as to size, form, color, and quality of the hair, which domestication has brought about. It belongs to the order of carnivorous mammals, and to that section distinguished as *digitigrade*. The genus *Canis* includes, besides the dog, the jackal and the wolf. It is a question of considerable interest what was the parent stock of the dog. Some are of the opinion that the breed is derived from the wolf; others that it is a domesticated jackal; all agree that no trace of it is to be found in a primitive state of nature. That there are wild dogs, we know. The dhole of India and the dingo of Australia are examples which exist in a state of complete independence, and throw no light upon the question. The dog will live on cooked vegetable matter, but prefers animal food. In drinking, it laps with the tongue. It never perspires, but the nose is naked and moist, and, when hot, the tongue hangs out of the mouth. The female goes with young sixty-three days, and usually has about six or eight at a litter. The young are blind at birth, and do not acquire their sight until the tenth day. The dog attains its full growth at the expiration of the second year, it is old at fifteen, and seldom lives beyond twenty years.

Dormouse.—Small animals, in some respects intermediate between the squirrels and the true mice. They live in the trees of Europe, but in their hibernations they become so torpid that "he sleeps like a dormouse" is proverbial.

Doves.—A name for several of the more familiar pigeons, like the mourning doves of the United States and the turtle doves of the old world.

Dragon fly.—One of the insects of the order *Pseudoneuroptera*, which has an elongate body and long and slender wings. They lay their eggs in the water, where the young are hatched and feed upon all kinds of aquatic insects. The adults are of great value in destroying mosquitoes.

Duckbill.—A peculiar mammal of Australia, living in the streams, and feeding, like a duck, on the matter contained in the ooze at the bottom. In accordance with these habits the toothless jaws are prolonged into a duck-like beak and the feet are webbed. The animal has many other peculiarities of structure, among them the presence of but a single opening (as in reptiles and birds) for the digestive and urogenital organs. It also does not bring forth living young, like all other mammals, but it lays eggs. It is about a foot in length.

Ducks.—A group of swimming birds, too well known to need description. Most of the species are migratory and some, like the mallard and the shoveller duck, are found in both the old and the new worlds. Among the interesting forms are the eiders, well-known from their soft down. They are found in the colder parts of both continents. The Labrador duck was formerly very abundant, but is now probably extinct. Specimens are far rarer in museums than of the great auk. The wood duck is possibly the most beautiful species.

Eagle.—A genus of birds belonging to the order *Accipitres*, and to the same family as the falcons and the hawks. They are found in all parts of the globe. The size varies according to the species, but all attain imposing dimensions. The golden eagle measures about three feet nine inches in height, and the spread of its wings is nearly ten feet. The eagle soars at great heights, and its sense of vision is very acute. It builds its nests in the clefts of inaccessible rocks, and lays generally two or three eggs; the period of incubation is thirty days. Besides the golden eagle, there are other species, such as the American eagle, whitetailed eagle, the tawny eagle, the booted eagle, and numerous smaller species in tropical regions.

Earthworms.—A group of burrowing worms, found in the earth in almost all parts of the world. They are without eyes or well developed appendages. They live on the organic matter in the soil, and to obtain this they swallow the earth through which they mine, and cast the refuse on the surface. This makes them of great value to the agriculturist, as they work over and loosen the soil. In the winter they burrow down beneath the frost, and the large numbers frequently seen after a storm is not due to their having descended with the rain, but to their having been drowned out of their holes.

Echinoderms.—A great group of animals with a radiate structure, and with a spiny skin. They are all marine. The class includes the starfish, sea urchins, sea lilies, and some other less commonly known forms.

Edentates.—A group of mammals in which the teeth are not always lacking, as the name would imply, but in which they are imperfectly developed. The group is largely American and includes the armadillos, sloths and ant-eaters.

Eels.—Fishes of very elongate form, living in the sea. There are several species belonging in very different groups. The lamprey eels have no true jaws, no limbs, and a large number of gill openings. They ascend the rivers in the spring to deposit their eggs, while the true eels descend from the rivers in the fall to the sea for the purposes of reproduction.

Elephant.—A genus of mammals, the only living representatives of the order *Proboscidæ*, or animals with a trunk or proboscis. They are exclusively confined to the tropical regions of the old world, in the forests of which they live in herds. Only two existing species are known, the Asiatic elephant and the African elephant. In both species the two upper incisors, or front teeth, are enormously developed, constituting long tusks. The lower incisors are absent, and there are no other teeth in the jaws except the large molars, or grinders, of which two are usually in use at one time on each side of each jaw. The molars are very large and are composed of a number of transverse plates of enamel, united together by dentine. The nose is prolonged into a cylindrical trunk, movable in every direction, highly sensitive, and terminating in a finger-like, prehensile lobe. The nostrils are placed at the extremity of this proboscis. The feet are furnished with five toes, but these are only indicated externally by the divisions of the hoof; and the sole of the foot is formed of a thick pad of integument. The Indian elephant is the only species which is domesticated; and, as it will scarcely ever breed in captivity, the demand for it is supplied entirely by the capture of adult wild individuals. The Indian elephant has a concave forehead and small ears, while the African elephant has a convex forehead, and large ears. The African elephant is chiefly hunted for the sake of its ivory, and there is reason to believe that the pursuit will ultimately end in its extinction. The elephants are vegetable feeders, living almost entirely on the foliage of shrubs and trees, which they strip off by means of the prehensile trunk. As the tusks prevent the animal from drinking in the ordinary manner, the water is sucked up by the trunk, which is then inserted in the mouth, into which it empties its contents. Many species of fossil elephants are known, the most familiar of which are the mammoth and mastodons.

Falcon.—A name of various birds of prey, members of the family *Falconidæ*. The falcons proper, for strength, symmetry, and powers of flight, are the most perfectly developed of the feathered race. They are distinguished by having the beak curved from the base, hooked at the point, the upper mandible with a notch or tooth on its cutting edge on either side, wings long and powerful, the second feather rather the longest, legs short and strong. Most prominent of the falcons are the peregrine falcon and the gyrfalcon. These were the principal birds used in falconry during the middle ages, not only in Europe but through the east. At one time the sport was only allowed to the nobility. Falcons were carefully trained, and at a hawking party the birds were loosed and they immediately set upon any other game that might be in sight. The pleasure was in watching the falcon getting the better of birds, sometimes many times their size.

Fishes.—The lowest class of vertebrate or backboned animals. They are adapted for an aquatic life, their shape being such as to permit easy and rapid progress through the water. They breathe by gills placed on the walls of slits in the sides of the neck, and their appendages (fins) are such as to make efficient paddles. There are usually one or more fins in the middle line of the back and one or two in a corresponding position beneath the tail (anal fins); while the tip of the tail is terminated by a caudal fin, the chief organ of swimming. The caudal fin presents three different types. In the diphycercal fin the backbone is straight at the tip, and the lobes of the caudal fin are equally disposed on its two sides. In the heterocercal tail the backbone is turned upward at the tip, this making one lobe, while a smaller second lobe is developed on its under side. This is the type of tail in the sharks. The homocercal tail has the same bent backbone as the last, but the two lobes are equal. Most fishes have the latter type. All of the fins are supported by a skeleton of rays, either horny or spinous in character. There are but two chambers to the heart, and the occurrence of a swim bladder, an organ for regulating or recognition of the depth of the water in which the fish is, is very frequent. There are several great groups of fishes, distinguished by the presence of a cartilage or a bony skeleton, by having the gill slits free or under a gill cover, by characters of the skull, presence or absence of air bladder, and by peculiarities of the digestive tract and nervous system.

Flamingo.—A genus of web-footed birds, in some respects intermediate between the storks and the ducks, their long legs and necks giving them a resemblance to the former, while their webbed feet connect them with the latter. There are nine species of true flamingoes. Their food appears to be mollusca, spawn, grass, water plants, insects, etc. They breed in companies in mudflats or inundated marshes, raising up the mud into a small hillock, which is concave at the top so as to form a nest. In this hollow the female lays her eggs and hatches them by sitting on them with her legs doubled up under her. The young, which never exceed three in number, do not fly till they have nearly attained their full growth, though they can run very swiftly and swim with ease almost immediately after hatching. The common American species is deep red with black quills. It is peculiar to tropical America, migrating in summer to the Southern, and rarely to the Middle states.

Flea.—A group of wingless insects, mostly parasites on other animals. They have a hard skin, covered with spines so arranged that they can easily work themselves through the hair, legs admirably adapted for jumping, and the mouthparts fitted for piercing and sucking. The fleas breed in the cracks in a floor or some similar place where there is dirt, and when they are mature they attack animals. The irritation and annoyance of their bites are sufficient to make them a nuisance, but now it is known that they are an important agency in the transmission of certain diseases, bubonic plague being communicated to man by their bites.

Flatfishes.—A group of fishes, including the halibut, sole, turbot, flounder, etc., in which the extremely flattened body has undergone a strange modification, both of the eyes of the adult being on the same side of the head. In correlation with this the fishes live on the bottom of the ocean, with the eyed side uppermost, waiting for their prey. The lower, eyeless, side is white, the other colored similarly to the bottom.

Flies.—A term applied to various insects of different groups, but strictly belonging to the two-winged insects, the *Diptera* of science. Besides the number of wings, the group is distinguished by having a metamorphosis, and by its sucking mouthparts. There are some thirty or forty thousand species of flies known, while no other order has so many individuals as this. Some species are closely connected with man, and of these the common house fly is especially noticeable. This lays its eggs in manure or other refuse, these hatching out, passing through all their stages and emerging as perfect insects in a few days. Their uncleanly habits make the house flies most efficient agents in the carriage of different diseases, especially typhoid fever and others which attack the digestive tract. Flies are therefore not merely a nuisance to be deplored but a positive danger to mankind. Among other flies are the carrion flies, black flies, the gnats and the mosquitoes, all troublesome to man, while others attack various plants.

Flounder.—One group of flatfishes of moderate size, common near the shore. They are held in moderate esteem as food fishes.

Flying-fish.—A name common to various fishes which have the power of sustaining themselves for a time in the air by means of their large pectoral fins. Generally, however, the name is limited to the species of the genus *Exocætus*, which belongs to the family *Scomberesocidæ* (mackerel-pikes). These can pass through the air to a considerable distance, sometimes as much as 200 yards, to escape from the attacks of other fishes, especially the dolphin. They are most common beween the tropics.

Flying-squirrel.—A genus of rodents, family *Sciuridæ* (squirrels), which, by means of the skin of the flank, extending between the fore and hind legs, can support themselves for a moment in the air, as with a parachute, thus making great leaps. The American flying-squirrel lives in the northern parts of North America.

Fox.—Carnivorous animals, of which there are several species, belonging to the same family as the dog. It is characterized by its sharp muzzle, and long bushy tail; as well as by its cunning, which has passed into a proverb. The pupil of the eye is elongated, and not circular as in the dog, and the ears are triangular and pointed. A very powerful scent is emitted from glands near the root of the tail; this odor is so fetid that even other animals avoid its locality. The common fox is an inhabitant of most parts of Europe and America, and extends also into Northern Asia. Its senses are extremely acute. It usually remains concealed during the day in a burrow, and ventures abroad chiefly at night, in search of food. Birds, rabbits, or hares constitute its usual prey, but, when pressed by necessity, it will have recourse to other food, and it has a predilection for certain kinds of fruit, such as grapes. To poultry it is destructive. Though slightly made, the fox has great muscular vigor, and bites with much severity. Even when taken at a very early age, it is never properly domesticated; and adults, when placed in confinement, show great ferocity, and rarely die. Its power of endurance and its great speed, as well as the cunning which dictates various expedients for escape, makes the chase of this animal exciting. Among its expedients for

escape is that of feigning death, which is done also by several other animals. Numerous other species of fox exist in the old and new worlds, of which the most important are the arctic, or blue fox, and the American, or red fox. The arctic fox is remarkable for changing its color with the season, being brown or bluish in summer, and white in winter; the soles of its feet are hairy. The red fox, found throughout North America, is very variable in color and marking, and varieties of it are known by different names. The skins of all the species are valuable.

Frog.—A common name for any species of the amphibian genus *Rana*, characterized by a smooth skin, a large ear spot (tympanum), webbed hind feet, and pointed toes. The genus is almost cosmopolitan. The adults lay their eggs in long strings in the water, and from them are hatched out larvæ (the tadpoles) which are fish-like in having a broad, swimming tail and gills on the sides of the neck. The tadpoles feed upon small aquatic plants which they scrape off from sticks and stones with their horny jaws. As they increase in size, the legs grow out and the tail is absorbed. In the growth of the legs, the anterior pair is first formed, but as this pair is at first under the skin, it is usually thought that the hind pair is first formed. With the growth of legs and the loss of tail the gills disappear and the lungs come into use, but most species always remain in close proximity to water throughout their lives. The adults live on animal food—insects, mollusks, small fishes, etc.—and do not hesitate to eat their own species. They do much good in keeping down certain species of insects; they also furnish an article of diet in their hind legs. Frogs are also an important animal for physiological investigations, because of the great vitality of their tissues.

Gallflies.—Insects of several orders, but chiefly of the *Hymenoptera*, which have a boring apparatus at the end of the body, with which they make holes in plants and deposit their eggs. This stimulates the plants to form enlarged structures, the galls, in which the eggs hatch into larvæ which feed on the tissues of the plants. These galls may occur on stems or leaves, and each species of insect and plant forms galls peculiar to the species. Prominent among these are the nut-galls, once used extensively in the manufacture of ink.

Gasteropoda.—A large group of mollusks, including, among others, the forms commonly known as snails. They creep on a broad fleshy portion known as the foot, have a head in front, with one or two pairs of tentacles, and with the mouth beneath. On the back is the shell (some species have none), which is usually coiled in a spiral, though sometimes it is a simple cone. These shells have a great variety of shapes and colors. The snails have a peculiar ribbon just inside the mouth which is armed with numerous minute teeth. With these the snails rasp their food, while some of them bore through the shells of clams, etc., on which they feed.

Gavials.—Alligator-like animals occurring in the rivers of Asia. They have a long head, much narrower than that of the alligator and crocodile. In habits they are all much alike.

Gazelle.—An animal belonging to the antelope family; of very graceful shape, and rather smaller than the chamois. The color is fawn or dun on the back, separated from the white belly by a brown or blackish band. The horns, stronger in the male than in the female, are in the shape of a lyre. The eyes are beautiful and soft in expression, and its movements are elegant and light. It inhabits the large plains and the Saharan region of northern Africa, as well as Arabia and Syria, living in numerous herds. When taken young, the gazelle, though naturally wild and timid, is readily domesticated.

Gila monster.—A large lizard, found in New Mexico and Arizona, colored black and yellow, and remarkable as the only poisonous lizard, though not dangerously so. It reaches a length of three feet.

Giraffe.—The tallest mammal, often called the *camelopard*, because the skin is spotted like the leopard, while the neck resembles that of the camel. It inhabits various parts of Africa, and, together with the recently discovered okapia, form an entire family, belonging to the class *Ungulata*, or hoofed animals. The height ranges from fifteen to twenty feet, the greater part of which is the enormous length of the neck, which, nevertheless, has only the usual number of seven vertebræ, as in the whole class of mammals. The giraffe has an unusually long cylindrical tongue, which is prehensile, and is used for stripping the leaves off the trees on which it feeds.

Goat.—A genus of ruminant quadrupeds closely allied to the sheep, although the common domestic goat and sheep are of widely different appearance. The uses of the goat are numerous. The flesh, especially that of the kid, or young goat, is much used as food, though rather poor in quality. The milk is very rich and nutritious, more easy of digestion than that of the cow, and is often useful to consumptive patients. Some goats yield as much as four quarts of milk daily, although the average quantity is more nearly two. The skin is dressed as leather for many uses, particularly for gloves and the finer kinds of shoes. The horns are used for making knife-handles, etc., and the fat is said to be superior to that of the ox for candles. Goats are found wild in mountainous countries; scrambling among rocks and bushes, are extremely sure-footed, and display great strength and agility in leaping. The Rocky mountain goat is an animal of the antelope family. Its size is about that of an ordinary sheep, and its general appearance is not unlike that of a sheep of the merino breed, its long, straight hair hanging down in an abundant white fleece.

Goose.—A genus of web-footed birds, having the bill not longer than the head, the upper mandible slightly hooked at the tip; the legs farther forward than in ducks, and so better adapted for walking; the neck of moderate length, with sixteen vertebræ, a character which distinguishes them from swans. In general, geese spend more of their time on land than any other of the *Anatidæ*, feeding on grass and other herbage, berries, seeds, and other vegetable food. Although large birds, and of bulky form, they have great powers of flight. They strike with their wings in fighting, and there is a hard callous knob or tubercle at the bend of the wing, which in some species becomes a spur. The domestic goose is regarded as deriving its origin from the common wild goose, but all the species seem capable of domestication. The graylag goose is almost three feet in length from the tip of the bill to the extremity of the short tail. Its extent of wing is about five feet. The weight of the largest birds is about ten pounds. The color of the plumage is gray, varying in some parts to grayish-brown; the rump and belly white, the tail grayish-brown and white; the bill is orange, the nail at the tip of the upper mandible white. The young are darker than the adults.

Gorilla.—The largest of the man-like apes from tropical West Africa. It reaches a height of five feet eight inches, and the arms are proportionately shorter than in any other ape. They are very strong, but usually they retire before man. They can climb, but are far less arboreal than their relatives, the orang and the chimpanzee. The gorilla was known to the ancients, but was brought to the knowledge of the modern world by the American missionary, Dr. Savage.

Grouse.—A general term for a number of birds allied to the quail, and, more distantly, to the pheasants. Among them are the ptarmigan of the northern parts of America, which exhibit an interesting example of sympathetic coloration, as they turn white in winter, like many other northern animals. Another grouse is the prairie chicken, once so abundant on our western prairies and plains, but now protected almost everywhere. In the east it has been exterminated everywhere except on the island of Martha's Vineyard. A third example is the partridge of the north, the pheasant of the south.

Guinea pig or **cavy.**—A small animal belonging to rodents. It is indigenous to South America, and has been introduced into Europe and America, where it is domesticated as a pet. It possesses a very low degree of intelligence; in its natural home it is gregarious, and is usually found living on dry lands covered with low brushwood. The color is variegated, and the tail is rudimentary. It is extremely prolific, and begins to breed at the age of ten months, producing several broods in a year; each litter usually consists of about eight. The popular name is very inappropriate; the animal does not come from Guinea, nor is it a pig.

Gulls.—Large web-footed birds, common about large bodies of water in the northern hemisphere. Their colors are usually white below with the upper parts varying from a light gray to a black. All are much alike in their habits, noisy and quarrelsome, searching the water for any possible scrap of food, and often following ships for days. They breed on uninhabited islands. The closely allied terns are usually smaller and have a forked instead of a square or even pointed tail. Both are strong fliers but the terns are the most graceful.

Haddock.—One of the most important of the food fishes, closely related to the cod, but distinguished by a notched tail and a white line along the side. In habits the two are much alike, being voracious, eating anything edible, but largely clams and the like, a fact indicated in the German name for shellfish given them.

Halibut.—A member of the group of flatfishes, remarkable in having the eyes on the same side of the head and of swimming, not in a vertical position, like other fishes, but on the side, with the eyes uppermost. The very young flatfishes are normal, but when less than half an inch long they turn on the side and at the same time the eye begins its migration which ends by both eyes being on the same side, the twisting even distorting the bones of the skull. The average weight of the halibut is about 120 pounds; the largest known weighed 720 pounds. The flesh is white and most excellent.

Hawks.—A common name of several small raptorial birds, allied to the eagles, but with no one common distinctive character, for the name is applied loosely to buzzards, ospreys and several other forms.

Hedgehog.—A European animal, like a porcupine in having the body covered with sharp spines, but differing much in structure and in food. The hedgehog feeds upon insects, lives in holes in the ground, and, when disturbed, rolls into a ball with the spines sticking out in every direction, and forming a most excellent defense.

Herring.—A small soft-finned fish spread over the whole North Atlantic, of great economic importance. It occurs in large schools, swimming through the sea with open mouths, scooping up the minute life for food. Immense numbers are taken both here and abroad, the annual catch for Europe and America being estimated at a billion and a half pounds. The young are also taken in vast quantities and are preserved as American sardines. With us most of the adults are smoked and dried.

Hippopotamus.—A genus of animals nearly allied to the pigs, hogs, and peccaries, and belonging to the order *Ungulata*. The group is represented by only one living species, the *Hippopotamus amphibius* of Africa. It is enormously bulky and unwieldy, attaining a height of five and a length of twelve feet. The feet are massive, and are terminated by four hoofed toes; the skin is very thick. The hippopotamus feeds upon vegetable substances, such as grasses and shrubs; it dives and swims with great facility.

Hornet.—A common name of the paper-making wasps or yellow jackets, well-known for their stings.

Horse.—An ungulate or hoofed mammal. The horse proper is characterized by the tail with long hairs from its base; the long and flowing mane; a bare callosity on the inner surface of the hind as well as of the fore legs; and by the head and ears being smaller and the limbs longer than in the ass and other related species. The native country of the horse seems to have been central Asia. It became early domesticated in Egypt. It is mentioned throughout the bible. The Greeks and Romans had some covering to secure their horses' hoofs from injury. In the ninth century, horses were only shod in time of frost. Shoeing was introduced into England by William I., 1066. It is believed that the original breed of horses is extinct, and that the half-wild herds existing in many places have descended from animals once in captivity. Thus, when the horse was first introduced by the Spaniards in 1537, at Buenos Ayres, there were no wild horses in America. But individuals escaping ran wild, and, by 1580, their descendants had spread over the continent as far as the Straits of Magellan. More fossil horses have been found in the new than in the old world. The horse may have descended from a striped ancestor, stripes still sometimes remaining, especially in duns and mouse-duns. His age is ascertained by examining first which teeth are developed, and then to what extent they have been worn away by use. Like other domestic animals the horse has run into various breeds. The most celebrated is the Arab horse. Great attention is given in America to the breeding of horses, and American horses have won races both in England and on the Continent.

Humming birds.—A group of small birds, of great delicacy of body and wonderfully brilliant plumage, which are entirely restricted to America. Some four hundred species are known, only three or four entering the United States, one ranging north to Canada. Their common name is due to the humming noise which they make when hovering over a flower. Aside from their beauty there is little else attractive about them. They have little intellect and are exceedingly quarrelsome.

Hyena.—A genus of carnivorous animals, containing three species, from Asia and Africa. These animals are covered with coarse bristly hair, short over the greater portion of the body, but forming a mane along the ridge of the neck. The hind legs are shorter than the fore, giving the body a slope from the withers to the haunches. In size they are somewhat larger than a shepherd's dog. The cheek muscles are greatly developed, and the large grinding teeth have great conical crowns, giving to them the power of smashing the thigh-bones of animals the size of a horse. As carrion feeders they are useful scavengers. All the species are nocturnal in their habits.

Jaguar.—A carnivorous mammal belonging to the cat family. It is rather larger than the leopard, but more elegant in form and in beauty of its skin, the ground color of which is pale brownish-yellow, variegated on the upper parts with streaks and irregular oblong spots of black. This animal is one of the most formidable beasts of prey found in America, being extremely fierce. It extends from the southern regions of the United States, through Mexico, Central America, and Brazil, as far south as Paraguay. Wooded banks of rivers are its favorite haunts, and it is said to frequent the reedy margins of lakes, seeming to have great predilection for water. It preys chiefly upon the water-hog, and is said to catch fish; but occasionally it kills horses and cattle, and even men. The jaguar is a noisy animal, roaring much at night, especially on the approach of bad weather.

Jellyfish.—A common name for numbers of marine animals belonging to the group called by naturalists *Cœlenterates*. All agree in having a more or less bell or umbrella shaped body, with a proboscis hanging down in the place of the handle of the umbrella or the tongue of the bell. The mouth is at the end of the handle and leads into a stomach which divides and sends out branches, like the ribs of the umbrella, to the margin. The

common name is due to its gelatinous consistency. Most of the species start in life as buds from attached animals, which later separate and henceforth lead a free existence, swimming by opening and closing the bell. The jellyfish are the sexual animals, producing the eggs from which the fixed stages arise. None of the jellyfish has any practical value; they have nettling organs which are used for defense and to kill their prey. In some they are strong enough to cause severe irritation to man. A general name for the group is *Medusæ*; while the fixed stages are called polyps.

Kangaroo.—A family of pouch-bearing or marsupial animals. They are the most highly developed members of the order, and occur in Australia, taking the place of deer and cattle. The family comprises over fifty species, and of these the great kangaroo may be taken as a type. This species was formerly plentiful over the plains, but it is now retiring before the colonist. The fore-limbs are small; the hind-limbs very large and thick; the head small, with rather long ears, and a long, dusky-brown muzzle; the body long, with the fur shortish but thick, and of a gray-brown tint. In height it is as tall or taller than a man. The female carries her young in a pouch on the underside of the belly. When moving quickly the hind-limbs alone are brought into action; and by means of these the animal bounds along in great leaps of from ten to fifteen feet, the body being carried in a nearly horizontal position, and the tail extended to balance it. The fore-limbs are chiefly used in handling, and with these the females lift their young, and place them in the pouch. The kangaroos are vegetable feeders.

Lamprey eels.—Eel-shaped animals of a very low position, mostly living in the sea, but going to fresh water to lay their eggs. The large sea lamprey is nearly three feet long. It has no lower jaw, but its mouth is permanently open and is lined with horny teeth by which the animal fastens itself to other fishes, on the blood and mucus of which it lives. There is a single nostril and seven gill openings on the side of the neck. They are used as food in some places. Allied are the hag-fishes, which become true parasites, entering the body of a fish through the gills and completely devouring the flesh in a single night. The hag-fishes are not common on our east coast; they are more abundant in Europe and California.

Lark.—The common name of birds comprising the genus *Alauda* and *Stremella*. The skylark of Europe, the most harmonious of this musical tribe, commences its song early in the spring, continues it during the whole summer, and is one of those few birds that sing while on the wing. When it first rises from the earth, its notes are feeble and interrupted; as it ascends, however, they gradually swell to their full tone, and long after it is lost to the sight it still continues to charm the ear with its melody. It mounts almost perpendicularly, but descends in an oblique direction, unless threatened with danger, when it drops like a stone. The meadow-lark of North America, about ten inches long, somewhat resembles the skylark in its habits, but its song is not so sweet.

Leeches.—A group of flattened worms found almost entirely in fresh water, though in Asia there are species which live on the land or in trees. At the anterior end is a sucker, and there is a second at the hinder end. The anterior sucker surrounds the mouth, and this, in some species has radiating from it three jaws, each like half of a buzz saw. With these they cut the skin of higher animals, sucking their blood through the wound. Half a century ago leeches were extensively used by physicians in the attempt to relieve certain diseases, but it has since been found out that the system needs strengthening, not weakening, and the use of leeches has ceased.

Leopard.—The *Felis pardus* differs from the panther by having small spots thickly set, while the panther's spots are large and open. The species is a native both of Africa and Asia. The body of this fierce and rapacious animal is about four feet long. It can take surprising leaps, swim, crawl, and ascend trees.

Lion.—The largest and most majestic of carnivorous quadrupeds. It is, when mature, of a nearly uniform tawny or yellowish color, paler on the under parts, the young alone exhibiting markings like those common in the *Felinæ*; the male has, usually, a great shaggy and flowing mane, and the tail, when it pretty long, terminates in a tuft of hair. The whole frame is extremely muscular, and the foreparts, in particular, are remarkably powerful, giving, with the large head, bright eye and copious mane, a noble appearance to the animal, which, with its strength, has led to its being called the king of beasts. A lion of the largest size measures about eight feet from the nose to the tail, and the tail about four feet. The lioness is smaller, has no mane, and is of a lighter color on the under parts. The strength of the lion is such that he can carry off a heifer as a cat carries a rat. The lion is chiefly an inhabitant of Africa, although it is found also in Asia, particularly in certain parts of Arabia, Persia, and India. It was anciently much more common in Asia, and was found in some parts of Europe—Macedonia and Thrace, according to Herodotus and other authors. The lion is an inhabitant of open plains in which the shelter of occasional bushes and thickets may be found. It is easily tamed, at least when taken young and when abundantly supplied with food. Lions were made to contribute to the sports of the ancient Romans; a combat of lions was an attractive spectacle, and numbers were imported into Rome, for the amphitheater.

Lizards.—A group of four-footed reptiles occurring in warmer climates, and especially abundant in the tropics. The body is covered with scales on both back and belly, while the head is covered with larger plates, called scutes. This is important when the question comes up regarding a few legless forms, which look like snakes, the presence of scales beneath, instead of broad scutes, showing at a glance their proper position. Most of the lizards are insect eaters and thus do much good. Only a single one, the Gila monster, is poisonous. Some of the larger tropical species are used as food. Some of the species have a great capacity for changing the color to correspond to the surroundings. This is most marked in the chameleons of Africa, and exists to a less extent in some of our American species which are popularly called by the same name. The change of color is due to the enlargement or contraction of small colored bodies in the skin. Among the interesting lizards are the horned toads of our southwest, the glass snakes, footless lizards whose tails are very brittle and break off at slight provocation, and then grow again; the frilled lizard of the East, which has a wondrous collar which he raises when alarmed; and the geckoes of southern Europe, which crawl about on the ceilings of the rooms, uttering the cry which gives them their name.

Llama.—An animal of Peru, allied to the camels in structure and serving as the native beast of burden, as does the camel in the old world. It is about the size of the common deer, with a long neck. It is capable of carrying about one hundred and fifty pounds. Allied is the alpaca, which is kept for the hair, used as a textile material and greatly in vogue some forty years ago. When the hair was first sent to England no one would touch it on account of the difficulty of working it satisfactorily. Titus Salt solved the problem, winning a fortune and the knighthood. Llamas and alpacas defend themselves by spitting, and biting, and many a visitor to zoological gardens has received a missile from the mouth of one of these beasts. Llamas and alpacas are only known in a state of domestication; wild relatives are the vicuna and the guanaco of Peru. Possibly the tame forms have descended from these.

Lobster.—The most important crustacean, one species occurring on our east coast, another on the coast of northern Europe. The body is divided into two regions, the anterior bearing, besides the parts used in taking food, a pair of large pincers and four pairs of walking feet. At the front of the head are two pairs of feelers, which are sensory, and a pair of eyes on the ends of short stalks. The lobsters are fond of decaying fish and are among the scavengers of the sea. They are caught in large traps, called lobster pots, made out of lath and baited with decaying fish. The number taken is enormous, and overfishing has greatly reduced the numbers in the sea, so that almost everywhere laws have been passed to protect them. The annual catch on the New England coast is estimated at about thirty million pounds, the average weight of a lobster being between two and three pounds. Farther south on our east coast, in California and the Mediterranean a different animal is called lobster.

Macaw.—A genus of beautiful birds of the parrot tribe, distinguished by having their cheeks destitute of feathers, and their tail-feathers long. They are natives of tropical South America. The largest and most splendid is the great scarlet or red-and-blue macaw. The great green macaw and the blue-and-yellow macaw are somewhat smaller.

Mackerel.—An important food fish occurring in the North Atlantic and characterized by the slender shape, the series of little finlets on the tail and the deeply notched caudal or tail fin. It is taken both by hooks and by seines. Some are eaten in the fresh condition and some are salted. Formerly it was very abundant on the eastern coasts of the North Atlantic states, but recently it has been comparatively scarce, possibly the result of overfishing. It goes in large schools. Allied is the Spanish mackerel of our southern waters and the large horse mackerel, which is not very abundant with us, but which is more common in the Mediterranean, where it is called the tunny. Large individuals may weigh over half a ton. It is used extensively as food, the chief fisheries being around Sicily.

Magpie.—A bird belonging to the crow family. There are several species, two of which belong to America. The common European magpie is about eighteen inches in length; the plumage is black and white, the black glossed with green and purple; the tail is stout, and the tail is very long. The magpies continue in pairs through all the year, and prey on a variety of food, chiefly animal. They are determined robbers of other birds' nests, destroying the eggs and young birds. In captivity they are celebrated for their cunning instincts, their power of imitating words, and their propensity to purloin and secrete glittering articles.

Mammals.—One of the great groups of vertebrates, including the forms commonly called animals. The term animal really has a much wider meaning and includes all living forms that are not plants. Thus corals, snails, clams, insects, fishes and the like are just as much animals as are the mammals. A mammal is readily recognized by the hair (which occurs nowhere else), the warm blood, by bringing forth the young alive and nourishing them with milk secreted by the mother. To the statement that they have living young and do not lay eggs the only exceptions are three small forms found in Australian regions. These form a group called monotremes. Next above them are the marsupials, in which the young are very immature when born. Therefore they are taken into a pouch on the ventral side of the mother, where they remain until able to shift for themselves. To this group belong our opossum; all of the others, including the kangaroos, wombat, sugar squirrel, etc., belong to Australia and the adjacent islands. Next are the insect eaters or insectivores, including our moles and shrews; then come the rodents or gnawers (squirrels, rats, mice, porcupines, rabbits, beaver, etc.), in which the front teeth are fitted for gnawing. The ungulates are the hoofed animals and are subdivided according as the number of toes are odd (horse, ass, tapirs, rhinoceros) and the even-toed group (cattle, sheep, deer, antelope, camels, etc.). The elephants come next, at present restricted to Asia and Africa, but formerly spread over Europe and America in the species known as the mammoth and the allied mastodon. Another group is the bats, the only flying mammals, which have a wing of skin supported on the extremely elongated fingers. All of our species feed on insects, but in South America there is one which is said to suck blood (vampire) and in Asia there are bats which eat fruit. Whales form an additional group, wonderfully adapted for aquatic life, as also are the sirenians (manatee and dugong). The carnivores are the flesh eaters, with teeth adapted to cutting flesh and cracking bones. Here are the bear, weasels, otter, mongoose, dogs, foxes, wolves, and the long line of cats, while the seals and sea lions form an aberrant aquatic side branch. Lastly come the primates, the group including the monkeys, apes and man.

Manatee.—The sea-cow, a gregarious aquatic mammal of the genus *Manatus*, order *Sirenia*, found on the coasts of Florida and tropical America. They generally frequent the mouths of rivers and estuaries, and feed on algæ, such littoral vegetations as they can reach at high tide. Their anterior limbs or swimming paws are furnished with nails by means of which they drag themselves along the shore. They are large, awkward, whale-like animals, attaining a length of eight to ten feet as a rule, but sometimes growing to twenty feet. The skin is grayish-brown, sparsely covered with hairs. Their flesh is excellent, and they furnish a soft, clear oil which does not become rancid. An ally with similar habits is the dugong of Australia.

Mandrill.—A species of baboon distinguished by the short or rudimentary tail, by the elongated, dog-like muzzle, and by the presence of buttock callosities which are generally brightly colored. It has cheek protuberances colored with stripes of brilliant red and blue. The mandrills inhabit western Africa, where they associate in large troops. Full-grown males measure about five feet; they are exceedingly strong and muscular, and fierce in disposition.

Mice.—Small mammals of the group of rodents, belonging to the same genus (*Mus*) as the rats. Our common house mouse is an immigrant from Europe. Its habits are well known. There are some interesting varieties, among them the white or albino mice, which are interesting as pets, since they are less apt to bite than the wild stock. The Japanese dancing mice have the queer habit of turning around every few seconds. The field mice are different species.

Moccasin.—A poisonous snake of the warmer United States, related to the rattlesnake, but lacking the rattles characteristic of the latter. It is more aquatic than its relative the copperhead, frequenting streams and marshy places in search of frogs and other animals on which it feeds. Its bite is dangerous.

Mocking bird.—A genus of the family *Turdidæ*, or thrushes, exclusively American in its distribution, but ranging widely over the continent. These birds are remarkable for their power of song. The best known species is *Mimus polyglottus*, which has marvelous power of voice, and is able to imitate almost any species of animals, as well as noises produced artificially. Its own song is loud, full, and exceedingly varied. In plumage it is decidedly somber, being of a general ashy-gray hue, paler beneath; its sweet and varied notes, and its faculty of imitation, render it a prime favorite.

Mongoose.—One of the small carnivorous mammals of India, noted as a destroyer of snakes and accordingly encouraged. It does not hesitate to attack the most venomous serpents, killing them by agility and having no protection against their poison except its hair and ability to dodge the blows. An

excellent description of their habits is given in Kipling's *Riki-tiki-tavi*. Some years ago mongoose were introduced into Jamaica to rid the island of snakes. The result is an additional evidence of the danger of interfering with nature. The animals killed off most of the snakes and then turned to birds, including the common fowls. Bird and snakes being thus reduced the insects have had it all their own way, and now something is desired to rid the island of the mongoose. The mongoose and its near relative, the ichneumon of northern Africa, are gray and a little larger than a rat. All make interesting pets.

Monkeys.—A common name for certain members of the mammalian group of primates, but no scientific definition is possible, for the term is used with very different meanings. All of the American monkeys are true monkeys, but in the old world there is no line between ape, baboon, gibbon, macaque and monkey. Most of the American species (the marmosets excepted) have one more molar tooth on each side of each jaw than does man, but the forms of the eastern continent are like man in that respect, as they are in having nails rather than claws on at least some of the fingers and toes. Many of the new world species have prehensile tails, but this never occurs in the others, the tail exhibiting a tendency to be reduced, at last disappearing in the man-like apes. Then the American apes have the nostrils widely separated and opening sidewise, while in the others they open in front and downward as in man. Monkeys are extremely interesting because of their caricature of man. Some make most interesting pets, and others are disagreeable, in looks temper and habits. Most of them are vegetarians for most of their diet, but they are fond of eggs and young birds, as well as insects. None stray far out of the tropics and only one enters Europe at Gibraltar.

Mosquitoes.—A group of two-winged (dipterous) insects, distantly related to the common house fly. The animals usually lay their eggs in water; from them hatch out the larvæ, which, from their motion in the water, are commonly called wrigglers. When fully grown, the wrigglers come to the surface, the skin splits down the back, and the perfect insect emerges. As adults they live on blood, which they suck from punctures which they make by the proboscis. In order to stimulate the flow of blood they inject a little of their poisonous saliva into the wound. This causes the itching which was formerly thought to be the worst effect of their bite. Within the past few years it has been found that mosquitoes are the means of inoculating man with malaria, yellow fever and possibly other diseases. They get the germs from some one affected with the disease, and, after a few days, are able to pass them along with the saliva. This discovery has led to warfare against the mosquito and to preventing the attacks by means of screens. Not all species are able to spread these diseases. Thus only *Anopheles* can convey malaria, mosquitoes, which raise the hind end of the body when they bite. In the same way yellow fever is conveyed by *Stegomyia*. The commonest mosquitoes, species of *Culex*, are not known to convey disease. The best ways of eradicating these pests are the emptying of all possible breeding places, and when that is not possible, by covering the top of the water with kerosene.

Moths.—The common name of certain insects belonging to the *Lepidoptera*. Like all *Lepidoptera* they have scaly wings, the fore wings larger than the hind, and a sucking tube on the lower side of the head. They differ from the others of the group, the butterflies, in that the antennæ or feelers on the front of the head never end in a club, but, whether feathered or not, they taper to a point. When at rest they carry the wings horizontally instead of folded over the back, and with few exceptions they fly at night. Only a very few feed on anything except vegetable matter. The larvæ of the clothes moth eat woolens, silk and other animal matter. With the vegetable food of the larvae, the caterpillars, the group does great damage, the worst pests with us being some of the species that have been recently imported, like the gypsy moth, the brown tail, and the leopard moth. Our older forms, like the codling moth and the army worm, and the various measuring worms, are of far less importance. On the other hand, only a few are of any actual value, among them the silkworm, which more than repays its depredations on the mulberry trees by the silk which it spins from glands near the mouth.

Mule.—See *Ass*.

Mouse.—The name given to certain species of small mammals, belonging to the order *rodentia*, or gnawing animals. The *common house mouse* is too familiar to need any description; the *harvest mouse* is the smallest and at the same time one of the prettiest of mammals. The *long-tailed field mouse* frequents fields and gardens. The *dormouse* belongs to another family. *myoxidæ*, of the same order.

Musk-deer.—A genus of deer of the family *Moschidæ*, distinct from the family *Cervidæ*, or true deers. Their habitat is Asia, though one species is found on the west coast of Africa. The typical species is found in the elevated table-lands of central Asia, particularly Tibet. These animals attain the size of a young roe-deer, and the upper jaw bears prominent canine teeth. The males alone yield the musk, which is secreted by an abdominal gland of about the size of a hen's egg. The Tibet musk is most in repute, that known as Russian or Siberian being inferior in quality. Besides its familiar use as a scent, musk is employed medicinally as an antispasmodic. There are six or seven other species of moschus, two of which are very diminutive, and lack the musk gland.

Musk-ox.—An animal closely related to the sheep and only remotely to the ox. Its body is covered with tufted hair, brownish in color and of great length. The hair about the neck and shoulders is so thick as to give the animal a humped appearance. The musk-ox is active and agile. The horns, broad at the base and covering the forehead and crown, curve downward between the eye and the ear, and then upward and slightly backward. The horns of the female are smaller than those of the male. The ears are short, the head large and broad, the muzzle blunt. The average male will weigh about four hundred pounds. The food consists of grass, lichens, etc. The musk-ox inhabits the arctic regions of America north of the sixtieth degree of latitude. The flesh is pleasant to the taste, though it smells strongly of musk, the odor of which is also diffused from the living animal.

Nightingale.—A genus of birds belonging to the order *Passeres*, of which there are two species, very similar in plumage, inhabiting Europe and North Africa. One of these is a summer visitant to the southern and eastern counties of England arriving about the middle of April. The plumage of this delightful songster is of a somber hue, being on the upper surface of a reddish brown, redder on the head and rump; the tail a lighter tint; the throat, lower part of the breast, and abdomen, grayish-white; the lower neck and sides pale grayish-brown. The favorite haunts of this bird are copses and hedgerows, and its food consists of insects. The nest is composed of dry leaves, lined with grass, roots, and hair. The eggs are four or five in number, and of a uniform olive-brown, tinged with grayish-blue.

Nutria.—Another name of the coypu, a South American animal about the size of the beaver, and, like it, furnishing a fine fur; yet it is first cousin to the porcupines. It is semiaquatic, swimming well with its webbed feet.

Octopus.—A genus of mollusks with a rounded body, and a small head bearing a pair of well-developed eyes, the mouth surrounded by eight long arms, each arm bearing numbers of suckers by which the animals hold their prey. Inside the mouth are a pair of jaws, shaped much like those of a parrot. Most of the species are small, possibly averaging a weight of five pounds, but on the Pacific coast (Alaska) some can spread nearly twenty-eight feet. The octopus is eaten extensively in the Mediterranean countries. The stories of large octopi attacking man are very doubtful.

Okapia.—A recently discovered mammal, allied to the giraffe. It is found in the forests of the Kongo (Africa). The head is fawn color, the body dark brown and the legs striped with black and white. The first individual discovered had no horns, but others since found have small horns in both sexes.

Opossum.—A family of mammals, belonging to the order of pouch-bearers, which range throughout the wooded districts of America, from the Middle states to the La Plata river of South America. One species is found from Florida to the Hudson river, and west to the Missouri. They are rat-like in form, the largest species about the size of the common cat; they have a long tail, which is almost destitute of hair, and is very useful from its prehensile nature, enabling the animal not only to hang by it, but also to climb and descend trees. They are sly and live chiefly in trees, lying up in the daytime, and at night roaming in search of their food, which consists of insects, small reptiles, birds' eggs, etc.

Orang-outang.—The Malay name (it means man-of-the-woods) for a large man-like ape found in Borneo and Sumatra. It never reaches a height much over four feet, but the arms of one four feet two inches spread seven feet nine inches, and when erect the hands nearly touched the ground. The orang lives almost entirely in trees. It never jumps, but progresses through the forest by swinging itself from limb to limb. The skin is dark brown and the scanty hair black. The young are more like the human being than is the adult. As the age increases the jaws protrude more and more and the disproportionate length of the arms increases.

Orioles.—A family of birds which inhabit the old world, while one species, the golden oriole, is a summer visitant to central Europe. The male of this species has a brilliant yellow body and black wings and tail. The female is a greenish hue, streaked with dusky lines. It is about the size of the common thrush. The name oriole is also applied to several American birds, of which the Baltimore oriole, a bird ranging from Canada to Mexico, is a well-known example. It has the head, throat, wings, and upper back black; the lower back and all the under parts bright orange, deepening into vermilion on the breast.

Ostriches.—A family of birds inhabiting the southern hemisphere, the true ostrich occurring in Africa, the rhea living in South America, and the emu in Australia. All are flightless birds, and as the wing muscles are reduced there is no keel on the breastbone. The African ostrich has but two toes, the others three. The rheas and the emus may be dismissed with mere mention, the rheas furnishing the feathers used in feather dusters. The African ostriches furnish the well-known plumes and are bred for the purpose, the export of feathers from Africa amounting to over five million dollars a year. There are now ostrich farms in South America and California. The eggs are laid in the sand and in nature are incubated by the heat of the sun. The plumes are cut (not pulled out) once a year.

Otters.—Carnivorous mammals related to the bear, which furnish valuable furs, the skins of the sea otters of the Pacific coast being the most valuable. All are fond of the water, the sea otter spending most of its time in the sea.

Owls.—The popular name of a group of nocturnal birds of prey. This order is a sharply-defined one. The head is extremely large; the eyes huge and directed forward; the bill short and stout; the apertures of the ears very large; the legs feathered: the toes four in number, the outer one capable of being directed backward. The plumage is remarkably soft, the feathers of the face forming disks around the eyes. The owls are cosmopolitan, ranging over the whole globe. They feed on small mammals, birds, fishes, and insects, swallowing the hair, bones, feathers, and scales, which they afterward disgorge in the shape of pellets. They nest on the ground, among rocks, in hollow trees, and in buildings, while some resort to the old nests of other birds. They lay from two to five roundish white eggs.

Oyster.—A familiar shellfish, possibly the most valuable of all of the mollusks. There are various species in all parts of the world, but the best is the American species, which now occurs from Cape Cod to the Gulf of Mexico. Formerly it extended to the coast of Maine, and even now there are scattered beds in the Gulf of St. Lawrence. The oyster grows in shallow water, fastening its shell to some rock or shell, and in this way large beds are formed. They are also planted; that is, the young are taken and placed in favorable situations for rapid growth. The great enemies of the beds are the "drill," a small snail that bores holes through the shell in order to obtain the flesh, and the starfish, which destroy large numbers. The oyster contains but comparatively little nourishment, though eaten extensively. The European oyster is smaller than ours and has a coppery taste. Our species have the sexes separate, in the European species they are united in the same individual. Allied to the true oysters are the pearl oysters, especially abundant around Ceylon. These have the interior of the shell lined with mother-of-pearl, and when foreign particles get between body and shell they are covered with the same substance, thus forming the pearls used for adornment. These oysters are obtained by diving; the animal matter is allowed to rot, leaving the pearls behind. The shell is also of value, furnishing material for knife handles, buttons, etc., though most of our pearl buttons are now made from the shells of fresh-water mussels from the Mississippi valley.

Pangolins.—A group of ant-eaters from Asia and Africa in which the body is covered with small scales arranged somewhat like those of a pine cone. Some of them are partially arboreal and are aided in climbing by a prehensile tail.

Panther.—Another name for the leopard, a carnivorous animal measuring about six feet and a half from nose to tail, which is itself about three feet long. The manner it seizes its prey, lurking near the sides of woods, etc., and darting forward with a sudden spring, resembles that of the tiger. The puma, or cougar, is sometimes called the American panther.

Parrot.—The name applied in a general sense to all the members of the order *Psittaci*, which comprises the parrots proper, the cockatoos, paroquets, macaws, lories, nestors, etc. The true parrots have the upper mandible toothed, and longer than high, and a short, rounded tail. These birds combine with the beauty of their plumage a nature of great docility, and have the faculty of imitating the human voice in a degree not possessed by other birds. They are found chiefly in Africa, from whence we get the gray parrot, the best talker. South America, which is particularly rich in species, furnishes the well-known green parrot; and North America is the home of a single species, the Carolina parrot. The parrots are forest birds, and are adepts at climbing, using for that purpose both the feet and the bill. Their food consists of seeds and fruits.

Partridge.—A European member of the grouse family, from which the name has been transferred to the quail in the Southern states, the ruffed grouse farther north.

Peafowl.—Members of the group of pheasants, coming from Asia, but now domesticated on account of the brilliant tail feathers of the male in all parts of the world, the female having a smaller tail and more inconspicuous colors.

Peccary.—A genus of quadrupeds, allied to swine, confined to America. In general form they

resemble small pigs. The best-known species are the collared peccary and the white-lipped peccary. The former occurs abundantly in South America, and also extends into North America, living generally in small flocks, which do not hesitate to attack with their tusks any one who meddles with them. Their food consists of maize, potatoes, sugar-cane, and similar materials; and cultivated fields suffer much from their raids. The flesh is savory, and less fat than pigs' flesh. The peccary possesses a glandular sack, situated in the loins, which secretes a strongly-smelling fluid. This must be cut away immediately on killing a peccary, to avoid contaminating the flesh.

Pelicans. — Fish-eating swimming birds of the warmer regions, with a large pouch of skin between the halves of the lower jaw. In fishing they swim, striking the surface of the water with the wings, scooping the fish into the pouch, and later retiring to the shore to devour them. There are two species in the Gulf states, one white, the other brown in color.

Penguin.—The name of birds which form the order *Impennes*. Their wings are very small and hard; are covered with small stiff feathers of a bristly nature, and are absolutely useless for flight; the birds swim well, using both their webbed feet and their wings. There are about eighteen species, entirely confined to the Southern Ocean and the antarctic regions, where they represent the auks and divers of the northern seas. During the breeding season they resort to rocky islands in immense numbers, and stand erect with their eggs under them. Their food consists chiefly of fish.

Perch.—The common name for several species of fish in both fresh and salt water, all of which are characterized by having spines in the fins and hard scales. The name properly belongs to the fresh-water species, which are of some value as food.

Petrels.—A species of birds related to the albatrosses and varying in size from Mother Cary's chickens, six inches long, to the fulmars, three feet in length. All of them live on the high seas, and many of them will follow a ship for days for the scraps thrown overboard. At night they follow close behind the stern of the vessel.

Pigeons.—A group of birds, including some three hundred species, distributed in nearly all parts of the world, all of which are so much alike that no one is in any doubt about the membership of any form in the group. Most of the domesticated varieties, with their great differences in form, differences which in other groups would be considered as distinct species or even genera, are derived from the rock dove. Among the interesting species are the passenger pigeon, which eighty years ago formed immense flocks over the whole of the eastern part of our country, but which are now nearly or quite extinct. The mountain witch of Jamaica is one of the most beautiful of birds. The largest member of the group was the dodo of islands in the Indian ocean, which became extinct before 1700, partly because it lacked the power of flight. It was somewhat larger than a turkey, with the same external appearance but with a head and a part of the legs, like those preserved in the museum at Oxford.

Polecat.—A name common to several species of the weasel family. The common polecat is found in Europe. It is about seventeen inches long, the tail six inches. The color is dark brown. It is nocturnal, sleeping during the day and searching for its prey at night. It is destructive to poultry, rabbits, and game, so that in Britain it is being rapidly exterminated. It has glands secreting a fetid liquor, somewhat like that of the American skunk, which it ejects when irritated or alarmed. Its fur, which is imported in large quantities, is known as fitch. Its hairs form superior artists' brushes.

Porcupines.—A group of large rodents characterized by having some of the hairs modified into large spines or quills. These ordinarily lie flat, but when disturbed the animal rolls itself into a ball, when all of the quills with their sharp points stand outward, forming a very efficient defense. The quills come out very easily but there is no truth in the statement that the animals have any power to shoot them. Our American species has quills about three inches in length. It feeds upon the bark of trees, which it climbs with great ease, and it may do great damage. The species found in southern Europe and northern Africa lives in holes in the ground and has quills a foot in length and as large in diameter as a lead pencil.

Porgy.—A food fish on the eastern coast from Cape Cod south, known also as scup. It should not be confounded with the pogy or menhaden, one of the herrings, which is taken extensively for oil.

Porpoise.—A very small whale belonging to the group of dolphins, usually some four or five feet in length. It is usually blackish above, lighter or even white beneath. It feeds on fish, and schools of porpoises are often seen following shoals of small fishes. Like all of the whales the porpoises are compelled to come to the surface to breathe. They are one of the common sights on an ocean voyage.

Prairie dog.—Small rodent animals of the squirrel family, found on the plains east of the Rocky mountains. They resemble their allies, the marmots, in appearance, and have well-developed claws on all the toes of the fore-feet; shallow cheek-pouches. The best known species is about one foot in length, and has a tail of about four inches. On the upper surface it is reddish-brown variegated with gray. These animals live together in great societies on those portions of the prairies where the buffalo grass grows luxuriantly. Here they excavate burrows in the ground in contiguity to each other, and, when the little creatures are out, quite a busy scene is presented. The name is given on account of a resemblance between its cry and the bark of a small dog.

Puma (or cougar).—A carnivorous animal peculiar to America, where it ranks next to the jaguar in importance as a destructive or dangerous creature. It is known as the American lion, but it is considerably less in size, and lacks a name. Its length is about fifty inches, exclusive of a tail of twenty-six inches; its height is about two feet. The range is extensive, though it is less abundant in North than in South America, where it haunts a variety of situations, equally at home in dense forests, open plains, and the Andes to at least 10,000 feet. It is cowardly, and is not regarded with fear by man. Unlike most of the larger cats it is remarkably silent.

Python.—A genus and family of serpents allied to the family of boas. They are not venomous, but kill their prey by compression. The pythons belong exclusively to the old world, and are of enormous size, sometimes attaining a length of thirty feet. A rudimentary pelvis and traces of hinder limbs exist, terminating externally in a hooked claw. The head exceeds the neck in thickness, and the mouth is extremely large. Aided by their prehensile tails, the pythons suspend themselves from the branches of trees and lie in wait near water for animals which come to drink.

Quail.—A common name of different species of grouse.

Raccoon.—A small family of plantigrade carnivorous mammals, bear-like in appearance and of small size. The raccoons are peculiar to America, where they range from British Columbia and Canada to Paraguay. The common raccoon is a pretty animal, about the size of a cat, but much stouter; it has a long brown or grizzled coat, a ringed and bushy tail, and a turned-up nose. Its legs are short, and are armed with strong claws, useful for digging or climbing. In its attitudes it is somewhat monkey-like, and usually sits upon its haunches when feeding, holding its food in its forepaws. It has a curious habit of washing articles given to it, and of soaking food in water before eating it. Its skin is valued as a fur.

Rats.—The common name of a group of rodents which have accompanied man over the earth. Formerly we were troubled by the black rat, but about two hundred years ago the much fiercer gray rat (also called Norway rat) appeared in eastern Europe from Asia, and has since overrun a large part of the earth, practically exterminating the black rat. White rats are albino varieties of the black rat. The damage done to human possessions has always been so great as to warrant all sorts of measures for their extermination, but more recently the indictment against them has been more severe, as it is found that they are important means of distributing disease, especially the bubonic plague, which is apparently the same as the black death that made such ravages during the middle ages.

Rattlesnakes.—A genus of poisonous snakes of America in which, when the skin is shed each year, a portion of the old skin remains, in a dry condition, attached to the end of the tail, this forming the rattle. When excited the snake vibrates the end of the tail rapidly and the dried rings of skin make the noise. Usually the approximate age of the snake may be known by counting the rings of the rattle, one for each year and one for the button; but this is not always true. The poison is injected by means of the poison fangs, two long teeth in the upper jaw, which are tubular; the poison gland is in the roof of the mouth.

Redbreast.—A bird of the family *Sylviadæ*, familiarly known in the British islands and throughout most of Europe. It is generally designated as the "robin redbreast," or more briefly "a robin." Its length is about five and three-fourths inches, but it is of a rounder and fuller form than many of the *Sylviadæ*, the slenderness of its legs rather strikingly contrasting with the form of the body. The wings are rather short. The tail is scarcely forked. The general color is olive-brown, and the reddish orange-breast is a conspicuous characteristic, particularly of the male. The name robin is improperly given in the United States to a species of thrush.

Reptiles.—A great group of vertebrates, including lizards, snakes, tortoises, crocodiles and a large number of extinct species, some of bizarre shapes and enormous size. Reptiles are characterized by having a scaly skin, breathing by lungs, never by gills, and by having blood which is about the temperature of the surroundings, commonly called cold blood. There are several other peculiarities in internal structure, some of which may be mentioned. Thus the heart has three chambers, the third not being completely divided except in the alligators. There are two aortic arches carrying the blood back from the heart. The skull articulates to the vertebral column by a single rounded knob (condyle). All produce eggs, but some of the snakes retain them in the body until they are hatched. Reptiles and birds resemble each other in several points, so that they are united in a group of *Sauropsida* (reptile-like). Snakes and lizards are closely related, both having the scales merely horny plates on the outside of the skin; they have a movable bone inserted between the lower jaw and the skull. In the crocodiles and turtles this *quadrate* bone is present but immovable. The turtles have the body inclosed in a bony case, the upper half being formed of the ribs united to the skin, the lower of plates developed in the skin. In the crocodiles the scales are strengthened by the formation of bone beneath the horny portions. Most reptiles have teeth, but all of the turtles lack them, the jaws being covered with horny sheaths. Some of the snakes and a single lizard (the Gila monster) are poisonous, the poison glands being developed in the mouth.

Rhinoceros.—The name of a family of mammals, represented by nine living species, characteristic of Africa south of the Sahara, India, Borneo, and Java. They have large unwieldy bodies; short thick legs, terminating in large pads, with hoof-bearing toes; large elongated heads, with a long horn or horns springing from the snout in existing forms; small eyes and ears, and short tails. Their hide is extremely thick. Five species belong to Africa, all possessing two horns. Of these, the white rhinoceros is the largest, attaining to a length of over twelve feet and a height of nearly six feet; but the black rhinoceros is best known. The Asiatic species are four; the hide has much the appearance of armor plates. They are smaller and two of the species possess double horns, and two a single one. The Indian rhinoceros, a one-horned species, is the one usually seen in menageries in this country. It leads a tranquil, indolent life, wallowing on the marshy borders of lakes and rivers. Owing to the keenness of its smell and hearing, the rhinoceros cannot be easily attacked; but, when brought to bay, it charges with great fury and impetuosity.

Sable.—A carnivorous mammal, nearly allied to the common marten and pine marten, found chiefly in Siberia and Kamchatka, and hunted for its fur. Its length, exclusive of the tail, is about eighteen inches. Its fur, which is extremely lustrous, and hence of the very highest value, is generally brown, grayish-yellow on the throat, and with small grayish-yellow spots scattered on the sides of the neck. It is densest during winter, and owing to the mode of attachment of the hairs to the skin it may be pressed or smoothed in any direction. Two other species of sable are enumerated, the Japanese sable and a North American species. The Tartar sable is the name given to a species of the weasel genus found in northern Russia and Siberia, and the pekan of North America is sometimes known as the Hudson bay sable. The skins of all these varieties are frequently dyed and otherwise manipulated to imitate the true Russian sable. Sable hair is also used in the manufacture of artist's pencils. Sable fur has been of great value from early times.

Salamanders.—A group of amphibians which have four legs and a well developed tail. Like all of the amphibia, they breathe when young by means of gills, some retaining them through life. They may be distinguished from lizards, with which they are often confused, by the smooth skin, in which there are never any scales. Most of the species lay eggs, usually in the water. From these the gilled young hatch out. They are carnivorous or insectivorous. In the adult stage, some are aquatic, but more live on the earth burrowing beneath the soil or under stones, seeking their prey at night. None are poisonous, except that they have glands in the skin which secrete an acrid juice. Our largest species is the mud puppy (*Necturus*) of the Mississippi basin; the largest living species is the giant salamander of Japan, three feet in length.

Salmon.—A well-known fish, forming the type of the family *Salmonidæ*. The salmon inhabits both salt and fresh waters, and ranks among the food-fishes. It generally attains a length of from three to four feet, and an average weight of from twelve to thirty pounds, but these limits are frequently exceeded. The adult fish is a steel-blue on the back and head, becoming lighter on the sides and belly. It usually continues in the shallows of its native stream for two years after hatching, and during this period it attains a length of eight inches. When the season of its migration arrives, the fins have become darker and the fish has assumed a silvery hue. It is now known as a *smolt* or *salmon fry*. The smolts now congregate into shoals and proceed seaward. On reaching the estuary they remain in its brackish water for a short time and then make for the open sea. Leaving its native river as a fish weighing, it may be, not more than two ounces, the smolt, after three months' absence, may return to fresh water as a *grilse*, weighing four or five pounds. In the grilse stage, the fish is capable of depositing eggs. After spawning in the fresh water the grilse again seeks the sea in the autumn, and when its second stay in the ocean is over it returns after a few

months' absence as the adult salmon, weighing from eight to ten pounds. The salmon returns as a rule to the river in which it passed its earlier existence. The fertility of the fish is enormous. Salmon are caught by the rod, and by means of nets, the fishings being regulated by law. There are important fisheries in some European and North American rivers. In Europe the fish is found between the latitudes of 45 and 75 degrees, in North America in corresponding latitudes. The flesh when fresh is of a bright orange color, and is of highest flavor when taken from the sea-feeding fish. In the waters of northwestern America are several salmon belonging to a distinct genus, including the quinnat or king-salmon, blue-back salmon or redfish, silver salmon, dog salmon, and humpback salmon. The quinnat has an average weight of twenty-two pounds, but sometimes reaches 100 pounds. Both it and the blue-back salmon are caught in immense numbers in the Columbia, Sacramento, and Frazer river (especially in spring), and are preserved by canning.

Sand dollar.—A flattened sea urchin on the Atlantic coast. On the upper surface are five petals recalling those of a flower, and the whole body is covered with small spines. These contain a dark brown or purple color, and the fishermen grind them up to make an indelible ink.

Scale insects.—A group of hemipterous insects (bugs) in which the body takes the shape of a scale. All are parasites on other vegetation. They have a slender proboscis with which they bore into the skin or bark, and remain there the rest of their life, sucking the juices of the plant. They do great damage, some, like the recently introduced San Jose scale, attacking all sorts of fruit trees, and killing them in a short time. The scale insects are among the most difficult to combat, and can only be got rid of by sprays and by gases. They are distributed by the feet of birds.

Scorpions.—Spider-like animals in warmer countries. They have four pairs of legs and a pair of large pincers, as well as a small pair on the anterior half of the body, while the hinder portion consists of at first a broad region, followed by a narrower one, the whole terminated with a sting, with which a poison gland is connected. The animal strikes by bending the end of this tail over the back. Its sting is very painful, but rarely if ever is it fatal. Scorpions occur as far north as Nebraska, but are more common in the tropics. They bring forth living young and care for their brood for a while.

Sea anemones.—Marine animals related to the corals, common beneath tides and lower on all coasts. They are cylindrical animals, with a mouth surrounded by tentacles at one end. Inside there is a single cavity which serves as a stomach and whose branches run to all parts of the body, thus distributing the food like a blood vessel. The colors, especially in the tropics, are variable, and often gorgeous.

Sea cucumbers.—Marine animals, sort of second cousins to the sea urchins and rather more distantly related to the starfish. As the name indicates, they are shaped like a cucumber, and hundreds of little feet on the side heighten the resemblance, as they recall the spines on the vegetable. Inside they have a coiled intestine, usually filled with mud and the contained vegetable and other debris. With us no use is made of the animals, but they are taken in great numbers in the South Seas, and sent to China, where, as *trepang*, they form an ingredient in soups.

Seals.—A family of aquatic carnivores, in which the legs have become modified into flippers, of little use in progressing on land, but, with the tapering body, are well adapted for life in the water. All species are carnivorous, and they make great havoc in schools of fishes. Most of the species have no external ears. To this group belong the common harbor seal of the east coast, which is extensively hunted farther north for the skins, which are used for leather. On the Pacific coast are the eared seals, one of which is the gigantic sea lion, familiar near San Francisco. Another is the fur seal of Alaska. This breeds on one of the Aleutian islands and has been very carefully preserved, but lately has been sadly reduced by piratical pelagic sealing. When removed, the skin has none of the soft appearance so familiar. It has to have all of the long hairs plucked out, leaving the under wool. In order to protect its herds, the United States government absolutely forbids the importation of sealskins or articles made from them.

Sea urchins.—Radiated animals which are usually shaped like a flattened sphere. They have a mouth, surrounded by five chisel-shaped jaws at one pole, while the whole outer surface is covered with slender movable spines. Between the spines are numbers of slender, flexible, tubular feet, which pull the body along, while the spines act more like true feet. The animals feed mostly on seaweeds. They have no economic value with us, but in Europe the eggs of some species are eaten, forming part of the *frutti di mare* of every Italian seaport.

Shad.—A migratory fish of great food value which ascends all of the rivers of the eastern coast every spring to lay its eggs. It is closely related to the herring, but is much larger, and were it not so full of bones it would stand very near the head of food fishes.

Sharks.—A group of very simple fishes, which have only a cartilage skeleton, no bone being developed anywhere in them. They have the gill openings on the side of the neck separate, and in all of the common species the mouth is on the lower side of the head instead of at the tip, as in ordinary fishes. The tail has unequal lobes, the upper lobe being much the largest. There are always four paired fins and one or more on the back. The sizes of the sharks varies from the smaller dogfish, about two feet long, to the great basking shark, some forty feet in length. Most of the species are very voracious, but the tales of man-eating are often exaggerated, although occasionally they may occur. Some of the largest species feed exclusively on shellfish. The flesh of several species is good to eat, but they are mostly neglected in America. The livers are very rich in oil, which commands a good price for use in dressing leather. In some species the skin has small spines and was formerly used (it was called shagreen) instead of sandpaper. Skin with larger plates is sometimes used in the manufacture of pocketbooks, etc.

Sheep.—The common name of the genus *Ovis*, belonging to the hollow-horned ruminant family. Naturalists are by no means agreed as to what was the original breed of this invaluable animal, which is in modern farming almost equally important for furnishing the farm with a dressing of manure, and the community at large with mutton, clothing and other necessaries of life. The leading fact in the geographical history of this genus is that it occurs both in the new and the old world, whereas the goat tribe are naturally unknown in America. It is usually regarded by naturalists as being not only specifically, but generically, distinguished from the goat tribe; but some authorities, on the other hand, are inclined to believe that the generic separation is founded chiefly on characters which have arisen from the influential power of man. In a state of nature, the sheep is scarcely less active or energetic than the goat; its dimensions are greater, its muscular strength at least equal both in force and duration. It is also an Alpine animal, and among its native fastnesses bounds from rock to rock with almost inconceivable swiftness and agility. The four unsubdued races of sheep are as follows; The musmon; the bearded sheep of Africa; the argali, or wild sheep of Asia; and the Rocky mountain sheep of the United States. The latter is larger than the largest varieties of domestic breeds. The horns of the male are of great dimensions, arising a short way above the eyes, and occupying almost the entire space between the ears, but without touching each other at their bases. The hair in this species resembles that of a deer, and is short, dry, and flexible in its autumn growth; but becomes coarse, dry, and brittle as the winter advances. The most important breed of sheep as regards the texture of the wool is the merino, in modern times brought to the greatest perfection in Spain, though their originals probably formed the flocks of the patriarchs thousands of years ago, and have been the stock of all the fine-wooled sheep. They readily form cross breeds, called demimerinos, which have been brought to great perfection in France, whence, as well as from Spain, they have been imported into the United States.

Shipworm.—Not a worm at all but a mollusk, allied to the clams, which has a wormlike body and which lives in timber in the sea. The animal burrows in the wood, nobody knows how, frequently riddling it, and thus doing great damage to piles and to wooden ships.

Shrimp.—The common name of a large number of small crustaceans allied to the lobster, most of them inhabitants of the sea. In many countries they form an important part of the diet, but with us they are little used with the exception of one or two southern species which are used as a basis for shrimp salad. Shrimps are very abundant off our coast and could be made an important fishery.

Silkworm.—A term applied to the larvæ, or caterpillars, of several species of moths. The common silkworm moth, the most important, is a native of China, where it has been cultivated from a remote period. The caterpillar (*silkworm*) is yellowish-gray, and when full-grown is about three inches in length, with a horn-like projection on the last joint of the body. It feeds upon the white mulberry. The *silk* is produced in a pair of glands on the floor of the body which contain a gelatinous substance, and become much enlarged at the time when the animal is about to spin. These silk-glands unite at the mouth to form a common duct termed the *spinneret*, and through this tube the semifluid substance is ejected, and on coming in contact with the air hardens into the fiber so largely used in commerce. The caterpillar employs the silk in constructing a cocoon in which it assumes the pupa state. The pupa is usually killed by plunging the cocoon into hot water, because the natural exit of the moth is injurious to the silk. After the pupa is killed the silk is reeled from the cocoon and sent to the market as raw silk. The color of the silk varies from a bright orange to almost white. In Europe some moths produce one, others two generations annually. A valued variety is the novi race of Italy, which spins a large white oval cocoon. The Japanese have several varieties, including an oak-feeding silk-moth, producing a green cocoon, the silk of which is much used for embroidery. There are also different kinds in China and India.

Skates.—A group of fishes, closely related to the sharks, but having the body flattened from above downward, and with the anterior fins so united to the side of the head and the body that it has a rhomboid appearance and the tail seems like an inconsiderable appendage. The mouth and the gill openings are on the under surface. The animals are bottom feeders, living on clams and mussels, buried in the mud. In Europe some of the smaller species are used as food, but in America only by some of the immigrants. One of the species has the front of the head prolonged as a long snout, the sides armed with teeth, giving it the name of the sawfish. Another has a large electric battery on either side of the head, capable of giving very strong shocks. This is called the torpedo. The largest is the manta of the West Indies, which may measure twelve or fifteen feet across.

Skunk.—A carnivorous mammal, usually marked with black and white in a striking manner. It is nocturnal, feeding on whatever it may find, and is especially fond of poultry. It is defended by the secretion of a gland near the vent, which it can eject at will. It is said that this offensive fluid can be destroyed with ammonia.

Sloth.—A large mammal belonging to the edentates or animals with imperfect teeth. It is arboreal, living, back downward, hanging by its strong claws from the limbs of trees. It feeds upon the leaves, and its slow motions are said to give it its common name. It occurs in the forests of tropical America.

Snails.—A common name used for mollusks with two limitations. In the first sense it includes any mollusk with a coiled shell. In the narrower meaning it includes only those forms which occur on land and especially those embraced in the group of helices. These land-dwelling forms have a slight shell, into which the whole body can be retracted. They feed exclusively on vegetation, which they rasp by means of a long ribbon, just inside the mouth, the surface of which is covered with thousands of minute teeth, so that the whole is a flexible file. The animal creeps about on a broad sole, and has four tentacles on the head, one pair of them bearing the simple eyes at the tip. Snails do considerable damage where they are numerous. One species is eaten by many in Europe, especially in France and Italy. Over ten thousand species are known.

Snakes.—A group of limbless reptiles, occurring in almost all parts of the world except the arctic regions. They have a rounded body, scaled above but with broader plates or scutes on the lower surface. The mouth is very distensible, and the jaws are armed with teeth pointing backward, which are of great assistance in forcing large animals down the throat. Most of the species are so colored that they are inconspicuous in their natural surroundings, but most of the poisonous species have no such protection. The largest of the snakes are the pythons of India and Africa. The most poisonous species are the fer de lance of the West Indies and the karet of India. One group is entirely aquatic, living in the middle of the Indian and the tropical Pacific Oceans, and bringing forth its young alive. These are also poisonous, and have a flattened tail for swimming.

Sparrow.—A well-known bird of the finch family which inhabits Europe, and was introduced into North America with the absurd idea that it would leave its former grain-eating habits and turn to cankerworms. It has become everywhere an unmitigated pest. Certain buntings are called sparrows in America.

Sparrow-hawk.—The common name of several hawks of different parts of the world. The American sparrow-hawk is the smallest of our falcons. It often preys on the chickens in poultry-yards.

Spiders.—A group of animals with jointed bodies and legs, the bodies divided into two regions, the anterior of these bearing four pairs of legs and two smaller pairs of appendages. The most anterior of these are the poison claws. They have a poison gland in the base, while the end of the claw tapers to a point, serving as a hypodermic syringe. The front of the head has from six to eight simple eyes. The hinder half of the body, the abdomen, is without appendages, save for two or three pairs of very small projections, the spinnerets. Each of these has numbers of openings at the tip through which a fluid is forced at will. This hardens immediately it comes in contact with the air and furnishes the silk of which the web is woven. Fine as it is, this silk is really a cable, being made of numbers of finer threads, one for each opening in the spinnerets. Spiders breathe by means of sacks—so-called lungs—on the lower side of the abdomen. They use the silk for making webs, for cocoons for the eggs, nests, and in some cases for parachutes for flying. Each species makes its own type of web. Our common house spider is the same as that of Europe; the largest species we see is the one found occasionally in banana bunches. The tarantula has the greatest reputation from the unfounded belief

that its bite causes madness which can be cured only by music. So far as is known there is only one species which can cause serious effects by biting man, and even these cases are not sufficiently authenticated.

Squid.—A mollusk nearly related to the cuttle-fish. It has a barrel-shaped body, with a head in front bearing ten pairs of tapering tentacles, each with numerous suckers. On the side of the head is a well-developed eye. Squid live largely on small fishes which they catch with the tentacles, biting them with a pair of parrot-like jaws. They are largely used as bait in fishing, and to a limited extent as food. The average length is a foot or two, but in the seas around Newfoundland and Japan giants are occasionally found with bodies a dozen feet in length and tentacles adding thirty feet to this. These were comparatively abundant about 1875, but none has been reported for years.

Squirrels.—A group of rodents, too well known to need description. They are abundant in all of the northern hemisphere, living in trees and feeding largely on nuts, etc. There are several species in the United States, the fur of the larger kinds having considerable value. Nearly related are the ground squirrels or chipmunks, and the flying squirrels, which really do not fly but glide by means of a parachute of skin extending between the legs of each side.

Stork.—A family of birds, chiefly confined to the old world. The true storks number six species, ranging over Europe, Asia, and Africa, and found also in South America. They resemble the herons, but are more robust, and have larger bills, shorter toes, with a nonserrated claw on the middle toe. They inhabit the vicinity of marshes and rivers, where they find food, consisting of frogs, lizards, fishes, and even young birds. They are migratory, arriving at their breeding haunts in the early spring and departing again in the autumn. The white stork is common in Europe, constructing a large nest, most frequently on the chimney of a cottage.

Swallow.—Any one of 125 species of birds belonging to the family *Hirundinidæ* characterized by the very wide gape of the mouth, to which the common name may allude. All are noted for their graceful flight. They feed almost exclusively on insects and hence are very valuable. Among our common swallows are the purple martin, the cliff swallow, the barn swallow and the sand martin. The so-called chimney swallow is, strictly, not a swallow but a swift.

Swans.—Swimming birds, closely related to the ducks and geese, with long and slender neck, bill about as long as the head, and with a soft cere. Nine species are known, one coming from Chili, the black swan from Australia, and the others from the northern hemisphere. We have two white species, the whistling and the trumpeter swans, but the tame species are all of European origin. Once swans were bred for the table, now solely as ornament.

Tapirs.—A genus of hoofed animals with an odd number of toes on the hind feet. All are tropical, some living in Asia, others in America. All are bulky beasts, recalling somewhat the swine in appearance. They have the snout prolonged into a flexible proboscis with the nostrils at the tip. Their flesh is said to be good.

Thrush.—Any singing bird belonging to the family *Turdidæ*. They are represented with us by the wood thrush, Wilson's thrush, our common robin and several others. The wood thrush is the best singer of our species; the European song thrush is much like our wood thrush but is larger.

Ticks.—A group of semiparasitic animals nearly related to the spiders. The young attach themselves to some higher animal, and then begin to burrow the head under the skin in order to suck the blood. Man and domestic animals are affected by them, and one species is now known to convey the Texas fever to cattle.

Tiger.—The largest and most dangerous of the *Felidæ*; exceeding the lion slightly in size, and far surpassing him in destructiveness. It is purely Asiatic in its habitat, but is not by any means confined to the hot plains of India, though there it reaches its highest development, both of size and coloration. The full-grown male Indian tiger is from nine to twelve, and the tigress from eight to ten feet from the nose to the tip of the tail. The ground color is rufous or tawny yellow, white on the ventral surface, with vertical black stripes or elongated ovals and brindlings. Though possessed of immense strength and ferocity the tiger rarely attacks armed men, unless provoked, but often carries off women and children. When pressed by hunger or enfeebled by age and incapable of dealing with larger prey, like buffaloes, the tiger prowls around villages, and, having once tasted human flesh, becomes a confirmed man eater. In a government report it is stated that "one tigress caused the desertion of thirteen villages, and 250 square miles of country were thrown out of cultivation." The jaguar is sometimes called the American tiger.

Toads.—The common name of any amphibian without a tail, no teeth and a warty skin. They are common in most parts of the world, there being few in the Australian region. They are mostly nocturnal, and, as they feed on insects, they are among the best friends of man and deserve encouragement. The warts are caused by glands in the skin which secrete an acrid fluid, the chief means of defense, as few animals will touch them. It is scarcely necessary to say that they are perfectly harmless to man, and that they cannot cause warts.

Trout.—A common name for several fishes with soft rayed fins and a small fin without rays on the back, behind the large fin. They have very small scales. All are excellent eating and all are regarded as game fish. Our brook trout is typical. This thrives in the coldest and clearest streams, laying its eggs in December or January. Other species in North America are the lake trout and the salmon trout in the east and the rainbow and the Dolly Varden trout in the west. Europe has its own trout. All of the species belong to the northern hemisphere, but they have been introduced into Australia and New Zealand.

Turkey.—A large scratching bird, a native of America, from Canada to Central America. It is chiefly known now in domestication, but is still found wild in some parts of the United States. The tame birds differ some in appearance from the birds in a state of nature. The name was given under the misapprehension that they came from Turkey.

Turkey buzzard.—A large vulture, common in the southern half of our country. It feeds on carrion and thus makes an important scavenger and is protected in some states. It is remarkable for its sustained sailing flight.

Turtles.—The common name of the reptiles known as *Testudinata* or *Chelonia*. They are remarkable for having the body inclosed in a hard case, composed above of the enlarged ribs, below of several large bony plates. In some the head and legs can be retracted inside this shell. Over the outside of the case are horny plates, which, in the hawkbill turtle are of value, as they afford the tortoise shell used for combs, etc. Turtles never have teeth, the edges of the jaws being covered with horny material. Most of the species are carnivorous. Some are terrestrial, some occur in fresh water, and some in the sea. The largest species are the marine leather-backs of the tropics, which occasionally drift north to New England, and the giant species occurring on the Galapagos islands, off the west coast of South America, and on some islands in the Indian Ocean. The marine green turtles are favorites with epicures, as are the terrapins of our east coast. Most species are inoffensive, but our soft-shelled turtles and snapping turtles are savage animals.

Vertebrates.—One of the great groups of the animal kingdom. The vertebrates have a back bone, or vertebral column, which protects the spinal cord, and terminates in front in the skull containing the brain. The alimentary canal lies entirely below this central skeleton, and the organs of respiration are always connected with this, being either gills in openings passing from the throat to the exterior, or lungs connected with the throat by a windpipe. The heart is always below the digestive tract, usually beneath the throat, but in the higher forms it is carried back into the chest. Some lack legs or their equivalent fins, but most have two pairs of these structures, and the aquatic species have also fins in the middle line of the back and belly. All reproduce exclusively by eggs, there being no cases of division or budding, so common in the lower divisions of the animal kingdom.

Walrus.—A marine carnivorous mammal, closely related to seals and sea lions, with enormous downturned tusks, or canine teeth, projecting from the upper jaw, which sometimes reach a length of sixteen inches beyond the sockets. Walruses have a thick clumsy body, deepest at the shoulders, and their feet are adapted for swimming. They reach a length of twelve feet or more and a weight of 2,200 pounds. There are two species, one in the Atlantic and one in the Pacific. The Atlantic form is found on the coast of Labrador and Hudson bay, but formerly extended farther south. They feed largely on clams and other mollusks which they dig from the sea bottom with their tusks. They are hunted for their hides and oil.

Wasps.—A group of insects with two pairs of wings, the hinder part the smaller, and a well developed sting, with a poison gland connected, at the hinder end of the body. It is not easy to frame a definition in common words that will separate them from the ants and the bees. Some are solitary, some form colonies in which the individuals work together for the common good. Among the first are the digger wasps, which excavate holes in the soil, or in wood, which they store with insects that they have paralyzed with the sting, and then lay their eggs in the mass, so that the young, on hatching out will have abundant food. Other solitary forms are the mud daubers, which build nests for the eggs by sticking mud to beams in barns and in other similar places. The social wasps make a nest in common, sometimes in the earth, but the well-known yellow jackets or hornets make paper nests from bits of decaying wood which they chew into a real paper pulp. In the colonies the males die at the approach of winter, but the females live to form a new colony in the spring.

Weasel.—The name of a number of small carnivorous mammals related to the sable, mink, and skunk. They have a remarkably slender, round body with a long neck, which gives the animal the appearance of having the fore legs set back too far. The legs are very short. The common weasel, found both in the old and the new worlds, reaches a length of eight or ten inches; it is light reddish-brown and whitish below, and in northern districts becomes whitish in winter. It feeds on mice, moles, and rats, following them into their holes, and even rabbits fall a prey to it. It rarely visits hen-yards. The stoat, or ermine, likewise inhabits Europe, Asia, and America. It is eight to eleven inches long. In summer its color is mahogany brown, with a black tip to the tail. In winter it changes in northern regions to a pure white except the tip of the tail which, remains black.

Weevils.—A group of beetles in which the head is prolonged into a snout with the jaws at the end. With this they bore into plants of all kinds to lay the eggs, the grub hatching out feeding upon the substance. Hence they are considerable pests. Over 400 species have been described from the United States. Farmers often apply the name to other injurious insects, some of which are not even beetles.

Whale.—The popular name of the larger cetaceans, particularly of all those belonging to the families *Balaenoidæ* and *Physeteridæ* or *Catodontidæ*. In the *Balaenoideæ* the head is of enormous size, but is entirely destitute of teeth, instead of which the palate is furnished with an apparatus of *baleen*, or whalebone, for the purpose of straining out of the water the small crustaceans, which form the food of these whales. The fibrous structure of baleen, or whalebone, its elasticity, and its heaviness, are well known. The plates of it in the mouth of a whale are very numerous, several hundreds on each side of the mouth, and they are very closely placed together, so that the mouth is filled with them. The head of whales usually occupies from a third to a fourth of the whole length. The lower surface of the true skin extends into a thick layer of blubber, an open network of fibers, in which fat is held. The blubber is from one foot to two feet in thickness, the whole mass in a large whale sometimes weighing more than thirty tons. The most important species is that known as the right whale or Greenland whale. It inhabits the seas of the northern parts of the world, and abounds chiefly in the arctic regions. It attains a size of sixty or seventy feet in length. It was formerly supposed that the Greenland whale was an inhabitant of the southern as well as the northern parts of the world; but the southern or cape whale is now regarded as a distinct species, the head being smaller in proportion than that of its northern congener, and the color a uniform black. The main physical characteristics of the whale are its distorted jaws, with upward directed nostrils, its great bulk, and rudimentary limbs. The huge bulk of the creature is driven forward by the flexible caudal fin, and while the body is rigid in front it exhibits great mobility behind. The blowholes are placed on the top of the head, and the animal can only respire when these are above water. The larger whales travel at the rate of about four miles an hour, but when pursuing their prey or goaded by pain they rush through the water at a much greater pace. They are aided in this by the broad and powerful tail, which is their chief organ of locomotion. Instead of being vertical, as in the fishes, this is horizontal, and the larger species can command immense driving power. The tail is also used as an offensive and defensive weapon. The smooth, shining skin is immediately underlaid by a thick coating of blubber, the great object of the whalers. This is at once dense and elastic, and while it preserves the animal heat it also serves to reduce the mighty bulk of the whale and to bring it nearer to the specific gravity of the element in which it spends its existence. It might be thought that the whale, with its vast bulk, would need sea creatures of a high organization to nourish it; but this is not so. Its chief food consists of minute mollusks, and with these its immense pasture-grounds in the north seas abound.

Whip-poor-will.—A bird widely known on account of its oft-repeated cry of *whip-poor-will*. It is not often seen, although abundant in damp woods of the eastern United States. It usually rests on the ground during the day and is active at early nightfall, sending forth its cry, and also coursing low over the grass in search of insects. It is about ten inches long and of plain colors, being grayish, much variegated with black and buff. Its bill is very broad, its mouth large and provided with a tuft of long bristles. It builds no nest, but deposits its eggs on leaves or a slight depression in the ground. To the same family belong the chuck-will's-widow and the night-hawk.

White ants.—A group of insects which are not at all related to the true ants, but which are so called because they live in colonies like the true ants. So the name termites is better for them. In the colonies there are different kinds of individuals. Only the king and queen (male and female) are winged, and these have only to do with the perpetuation of the species. Then there are the workers and the soldiers, whose duties are indicated by their names. The white ants feed upon wood, burrowing holes in every direction through it and never, if they can help it, coming into the

daylight. In the tropics they are very destructive and they will frequently riddle a house without their ravages being suspected. They are more rare in cooler climates, but they extend into New England. Some of the tropical species build immense nests of clay and chewed wood, ten or fifteen feet high and twice that across.

Wolf.—The name applied to several species of carnivorous animals, belonging to the dog family. The common wolf is about five feet in length including the tail, which is twenty inches, and about thirty-two inches in height at the shoulders. The muzzle much resembles that of a sheep-dog; the ears are upright and pointed, and the eyes are set obliquely. The coat is subject to variation in tint, depending much upon the country the animal inhabits. Perhaps the most usual tint is a yellowish-gray, but it is sometimes almost black. In Europe the animal is still found in Lapland, Norway, Sweden, Russia, Poland, Hungary, and some districts of Germany, France, Italy, Spain, and Greece. In Britain, the last wolf was slain in 1680, but in Ireland the species lingered until 1710. The wolf of India is considered a distinct species, and has a dingy reddish-white fur. The North American wolf has a wide range, extending from Greenland to Mexico, and is closely similar to the European race.

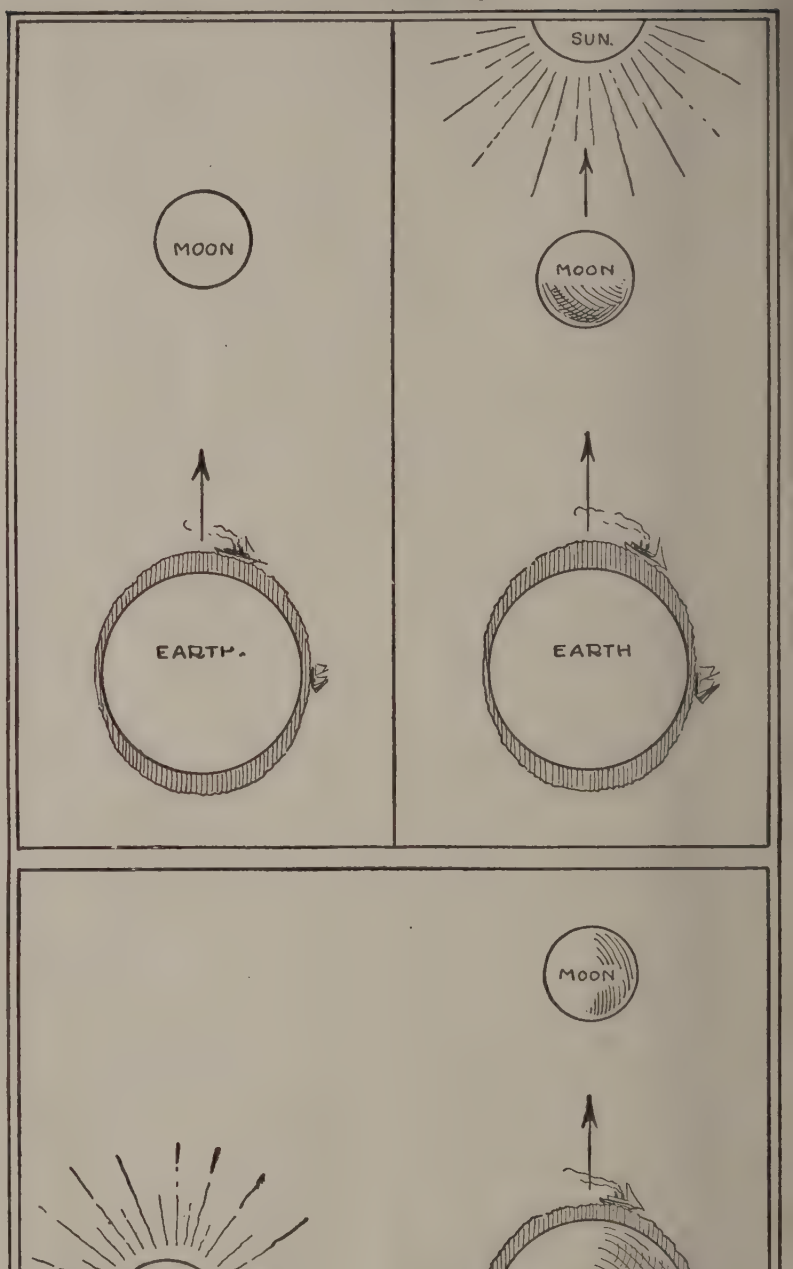
Woodcock.—A famous game bird belonging to the snipe family, and found in northern parts of both the old and new worlds. The American woodcock is about eleven inches long, variegated in black, brown, gray, and rusty colors. The bill is very long and flexible at the end. It is thrust into the soft ground, in search of earthworms, and the presence of woodcocks can often be detected by a cluster of these holes. The European bird is larger.

Woodpecker.—The common name of any of three hundred birds which have climbing feet, stiff tail feathers and which bore into trees for grubs on which they feed, though some of them are fond of fruit and other vegetable food. Most of the species have barbed and pointed tongues with which they spear the larvæ, but in some the tongue is smeared with a sticky substance, secreted by glands in the throat. There are no woodpeckers in Australia or Madagascar, but they occur in all other parts of the world.

Wren.—A genus of birds having a slender, slightly curved, and pointed bill; the wings very short and rounded; the tail short, and carried erect, the legs slender, and rather long. Their plumage is generally dull. They live on or near the ground, seeking for insects and worms among low brushes, and in other similar situations. The European wren is next to the smallest bird in Europe; it is more abundant in the north than in the central and southern parts. It frequents gardens, hedges, and thickets. The North American species of wren are numerous. The house wren is larger than the European wren, and is abundant in the eastern parts of the United States. It often builds its nest near houses, and in boxes prepared for it. The song is very sweet. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself, as the bluebird and swallows.

Zebra.—A name sometimes given to all the striped *Equidæ*, natives of South Africa; but also, in a more restricted use, designating a single species, *Equus zebra*. All resemble more the ass than the horse. The zebra is about twelve hands high at the shoulder. It is light and graceful, with slender limbs; the ground color creamy; the head, neck, body, and legs striped with black; closely related are Burchell's zebra and the quagga, differing in the distribution of the stripes. Zebras are practically untamable, though they have been driven in harness.

TIDES



The magnetism of the moon draws the water of the oceans in a heap on the sides of the earth nearest and farthest away from the moon. As the moon changes its position in relation to the earth, these two great heaps of water move around the earth, causing a depression of the water at the other places. Where the water is heaped, we have high tide; where depressed, low tide. The magnetism of the sun is much less because it is so much farther from the earth. There are two high tides and two low tides each day, alternating about every six hours.

BOOK XII

GOVERNMENT AND LAW

LINDLEY D. CLARK, M.A., LL.B
O. E. RICHARDS, M.A.
JEREMIAH JENKS, LL.B., Ph.D

Modern Government in Contrast with Government of Former Times.—Until quite recently government was regarded as a mystery and beyond the understanding of ordinary mortals. In fact, it is so regarded in many countries of our modern world in which new ideas have been slow to enter. No doubt this idea of government had its origin in the desire of monarchs to inspire their subjects with loyalty and obedience. Now, however, that notion of the governing power has changed in all countries which are democratic, consequently, people are rapidly coming to regard their political organizations as servants of the people. In this way it has come about in the United States, that government is simply a certain number of citizens set aside in each village, township, county, city and state and in the nation and empowered by the voters to undertake certain tasks for the people. Of course, it must be admitted that this ideal is not fully carried out in practice, but it is wonderful progress that we now regard government as an agency to care for the needs of the people rather than an agency acting for the benefit of a king or a ruling oligarchy.

Why Do We Need Government.—Primitive man did not have much government, for his needs were so simple that he could satisfy most of them by his own individual efforts. As the number of the people and the complexity of their needs increased government was instituted to control that which they could not well provide for themselves. At first the king undertook to care for these needs but because of his failure to do his work well he has been overthrown and the rule of the people set up. It would be impossible for the individual family of today to produce its own food; provide its own shelter; protect itself from criminals and disease; educate its own members; carry its own products to the consumers, and bring its needs to the family fireside. Today we are very largely dependent upon one another for freedom, health, and safety, as well as for the necessaries of life. In his relation to the government, the individual who lives in a modern democracy, bears a two-fold relationship. He has duties to perform, and in return for this he obtains protection and help in the performance of his regular activities.

Functions of Government.—According to ex-President Wilson, as stated in his excellent work, "The State," there are eight essential functions of government.

(1) To keep order and provide for the protection of persons and property from violence and robbery.

(2) To fix the legal relations between man and wife and between parents and children.

(3) To regulate the holding, transmission and interchange of property, and the determination of its liabilities for debt or for crime.

(4) To fix contract rights between individuals.

(5) To define crime and provide for the punishment of criminals.

(6) To provide for the administration of justice in civil causes.

(7) To determine the political duties, privileges and relations of citizens.

(8) To regulate the dealings of the State with foreign powers, to preserve the State from external danger, and to advance its international interests.

There are very few people who object when government performs the above duties. However, there is much dispute when the government attempts to push its authority further. When the public authority begins to regulate commerce and labor, as it often does; to provide for internal improvements; regulate postal and telegraphy systems; own or control public utilities such as telegraph and telephone systems, railroads, power and gas plants; to establish rules for the control and development of education; to care for the poor and incapable; and to set up sumptuary laws, such as "prohibition," we find the public divided into three rather distinct groups. One favors the policy of governmental interference with these activities; another opposes them, and the third is more or less indifferent to them until it has been won over to support them by one or the other of the more active groups.

The ever shifting control of the government in democratic countries from one political party to another is to be accounted for by the fact that either the advocates or opponents of further extending political authority have for the time being persuaded the "indifferent" that their policy is correct. Politicial activity of today operates something as follows: An active minority believes that it would be advantageous for the government to exercise more control over commerce, labor, education or any of the optional functions of government. This aggressive group begins to win supporters for its course by public speeches, by printing its convictions in the newspapers and magazines. In the course of time an election is held and this group scores a victory. In the meantime the opposition has set its forces to work. It started its work soon after the advocates launched their campaign, but due to the fact that opposition is often slow to develop, the measure of the active advocates is carried. However, this defeated group, (if there is much at stake) becomes the aggressor and continues its campaign, sometimes quietly and at other times loudly, fully expecting to win at the next election. The victors, fully confident that they have won, fail to continue the defense or do not defend well enough so that at the next election the policies of the group that had won at the earlier election are fully or partially repudiated by the voters. Thus the struggle continues until "in the course of human events" sufficient scientific knowledge is evolved to establish a new political principle or to show that what has been advocated is of no political value.

The Need for the Study of Government.—In as much as political policies and their administration in our republic fall in the last analysis upon the "will of the people," it greatly behooves all well meaning and earnest citizens to make a careful study of the science of government. Every citizen should make it his business to know as fully as possible what his government is, and what it should become.

In a long and costly struggle with kings and nobles our forefathers have won for us the right to control our own political affairs. That victory is now ours and we are enjoying its benefits. Some one has said that the big political battle of the last several centuries was the struggle for the right to vote, and that the biggest political problem of today is to learn how to vote intelligently.

GOVERNMENT OF THE UNITED STATES

The Colonial Period.—In its fundamental aspects, American government, originated in the actual experience of the English colonists, gained by generation after generation in managing their own political affairs. When the colonies were established, the English authorities had no thought of setting up new governments. In origin each and every one of the English colonies was either a grant of privilege to an individual—like Pennsylvania to William Penn, or to a corporation like Virginia or Massachusetts Bay. However, due to the fact that those who settled in the colonies were brave, venturesome individuals, not desirous of asking favors of royalty, and the fact that they were three thousand miles from the seat of the central government, which was more or less indifferent to their interests, self-government quickly found roots in the soil of America.

When the American Revolution occurred there was very little that was fundamentally new in the way of political institutions. The Revolutionists of Rhode Island and Connecticut, where the governors, councillors, and judges were not appointed by the Crown, but created solely by the colony, found their colonial systems of government, based on seventeenth-century charters, so well suited to their needs and ideals that they made no alterations in them other than casting off their allegiance to the King of Great Britain. The royal charter granted to Connecticut by Charles II. in 1662 remained the constitution of that state until 1818, and the charter of Rhode Island, granted in 1663, remained in force until 1842. In all of the states after the Revolution, the distribution of representation, the suffrage, the qualifications for holding office and the legislative, executive and judicial institutions were continued without many radical alterations.

On the eve of the Revolution, the Thirteen Colonies had forms of government which presented striking similarity. Each had a governor, an assembly and a judicial system, and the Common Law of

England, as far as it was applicable and had not been changed by legislation, was binding in all of them.

In eight of the colonies—Massachusetts, New Hampshire, New York, New Jersey, Virginia, North Carolina, South Carolina, and Georgia, the governor was appointed by the king and recognized as the king's personal deputy. But, on the other hand, he was the highest executive official in the colony, and as such was charged with the preservation of peace and the advancement of the welfare of the colonists.

The Governor, as the chief executive, supervised the enforcement of the laws and appointed, usually with the advice of his council, the important civil officers. He could, except in Massachusetts, remove any of the council and other officials for cause and direct them in their work. By virtue of his position as chancellor, he was head of the highest court in the colony, which handled appeals from lower courts and exercised important original jurisdiction in many matters. He also granted pardons and reprieves. He was commander-in-chief of the colonial forces, appointed the military officers of high rank, levied troops for defense of the colony and enforced martial law when that was necessary owing to war, invasion or rebellion. Since he was the king's ecclesiastical representative, he exercised considerable ecclesiastical authority also.

The royal governor, also enjoyed extensive powers in connection with the colonial legislature. In all of the eight colonies of this type except Massachusetts, he nominated the council, which composed the upper house of the legislature. He summoned, adjourned and dissolved the assembly; he placed before it projects of law desired by the home government and exercised the right to veto all laws which he considered objectionable.

It must be remembered, however, that the royal governor was by no means an unlimited sovereign in his province, for he was bound by his instructions from the British government and by restraints which the assembly imposed through its power of controlling grants of money. Furthermore, complaints against his actions often were taken to the Board of Trade or the king in council across the sea.

In Massachusetts the governors which were appointed by the king, had their powers somewhat restricted by the colonial charter. The governor could adjourn, prorogue or even dissolve the assembly, but he could not appoint the members of the upper house, and all civil officers were appointed by him with the consent of the council. In other important respects the governor of Massachusetts enjoyed practically the same power as the other royal governors.

In Rhode Island and Connecticut the governor was elected annually by a general assembly composed of the governor, assistants and representatives chosen by the voters in each "city, town or place." In these colonies the governor did not stand out as a separate and distinct official. His duties were performed only in cooperation with the assembly and council.

The executive authority in the proprietary colonies of Maryland, Pennsylvania and Delaware differed vastly from that of the other colonies. The proprietary colony was a vast estate, carved out of the royal domain and granted by the Crown to a proprietor. When the proprietor was in the colony he had the right to assume control of the executive authority there and when he was absent he vested it in a lieutenant-governor, who served in the capacity of agent for the real owner of the estate. The power of the governor in these colonies was less limited than any of the others, but toward the end of the colonial era there was a gradual decline of his power, due to the rise of power of the assembly to control appropriations.

All of the colonies had two branches of the legislature except Pennsylvania, which had only one. In Massachusetts, Connecticut and Rhode Island the upper house was elected by the assembly; in the proprietary colonies the proprietor or his representative selected the councillors; in the other colonies, the upper house, or council was chosen by the king acting through the royal governor, who usually made the selection himself.

The council enjoyed the right to discuss and vote on all laws and with the governor enjoyed executive and judicial functions. It advised the governor on many important matters and in conjunction with him it formed the biggest judicial tribunal in the colony.

In every colony there was an assembly of representatives chosen by popular vote, but, contrary to common impressions, there was nothing like universal manhood suffrage. In every colony there were restrictions on the suffrage. These restrictions were either property or religious qualifications, or both.

The colonial assemblies from an early period of colonial history maintained that they possessed entire and exclusive authority to regulate their domestic concerns. In the matter of taxation they stoutly asserted their exclusive rights not only in formal declarations but also in actual resistance to the royal and proprietary governors. In addition to general legislative power, the assemblies, usually exercised a large control over the executive department through their power to withhold the salaries of the officials.

The lowest colonial courts were those of justices of the peace, who were generally appointed by the governor, or in some instances elected by local freeholders. In civil cases these justices had jurisdiction over cases involving small amounts; in criminal matters they were allowed to try only the pettiest offences against the law. In Massachusetts and a few other colonies the practice of uniting all of the justices of the country in a general court was followed; this court not only exercised criminal jurisdiction but supervised roads, bridges and similar affairs.

Above the justices of the peace there usually were the county courts whose judges were appointed by the governor, except in New Jersey where they were elected. In most colonies the county court had criminal jurisdiction over all except capital cases, but in Massachusetts, criminal matters were taken care of by the regular sessions of the justices of the peace. The county courts also had civil jurisdiction in cases involving certain amounts that were specified by law in each colony.

A high court was set up in each colony to decide weighty matters and appeals from the lower courts. In the royal colonies the governor, acting as chancellor, and his council generally composed this tribunal. In Massachusetts it consisted of a chief justice and four associates, appointed by the governor and council. In Pennsylvania the Supreme Court was composed of a chief justice and three associates, chosen by the governor.

Of course, appeals always lay from the highest court in the colony to the king in council and this power was frequently exercised just as certain cases are appealed to the Supreme Court of the United States at the present time.

2. Important Steps Toward Union.—(a) From 1643 to 1684 Massachusetts Bay, New Plymouth, Connecticut and New Haven colonies formed the New England Federation to strengthen their defense against the Indians, Dutch and French, representatives being sent from each. After that in time of need intercolonial conferences were held from time to time.

(b) In 1754 a congress of twenty-five members from seven colonies met at Albany to arrange a treaty with the Iroquois Indians and to consider other common interests. The Congress adopted Franklin's plan for a permanent federation, but it was rejected by all the colonies.

(c) In 1765, in consequence of the passage of the Stamp act in Great Britain, at the instance of the Massachusetts house of representatives nine colonies sent representatives to the Stamp act congress at New York, which issued a declaration that the rights of natural born English subjects belonged to the colonists, and framed petitions to the English government for relief.

(d) Further acts of England, especially the Townshend act, led to the formation of *committees of correspondence* among the colonists, who thus fostered unity of sentiment against England and for their common interests.

(e) *The First Continental Congress* was called by Massachusetts in 1774 when the English government passed the acts providing for the coercion of that colony. All the colonies except Georgia sent delegates to Philadelphia, who drafted the Declaration of Rights of the colonies, adopted articles of association, advised resistance and provided in case of need for the meeting, May 1775, of the Second Continental Congress.

(f) *The Second Continental Congress.*— This met, delegates from all the colonies being present. In the meantime, England had passed other measures of coercion and in attempting to sieze the war supplies of the colonists had brought on the battle of Lexington. It therefore became necessary for the Congress to make provisions for continuing resistance. In fact, it became a governing body and with adjournments from time to time, until May 1, 1781, it directed the War of the Revolution, and really organized and managed a new state. It issued the Declaration of Independence, recommended the colonies to provide for themselves state governments, instituted relations with foreign countries and did other needed work.

(g) *The Confederation.* — When the American colonies declared their independence of Great Britain they also appointed a congressional committee, composed of one delegate from each state, to draw up a form of Union for all the new states. The articles of Union, thus drawn up, were discussed for more than a year and were

adopted by Congress in 1777. However, they were not ratified by all the states until 1781.

This confederation provided for a league of friendship among the several states, each of which claimed to retain "its sovereignty, freedom, and independence." The new government consisted of a congress of from two to seven delegates from each state, but each state had just one vote.

Congress under the articles had control of making war or treaties, creating an army and navy, regulating the value of coin, arranging treaties with the Indians and settling disputes of the states regarding land claims.

In practice Congress was unable to set up a stable government due to the fact that: (1) no important law could be passed without the consent of nine states: (2) the failure of Congress to provide revenue for expenses: (3) the inability to regulate interstate and foreign commerce (4) the lack of effective authority to enforce laws: (5) the impossibility of remedying these defects because no amendment could be passed except by unanimous action of the States: (6) it had no power to tax: (7) because the government did not act upon individuals.

(h) A meeting of commissioners from Maryland and Virginia in 1785 to discuss a commercial dispute led Virginia to call a meeting of delegates of all the states at Annapolis in 1786 to consider commercial relations. Representatives of only five states came, but among them were several far-sighted statesmen, and before adjourning they adopted a resolution offered by Alexander Hamilton calling a convention to amend the Articles of Confederation.

(i) This *Constitutional Convention* met at Philadelphia May 25, 1787. Representatives of all the states except Rhode Island were present, among them the most noted and ablest men of the time. Different plans were proposed, important compromises, especially to settle controversies between large and small states and those concerning slavery, were made and at length the Constitution was adopted and signed, September 17, 1787.

(j) It was then submitted to Congress and by it sent to the states to be ratified. On June 21, 1788, New Hampshire, the last of the nine states whose ratification was needed, adopted it. The last state, Rhode Island, ratified it May 29, 1790. Congress provided an act by which it went into operation in 1789.

(k) *Amendments.*—To satisfy the wishes of several of the states, a Declaration of Rights was provided in the first ten amendments, which were ratified by the state legislatures soon after the adoption of the Constitution. Amendments XI. and XII. were passed to settle practical difficulties in administration, while Amendments XIII. XIV. and XV. were passed to clinch the results of the Civil War on the question of slavery.

THE FEDERAL GOVERNMENT. — I. Congress; General Powers.—The Congress, which has been created under the Constitution as the law-making body, consists of the senate and the house of representatives and has several general powers granted it: To pass laws, to judge the elections and qualifications of its own members, to determine its own rules of procedure, to lay and collect taxes, duties, imports and excises, to pay the debts and provide for the common defense and general welfare, to borrow money on the credit of the United States, to regulate commerce with foreign nations and among the several states and with the Indian tribes, to coin money and provide for certain substitutes for coin, and make provisions for controlling the value and purity of both, to fix standards of weights and measures, to establish uniform rules of naturalization, and uniform laws of bankrupcty, to establish and maintain a postal system with all needed equipment for efficient service, to make provision for the encouragement of inventors and authors by patent and copyright laws, to define and punish piracies and felonies committed on the high seas and offenses against the law of nations, to declare war and make full provision for carrying on war by land and sea by regular army and navy or by militia, and to exercise exclusive jurisdiction over all districts that are acquired for the use of the federal government in its civil or military capacities. Besides these special powers, the right to make all regulations necessary to carry these into effect is granted and by decisions of the Supreme Court has been fully established.

Scarcely less important than the powers granted to Congress are the restrictions placed upon the government. It shall not suspend the writ of *habeas corpus* except in cases of rebellion or invasion if the public safety requires it; shall not pass bills of attainder or *ex post facto* laws. No money shall be drawn from the treasury, but in consequence of appropriations made by law, and regular accounts thereof shall be published; no titles of nobility shall be granted by the United States, and presents and titles from foreign governments or rulers are forbidden to office holders without the consent of the Congress.

These prohibitions are all in the interest of the people as against possible encroachments by the government.

To give needed unity of action in matters of national import the several states are forbidden to enter into any relations with foreign states and are restricted closely in their actions regarding money, the law of contracts and some other important matters. Especially rigid are the provisions forbidding state interference with interstate or international commerce and relations with foreign powers

Sessions of Congress begin the first Monday in December. In the years following a congressional election the term ends on March 3d; in other years it extends until it decides to adjourn, usually early in the summer. The President may call special sessions.

Bills are introduced by private members, referred to committees, appointed by the speaker of the house and elected in the senate, that consider and amend at will and report with such recommendations as they see fit. The committees often suppress bills, and their report has great weight in determining the action of Congress.

The Senate.—(a) Consists of two members from each state, elected by the people at large, each senator to have one vote, which he is to cast independently.

(b) The term is six years, the senators being divided into three classes so that one-third retire every two years, securing thus a continuing body. In case of a vacancy the place may be filled by appointment by the executive of the state until the state legislature meets, when it elects a senator.

(c) A senator must be thirty years of age, have been nine years a citizen of the United States and an inhabitant of the state from which he is chosen.

(d) Senators receive a salary of $10,000 a year, mileage of 20 cents a mile each way from their homes to attend sessions, stationery, $1,800 a year for clerk hire, and certain uses of rooms and secretaries of committees.

(e) The Senate, over which the Vice President is the regular presiding officer, chooses a President *pro tempore* to act in the absence of the Vice President, acts as a court for the trial of impeachment cases, a two-thirds vote of the members present being required for conviction. When the President of the United States is impeached the Chief Justice of the United States Supreme Court presides.

(f) The Senate must approve the appointment of the higher officials made by the President and must approve by a two-thirds vote treaties negotiated by him with foreign powers, if they are to go into effect.

The House of Representatives.—(a) Consists of 435 members, chosen by the voters of districts in the several states, made up as nearly as practicable in proportion to the number of inhabitants.

(b) For a period of two years.

(c) A representative must be 25 years of age, have been seven years a citizen of the United States and a resident of the state from which he is chosen. By custom the representative is usually a resident of his district, but this is not necessary; and sometimes, especially in the large cities, a representative resides beyond the boundaries of his district.

(d) The salary, mileage and emoluments of representatives are the same as those of senators, except that senators from their smaller numbers have a more liberal use of rooms.

(e) The house of representatives elects its speaker, judges the elections and qualifications of its members, makes its own rules of procedure and has the sole right of impeachment of executive and judicial officials before the senate sitting as a court of impeachment. Bills for raising revenue must originate in the house of representatives; but, as the senate has an unlimited right of amendment, the privilege is of little value.

Both representatives and senators are frequently consulted by the President and other executive officers in making appointments to office. Moreover, committees of either house, if duly authorized, may, during times when Congress is not in session, make investigations at home or abroad in connection with legislative measures. In such cases, while expenses are paid, no additional salary is given to members.

II. The Executive.—The chief executive is the *President* (a) chosen for a period of four years (b) by an electoral college, elected by the voters of the several states, usually on a general ticket, so that all electors from a state are generally from the same political party; the electors are in some states chosen by congressional districts. (c) The President must be 35 years of age and a natural born citizen of the United States. (d) His salary is $75,000 a year. In addition, Congress has for some years voted $25,000 for traveling expenses. He is given also secretaries, his residence (the White House), which is fur-

nished at public expense, stables, vehicles, and other minor emoluments necessary for his position and work. (e) The President is commander-in-chief of the army and navy and of the militia when in actual military service of the United States; he grants reprieves and pardons; he makes treaties with the concurrence of two-thirds of the Senate; he nominates and by and with the advice and consent of the Senate appoints ambassadors and other foreign representatives, judges of the federal courts, and other high officials, some others being appointed by him alone or by heads of departments; he makes reports and recommendations to the Congress concerning the state of the nation and legislative action; he calls special sessions of Congress, receives ambassadors and public ministers of foreign powers; and takes care that the laws are faithfully executed. The President approves bills passed by the Congress, or, in event of disapproval, returns them to the branch in which they originated. In case of such veto they must be repassed by a two-thirds vote of both houses to become effective. If he does not disapprove them within ten days (Sundays excepted) they become laws unless by adjournment in the meantime the Congress prevents their return, in which case they fail.

The Vice President has the same qualifications and is chosen for the same term and in like manner as the President. Unless the President dies or is removed or incapacitated, his sole duty is to preside over the Senate. In case of the vacation of the President's office, he succeeds. If the Vice President dies, the members of the cabinet succeed in the order of the establishment of the departments, beginning with the Secretaries of State and the Treasury. Salary, $15,000.

The Cabinet consists of the Secretaries of State, Treasury, War, Attorney-General, Postmaster-General, Secretary of the Navy, Secretary of the Interior, Secretary of Agriculture, Secretary of Commerce and Labor. They are (a) appointed by the President, confirmed by the Senate and (b) serve really at the pleasure of the President, usually for his term unless their resignation is sooner brought about. (c) Their salary is $15,000 a year, and while their office expenses are covered, their personal emoluments are only incidental to the official work. (d) The members of the cabinet are the official advisers of the President in both administration work and political policy. In administrative matters each member exercises much discretion in the management of his department and usually really controls the selection of his subordinates who are not under civil service regulations. In matters of policy and making important decisions, his personal judgment is of prime importance. Routine business is frequently managed by subordinates whose tenure of office is practically during good behavior and efficiency.

The Civil Service is made up of (a) those officials appointed without competitive examination—generally higher officers, those whose services are personal or confidential in their nature, like private secretaries, unskilled laborers, or temporary employes, as employes of special commissions; and of (b) the classified service, the members of which are appointed after a competitive examination. Such appointees are apportioned among the states in proportion to population so far as possible, and the positions are permanent during efficiency. The President may extend by order the classified service, which now includes some 200,000. Examinations are held regularly twice a year at various places throughout the country, as designated by the civil service commission, a board of three members appointed by the President to administer this law, free from the influence of partisan politics.

III. **The Judiciary** consists of the Supreme Court of the United States and such inferior courts as Congress may establish. All United States judges are appointed by the President, to hold their office during good behavior. Their salaries shall not be reduced during their term of office

1. The Supreme Court consists of the chief justice, whose salary is $20,500, and of eight associate justices with a salary of $20,000 each.

2. Nine circuit courts of appeal have been established which consist of three judges each. Eligible to sit in this court are the Supreme Court justice assigned to the circuit, the circuit judges (of which there are two to four in each circuit), and the district judges within the circuit. The salaries are $12,500.

3. The territory of the United States has been divided into some 83 judicial districts, none of them crossing state lines. There are 132 district judges, performing the duties in these districts.
The salaries are $10,000.

A judge who is 70 years of age and has served ten years may retire on full pay for life.

4. The United States courts have (also appointed by the President) district attorneys and marshals to prepare and prosecute cases in behalf of the government and to execute processes and other orders of the courts.

5. The jurisdiction of the federal courts pertains to matters concerning the federal government, such as the post office, coinage laws, etc., and to cases which might involve the states in disputes with one another or with foreign countries.

6. Besides the courts mentioned for the disposal of controversies, there has been established (a) the court of claims, before which come claims of various kinds (excepting pensions) against the United States, and (b) the customs court, which settles controversies arising in connection with the collection of our customs duties.

The States. 1. The original thirteen states, at the suggestion of the Continental Congress, each in its own way and time adopted a state constitution. It is customary of late years for the Congress to pass an act admitting a state under prescribed conditions of boundaries, population, etc., with the provision that it shall frame and adopt a constitution satisfactory to the Congress. These are all modeled in part after the Constitution of the United States and of the older states. Of late years there is a tendency to make them longer and to include in the constitution subjects usually left to the legislature.

2. (a) All the states have legislatures consisting of two houses. The members of the larger, or lower, house are elected from districts and meet in six states annually; in the others the legislature meets only biennially. Members of the upper house are usually chosen for a period of two or more years. (b) Salaries are paid to all but vary from annual salaries to a per diem for days actually served. In several states the sessions are limited in time to sixty or ninety days. (c) In most of the states there are restrictions upon the powers of the legislatures, such as prohibitions of special legislation, and limiting the borrowing power of cities. Provisions against corrupt lobbying, blackmail and other abuses are common. In the main, the laws that touch most closely our daily life, those regarding contracts, crimes, marriage and divorce, inheritance, etc., are left to the states. Of late there is a movement in some of the states toward direct legislation by the people under the initiative and referendum.

3. The executive department of the state consists of a governor, lieutenant-governor, secretary of state, auditor or controller, treasurer, attorney-general and others needed to carry out the laws. The terms and compensation vary in the different states. The most important difference between the state and federal executive departments is that in the states the other officers are elected and not appointed by the governor, so that there is not the unity of action that comes from an appointive cabinet.

4. The judiciary department consists of a supreme court, and sometimes a court of appeals, and of such subordinate courts as the size of the state and the nature of its business and customs have made suitable. There are great similarities throughout the country. The judges are usually elected and for terms of two to fourteen years.

5. The county, town and city governments are all under the control of the state, but the forms vary widely, usually there being a tendency, as regards the rural districts especially, to follow models of some of the older states as indicated in the brief historical introduction. Each local subdivision has, of course, some body with minor legislative or ordinance powers, an executive and a judiciary.

Territories and Dependencies.—The territories and the insular dependencies of Hawaii, Porto Rico and the Philippine islands are under governments established by Congress and approved by the President and subject to change by regular legislative procedure.

All have governors and administrative and judicial officers appointed by the President. To them Congress has given a legislative body to make new laws under the powers granted In Porto Rico and the Philippines the members of the upper house are appointed by the President and consist in part of the administrative officers mentioned. The lower house is elective. In event of a deadlock the revenue and appropriation laws of the preceding year continue in force. No new laws can be made without the assent of both houses. There seems to be an inclination to increase the powers of self-government of the territories and insular possessions as rapidly as the people, hitherto not accustomed to self-rule, shall show themselves fit to take it.

In all cases Congress retains under the constitution the right to modify to any extent the method of governing these territories and possessions.

SPEAKERS OF THE HOUSE OF REPRESENTATIVES

Congress	Years	Name	State	Born	Died
1	1789–91	F. A. Muhlenburg	Pa....	1750	1801
2	1791–93	J. Trumbull.....	Conn.	1740	1809

The Government and the Indians.—The relations of the Indians with the United States government are controlled and directed by the secretary of the interior through the commissioner of Indian affairs There are about 6,000 government employees in the Indian service, of whom about 2,000 are Indians. In twenty-six states about 200 bonded superintendents of Indian schools discharge the duties of supervision and administration which formerly devolved upon the Indian agents. Almost the entire Indian service is now under the civil service regulations. In 1924 citizenship was conferred on all noncitizen Indians in the United States.

Indian Population.—The number of Indians enrolled as in relations with the federal government has not materially decreased for the last hundred years. In the United States proper, exclusive of Alaska, 340,917 Indians are officially reported in 1922. But "fullblood" Indians are outnumbered by the "mixed bloods" in many tribes, individuals with only one-sixteenth or one thirty-second of Indian blood, and with no distinguishing Indian features or traits, standing on the rolls as "Indians." Thus 101,469 "Indians" are on the tribal lists of the "Five Civilized Tribes" (Cherokees, Chickasaws, Choctaws, Creeks and Seminoles) in Oklahoma (old "Indian Territory") and of these, only 24,705 are fullbloods, while 50,775 are mixed-bloods, and 25,989 are intermarried whites and negroes —all enrolled as "Indians."

Indian Legislation.—Upon the whole the last thirty years has shown in its general trend and at its critical points, a determination upon the part of congress and the executive to treat the Indians with that consideration for their rights and their best interests which ought to mark the relations of a kind and just guardian to his ward.

Education.—It has built up for the Indian children a great system of schools with valuable features of industrial training. Appropriations by the United States government for Indian schools began with $20,000 in 1877, and have increased steadily to $11,021,910 for 1922. The average attendance of Indian children in Indian schools in 1877 was 3,598; while for 1909 the average attendance was 25,568. These figures do not include the five civilized tribes which have had a more or less efficient system of tribal schools of their own. The government boarding-schools for Indian children, in which 20,000 Indian children in 1909 were clothed, fed and taught by the government, are 82 in number on reservations, and 27 off Indian reservations.

Industrial Schools.—Such schools as that at Carlisle, Pennsylvania, and Haskell Institute at Lawrence, Kansas, have led the way in industrial training along lines and by methods which are being introduced into the "white" public schools of many states.

The Outing System inaugurated by Captain Richard H. Pratt at Carlisle, Pa., has placed hundreds of Indian boys and girls one by one in carefully selected farmer's homes, where for months or years such children have learned the ways of civilized Christian homes, and have been brought into touch with civilized life as they could never have been in schools on the reservations.

Day and Mission Schools.—One hundred and ninety-four Government day schools for Indians in 1909 gave instruction to 6,286 Indian school children. Christian mission schools not under contract with the government furnished instruction to 3,684 Indian children; and Mission boarding schools at which the government contracts to pay from tribal funds for the board and teaching of Indian children enrolled 1,050 pupils.

Reduced Area of Reservations.—As the pressure of increasing population has made it unreasonable to leave unoccupied the vast area of land which was included in the Western Indian reservations, Indian reservations have been reduced in size. Sometimes great sections have been bought by congress from Indian tribes at a nominal price, the proceeds held for the Indians in trust. When an Indian tribe is "allotted," and a homestead has been secured to each member of the tribe, frequently the rest of the reservation has been sold for the benefit of the Indians. In 1909 the unallotted area of all the Indian reservations (in about twenty states) was 48,477,796 acres (about 75,000 square miles). On July 1, 1909, there were $38,537,679.42 in the United States treasury of "Tribal funds held in trust by the government in lieu of investment" and annual interest, at either 3 per cent, 4 per cent, or in some instances 5 per cent, paid on certain of these funds amounts to $1,892,179.35 annually.

The New Policy.—The recognition of the family, not the tribe, as the social unit, and the responsibility of the individual to the law, underlie the wise policy of allotting homesteads to families, and giving an individual holding of land to each Indian. The steady improvement of the Indian in habits of industry, and in responsibility to law, has followed. It is believed by wise friends of the Indian that his personality should now be further strengthened by breaking up tribal funds into individual holdings upon the books of the United States treasury; that each Indian should be credited with his own proportionate share, such share to be administered for him by the government only so long as he is incapable of caring for it himself, principal and interest to be paid to each man and woman as rapidly as ability to care for property is demonstrated by the individual Indian.

Present Conditions—The amount of rations and clothing bought by the government for Indians is rapidly decreasing; school accommodations are now provided for five-sixths or seven-eights of the Indian children of school age; and the number of Indians under forty years old who are not now self-supporting is rapidly decreasing. No Indian tribe is now in "abject savagery." On the scale from savagery to civilization, the different tribes are scattered at irregular intervals through barbarism and Navajo semi-civilization (as the 30,000 Navajo, shepherds, with blanket-weaving and artistic silver work, with increasing agriculture,) the Sioux, cattle-raisers and rude farmers, the Pincus and Pueblos, for many generations peaceful agriculturists farming by irrigation;—to the leading families of the five civilized tribes, some of whose sons are now the third generation of college-bred men.

‡Prior to 1804 each elector was entitled to vote for two candidates for President. The candidate receiving the greatest number of votes was declared elected while the candidate receiving the next highest vote was declared Vice-President. †As there was no election the choice was decided by the House of Representatives. *It is claimed that the first Republican party was the progenitor of the present Democratic party. §Electoral votes not cast.

FAMOUS STATESMEN

SHEPPARD-TOWNER MATERNITY ACT

The Sheppard-Towner Act "for the promotion of the welfare and hygiene of maternity and infancy and for other purposes," passed by the senate by a vote of 63 to 7, and by the house by a vote of 279 to 39, was signed by the President and became a law on Nov. 23, 1921.

The act provided for the current fiscal year (1922) $10,000 for each state accepting the provisions of the act, and an additional sum of $1,000,000. Of this additional amount, not more than $50,000 was to be used for Federal administration, and the remainder was to be apportioned to the states and granted, if matched dollar for dollar by state apportions, $5,000 to each State, the remainder to be apportioned on the basis of population.

After the fiscal year 1921-1922 the authorized annual expenditure is $5,000 unmatched to each state and to be matched dollar for dollar, an additional $5,000, plus a prorated amount of the remaining $710,000 of the additional $1,000,000, after a maximum of $50,000 has been deducted for Federal administration.

The Federal board was changed from a Board Advisory to the Children's Bureau to the Federal Board of Maternity and Infant Hygiene, composed of the chief of the Children's Bureau, the Surgeon General of the U. S. Public Health Service and the Commissioner of Education. The board is given authority to approve or disapprove the plans submitted by the state and to withhold further certification of the Federal funds to a state if the money is not properly expended.

Local administration in the states is in the Child Hygiene or Child Welfare Division of the State agency of health, or, where such a division does not exist, the agency designated by the state.

The board has laid down no plan of work which a State must follow, nor has it made approval of plans contingent on complying with certain conditions, each plan being considered on its merits.

The bill was the direct outgrowth of the series of investigations on maternal and infant morality made by the Federal Children's Bureau during the nine years of its existence. These investigations, besides dealing with the social, economic, industrial and civic conditions surrounding mothers and infants, reveal a morbidity and a mortality which, authorities agree are to a great extent preventable.

In 1915 the infant mortality rate in the United States birth registration area was 100 per thousand births and the maternal mortality rate 6.1. In 1920 the infant mortality rate had fallen to 85.8, but the maternal death rate was 8. The total number of maternal deaths in the death registration area in 1920 was 16,776.

The States that are not in the birth registration area are: Alabama, Arizona, Arkansas, Colorado, Florida, Georgia, Idaho, Illinois, Iowa, Louisiana, Missouri, Nevada, New Mexico, North Dakota, Oklahoma, South Dakota, Tennessee, Texas and West Virginia.

Up to date 42 states have accepted the terms of the act—all except Maine, Massachusetts, Rhode Island, New York, Louisiana, and Washington. Twelve of these acceptances (New Hampshire, Delaware, New Jersey, Maryland, Virginia, South Carolina, Georgia, Kentucky, Mississippi, Minnesota, Oregon and New Mexico) are by state legislatures and the remaining 30 by governors pending the next regular session of the legislature.

PARLIAMENTARY LAW and practice consist of those rules, precedents, and usages which are generally accepted as the most convenient and practicable for the government of proceedings in deliberative assemblies or organizations. Most of the essential rules now accepted had their origin in the English parliament, although some of them have been changed to adapt them to the needs of our legislative bodies. The rules and usages of Congress have great weight as correct parliamentary law in the United States generally, but the legislature of each state has a code of its own containing the general rules, and special ones not commonly accepted.

Besides the common parliamentary law, which is recognized by deliberative bodies in general, each body may make rules for its own government. When there are no special rules to the contrary the body is controlled by the principles of common parliamentary practice, and these principles govern if there are no rules enacted by the body itself.

Uses.—Parliamentary law is needed in deliberative bodies in order that there may be a mu'ual understanding as to what may be done, that the rights of the body and of its individual members may be protected, and that business may be transacted with expedition and also deliberation.

A gathering does not become a deliberative body until it is duly organized. This implies officers and members. The number of the former may vary according to circumstances. There must be one to preside over the deliberations. Then there should be a clerk or secretary to keep a record of the transactions.

Parliamentary practice presumes that, ordinarily, matters for discussion and decision emanate from some member or members of the meeting, and that the discussing and deciding is done by the membership.

Organization.—Temporary.—At the time appointed, or a few moments later, some one steps forward and requests the meeting to come to order, and, having secured attention, he either makes a motion that a certain person, giving his name, act as chairman, or asks the assembly to nominate a chairman. And he puts motions or nominations to vote, until some one is elected to preside. The chairman then takes his place, and the organization is completed by the nomination and election of a secretary, and any other necessary officers.

Convention of Delegates.—In the case of a convention of delegates, a temporary organization is first made by electing a chairman and secretary *pro tem.* Then a committee on credentials is chosen, to ascertain who are duly authorized to take part in the deliberations and the voting. This committee next reports the names of those who are found to have proper credentials, also doubtful or contested cases, with recommendations. No one without proper credentials is allowed to vote on the report of the committee, or on any question until he is duly accepted as a delegate. The organization of the convention is finished by the nomination and election of permanent officers.

After a meeting is duly organized, it is customary for some member to state briefly the object of the meeting, and business may be introduced at once, or the time may be occupied by addresses. A committee is sometimes appointed to prepare resolutions, while addresses are being given to fill up the time, and they report as soon as possible or they may be given more time, and bring in their resolutions after a recess, or at a subsequent meeting.

Permanent.—In organizing a permanent society a temporary organization is first effected, after which the chairman calls upon some person who is taking a leading part in getting up the society to state the object of the proposed organization. A motion or resolution favoring the organization is next in order, and, if carried, a committee is appointed to draft a constitution or by-laws or both. The constitution should contain five articles at least, *viz.*: 1. Name and object of the society. 2. Qualifications of members. 3. Officers, their election and duties. 4. Meetings of the society. 5. How to amend the constitution.

At the second meeting the constitution is adopted, and after all have signed the constitution who wish to become members, by-laws are adopted if desired, and a committee is appointed to nominate permanent officers, to be elected at this or an adjourned meeting. Each officer as elected takes the place of the temporary one, and when all are elected the organization is completed.

Nominations and Elections.—Generally the most prudent and expeditious way of making nominations is to place the matter in the hands of a committee created for the purpose, who, after due consideration, make the nominations and tender their report to the assembly, after which a motion is made and seconded to adopt the report of the committee. Then the names of the nominees are again read with a pause after each, to give opportunity for amendments. Any member who is not satisfied with a nomination may move to substitute another name, and if this motion receives a second and is carried the substituted name takes the place of the regular nominee.

The vo e, if by acclamation, may be taken upon each name before passing to the next, but the more common way is to vote upon the names as a whole, after the entire list has been considered.

Sometimes the chairman is authorized by the assembly to make the nominations, and in this case the names are treated the same as if brought in by a committee.

Another way of nominating is as follows: Some member obtains the floor and says, "*I nominate Mr. A.*" In the same way another member nominates Mr. B. and another Mr. C, and so on, When a number of candidates have thus been nominated, some member moves that the nominations close, and if this motion is seconded and carried the chairman then takes the vote upon the names, in the order in which the nominations were made, and continues until one is elected. If there is more than one office to be filled, the same process must be gone through with in each individual case.

If the election is to be by ballot, and the names are on the ballots, each voter may cast his ballot as it is, or he may cross off names and write others in their places. If blank slips are used, each voter writes on his slip the names of the nominees, or substitutes other names according to his choice. A majority of all the votes cast is necessary to a choice. In case the office or offices are not filled at the first ballot, the voting must be continued until the necessary officers are elected.

Officers and Their Duties.—Chairman, President, or Moderator.—The presiding officer is generally known by one of these titles. He should always be addressed by his title, and in referring to himself he should always use his official title, thus: "*It is the opinion of the chair,*" etc.

It is his duty to take the chair and call the meeting to order at the proper time, to announce in its order each item of business, to state all proper questions, to put them to vote, and to declare the result of the vote, to see that the rules of debate are not violated, to preserve order, to state points of order or course of proceeding, by request, or when he finds it necessary to do so, to receive all messages and other communications and announce them to the assembly, to act for the assembly in signing all papers, etc.

He may sit while stating a question, but he should rise to put a question to vote, or to speak to a question of order.

Vice-President.—The vice-president acts in place of the president in his absence.

Clerk or Secretary.—The recording officer, whether called clerk or secretary, keeps a correct record of the proceedings, or the *minutes*, and reads them at the next meeting. In the absence of the chairman (if there is no vice-president present), it is his duty to call the meeting to order, and to occupy the chair while the assembly proceeds to elect a chairman *pro tem.*, to read papers to be acted upon when requested to do so, to call the roll of the assembly when necessary, to hand to the chairman of every committee appointed a list of the persons on the committee, and a statement of the matter committed to them, to make out in order and hand to the chairman before each meeting, the items of business for the meeting, to have at each meeting a list of all committees, to have the custody of all papers and documents, to sign his name to the minutes, and to authenticate by his signature alone, or in connection with that of the chairman, all the acts, orders, and proceedings of the assembly. In some assemblies the secretary also acts as treasurer.

Treasurer.—The treasurer has charge of the funds of the society, and pays them out by order of the assembly, signed by the secretary. His annual report should give the amount in the treasury at the beginning of the year, the amount received, the amount paid out, and the balance on hand. This report should be examined by an auditor or by an auditing committee, and compared with the itemized accounts kept by the treasurer, and the receipts he has received for payments made, and if found correct it should be approved by a vote of the society.

Committees.—A committee for deliberation or investigation should be large, and should represent all classes and localities. A committee for action should be small, and should consist of those only who are in favor of the proposed action.

A committee may be nominated and elected, or the chairman may be authorized by the constitution or by-laws, or by a vote of the assembly, to appoint a committee or committees. The constitution or by-laws may also prescribe the number of members of which each committee shall be composed, or the number may be included in the motion if the appointment is ordered by the assembly.

Sometimes the assembly proposes different numbers, and in this case the number is decided by vote; the vote being taken first on the highest number proposed, and then upon the next, and so on until a vote is carried deciding the number.

A *select* committee is a committee appointed for a particular occasion. A *standing* committee is one appointed beforehand, for all matters that may arise of the same nature.

The person first named on a committee calls the members together, and presides all through, or until the committee elects another chairman; which is seldom done. In the absence of the first member, the next in order who is present acts as chairman. The committee chooses one of its own number to act as secretary. It conducts its proceedings in the same manner as business is conducted in the assembly.

A committee must be assembled to do business and a quorum must be present.

A paper referred to a committee must not be altered, or rejected by them. The committee may present amendments written on another sheet, or they may recommend a substitution, or make any recommendation they see fit. The report of the committee is signed by all the members, or by the chairman alone, and he makes the report to the assembly unless another has been chosen to tender it. Only that which has been agreed to by the majority can be incorporated in the report, but the minority may also tender a report if they choose. The minority report may be

substituted for the report of the committee, by a vote of the assembly. When the committee has tendered its report in full and the report has been accepted, the committee is thereby discharged, but it may be revived by having the report or some part of it referred back to it.

Committees may *adjourn* from time to time until their work is completed, then the motion is to *rise*, which motion means the same as to adjourn, and is subject to the same rules.

Committee of the Whole.—The object of resolving the assembly into the "committee of the whole," is to permit of less formality in the consideration of a subject than is allowed under ordinary circumstances, and the motion is, *"That the assembly do now resolve itself into a committee of the whole, to consider,"* etc., specifying the subject. If carried, the presiding officer at once calls another member to the chair, and takes his place as a member of the committee. The only motions in order are "to amend," "to adopt," and "to rise and report." Before going into the "committee of the whole," the assembly may pass an order limiting debate, which order cannot be changed in the committee.

The chairman having resumed his seat, the member who presided in the committee rises and informs the chairman that he is ready to report. The report may then be received, or the time fixed when it shall be received.

The clerk keeps the minutes of the proceedings of the committee, if there is not an assistant clerk to keep them, but the only record he makes in the minutes of the assembly is the report as received from the committee. If at any time the committee becomes disorderly, the presiding officer may resume the chair and declare the committee dissolved.

The quorum of the committee of the whole is the same as that of the assembly.

Informal Action.—Instead of going into a committee of the whole, the assembly may consider a question informally, with the same freedom and the same restrictions as in the committee of the whole. In this case the chairman retains his seat and there is no motion to rise and report. The chairman brings the subject that has thus been considered before the assembly, and it is treated as if reported by a committee.

Any motion except "to amend" or "to adopt," puts an end to the informal action. A temporary memorandum is kept the same as in the committee of the whole, and the clerk enters the chairman's report only in the minutes.

Quorum.—A quorum of an assembly, or of a committee or a board, is such a number as is competent to transact business; and unless the number is prescribed by the constitution or by-laws, or by an order of the assembly, it consists of a majority of the members. The number may be fixed at much less than a majority. When a quorum is not present the only action that can be taken is to adjourn.

Order of Business.—In the absence of special rules upon the subject, the regular order of business is as follows:

1. Reading the minutes of the previous meeting. 2. Reports of standing committees (boards of managers, trustees, etc., come under this head). 3. Reports of select committees. 4. Unfinished business. 5. New business.

To take business up out of its order requires a suspension of the rules, but a better way, sometimes, is to lay on the table business as it comes up, and thus reach a question that it is desirable to consider first.

Introduction of Business.—New business must be introduced when there is no question before the assembly. It may be brought in in the form of a resolution or recommendation, or in the form of a simple motion. The member rises, addresses the chairman by his title, and after being recognized by a bow or having his name announced, he reads his resolution or recommendation and moves its adoption; or he makes a simple motion as suggested above. In either case another member seconds the motion.

Amendments and all other questions are introduced in the same way as new business. The table of motions shows when each motion is in order, and how the question may be treated.

The mover of a motion may modify it, or withdraw it altogether before it is stated by the chair, but after it is stated he can do neither without the consent of the assembly. If a mover modifies his motion, the one who seconded it may withdraw his support.

Mere routine business may be transacted without the formality of a motion, if no one objects.

Resolutions, Recommendations, and Motions.—**Common Forms.**—*Resolved*, That fifty dollars of the funds of this society be appropriated to defray the expenses of its delegates at the general convention.

We recommend, That a committee of three be appointed by the chair to draft resolutions, or to make recommendations, respecting the establishment of a branch office in San Francisco.

(First member) "Mr. Chairman:

"I move that the resolutions be adopted."

(Second member) "Mr. Chairman, I second the motion."

A resolution or recommendation may have a preamble or preambles worded about as follows:

Whereas, It is desirable to procure only the best of material for our new building; and,

Whereas, We deem it necessary to send a man to personally superintend its selection; therefore,

Resolved, That etc., or *We recommend*, That etc.

The Motion.—The basis of business—the point for discussion and decision—is called the *motion*.

A motion is a formally-worded proposition presented in a deliberative body for its consideration, and for its decision by vote.

A member having something to which he desires the meeting to agree makes a motion to that effect.

Before making his motion he must obtain the floor. To do this in an organized meeting, he rises and, addressing the chairman, says *"Mr. President"* (or whatever the title may be), and then waits for recognition. The chairman hearing the voice and seeing the member who has risen, *recognizes* him by pronouncing his name, *"Mr. ——,"* or *"The gentleman* (or *member*) *from——,"* mentioning the locality he represents.

No member has a right to make a motion, discuss a question, or address a meeting until he has thus addressed and has thus been recognized by the chairman. Then he *has the floor*.

Having obtained the floor, the member says, *"Mr. President"* (or whatever the title may be), *"I move——thus and so."*

Now it is necessary for another member to indicate his desire to have the proposition considered. This is called seconding the motion. To do this the second member must arise and secure recognition as in the former case, and then say, *"Mr. President, I second the motion."*

Stating the Question.—The presiding officer then says, *"It has been moved and seconded that——,"* and reads the resolution, or hands it to the secretary to be read by him. After stating or reading the motion, the president says, *"The question is on the adoption of the resolution or motion just read,"* or he may say, *"You have heard the motion. Have you any remarks to make?"* or, *"Remarks are in order,"* or use some equivalent expression. This is called "stating the question."

After the chairman has thus stated the question the subject is open to discussion, but not before.

In routine work the chairman may often put a question without waiting even for a formal motion. This can be done only with common or universal consent, and should be used only in regard to minor matters. Then this method saves time, and does no injustice.

After a motion has been made and seconded and the question has been stated by the chair, the members may enter upon its discussion.

Debate.—In order to debate a question the member must secure the floor in the same manner he would secure it for the purpose of offering a motion. The ordinary rule is for the presiding officer to give the floor to the member whose voice he first hears. When two or more address the chair at the same time, the chair must decide who is entitled to the floor. In such a case the member upon whose motion the subject was brought before the body, or who presents the report, if he has not already spoken to the question, has the prior claim and should be recognized, even if another addressed the chair before him. A member who has not spoken has priority over those who have.

Points of Order.—It is the privilege of any member to call attention to a breach of order in debate, by obtaining the floor and saying, *"I rise to a point of order."* The chairman then says *"Please state your point of order."* When the point is stated, the chairman decides whether it is well taken or not, this decision being subject to appeal. When a question of order is raised, the speaker should at once take his seat and await the decision. Then if the decision is in his favor he may proceed, but if against him, and any one objects to his speaking further, he cannot continue without permission from the assembly.

Limiting Debate.—It is the custom of bodies to limit the time of a speech and the number of times a member may speak to the same question.

The common parliamentary law is not to allow a member to speak more than once to the same question until all who desire have spoken.

If a member offers to speak a second time, and no one signifies a desire to occupy the floor, and there is no objection, the chair may permit the member to proceed. Otherwise, to obtain the privilege of speaking a second time, the question must be put to vote for the decision of the meeting.

An order limiting or closing debate can be adopted, so that, at the time specified, all discussion upon it shall cease. As a body can limit the time of a speaker, it can also *extend his time*. The meeting can also *extend the time of the debate*.

In the discussion the speakers must confine themselves to the question before the body, and avoid personalities or other improprieties.

The maker of a motion may vote against, but cannot speak against, his motion.

Putting the Question.—If no one rises to speak, or the chairman thinks the debate has ended, he asks, *"Are you ready for the question?"* If then no one rises to debate it, he proceeds to put the question to vote.

In putting the question, as it is termed, the ordinary form will be something like the following: The chair will say, *"The question is on the adoption of the motion, or resolution, which you have just heard read; as many as are in favor of its adoption will say aye."* The ayes having voted, he will then say, *"As many as are of a contrary opinion will say no,"* or *"All opposed will say no."* The chair, judging the comparative vote, will announce the result, stating that the motion is carried or lost, as the case may be. If he thinks the ayes are in the majority he says, *"The ayes appear to have it."* Then pausing, to see if any one expresses doubt, and none being raised, he says, *"The ayes have it, and the motion is agreed to (is carried, or prevails)"* or *vice versa*, if he thinks the noes have it.

Form of Voting.—This varies. Sometimes it is by voice, sometimes by show of hands, sometimes by counting hands, or a rising vote by counting members as they stand, by tellers who count the members as they pass between them, by yeas and nays, and by ballot.

Where a hand-vote is customary the chair may say, *"Those in favor of the motion or resolution will hold up the right hand,"* and *"Those opposed will manifest it by the same sign."* Excepting in a few cases a majority vote determines a question.

Discussion can be renewed even after the voting has begun, and up to the final taking of both sides.

Division.—Sometimes a motion may consist of more than one distinct idea, and therefore would be divisible into two or more distinct propositions, and it might be that some would favor one part and not another, and, consequently, would desire to vote on the parts separately. In such a case a member can move that the question be *divided*, and specify in his motion how it is to be divided. If the motion for a *division of the question* prevails then each part will be put to vote as though it were a separate motion, and one part may be carried and another lost.

When the chairman announces the result of a vote any member may express a doubt as to the accuracy of the decision by rising and saying, *"Mr. President, I call for a division of the house."* If a member thus calls for *"division"* the presiding officer shall say, *"A division is called for; those in favor of the motion will rise and stand until counted."* After they are counted and the number announced, he shall say, *"Those opposed will rise;"* and they will be counted and the number announced.

The chair or the clerk, or both, may count. After the announcement of the result a member may press the doubt further by calling for a count by tellers, and even after that has been taken there may be a demand for the yeas and nays.

Yeas and Nays.—The object of calling the *yeas* and *nays* is usually to place the names of the members on record so that it will be known how each man voted. At other times it is used as a dilatory motion, and is made for the purpose of consuming time. In Congress one-fifth of the members present can order the vote to be taken by *yeas* and *nays*. In some bodies it is ordered on the call of a single member. Societies should have a rule stating what small minority may order the *yeas* and *nays*. In any meeting a majority vote can order the *yeas* and *nays*. When the yeas and nays have been ordered, the presiding officer will put the question in a form similar to the following: *"As many as are in favor of the adoption of the resolution will, when their names are called, answer yea, (or yes); those opposed will answer nay, (or no). The secretary (or clerk) will call the roll."*

The roll is then called, and each member, as his name is called, rises and answers *yes* or *no*, (or *yea* or *nay*), which answer is noted by the clerk. When the roll-call is ended the clerk reads the names of those who voted in the affirmative, and afterward those who voted in the negative. Errors may then be corrected. The clerk then gives the number voting on each side to the chair, who announces the result.

The Ballot.—Sometimes a vote is by ballot. It is common and most equitable in the election of officers.

The chairman appoints at least two tellers, who distribute slips of paper upon which the members write their votes. The tellers collect and count the votes and report the result to the chairman, who announces it to the meeting. In counting ballots all blanks are ignored. In case of an election the chair will say: *"The whole number of votes cast is——; the number necessary for a choice is——; Mr. A. received——; Mr. B.——; Mr. C.——. Mr. A., having received the requisite number, is therefore elected."*

Tie Vote.—When there is a tie vote the motion fails. The chairman, if a member of the meeting or, authorized by constitutional law, however, has the casting or deciding vote in such a case, and, if he gives it for the affirmative, the motion prevails. He may even vote with the minority when his vote will make a tie, and thus defeat a measure, and he may vote in any case where his vote would change the result. Thus where a two-thirds vote is necessary, and his vote given to the minority would prevent the adoption of the question, the presiding officer can so cast his vote.

Classes of Motions.—Motions are differently classified according to their nature and purpose.

First.—The principal motion or main question by which the subject is brought before the body.

Second.—Those which bear upon the main question. These are called subsidiary motions, and are as follows: 1. To postpone indefinitely. 2. To amend. 3. To refer (commit or recommit). 4. To postpone to a certain day or time. 5. The previous question. 6. To lay on the table.

Third.—Incidental questions, so called because they are occasioned in a casual way during the consideration of other questions. From their very nature they must be decided before the questions which give rise to them. They cover: 1. Suspension of the rules. 2. Withdrawal of a motion. 3. Reading of papers. 4. Objection to the consideration of a question. 5. Questions of order (including appeals from the decision of the chair).

Fourth.—Privileged questions. They are so called because of their pressing importance and their need of immediate attention; therefore they may interrupt other proceedings. They are: 1. Calls for the orders of the day. 2. Questions of privilege. 3. The motion to adjourn. 4. The motion to fix the time to which to adjourn.

Order of Precedence.—The motions below numbered 1 to 9 take precedence over all others in the order given, and any one of them, except to amend or substitute, is in order while a motion of a lower rank is pending.

Letters refer to rules following.

Closing a meeting.	
1. To fix time to which to adjourn	B
2. To adjourn (in committees, to rise), or to take a recess, without limitation	A E F
Concerning Orders, Rules, etc.	
3. For the orders of the day	A E H N
To make subject a special order	M
To amend the rules	M
To suspend the rules	A E F M
To take up a question out of its proper order	A E
To take from the table	A E G
Questions touching priority of business	A
4. To lay upon the table	A E G
To bring up a question the second time.	
To reconsider debatable question	D E F I
To reconsider undebatable question	A E F I
Questions of privilege.	
Asking leave to continue speaking after indecorum	A
Appeal from chair's decision touching indecorum	A E H L
Appeal from chair's decision generally	E H L
Question upon reading of papers	A E
Withdrawal of a motion	A E
Suppressing or extending debate.	
5. For the previous question.	A E M
To limit, or close, debate	A M
To extend limits of debate	A
Deferring action.	
6. To postpone to a fixed time	C
To refer to committee.	
7. To commit (or recommit)	D
Modifying or amending.	
8. To amend or to substitute, or to divide the question	K
Suppressing the question.	
Objection to consideration of question	A H M N
9. To postpone indefinitely	D E

Rule A.—Undebatable, but remarks may be tacitly allowed.

Rule B.—Undebatable if another question is before the assembly.

Rule C.—Limited debate allowed on propriety of postponement only.

Rule D.—Opens the main question to debate. Motions not so marked do not allow of reference to main question.

Rule E.—Cannot be amended. Motion to adjourn can be amended when there is no other business before the house.

Rule F.—Cannot be reconsidered.

Rule G.—An affirmative vote cannot be reconsidered.

Rule H.—In order when another has the floor.

Rule I.—A motion to reconsider may be moved and entered when another has the floor, but the business then before the house may not be set aside. This motion can only be entertained when made by one who voted originally with the prevailing side. When called up it takes precedence of all others which may come up, excepting only motions relating to adjournment.

Rule K.—A motion to amend an amendment cannot be amended.

Rule L.—When an appeal from the chair's decision results in a tie vote, the chair is sustained.

Rule M.—Requires a two-thirds vote unless special rules have been enacted.

Rule N.—Does not require to be seconded.

General Rules.—No motion is open for discussion until it has been stated by the chair.

The maker of a motion cannot modify it or withdraw it after it has been stated by the chair, except by general consent.

Only one reconsideration of a question is permitted.

A motion to adjourn, to lay on the table, or to take from the table, cannot be renewed unless some other motion has been made in the interval.

On motion to strike out the words, *"Shall the words stand as part of the motion?"* unless a majority sustains the words, they are struck out.

On motion for previous question, the form to be observed is, *"Shall the main question be now put?"* This, if carried, ends debate.

On an appeal from the chair's decision, *"Shall the decision be sustained as the ruling of the house?"* the chair is generally sustained.

On motion for orders of the day, *"Will the house now proceed to the order of the day?"* This, if carried, supersedes intervening motions.

When an objection is raised to considering questions, *"Shall the question be considered?"* objections may be made by any member before debate has commenced, but not subsequently.

Legal Holidays.—In the United States.

January 1. *New Year's Day:* In all the states (including the District of Columbia), and in all the territories and colonial possessions.

January 8. *Anniversary of the Battle of New Orleans:* In Louisiana.

January 19. *Lee's Birthday:* In Florida, Georgia, North Carolina, South Carolina, Virginia, Alabama, and Arkansas.

February. *Mardi-Gras:* In Alabama and the parish of Orleans, Louisiana.

February 12. *Lincoln's Birthday:* In Colorado, Connecticut, Delaware, Illinois, Kansas, Minnesota, Nevada, New Jersey, New York, North Dakota, Pennsylvania, Washington, and Wyoming.

February 22. *Washington's Birthday:* In all the states (including the District of Columbia) except Mississippi. It is observed, however, in the public schools of the latter state.

March 2. *Anniversary of Texan Independence:* In Texas.

April. In Oregon, the forty-fifth day preceding general state election, primary nominating election held. Every day on which an election is held throughout Oregon is a legal holiday.

Good Friday: In Alabama, Connecticut, Delaware, Florida, Louisiana, Maryland, Minnesota, New Jersey, Pennsylvania, Tennessee.

April 19. *Patriots' Day:* In Maine and Massachusetts.

April 21. *Anniversary of the Battle of San Jacinto:* In Texas.

April 26. *Confederate Memorial Day:* In Alabama, Florida, Georgia, and Mississippi.

May 10. *Confederate Memorial Day.* In North Carolina and South Carolina.

May (second Friday) *Confederate Day.* In Tennessee.

May 20. *Anniversary of the signing of the Mecklenburg Declaration of Independence.* In North Carolina.

May (last Friday). *Pioneers' Day.* In Montana, observed in public schools.

May 30. *Decoration Day.* In all the states and territories (and District of Columbia) except Alabama, Florida, Georgia, Idaho, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, and Louisiana. In Virginia, known as "Confederate Memorial Day," as also in certain other Southern states.

June 3. *Jefferson Davis Birthday.* In Florida, Georgia, Alabama, Mississippi, Tennessee, Texas, and South Carolina. In Louisiana, known as "Confederate Memorial Day." In Virginia, in public schools.

June (first Monday), even years. General state election in Oregon.

July 4. *Independence Day.* In all the states, District of Columbia, and territories.

July 24. *Pioneers' Day.* In Utah.

August 16. *Bennington Battle Day.* In Vermont.

September (first Monday). *Labor Day.* In all the states and territories (and District of Columbia), except North Dakota. In Louisiana, observed in Orleans parish. In Wyoming, by proclamation of the governor.

September (first Tuesday). *Primary Election Day.* In Wisconsin.

September 9. *Admission Day.* In California.

September 12. *"Old Defenders' Day."* In Baltimore, Md.

October 12. *Columbus Day.* Every state and territory except Alaska, Arkansas, District of Columbia, Florida, Georgia, Hawaii, Iowa, Maine, Minnesota, Mississippi, North Carolina, Oklahoma, Philippines, South Carolina, South Dakota, Tennessee, Utah, Virginia, Wisconsin, and Wyoming. (In Kansas it is not a holiday as to Courts or Notes.)

October 31. *Admission Day.* In Nevada.

November 1. *All Saints' Day.* In Louisiana.

November. General Election Day. In Arizona, California, Colorado, Delaware, Florida, Idaho, Illinois (in Chicago, Springfield and East St. Louis only), Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Michigan, Minnesota, Missouri, Montana, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio (from 5:30 a. m. to 9. a. m. only), Oklahoma, Oregon (vote for presidential elections only), Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, West Virginia, Washington, Wisconsin, and Wyoming, in the years when elections are held therein.

November 11. *Armistice Day.*

November. *Thanksgiving Day* (last Thursday in November). Is observed in all the states, and in the District of Columbia, though in some states it is not a statutory holiday.

December 25. *Christmas Day.* In all the states, District of Columbia and territories.

Sundays and fast days are legal holidays in all the states which designate them as such.

There are no statutory holidays in Mississippi, but by common consent the Fourth of July, Thanksgiving, and Christmas are observed. In New Mexico, Washington's Birthday, Decoration Day, Labor Day, Flag-Day (June 14), and Arbor Day are holidays when so designated by the governor. In South Carolina, Thursday of Fair week is a legal holiday.

Arbor Day is a legal holiday in Arizona, Maine, Maryland, New Mexico, Wisconsin, and Wyoming, the day being set by the governor; in Texas, February 22; Nebraska, April 22; Utah, April 15th; Rhode Island, second Friday in May; Montana, second Tuesday in May; Georgia, first Friday in December; Colorado (school holiday only), third Friday in April; in Oklahoma, the Friday following the second Monday in March; in Arkansas, first Saturday in March.

Old English Holidays.—These holidays, with their names, had their origin in mediaeval England when the state religion was that of the Church of Rome, and they are still observed generally or in some parts of England, Scotland, and Ireland.

January 6. *Twelfth Day*, or *Twelfth-tide*, sometimes called Old Christmas Day, the same as Epiphany. The previous evening is *Twelfth Night*, with which many social rites have long been connected.

February 2. *Candlemas.* Festival of the Purification of the Virgin. Consecration of the lighted candles to be used in the church during the year.

February 14. *Old Candlemas.* St. Valentine's Day.

March 25. *Lady Day.* Annunciation of the Virgin. April 6 is old Lady Day.

June 24. *Midsummer Day.* Feast of the Nativity of John the Baptist. July 7 is old Midsummer Day.

July 15. *St. Swithin's Day.* There was an old superstition that if rain fell on this day it would continue forty days.

August 1. *Lammas Day.* Originally in England the festival of the wheat harvest. In the Church the festival of St. Peter's miraculous deliverance from prison. Old Lammas Day is August 13.

September 29. *Michaelmas.* Feast of St. Michael, the Archangel. Old Michaelmas is October 11.

November 1. *All hallowmas.* Allhallows or All Saints' Day. The previous evening is All hallowe'en, observed by home gatherings and old-time festive rites.

November 2. *All Souls' Day.* Day of prayer for the souls of the dead.

November 11. *Martinmas.* Feast of St. Martin. Old Martinmas is November 23.

December 28. *Childermas.* Holy Innocents' Day.

Lady Day, Midsummer Day, Michaelmas, and Christmas are quarter (rent) days in England, and Whitsunday, Martinmas, Candlemas, and Lammas Day, in Scotland.

Shrove Tuesday, the day before Ash Wednesday, and Maundy Thursday, the day before Good Friday, are observed by the Church. Mothering Sunday is Mid-Lent in which the old rural custom obtains of visiting one's parents and making them presents.

GOVERNMENT OF CANADA. — The government of the Dominion of Canada (which comprises all of British North America except Newfoundland) is carried on by means of a *federal government* and a *federal parliament*, which deal with all affairs of the Dominion as distinguished from merely provincial affairs, the latter being dealt with by provincial district governments of each province, district or territory.

Source of Governmental Powers.—All constitutional power and authority of both the federal and provincial and district governments and legislatures, are derived from the imperial Parliament of Great Britain; and the principal act by which the government of the dominion and the various provinces, districts and territories is regulated, is known as the British North America Act of 1867. Canada, like the United States, has in effect a written constitution, but it is supplemented by certain unwritten conventions which are derived from the constitutional law of the United Kingdom. Although the imperial Parliament of Great Britain is the supreme legislative body for the whole empire, yet it has delegated the powers of self government to the Dominion and ceases to legislate for it except so far as it may be requested so to do.

Limitations of Power.—Although the imperial Parliament has supreme power and jurisdiction over the whole empire and its acts cannot be brought in question or their validity contested in any court of law, the statutes passed by the Canadian Parliament, whether federal or provincial, must not exceed the legislative limits which the imperial Parliament has laid down, or they may be judicially declared to be *ultra vires* of the legislature which has assumed to pass them.

EXECUTIVE DEPARTMENT

The Sovereign.—The executive power of the whole British empire is by law vested in a single person—the Sovereign. The crown is by common law and constitutional custom, hereditary, and yet in the formal act of Recognition still preserved in the coronation ceremony, the assent of the people is theoretically necessary. The right of inheritance may, and has been, changed by the imperial Parliament, and subject to such change continues hereditary. The heir of the preceding Sovereign is the rightful successor, and as in common law descents, the preference of males to females, and the right of progeniture are strictly adhered to. Besides being heir to the preceding Sovereign, the successor must also be a Protestant.

How the Sovereign Acts.—In the exercise of executive power the Sovereign acts upon the advice of the ministers of the crown who are strictly accountable to Parliament for all public acts of the Sovereign. Through Canada and all parts of the British empire all writs run in the sovereign's name and all crimes are charged to be "against the King's peace, his crown and dignity."

Term of Office.—The Sovereign's term of office is during life, but in case of personal incapacity for the official duties of the office, by reason of infancy or other cause, a Regent may be appointed by Parliament.

Powers and Duties of the Sovereign.—It is difficult within a short compass to specify all the duties of the Sovereign, but among the more important are the following:

Commander-in-chief of Army and Navy.

Communicates with Parliament verbally or by message.

Chooses ministers of imperial government.

Approves or disapproves of acts of Parliament.

Makes treaties with advice of his imperial ministers.

Power to declare war and make peace.

Appoints public officers with advice and consent of his imperial ministers.

Commissions public officers.

Grants reprieves and pardons for crimes.

Confers honors, peerages, baronetcies, knighthoods, etc.

Has supreme judicial authority in all causes and matters in his dominions, such judicial authority being exercised on the judicial committee of his council.

The Governor-General of Canada

How Chosen.—The Governor-general is the Sovereign representative in Canada, and is appointed by the Sovereign with the advice of the imperial ministers.

Term of Office.—The term for which the Governor-general is appointed is usually five years, but the time may be extended or shortened by the Sovereign.

Eligibility.—The person to be chosen must be a British subject, and is usually selected from the ranks of the statesmen of Great Britain.

Salary.—The salary of the Governor-general is fixed by a statute of the Dominion Parliament at £10,000, and is paid out of the Dominion exchequer.

Powers and Duties.—Is the representative of the Sovereign in Canada and acts for him.

Communicates with Canadian Parliament, verbally or by message.

Chooses ministers of Canadian government, who are able to command a majority vote of the Canadian House of Commons.

In Sovereign's name approves or disapproves of acts of Canadian Parliament.

May reserve acts of Dominion Parliament for consideration of the Sovereign.

May, with advice of Canadian ministers, disallow Acts of provincial legislatures.

Appoints public officers of Dominion of Canada with advice of Canadian ministers.

Commissions public officers of Dominion.

Exercises Sovereign's prerogative of granting reprieves or pardons for crimes committed in Canada.

The Cabinet constitutes a kind of executive committee both of Parliament and the Privy Council. Its powers and duties are not defined by any statute or written law, but rest on conventions which have become part of the constitutional law of England and of the various parts of the empire to which the powers of self government have been delegated. It differs from the cabinet of the president of the United States in that it is considered essential that all of its members shall be also members of one or other of the Houses of Parliament, where they shall be able to explain and defend all their acts and proceedings. The cabinet of the dominion originates all legislation which it thinks to be necessary or expedient, and the defeat of any government measure of importance in the House of Commons, generally necessitates a resignation of the ministry, as no longer able to command the confidence of Parliament.

Salaries.—The salary of the Prime Minister is fixed by statue at $12,000 per annum. The salary of each of the other ministers is $7,000 per annum.

The Privy Council of Canada.—This is a body distinct from the cabinet. The statute law provides for the establishment of a Privy Council of the Sovereign in Canada to aid and advise in the government of Canada, the members of which are to be chosen and summoned by the Governor-general. No salary is attached to the office of Privy Councillor.

The Executive Departments.—The various Executive Departments of the Canadian government are under the control of ministers who are appointed to office by the Governor-general by commission under the great seal of Canada, and hold office during the pleasure of the Crown. The following are the Cabinet portfolios and their respective Executive Departments:

The Prime Minister, President of the Privy Council of Canada

The Ministers of Trade and Commerce, Department of Trade and Commerce

The Secretary of State, Department of Public Printing and Stationery, Department of Secretary of State

The Minister of Justice, Department of Justice

The Minister of Marine and Fisheries, Department of Marine and Fisheries

The Minister of Militia and Defense, Department of Militia and Defense

The Post Master General, Post Office Department

The Minister of Agriculture, Department of Agriculture

The Minister of Public Works, Department of Public Works

The Minister of Finance and Receiver General, Department of Finance

The Minister of Railways and Canals, Department of Railways and Canals

The Minister of the Interior and Superintendent of Indian Affairs, Department of Indian Affairs, Department of Interior

The Minister of Customs, Department of Customs

The Minister of Inland Revenue, Department of Inland Revenue

The Minister of Labor, Department of Labor

LEGISLATIVE DEPARTMENT

Parliament of Canada.—The Parliament of Canada is composed of the Sovereign, the Senate and the House of Commons. It is the prerogative of the Sovereign to summon meetings of Parliament and to prorogue or dissolve it. It is also the prerogative of the Sovereign to approve or disapprove of all bills which have been agreed to by both Houses. The Sovereign takes no part in debate. An annual session of Parliament must be held.

The Senate.

Number of Members.—87.

How Appointed.—By the Governor-general on the advice of Canadian Ministers.

Term of Office.—Life, but office may be forfeited.

Eligibility.—Thirty years of age or upward; national born or naturalized subject of the Sovereign; owner of $4,000 realty; resident of Province he represents; and in Province of Quebec his property qualification must be situated in the electoral district he represents.

Salary.—Fixed by statute at $2,500 and traveling expenses; speaker, $4,000.

Powers of Senate.

(a) Appoints its officers other than Speaker.

(b) Has power to approve, reject, or amend bills passed by the House of Commons.

(c) Cannot originate or alter bills passed by the House of Commons for raising revenue.

The House of Commons.

Number of Members.—221, elected by popular vote for electoral districts. Readjusted decennially.

Speaker.—Elected by House subject to approval of Governor-general.

Salary.—$2,500 and traveling expenses; Speaker, $4,000.

Term of Office.—Duration of Parliament, but may resign or be expelled for crime.

Duration.—Until dissolved by Governor-general, but not to exceed five years.

Powers. (a) Originates all bills for raising revenue.

(b) May approve, reject or amend bills passed by the Senate.

Legislation.—All laws must receive the assent of the Governor-general, the Senate and the House of Commons.

Legislative powers of Dominion Parliament are limited to federal matters.

JUDICIAL DEPARTMENT

Judges of Dominion Courts.

Supreme Court.—Consists of a Chief Justice and five other Judges.

How Appointed.—By the Governor-general with the advice of the Canadian ministers.

Term of Office.—Life and good behavior, but may resign after 20 years service on full pay.

Jurisdiction.—Appellate court to hear appeals from courts of last resort in various Provinces of the Dominion. Has original jurisdiction in certain constitutional matters.

Salary.—Chief Justice, $10,000; other Judges, $9,000.

Exechequer Court.—Consists of one judge.

How Appointed.—By the Governor-general with the advice of the Canadian ministers.

Term of Office.—Life and good behavior, but may resign.

Salary.—$8,000.

Jurisdiction.—Claims against the crown; federal railways; patents; trade marks; copyrights; admiralty.

GOVERNORS-GENERAL OF CANADA

Governor-General	Lineage	Term of Office	Birth	Death
The Right Hon. Viscount Monck, G.C.M.G.	Charles Monck, British statesman, made a peer of the United Kingdom in 1866	1867–1869	1819	1894
The Right Hon. Lord Lisgar, G. C. M. G.	Baron Lisgar, a British politician (Sir John Young)	1869–1872	1807	1876
The Right Hon. the Earl of Dufferin, K. P., K. C. B., G. C. M. G.	Was created Marquis of Dufferin in 1888 (Frederick Temple Hamilton Blackwood)	1872–1878	1826	1902
The Right Hon. the Marquis of Lorne, K.T., G. C. M. G., P. C., etc.	Eldest son of the eighth Duke of Argyll (John George Henry Douglas Sutherland Campbell)	1878–1883	1845	....
The Most Hon. the Marquis of Lansdowne, G. C. M. G.	Fifth Marquis of Lansdowne (Petty-FitzMaurice Henry Charles Keith)	1883–1888	1845	....
The Right Hon. Lord Stanley of Preston, G. C. B.	Sixteenth Earl of Derby (Frederick Arthur Stanley)	1888–1893	1841	1908
The Right Hon. the Earl of Aberdeen, K.T., G. C. M. G.	Seventh Earl of Aberdeen (John Campbell Hamilton Gordon)	1893–1898	1847	....
The Right Hon. the Earl of Minto, G.C.M.G.	Fourth Earl of Minto (Gilbert John Elliot-Murray Kynynmound)	1898–1904	1845	....
The Right Hon. the Earl Grey, G. C. M. G.	Fourth Earl Grey (Albert Henry George)	1904–1911	1851	....
H. R. H. the Duke of Connaught	Third son of Queen Victoria	1911–1916	1850	....
Duke of Devonshire		1916–1921	1868	....
General Lord Byng	(Hero of Vimy Ridge). Seventh son of Earl of Stafford	1921–1926	1862	....
Right Hon. Viscount Willingdon, G. C. S. I., G. C. M. G., G. C. I. E., G. B. E.		1926–	...	....

PREMIERS OF CANADA

Rt. Hon. Arthur Meighan	1920–1921	..	1874	....
Rt. Hon. Mackenzie King	1921–	..	1874	....

LAW may be defined as the system of rules established by organized society, performance of which it enforces or breach of which it punishes. It is the coercive character of its rules that distinguishes law from custom.

Its History.—Law has a natural course of development among uncivilized people; and what are at first merely customary usages or arbitrary decrees of a despotic ruler, intended only for a single case, become fixed as rules of law. In early law certain universal tendencies may be observed. Thus, such law is always formal. That is, the tests by which the validity of acts is judged are based on an arbitrary formality rather than upon the essential justice or reasonableness of the act. Procedure and proof are similarly formal. Such tests as ordeal or combat are held to determine the righteousness of a litigant's cause.

Five Systems.—In the history of the modern world five great systems of law have grown up: The Chinese, the Hindoo, the Mohammedan, the Roman, and the English. Of these the two last named are peculiar in having spread far beyond the countries in which they had their origin, and these two systems at the present day mainly dominate the civilized world.

Roman Law was partially diffused over the countries which the Romans conquered, and later was either tacitly or expressly adopted by most of the European countries. It now prevails over all southeastern Europe as well as in Germany, Belgium and Holland, and to a large degree its principles have been adopted in the Scandinavian and the Slavonic countries. The settlers of Central and Southern America carried their law with them and the Roman Law prevails throughout the countries there, as it also does in most of the East and West Indies.

A few portions of the British Empire and of the United States also have inherited the Roman law which, however, tends in such places with lapse of time to take on some admixture of the English common law. Scotland, parts of Africa, Ceylon, Quebec, Louisiana and the Philippine Islands come under this description.

The English Common Law has been spread by English colonists almost everywhere that the English language is spoken. Great Britain (with the exception of Scotland), Australia, New Zealand, British America (excepting the Province of Quebec), India, parts of Africa, numerous smaller British colonies, the United States, the Hawaiian Islands, all are dominated by the English system of jurisprudence, though in India native law as well as English law is enforced.

Our whole system of law is based on the English *common law*. This originated in local customary rules enforced in different communities in England from which was gradually evolved a common law for the whole kingdom. The earliest important influence in this direction was given by the establishment, in the reign of Henry II., of the Kings Courts, which had jurisdiction over the whole kingdom and travelled on a circuit through the several shires. These courts gradually superseded petty local tribunals. In the reigns of Edward I. and Edward III. parliamentary enactments strengthened the tendency to uniformity already begun and the foundations of the modern laws of real property were laid. Soon afterwards the equity jurisdiction of the chancellor became recognized, by means of which extensive modifications have been evolved in modern English law. In the reign of Henry VIII. and shortly thereafter the destruction of the Papal power in England prevented the further development of civil law principles through the medium of the canon law and the church. In other countries of Europe the canon law had been one of the means by which Roman or civil law had been extended. The great body of commercial law, which is so important to-day, has grown up almost wholly since the beginning of the eighteenth century.

When the English colonists settled in the United States they carried with them the system of law to which they had been accustomed and the revolution, though it severed the political union between the United States and England, did not change the system of law, so that except as subsequent statutes or decisions of American courts may have led to a different result English precedents still have weight in American courts.

Foundations of American Law.—The sources of American law are two: *statutes* and *decisions* of the courts. It is an important rule of the English common law that a previous decision of a court on similar facts creates a *precedent* binding the same court, or other courts of equal or lower rank, to render the same decision. It is due to this binding effect of precedent

that definite rules of law gradually were evolved by the courts without the aid of legislative enactment. The rules thus established must be sought in the published decisions of the courts.

Legislative Enactment is another very important source of law. But even when legislatures pass statutes, courts have the power of deciding what they mean, and thus even in regard to statutory law the governing rules often cannot be clearly known until courts have decided cases involving the construction of the statutes.

Classification.—Law may be divided into *public* and *private* law. Public law involves rights and duties between the state, or one acting by its authority, and a private individual, while private law involves the relative rights and duties of private persons.

Public Law comprises (a) International law, (b) Constitutional law, (c) Administrative law, (d) Criminal law.

International Law consists of rules governing the conduct of states toward one another, and the conduct of citizens of one state toward another state. In disputes between nations no court exists to which the parties may come and obtain a decree which will be forcibly carried out under the direction of the court; but the rules of international law are recognized by the courts of individual nations as binding when, as not infrequently happens, such rules affect the rights of the individuals.

Constitutional Law defines the manner in which the government is carried on, and the limits of the powers of the state as against the individual. In the United States not only the general government has a written constitution, but each state likewise has such a constitution. Each of these constitutions establishes the method of government and also contains grants and limitations of power to the several departments of the state. The Federal Constitution gives certain powers to the national government and denies certain powers to the individual states. Except in so far as powers are granted expressly or by necessary implication to the national government they are retained by the states. Both in Federal and State Constitutions the individual is protected in certain fundamental rights. Laws passed in violation of a constitution and within its jurisdiction are void, and whenever they are involved will be so treated by the courts.

Administrative Law relates to the rules by which government is administered by officers other than judges. Numerous rules affecting rights and duties are applied in this way: the collection of revenue; the promotion of health by boards established for the purpose; the supervision of banks, insurance companies, and other corporations; the management of public lands, are but a few of the activities which are carried on by administrative officers and in the exercise of these functions their rulings have a quasi-judicial character.

Criminal Law is the most familiar branch of public law. It consists of prohibitive rules to which penalties are attached. Criminal law, like civil law, grew up in England mainly by the decisions of courts creating a *common* law as distinguished from *statute* law. At the present time, however, criminal law has been more completely reduced to statutory form by legislative enactment than the civil law. Within the limits of the constitution the Congress of the United States has power to declare acts criminal and punish them as such, but there is no unwritten federal criminal law and the punishment of crimes is for the most part retained by the several states.

Legal Rights.—The rights enforced by private law may be divided into (a) Rights *in rem*; (b) Rights *in personam*. The former class of rights impose correlative duties on all the world, while the latter class impose correlative rights only on specified persons. The ownership of property affords an instance of a right *in rem*. The owner has a right to the property and everyone else in the world is under a duty to refrain from interfering with it.

Property is classed in the law as either *real* or *personal*. Real property consists of land, houses and other structures attached to the land and interests in such property. All other property, whether of tangible form or consisting of intangible rights, is personal.

Certain fundamental personal rights also may be classed as rights *in rem* since all the rest of the world is under a duty to each individual to refrain from interfering with these rights. Such interference constitutes what is called a *tort*, and, as such, gives a right of action for damages to the injured person and will frequently also constitute a crime and render the offender liable to prosecution by the state. Personal rights, such as are here alluded to, are the right to life, the right to freedom from bodily indignity either by assault or imprisonment; the right within certain limits to freedom from defamation either by written or spoken statements; the right of an innocent person to freedom from malicious prosecution for a crime, the right not to be injuriously misled by wilfully deceptive statements.

Recently Developed Rights.—The development of the boycott has given rise to questions not yet fully settled as to the right of individuals to freedom from such concerted attempts to cause damage—purely negative though a boycott may be. Similarly, the invasion of the privacy of individuals has given rise to questions of how far it is legal to publish by way of advertisement, or otherwise, pictures of individuals without their consent; and in other ways invade a reasonable privacy. The keen competition of modern business has also caused another new right to be recognized clearly, that of freedom from unfair competition. The simulation of the product of a manufacturer whether by the adoption of a deceptively similar name or by the use of deceptively similar packages, or otherwise, is illegal even though no trade-mark is infringed and no actual misstatement made.

Rights in Personam may be divided into (a) family rights; (b) contractual rights; (c) obligations imposed by law.

Family Rights and duties of husband and wife, and of parent and child are created by the existence of those family relations and are confined to persons bearing that relation to each other.

Contractual Rights and duties are created by the voluntary entering into an agreement of a sort which the law regards as binding. Agreements under the common law might be made binding either by attaching a seal to a writing containing the agreement or by an agreed consideration being paid by the promisee to the promisor.

Most of the ordinary transactions of business life involve applications of the law of contracts. The greater part of the law of agency, partnership, insurance, sales, negotiable paper and banking consists of specialized contractual law.

Certain other rights are given to specific individuals and duties imposed on other specific individuals irrespective of agreement or status by virtue of special statutes or for reasons of justice. The remedy or right of action allowed by law for breach of any legal duty may be classed under this head. When a right *in rem* is violated by a particular individual the owner of the right *in rem* then acquires, besides his original right against all the world, a special right *in personam* against the wrongdoer.

Thus, an owner of land acquires a right *in personam* against a trespasser for the recovery of damages suffered by the trespass. So a right *in personam* may change its character when the right has been violated. The right of a servant to employment under a contract becomes a right of action for damages if the employer wrongfully discharges the servant. Both rights against the master are rights *in personam*, but the right of action arising on breach of the contract is different from the right to employment which existed under the contract when unbroken.

Legal Remedies.—Closely connected with the subject of legal rights and duties is the subject of *legal remedies* for their enforcement. The rules defining the rights and duties of persons has been called the *substantive* law, that defining the remedies and the procedure and proof, the *adjective* law. *Adjective Law* may be divided into the law of *procedure* and of *proof* or *evidence*. *Procedure* in turn may be divided into *civil* procedure and *criminal* procedure; and civil procedure into procedure *at law* and *in equity*.

Civil Procedure.—The fundamental steps of civil procedure at law are the beginning of the action by a writ or notice to the defendant, *pleading*, trial and judgment.

Pleading consists first of a statement of the plaintiff's case variously styled a declaration or complaint. This is followed by a plea or answer of the defendant denying some or all of the facts alleged in the plaintiff's statement, or alleging further facts, or both. The answer is sometimes followed by other pleadings. The ultimate result of the pleading is that each party has set forth the facts on which he relies and these facts have either been admitted or denied by the other party. If essential facts are denied it is necessary to try the disputed question by means of *proof*.

But not only questions of *fact* but also questions of *law* might be involved in a dispute. The parties might agree as to the facts and dispute only as to whether on those facts the plaintiff had a right of action. Or the defendant might dispute both the truth of the facts alleged by the plaintiff and also assert that even though the facts were as the plaintiff alleged, still the plaintiff would have no cause of action. Questions of law are decided by a judge, and, in accordance with his decision on questions of law and a jury's verdict on questions of facts, final judgment is given by the court for the plaintiff or defendant, whichever is entitled to it. In the United States at the present day many questions of fact are decided by judges without the aid of juries, but owing to the provisions of state constitutions, this is generally impossible except by the parties' waiving their right to trial by jury.

Procedure in Equity differs from procedure at law in various respects. The plaintiff's pleading is called a *bill* or *petition* and is fuller than is usual in a declaration at law. The defendant's answer is also fuller as to facts charged in the bill. There is no jury; questions of fact as well as law being determined by the judge.

The most fundamental difference between *equity* and *law*, however, is in regard to the character of the final order of the court. When judgment is rendered at law in favor of the plaintiff an execution for an amount of the judgment is put in the hands of a sheriff, who endeavors to satisfy the execution by seizure of the defendant's goods. The decree of the court of equity, however, is directly against the person of the defendant, ordering him on pain of imprisonment, to do what the court directs. A court of law can only give a money judgment, a court of equity can effectively order a defendant to do many things besides the payment of money; and not only are affirmative orders possible, but negative orders or injunctions are possible, and constitute one of the most important branches of equity jurisdiction.

In many states of America the procedure at law and in equity is now made identical, and even in states where this is not so, the same court generally has jurisdiction of both actions at law and suits in equity. In any event, however, the distinction between equitable relief and legal relief is still necessarily observed.

Criminal Procedure is in the main like civil procedure at law; the chief difference relating to the beginning of the proceedings. A person may be charged with crime by *complaint* made by any citizen to a magistrate who, if satisfied that there is reasonable cause for the complaint, and if he has jurisdiction to try cases of the sort, may proceed with the trial of the accused or otherwise may hold the accused for trial in the proper court.

Another method of beginning a criminal prosecution is by *information* filed by a prosecuting officer, but the commonest method is by *indictment* found *by grand jury* on a case presented to it by the prosecuting officer. The accused may then be arrested and held for trial either by confining him or by admitting him to bail. Those who give bail are regarded as private keepers of a prisoner and are bound to produce him when called upon to do so.

Greater particularity is required in the criminal pleading of the indictment than is necessary in civil actions. The defendant makes no other answer or plea than either guilty or not guilty. The latter plea compels the government to prove everything essential to make out the guilt of the accused of the crime charged.

In civil cases it is sufficient for one alleging facts in his pleading to prove them by a mere preponderance of evidence; but in criminal trials the government must prove the prisoner's guilt beyond a reasonable doubt in order to convict him.

Trials, both civil and criminal, are ordinarily conducted by a single judge, but appellate courts are established to revise the rulings of law made by trial judges if these rulings are questioned. When the trial judge makes a ruling of law the party aggrieved by his decision may reserve the right to question the correctness of the ruling in an appellate court, which generally consists of from three to seven judges sitting together. If the ruling at the trial is held to be incorrect by the appellate court, a new trial is ordered.

Evidence.—A very important branch of the adjective law is that relating to evidence. It is an obvious rule of logic as well as of law that no testimony is admissible which is not *relevant* to the facts in dispute; but not all evidence which is relevant is admissible. Indeed the law of evidence has been defined as consisting of rules excluding various kinds of logically relevant testimony; the most important of these rules is that which excludes *hearsay* evidence.

Of vital importance also is that which excludes *oral* evidence of the contents of a *written document* when the written document is obtainable and which makes a written contract between parties a conclusive statement of their agreement. The rules of evidence grew up as an accompaniment of the jury system and to a large extent are designed to avoid the misleading of a tribunal composed of twelve men unlearned in the law and perhaps of no great education. The commonest kind of legal errors carried from trial courts to appellate courts consists of erroneous rulings admitting or excluding proffered testimony.

Contracts.—A contract is an agreement between two or more persons, enforceable at law, whereby rights are acquired by one party to acts or forbearances on the part of the other party. The two fundamental ideas of contract are agreement and legal obligation.

Classification.—Contracts are classified in various ways. There are *express* and *implied* contracts; *formal* and *informal* contracts; *executed* and *executory* contracts; *valid* and *voidable* contracts.

Express and Implied Contracts.—An express contract is one created by oral or written words. An implied contract is one inferred from the acts of the parties.

Formal and Informal Contracts.—Formal contracts are those whose validity depends upon their form. They are of two kinds—contracts of *record* and contracts under *seal*. At common law the seal consisted of an impression on wax or a wafer attached to the instrument. By statute, however, a mere scroll has the same effect as a common-law seal. All contracts which are not of record or under seal are *informal*.

Executed and Executory Contracts.—An executed contract is one which has been fully performed by both parties, while an executory contract is one in which something remains to be done. A contract may be executed on one side and executory on the other.

Valid and *Voidable Contracts.*—A valid contract is one which is enforceable at law against both parties. A voidable contract is one which may be avoided at the option of one of the parties.

Essentials of a True Contract.—All true contracts contain the following essentials: (1) competent parties; (2) a valuable consideration; (3) a real agreement; (4) a lawful object. Some contracts also must comply with certain forms prescribed by law.

Incompetent Parties.—Certain persons are more or less incompetent to make a valid contract. They consist of the following six classes: (1) infants; (2) insane persons; (3) drunkards; (4) married women; (5) aliens; (6) corporations.

Infants. At common law, all persons under twenty-one years of age are infants. In a few states, however, by statute, females are of age at eighteen.

Married Women.—At *common law* a married women's contracts were void. Courts of equity, however, from an early day, have protected her *separate estate* and recognized her *contracts* relative thereto. This estate included all property both real and personal, which was settled upon her to her sole and separate use. The legal title to it had to be in some other person, who might be her husband, who held it in trust for her.

The Married Woman's Acts, which are in force in every state of the Union, have greatly enlarged the rights and powers of married women. Generally speaking, they provide that property owned by a woman at the time of her marriage, and all subsequent acquired by her by gift, grant, bequest or devise, shall be her separate estate free from the debts of her husband, and that she shall have power to make contracts with reference to such estate. In a few of the states these modern statutes go further and gave her the right to make contracts in general and to engage in trade the same as a *feme sole*.

Corporations are artificial beings. They are invisible and intangible and exist only in contemplation of law. They must act, therefore, through the instrumentality of agents. They may make contracts, provided they act within the scope of their charters. Contracts which are foreign to their charters are *ultra vires*.

Consideration.—A promise is not legally binding unless supported by a valuable consideration. (A good consideration, such as blood relationship, will support a conveyance, but not a contract.) A promise, therefore, to make a gift is not enforceable. If, however, the object of the donation has been delivered to the donee the gift is irrevocable.

Promise Under Seal.—A promise under seal, at the old common law, was conclusively presumed to be supported by a valuable consideration. In this country, however, the presumption is disputable.

What Constitutes a Valuable Consideration.—A consideration is a valuable one in the eye of the law if it consists of some benefit, interest, or right accruing to the promisor, or some detriment, forbearance or responsibility suffered or undertaken by the promisee. It is not essential, however, that there be a real benefit to the promisor, or a real detriment to the promisee. The mere waiver of a legal right is sufficient. Thus, it has been held that a promise by an uncle that he would pay his nephew $5,000 if during his minority he would refrain from using intoxicating liquor and tobacco, and would not swear or play cards for money, is legally enforceable. In such case, the restriction upon the nephew's lawful freedom is a sufficient consideration for the uncle's promise.

A promise to perform an *impossible* thing is not a valuable consideration. Nor is a promise to do what the promisor is already bound to do. Marriage is a valuable consideration and so is a promise to marry.

Inadequacy of Consideration.—Mere inadequacy of the consideration is no defense to an action on a contract. It may be used with other testimony, however, as evidence of fraud, undue influence or duress.

A Real Agreement.—To create a contract there must be an offer and an acceptance. The minds of the parties must meet. In other words, the acceptance must be unconditional and conform to the terms of the offer. The offerer may prescribe the time and place of the acceptance and the mode of making it.

Revocation of Offer.—An offer may be revoked at any time before acceptance. It may become revoked by mere lapse of time. The death or insanity of either party before acceptance revokes it.

An Offer by Mail or Telegraph.—An offer by mail does not take effect until received, but an acceptance by mail, provided it is properly addressed and stamped, takes effect when posted. The fact that it is lost in the mails is immaterial. The offeror, however, may make the actual receipt of the acceptance a condition precedent to a contract. Similar rules govern relative to offer and acceptance by telegraph.

A Lawful Object.—The object of the agreement must be a lawful one. An agreement to do an act which is prohibited by positive law, or which is against public policy, is illegal and void.

Wagering Contracts.—In this country wagering contracts are quite generally prohibited by statute. At common law, however, they were enforceable. They include transactions on the board of trade, called futures, whereby the parties do not contemplate a delivery of the goods sold, but merely payment of the difference between the contract price and the market price at the time of delivery.

Sunday Contracts.—Sunday contracts, as a rule, are also prohibited by statute. At common law, however, they, like wagering contracts, were enforceable. The statutes of the various states vary considerably, but all exempt from their operation contracts founded upon works of charity or necessity. Under these statutes, promissory notes, bonds, deeds and mortgages delivered on Sunday are void, although signed on a secular day. But those delivered on a secular day are enforceable although signed on Sunday. This is owing to the fact that the instrument takes effect upon delivery.

Usury Statutes.—Usury statutes obtain in nearly all of the states. Usury is interest contracted for or paid in excess of the legal rate. The purpose of the usury statutes is to protect debtors from overreaching creditors. They vary in the different states. Some make the entire contract void. Others make the interest void. While still others merely make the excess above the legal rate void. They apply to loans, but not to sales. Hence they are not applicable where bills or notes are discounted by a third party. Nor, by the law merchant, do they apply where a banker in loaning money deducts in advance the highest rate of interest allowable. To constitute usury there must be a corrupt intent, but devices to cover this intent are carefully scrutinized by the courts.

Contracts in Restraint of Trade are against public policy and void. The chief reason is they tend to create monopolies. A person may, however, restrain himself from carrying on a business or profession within reasonable limitations as to territorial limits. And when he does this no limitation is essential as to time.

Contracts in Restraint of Marriage.—Contracts which unduly restrain a person from marrying are against policy and void. Thus, a contract never to marry, or not to marry any one but a certain person to whom the promisor is not already engaged, is void. But a contract not to marry until of age is valid. And, ordinarily, a contract not to marry without the consent of the promisor's parents is valid.

Cornering the Market.—Combinations whose purpose is to corner the market are against the public policy and void. This is because they tend to create monopolies and thereby unduly enhance prices. Similarly, where a buyer at a public sale is fraudulently influenced by fictitious bids to pay an abnormally high price he may rescind the contract.

Contracts Against Public Justice or the Public Service.—Agreements which tend injuriously to affect public justice or the public service are against public policy and void. Thus, a contract whereby a party agrees unduly to interfere officially in a law suit that does not concern him; or to pay a public officer a fee for an official act; or unduly to influence an election to a public office, are void.

Contracts Which Must be in Writing.—In some jurisdictions in this country a writing is now essential in one or more of the following cases: (1) contract of insurance; (2) acknowledgment of a debt which is barred by the statute of limitations; (3) acceptance of an order for the payment of money; (4) ratification by a minor after reaching his majority.

The Statute of Frauds.—In every state in this country there exists what is known as the Statute of Frauds. This statute contains two sections—the 4th and the 17th—of great importance in the law of contracts, especially the former.

The 4th Section of the Statute of Frauds.—The 4th section of the English statute provides that no action shall be brought (1) whereby to charge any executor or administrator upon any special promise to answer in damages out of his own estate; or (2) to charge the defendant upon any special promise to answer for the debt, default or miscarriage of another; or (3) to charge any person upon any agreement made upon consideration of marriage; or (4) upon any contract or sale of lands, tenements or hereditaments, or any interest in or concerning them; or (5) upon any agreement that is not to be performed within the space of one year from the making thereof, unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing, and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized. Failure to comply with the requirement of this section of the statute does not render the contract void, but renders it unenforceable by excluding oral testimony of it.

The 17th Section of the Statute of Frauds.—The 17th section provides that no contract for the sale of any goods, wares or merchandise, for the price of 10 £ sterling, or upward, shall be allowed to be good, except (1) the buyer shall accept part of the goods so sold and actually receive the same; or (2) give something in earnest to bind the bargain, or in part payment; or, that some note or memorandum in writing of the said bargain be made and signed by the parties to be charged by such contract, or their agents, thereunto lawfully authorized.

Contracts for Work, Labor and Materials Excluded.—This section does not apply to contracts for work, labor and materials. As to just what constitutes such a contract, however, the courts do not agree. In most of the states it is held that a contract for a chattel to be made is not one for work, labor and materials, provided the chattel is one which the vendor ordinarily makes and sells in the regular course of his business.

Minimum Value.—In most of the states the minimum value of the goods to which this section of the statute applies is fixed at $50. In a few, however, it is more, and in a few others less. And in at least two the amount is not limited.

In a few states, including Illinois, this section of the statute has been repealed.

Reality of Consent.—The mutual consent of the parties must be real. The causes which sometimes render it unreal are the following: (1) mistake; (2) misrepresentation; (3) fraud; (4) undue influence; (5) duress.

Mistake.—The kind of mistake which is meant in this connection is mistake of intention and not mistake of expression. The former avoids the contract, but the latter does not. Where the parties are mistaken as to the existence of the subject-matter the mistake, of course, avoids the contract.

Misrepresentation, as distinguished from fraud, is an innocent misstatement or nondisclosure of a fact. As a rule, it has no effect upon a contract. There are, however, some exceptions to this rule. These consist of contracts *uberrimae fidei*. From their nature one party relies upon the other party for knowledge of certain facts and that other party in consequence is bound to exercise the utmost good faith.

They include insurance contracts, and those made between parties occupying a fiduciary relation, such as guardian and ward, trustee and *cestu ique trust*, attorney and client, principal and agent, etc. In this class of cases a material misrepresentation, although innocently made, renders the contract voidable and entitles the injured party to equitable relief.

Fraud is a misrepresentation of a material fact, present or past, made with knowledge of its falsity or in reckless disregard whether it is true or false, with intent to deceive, and which does deceive the other party, to his injury.

Ordinarily, to constitute fraud there must be a *misrepresentation* as distinguished from a mere *concealment*. There are, however, some exceptions to this rule. Where the deceiving party is in duty bound to make a disclosure, or where he takes steps to prevent a disclosure, or where the concealment renders that which is stated false, the nondisclosure amounts to fraud. The effect of fraud upon a contract is to make it voidable at the option of the injured party.

Undue Influence.—Undue influence is akin to fraud. It consists in the taking by one of the parties to the contract of an unfair advantage over the other party, who either reposes confidence in him, or possesses a weak intellect, or is in distress. Like fraud, its effect upon a contract is to render it voidable.

Duress is actual or threatened violence or imprisonment which reasonably causes another to enter into a contract. It may be by one of the parties to the contract or by his agent. And it may be against, or of, either the other party to the contract, or his or her spouse or other near relative. It may consist of the threatened destruction of property, or, under oppressive circumstances, of the illegal detention of property. As in the case of fraud or undue influence, its effect is to render the contract voidable.

Rules of Interpretation.—The ultimate purpose of rules of interpretation of contracts is to ascertain the intention of the parties. To accomplish this the following rules are applied by the courts:

When the contract is in writing the writing itself is the best evidence of it. This rule does not apply, however, where the writing is a mere memorandum of the contract, or where the purpose in introducing oral testimony is to show fraud, illegality, mistake of expression, usage or custom, or a condition precedent. Nor does it apply to subsequent oral agreements. Nor to oral testimony whose purpose is to explain the meaning of terms. Again, where a proper foundation has been laid for the introduction of secondary evidence, oral testimony of the written contract is admissible.

When the instrument is partly written and partly printed and the written and the printed parts conflict, the former must control.

Ordinarily, words are to be given their plain, common meaning. If, however, the context or surrounding circumstances show that the parties intended to use them in a peculiar or technical sense they must be given that special meaning.

When doubt exists as to the meaning of a word or clause it is to be construed most strongly against the party using it.

When words or clauses are repugnant, those which are opposed to the manifest intention of the parties are to be rejected.

Subsequent acts of the parties may have a controlling influence in determining their intention. In no case, however, will they be allowed to defeat the plain import of the words.

The various parts of the instrument must be construed together. When there are several contemporaneous agreements relating to the same transaction they must be construed in the light of one another. And when one or more other papers are directly referred to in the instrument as constituting an inducement to the contract, they are entitled to consideration.

Modes of Discharging a Contract.—Contracts are discharged in the following ways: (1) by agreement; (2) by performance; (3) by impossibility of performance; (4) by breach; (5) by operation of law.

Discharge by Agreement.—The parties may agree that their contract shall no longer bind them. Such an agreement is called a waiver, cancellation or rescission. Express words of rescission are not essential. Thus, where the parties make a new contract, which is inconsistent with the old one the latter is discharged. In such case if a third party is substituted for one of the original parties with the consent of all three, the new agreement is called a novation.

Discharge by Performance.—Strict and full performance of a contract discharges it. Ordinarily, a reasonable time is allowed within which to perform a contract. When, however, time is of the essence of the contract, failure to perform within the time agreed constitutes a breach. Mercantile contracts, especially, belong to this class.

Performance may consist in payment of money or negotiable paper. In the latter case the performance may be absolute or conditional. Ordinarily, a presumption arises that the payee is entitled to sue on the original contract if the paper be not paid when due.

Tender, or an offer to perform, may constitute a release. Thus, when a party offers to render services, or deliver goods, or do some other act which he is bound to perform, and the tender is refused, he is usually released. It is to be observed, however, that when the obligation is the payment of money, a tender of the sum due does not discharge the debt. Usually, however, it stops the accrual of interest, and also puts the burden of costs on the creditor in case he sues to recover the debt. Moreover, if any security for the debt exists, it discharges it.

Discharge by Impossibility of Performance.—When the agreement shows on its face physical or legal impossibility of performance there is no contract. And the same is true when the subject-matter of the agreement has ceased to exist at the time the agreement is entered into.

Ordinarily, however, when the impossibility of performance arises subsequently to the formation of the contract it does not discharge it. The chief exceptions to this rule are as follows: (1) when the contract is one for personal services and death or incapacitating illness intervenes; (2) when the continued existence of some specific thing is essential to the performance and it ceases to exist through no fault of either party; (3) when the impossibility is created by law.

Discharge by Breach.—Breach of the contract by one of the parties always gives the other party a right of action for damages, and sometimes discharges the contract. When one party renounces the contract the other party may treat it as discharged and sue at once for the breach. When the promises are independent of each other, failure of performance by one party does not operate to discharge the other; but when the promises are conditional upon each other, it does. Independent promises are absolute, divisible or subsidiary. Conditional promises are precedent, concurrent or subsequent.

Discharge by Operation of Law.—Contracts are discharged by operation of law in the following ways: (1) merger; (2) alteration; (3) bankruptcy proceedings.

Merger is where a higher security swallows up or extinguishes a lower one. This cannot occur unless the securities are of unequal grade, and the subject-matter and the parties the same. A contract under seal will merge a simple contract, and a judgment will merge a contract under seal. But a written contract not under seal will not merge an oral one because they are of equal grade. Each is merely a simple contract.

Alteration of a contract discharges it, provided the alteration is material and made intentionally by one of the parties to it, or his agent, without the consent of the other party.

Bankruptcy releases a party from all his liabilities provable under the bankruptcy proceedings. The decree of the court constitutes the order of discharge.

Negotiable Instruments.—Negotiable paper should possess the following characteristics: (1) it must be in writing and signed; (2) it must contain an unconditional order or promise to pay a certain sum of money; (3) it must be payable to order or bearer; (4) it must be payable at a determinable time; (5) if a bill of exchange it must indicate the drawer.

Bills of Exchange.—A bill of exchange is an unconditional written order by one person upon another, directing him to pay a third party, or to his order or to bearer, a sum of money therein stated.

Bills of exchange are of two kinds: (1) foreign; (2) domestic. A foreign bill of exchange is a bill drawn in one state or country and payable in another state or country. A domestic or inland bill of exchange is a bill which is payable in the state or country in which it is drawn.

Parties to a Bill of Exchange.—The necessary parties to a bill of exchange are the drawer, the drawee and the payee. There may be, in addition, indorsers and indorsees. After the drawer accepts the bill he is called the acceptor. In accepting the bill he thereby becomes the principal debtor and the drawer becomes a guarantor of payment instead of a guarantor of acceptance.

Presentment for Acceptance Not Always Essential.—Unless the drawer has directed that presentment be made for acceptance it is not essential in the case of bills payable on demand, or on a certain date, to present them for acceptance. It is customary to do so, however, as to those payable at a specified time. Those payable a certain number of days after sight or demand must be presented for acceptance within a reasonable time.

Privilege of the Drawee.—The drawee is entitled not only to inspect the bill, but also to retain it twenty-four hours. This is to enable him to investigate the drawer's account before deciding whether he will accept the bill or not.

An acceptance which differs from the tenor of the bill may be refused by the holder; but if he accepts it he is bound by it.

Promissory Notes.—A negotiable promissory note is an unconditional written promise by one person to pay another person, or to his order or to bearer, at a determinable time, a sum in money. The *liability* of the maker, unlike that of the drawer of a bill of exchange, is primary and direct.

Transfer of Bills and Notes—A bill or note payable to bearer, or payable to order and indorsed in blank, is transferable thereafter by mere delivery. The transferor in such case impliedly warrants the genuineness of the signatures and the body of the instrument. He also impliedly warrants the capacity of the parties to make a contract and his title to the instrument.

When the instrument is indorsed in full, as, for example, "Pay to the order of John Brown," any further transfer will require the indorsement of the indorsee. Without such indorsement the equitable title would pass, but not the legal title.

Indorser's Liability.—An indorser of a bill or note not only impliedly warrants all that a transferor by mere delivery impliedly warrants, but also, in the case of an unaccepted bill payable at a certain future time, that it will be accepted unconditionally by the drawee when duly presented for acceptance; and in the case of a promissory note or an accepted bill payable at a certain future time, that it will be paid at maturity if duly presented for payment, or, if payable on demand, that it will be paid within a reasonable time after demand of payment is made. And furthermore, that in case of dishonor, either by non-acceptance or non-payment, after due demand, he will pay the obligation upon receiving due notice of the dishonor.

Where there are two or more indorsers they are liable *prima facie* in the order in which their names appear on the instrument.

Place for Indorsement.—The proper place for an indorsement is across the back of the instrument. It may, however, be elsewhere, even upon a separate paper. In such case the separate paper is called an allonge. It may contain several indorsements.

A Restrictive Indorsement is one which restrains further indorsement of the bill or note. Title is vested in the indorsee as a trustee or agent. Thus, "Pay to John Brown for my use"; "Pay to John Doe for my account"; are restrictive indorsements.

An Indorsement with Waiver is an indorsement which waives demand, notice or protest, or more than one of them. When in the body of the instrument it binds all the parties, but when it is above the signature of but one indorser he is the only person bound by it.

Protesting a bill or note consists in taking the necessary formal steps by a notary public to establish and certify to its dishonor. It is essential that the same notary take all the steps required and that the certificate of protest be based upon his acts.

Notice of Dishonor of a bill or note may be oral. Ordinarily, however, it is in writing. It should contain statements showing: (1) a sufficient description of the instrument dishonored; (2) that it was presented for acceptance or payment; (3) that acceptance or payment was refused; (4) that it has been protested, if this has been done; (5) that the holder looks to the party notified for payment.

Checks.—A check is an order on a bank or banker, payable on demand without grace, drawn by a depositor.

Relation between Bank, Depositor and Checkholder.—The fund on deposit belongs to the bank rather than to the depositors. The bank is the depositors' debtor. For this reason a checkholder, as a rule, may not sue the bank. If, however, the check has been previously certified by an authorized officer of the bank, he may do so. In such case the bank is the checkholder's debtor. Moreover, where the holder of the check procures the certification the drawer and the indorsers are released.

Presentment of Check.—A check should be presented within a reasonable time. What constitutes a reasonable time depends upon the circumstances of the particular case. Five days' delay has been held sufficient to render the check stale. On the other hand, a month's delay has been held insufficient to do so. A stale or overdue check admits equitable defenses against the holder.

Payment of Checks.—When a check, properly drawn, is presented for payment and there are sufficient funds on deposit to meet it, the bank is bound to pay it. A refusal to do so would render it liable to the depositor for damages.

When Fund is Attached.—When the fund of a depositor is attached the bank, as a rule, may not pay his checks. In those states, however, in which a check operates as an equitable assignment *pro tanto* of the fund upon which it is drawn, the bank may pay checks drawn before the attachment.

Forged Checks.—When a bank pays a check whose signature is forged it must bear the loss. And when it pays a raised check it also must bear the loss, unless the drawer's negligence in filling up the blanks facilitated the forgery.

Certificates of Deposit are negotiable the same as promissory notes, and the rules which apply to indorsers generally apply to this class of paper.

Bona Fide Holders of negotiable paper are persons who take it in good faith, without notice of equities in general, in the usual course of business, for a valuable consideration, before maturity.

As a rule, a *bona fide* purchaser of negotiable paper takes it free from all equities. (a) Negotiable paper is endowed with the capacity for transfer, and it is not the purpose of the law that, when passing from hand to hand, its origin shall be scrutinized at the peril of non-payment. Otherwise its valuable quality is impaired or lost. The requirement is that the transfer shall indicate a purchase with honest intent and belief that the paper is the evidence of an honest indebtedness. The confiding purchaser is not condemned, but the purchaser who is shown not to have bestowed an honest, credible confidence. To constitute notice of an infirmity in the instrument or defect in the title of the person negotiating the same, the person to whom it is negotiated must have had actual knowledge of the infirmity or defect or knowledge of such facts that his action in taking the instrument amounted to bad faith.

Agency.—An *agent* is one who represents and acts for another. A *principal* is one who is represented by and acts through another. *Agency* is the relation which exists between such persons.

Creation of the Agency Relation.—The relation of agency may be created by *agreement* or by *operation of law.*

By agreement it may be by appointment or by ratification. Ratification is the adoption of the act of an unauthorized agent. To create the agency relation by ratification the following conditions must exist: (1) the doer of the act must profess to do it on behalf of an existing principal; (2) the approval of the act must be given with full knowledge of all the facts; (3) the act must be approved as a whole. It may not be approved in part and repudiated in part.

Creation by Operation of Law.—As a rule, the agency relation is created by agreement of the parties. There are, however, two important exceptions to this rule: (1) agency by *estoppel*; (2) agency by *necessity.* In these cases there is no assent of the parties. The relation is created by operation of law.

In the case of *agency by estoppel* the principal by his act estops himself from disputing the agency. As said by an eminent judge, "Where one has so acted, as from his conduct to lead another to believe he has appointed some one to act on that belief, then, unless he interposes, he will, in general, be estopped from disputing the agency, though in fact no agency really existed."

A good example of *agency by necessity* is that which arises where a husband improperly fails to furnish his wife necessaries. In this case, as said by Chief Justice Holmes, "it (the law) creates a compulsory agency."

Classification of Agents.—Agents are classified as to the *scope of their authority* and also as to the *nature of their duties.*

As to scope of authority, agents are either general or special. A general agent is one who is appointed to do acts of a class, and a special agent is one appointed to do an individual act.

As to the nature of their duties, agents are either professional or non-professional. The former include brokers, factors, or commission merchants, auctioneers and attorneys-at-law.

Capacity of the Parties.—Any person who has legal capacity to act in his own right may act through an agent. And any person who has sufficient natural capacity to perform the act delegated to him may be an agent.

Appointment of Agents.—Ordinarily, an agent may be appointed orally. In some cases, however, by statute, a writing is essential. At common law, to empower an agent to bind his principal by an instrument under seal the agent's authority must be under seal. At present, however, this rule is subject to the following exceptions: (1) where the instrument is sealed in the presence of the principal, by his authority; (2) where the instrument does not require a seal.

Duties and Liabilities of Agents—An agent must be loyal to his trust and obey instructions. He must not engage in enterprises antagonistic to the interest of his principal nor reap secret benefits at the expense of his principal. He must exercise due care and skill and keep regular accounts of his transactions connected with the agency. If he exceeds his authority as agent he is liable to the third party. And in all cases he is liable to third parties injured by his torts, where they are not guilty of contributory negligence.

Rights of Agents—An agent is entitled to the compensation agreed upon, or to reasonable compensation where no sum is fixed by agreement. If the term is fixed, and he is wrongfully discharged he may recover the *actual* value of the services rendered, or has the option of treating the contract as recinded and recovering the actual value of the services rendered, or of treating the contract as subsisting and recovering damages for the breach. If he should decide to do the latter, he should wait until the end of the term.

Duties and Liabilities of Principal.—It is the duty of the principal to give instructions to his agent as to the duties he is to perform, to furnish him with proper appliances, etc., and to remunerate him according to the terms of the contract. The acts of the agent, within the scope of the agency, are the acts of the principal, and he is liable for them.

Termination of the Agency Relation.—The agency relation may be terminated as follows: (1) by act of the parties; (2) by expiration of the term; (3) by operation of law.

By Act of the Parties.—The parties may terminate the relation at any time, by mutual agreement. Moreover, as a rule, either party can renounce the agency at any time. In doing so, however, he exercises a power rather than a right and is liable in damages for breach of his contract. The only exception to this rule is where the agent's authority is coupled with a proprietary interest in the subject-matter of the agency. In such case the principal cannot renounce the agency.

By Expiration of the Term.—When the agency is created for a definite period it expires at the end of the term.

By Operation of Law.—The chief causes by which the agency relation may be terminated by operation of law are the following: death, insanity, bankruptcy, war and marriage. There are certain types of agency, such as a power coupled with an interest, which are not even terminated by the death of the agent so interested.

Corporations.—A business corporation, from a strictly legal point of view, is an artificial person created by law, invisible, intangible, and existing separate and distinct from its members. Practically, however, it is an association of natural persons endowed with power by the legislature to carry on business enterprises in many respects as an individual.

How Created.—In this country they are created by the legislature, and as a rule under general statutes. Under these statutes the charter of the corporation consists of the certificate of incorporation, the articles of association, and the statutory provisions.

Its Attributes and Powers.—As a legal entity, a business corporation has capacity: (1) to enjoy a potential immortality; (2) to enter into contracts; (3) to take, hold and transfer property; (4) to sue and be sued like a natural person; (5) to make contracts with its own members, and sue and be sued by them; (6) to have and use a common seal; (7) to enjoy grants of

privileges and immunities; (8) to make by-laws; (9) to commit torts, and even certain crimes for which it may be indicted and fined; (10) in the absence of statutes or special circumstances, to be solely liable for its obligations.

Management of Corporations.—The power behind the throne in the case of a corporation is the stockholders. They choose a board of directors, and this board is entrusted by the stockholders with the direct management of the business. The details of management are entrusted by the board of directors to a president, secretary and treasurer, chosen by the board.

Powers of the Majority.—The chief powers of the majority, with respect to the stockholders, are as follows: (1) to choose directors; (2) to make by-laws; (3) to make important changes in the business within the scope of the charter.

Voting Power.—Under modern statutes each stockholder is entitled to one vote for each share of stock owned, and he is permitted to cumulate them as he chooses. He may also vote by proxy.

Powers of Directors.—The board of directors has a wide discretion in the management of the business. It has sole power to declare dividends and to fix the time and place of payment. As a rule, the majority of the directors constitute a quorum. The board has authority to select agents of the corporation, but not to decide upon important changes in the company's business, nor to determine whether the business shall be wound up or not.

Liability of Shareholders.—As a rule, the shareholders whose subscriptions are fully paid are not liable to the creditors of the corporation. But where they participate in the wrongful diversion of the capital of the corporation to the injury of its creditors they are liable to them.

Modes of Dissolving a Corporation.—A corporation may be dissolved in any one of the following ways: (1) by expiration of its charter; (2) by surrender of its charter with the consent of the state; (3) by legislative enactment, provided it is constitutional; (4) by judicial proceedings for the purpose of forfeiture owing to misuser or nonuser of its franchises.

Partnerships.—A partnership is an unincorporated association of two or more competent persons who have agreed to unite their property, labor and skill, or some of them, in carrying on a lawful business as principals for their joint profit.

Requisites of a Partnership.—The requisites of a partnership are as follows: (1) two or more competent persons; (2) a voluntary, unincorporated association; (3) based upon contract; (4) a lawful business; (5) carried on by the partners as principals; (6) for pecuniary gain.

An oral contract of partnership is valid even to deal in real estate providing the property was owned by the members beforehand.

Classification of Partnership.—Partnerships are sometimes classified as *ordinary* partnerships, *limit* partnerships and *joint-stock companies*.

Ordinary Partnerships.—Ordinary partnerships are divided into *general* and *special* partnerships.

A general partnership is one for carrying on a general kind of business or several kinds of business. A special partnership is one created to accomplish a single adventure.

Limited Partnerships.—A limited partnership is one having one or more general partners whose liability for the firm debts is not limited, and one or more special partners whose liability is limited. In organizing this kind of partnership the provisions of the statute must be carefully followed.

Joint-stock Companies are partnerships with a capital stock divided into transferable shares. In the absence of statutory provisions they are governed by the articles of association, the by-laws, and the general principles of partnership.

Classification of Partners.—Partners are designated according to the relation that exists between them and the firm, or between them and third persons. Thus, depending upon such relation, they are called ostensible, active, secret, dormant, nominal, general, special, incoming, retiring, or liquidative.

Powers of Partners.—As a general rule, each partner, for the purposes of the partnership business, is an agent of the firm and of his co-partners. The extent of the agency depends upon the nature of the business. In a trading firm a partner has implied power to buy and sell goods, execute commercial paper, borrow money, pledge or mortgage firm personalty, collect debts due the firm, lease premises, hire property, appoint agents, etc. He has no implied power, however, to submit controverted partnership matters to arbitration, or make a general assignment for the benefit of creditors.

In the case of a non-trading firm the implied powers of a partner are more limited. Thus, he has no implied power to bind the firm by making, accepting or indorsing commercial paper. Such paper, therefore, is not enforceable even in the hands of a *bona fide* purchaser.

Rights of Partners.—Each partner, in the absence of an agreement to the contrary, has an equal right to share in the management of the business of the firm. And each has the right to have firm property applied to the payment of firm debts.

Duties of Parties.—The partnership relation is one of great confidence and trust. For this reason the law requires that partners exercise toward one another the highest integrity and good faith. In the absence of agreement, a partner must not engage in transactions antagonistic to the firm's business, or take secret profits at the expense of the firm. He must conform to the partnership agreement, keep accounts, exercise care and skill, and consult with his co-partners upon all proper occasions.

Liability of Partners.—Partnership obligations arising from *contract* are joint, while those arising from *tort* are joint and several. Each member of the firm is personally liable, however, for all the firm debts. But a partner who is compelled to pay firm debts out of his separate estate is entitled to contribution from his co-partners.

Partnership Property.—The property of the firm may be both real and personal. The legal title of the firm personalty may be held in the firm name. It is otherwise, however, as to the firm realty. This is owing to the fact that the firm is not a separate legal entity. The deed should run to all of the partners in trust for the firm. It may be held by any one, however, for the use of the firm.

Nature of a Partner's Interest in the Firm Property.—The interest of a partner in the the firm property is a peculiar one. It is simply his share in the surplus after the debts are paid. And this is all the buyer gets where his interest is sold by a separate creditor under a writ of execution.

Actions in Law and Equity.—Since the firm is not a separate legal entity, a partner cannot sue his firm at law. Nor can the firm sue him. Moreover, a partner cannot sue, as a rule, his co-partner at law. He may do so, however, as to transactions wholly distinct from the partnership business; and also as to matters arising prior or subsequent to the partnership, and which, though connected with it, are not partnership transactions. Thus, a partner may sue his co-partner at law for breach of his agreement to enter into the partnership relation, to furnish capital, pay debts, indemnify him for expenses paid, or reimburse him for capital advanced.

Dissolution of the Firm.—The partnership relation may be terminated either (1) by act of the parties, or (2) by operation of law.

By act of the parties it may be by original agreement or by subsequent act; and by original agreement it may be by lapse of time or by the accomplishment of the object.

By operation of law it may be by death, insanity, marriage, bankruptcy, or war between the countries of the partners. The circumstances under which each of these causes will effect a dissolution of the partnership relation are similar to those under which each of them will terminate the agency relation.

A court of equity may decree the dissolution of a partnership for any of the following causes: (1) fraud in creating the partnership; (2) insanity of a partner; (3) gross misconduct of a partner; (4) hopelessness of success.

Notice of Dissolution Required.—When the partnership is dissolved by act of parties notice of the dissolution must be given, not only to those who have had dealings with the firm, but also to the public generally. The former must have *actual* notice, but as regards the latter a general notice in a newspaper of general circulation in the neighborhood, for a reasonable period, is sufficient.

Effect of Dissolution.—When the partnership is dissolved by the death of a partner the legal title to all the firm personalty vests at once in the surviving partners, who hold it in trust for the firm. Moreover, the right of disposing of all the partnership assets, real as well as personal, vests in them. Firm creditors may proceed at law against the surviving partners, or in equity against the estate of the deceased partner. They may pursue the latter course irrespective of the extent of the firm assets.

After dissolution, the partners may perform acts with the view of closing up the business, but not with the view of creating new obligations.

Sale of Personal Property is the transfer of its general ownership for a price in money.

In the case of a barter or exchange one chattel is transferred for another; and in the case of a bailment there is a transfer of the possession of a chattel but not of the title.

What is frequently called an executory sale is merely an agreement to sell.

Formalities of a Sale.—A contract of sale requires no formalities unless it is within the provisions of the Statute of Frauds (which see). It may be oral or in writing; the price may be paid at once or on a future day; possession of the goods may be given the buyer immediately or retained for a time by the seller.

When Title Passes.—When the title passes is governed by the intention of the parties. Where they do not express their intention

it is to be inferred from their acts and the surrounding circumstances. If the goods are ready for immediate delivery the law presumes that title passes at once. If they are not, the law presumes that title is not to pass until they are put in a deliverable condition. If the sale is on approval the law presumes that title does not pass until the buyer has tried and approved them. In the case of a "sale or return" it passes to the buyer at once with the right to pass it back to the seller within the time agreed, or within a reasonable time when no time is fixed, if he chooses to do so. Where the goods are shipped C.O.D. the title passes to the buyer upon delivery to the carrier, but the buyer is not entitled to possession of them until he pays the price.

Duties of the Seller.—The duties of the seller are three-fold. He must furnish the thing agreed upon, transfer title to the buyer, and give him possession of it.

Warranties.—A warranty is an assurance of some fact coupled with an engagement, express or implied, to make the assurance good or pay for the deficiency. Ordinarily the seller impliedly warrants that he is the owner of the subject-matter of the sale and that it is free from incumbrance. When the goods are sold by sample, he impliedly warrants that they shall conform to the sample; and when sold by description, that they shall conform to the description. When sold by a manufacturer, he impliedly warrants that they are free from latent defects which might have been guarded against by the exercise of reasonable care. And when sold for a particular purpose, he impliedly warrants their fitness for that purpose.

Breach of Warranty gives the buyer a right of action for damages, whereas a breach of a condition usually entitles him to rescind the contract. He is entitled to recover the difference between the value of the goods as they are and what it would have been had the goods been as warranted.

Stoppage in Transitu.—The seller may stop the goods while in transit, provided they are not paid for and the buyer is insolvent. He may do this, as a rule, even where the buyer has resold them to a third party. The exception to this rule is where the bill of lading is given to the buyer and turned over by him to the subvendee who pays the price without notice or knowledge that his vendor has not paid for them.

Remedies of the Buyer.—When the buyer has paid for the goods and the seller refuses to deliver them the buyer is entitled to recover the market value of the goods at the time and place of delivery, together with interest. If he has not paid for the goods he is entitled to recover the difference between the contract price and the market price at the time and place of delivery, provided the latter price is greater than the former, together with interest.

Real Property is land and whatever is permanently fixed to land, together with certain incorporeal rights annexed thereto or issuing therefrom.

Classification of Estates.—Estates in real property are classified with respect to: (1) quantity of interest; (2) time of enjoyment; (3) number and connection of tenants; (4) manner of enjoyment.

Quantity of Interest—With respect to quantity of interest estates in real property are of two kinds: (1) freehold; (2) less than freehold.

Freehold Estates are of three kinds: (1) fee-simple; (2) fee-tail; (3) for life.

Life estates are either for the life of the tenant or for the life of another person. Those for the life of the tenant include (1) dower estate: (2) estate by the curtesy; (3) homestead estate.

Estates Less Than Freehold are also of three kinds: (1) for years; (2) at will; (3) by sufferance.

Time of Enjoyment.—With respect to time of enjoyment estates in real property are of two kinds: (1) in possession; (2) in expectancy.

Estates in expectancy are of two kinds: (1) remainders; (2) reversions.

Remainders are subdivided into (1) vested; (2) contingent.

Number and Connection of Tenants.—With respect to the number and connection of the tenants estates in real property are of four kinds: (1) in severalty; (2) in joint tenancy; (3) in common; (4) by entirety.

Manner of Enjoyment.—With respect to manner of enjoyment estates are of two kinds: (1) absolute; (2) conditional.

Definition of Estates.

In Fee-Simple.—This is the highest estate known to the law. It is an estate of inheritance, free from any condition and of indefinite duration.

In Fee-Tail.—This is an estate of inheritance which is descendable only to particular heirs of the grantee and not to his heirs in general. It had its origin in the desire of owners of great estates to keep them intact to particular families by restricting the power of alienation. In this country it is looked upon with such disfavor that where it is recognized at all the restraint upon free alienation is limited by statute so that the immediate grantee gets a life estate and the second taker the remainder in fee.

For Life.—An estate for life may be created by the parties themselves or by operation of law. An estate for life usually endures during the life or lives for which it is created.

For Years.—An estate for years is a mere chattel interest although created for a thousand years. It may be limited to commence presently or at some future time. It does not descend to the heir, but vests in the executor or administrator of the deceased in the same manner as other chattels.

At Will.—This is an estate which the tenant holds at the pleasure of the lessor. Statutes almost invariably require a notice to quit, and the practical effect of these statutes is to convert estates at will into tenancies from year to year or from month to month.

By Sufferance.—A tenant by sufferance is one who holds over after his term expires and is allowed by the owner to continue in possession. At common law he was not liable for rent beyond the term agreed, but modern statutes frequently make him liable for double rent.

In Remainder.—This is an estate which is limited to commence at a future time on the termination of a precedent estate created at the same time. It is either *vested* or *contingent*. A vested remainder is one in which there is an immediate fixed right of future enjoyment. A contingent remainder is one in which the right of enjoyment does not accrue until the happening of some uncertain event which may never happen.

In Reversion.—This is the residue of an estate left in the grantor, or his heirs commencing in possession upon the determination of a particular estate granted. It is subject to the same incidents as an estate in remainder. Practically the only difference between these two estates is that a *remainder* is always created by act of the parties and a *revision* always by operation of law.

In Severalty.—This is an estate held by one person in his own right. Most legal estates in real property belong to this class.

In Joint Tenancy.—A joint tenancy is an estate in which the grantees have the same interest, created at the same time, by the same conveyance, and held by them by the same undivided possession. The most important incident of this estate is the right of survivorship.

In Common.—At common law this estate is created when two or more persons acquire their interests by separate and distinct titles. The only unity between them is that of possession. In a joint tenancy there are the additional unities of title, time and interest. That is, the several tenants must obtain their title from the same source, at the same time, and acquire the same interest. Whereas tenants in common may acquire their title from different sources, at different times, and acquire different interests.

By Entirety.—This estate is created when a conveyance is made to husband and wife and the conveyance is silent as to the manner in which they shall hold. They are not joint tenants, nor are they tenants in common. Neither party can dispose of his or her interest without the assent of the other, and upon the death of either the estate survives to the other.

Absolute Estate.—An absolute estate is one which is free from restriction.

Upon Condition.—An estate upon condition is one which is commenced, enlarged or defeated upon the happening or performance of some condition.

Upon a Conditional Limitation.—This is an estate which is restricted by some condition, and which terminates by operation of law upon the happening of the event by which its limitation is measured.

Equitable Estate.—An equitable estate is a right or interest in real property not recognized at common law, but recognized and made available by courts of chancery. The three kinds of equitable estates are users, powers and trusts.

Title.—This is the means whereby the owner of realty has the just possession of his property. In other words, it represents the right or authority for the enjoyment of his land. Title to property is classified both as to *origin* and *nature*. As to origin it is original or derivative. As to nature it is legal or equitable.

Modes of Acquiring Title.—Original title to property is acquired in the following four ways: (1) occupancy; (2) discovery; (3) conquest; (4) cession.

Derivative Title is acquired in the following two ways: (1) descent; (2) purchase.

Title by *descent* accrues through consanguinity, affinity or adoption. Title by *purchase* is acquired by act of the parties or by operation of law. It is acquired by act of the parties either by public or private grant or by devise. Public grant is by patent or legislative grant. Private grant is by deed or by dedication.

Deed.—A deed is an instrument, written or printed, or partly written and partly printed, on paper or parchment, by which an estate is conveyed, of not less than a freehold, in lands, tenements and hereditaments.

Parties to a Deed.—The two parties to a deed are the grantor and the grantee.

If the grantor is married his wife also should sign the deed. This is essential to convey her dower interest. And where the land conveyed is a homestead it is also essential in order to transfer her homestead right.

If the grantor is a corporation the deed should contain the corporate name at the beginning and be signed by its president or other officer authorized so to do.

The Description of the Premises.—The premises should be accurately and minutely described. Reference should be made to prior deeds by which title was acquired by the grantor. If the land is described by metes and bounds, and also by specifying the number of acres, and the two descriptions differ, the former will govern.

Covenants in a Deed.—A quit-claim deed merely transfers all the right, title and interest in the land that the grantor has. A warranty deed, in addition to this, contains certain personal undertakings called covenants. These covenants warrant that the grantor is lawfully seised of the premises in fee-simple; that the premises are free from all incumbrances; that the grantor has good right to sell the same to the grantee, and that he will and that his heirs, executors and administrators shall, warrant and defend the same to the grantee, his heirs, and assigns forever, against the lawful claims of all persons whatsoever.

Execution of a Deed.—A deed is executed by the grantor and grantee signing it and annexing thereto their seals. At common law the sealing of the deed was the most important act in its execution. In some states, by statute, sealing is not essential. In some states two witnesses are essential, in some one, and in others none. In order that the deed may be recorded it must also be acknowledged.

Delivery of a Deed.—To pass the title to the property the deed must be delivered. And the delivery must be voluntary.

A delivery of the deed by the grantor to a third party to hold until the grantee has performed certain conditions, or until a certain time has transpired, does not pass the title. Such a delivery is called a delivery in escrow.

Recording a Deed.—Recording a deed is not essential to pass title to the grantee. To protect himself, however, the grantee should have the deed recorded at once. To do so gives constructive notice to the world that the title to the land is in him.

Wills.—Title to real estate may be acquired by devise or will in all the States of the Union. To render a person competent to transfer title by this means he must be of full age and of sound mind. Moreover, he must act voluntarily.

In most of the states a will must be in writing, signed by the testator, or by some person in his presence, and by his direction, and attested by witnesses, who must subscribe their names thereto in the *presence* of the testator. The form of wording a will is immaterial as long as its intent is clear.

Witnesses.—Most of the states require two witnesses, except in Connecticut (3), Maine (3), Massachusetts (3), New Hampshire (3), South Carolina (3), Vermont (3).

Males and females are competent to make wills at 18 years in the following states: California, Connecticut, Hawaiian Islands, Idaho, Montana, Nevada, North Dakota, Oklahoma, South Dakota, Utah; and in the following states only females at 18 years: Colorado, District of Columbia, Illinois, Maryland, Missouri, Washington, Wisconsin.

In the following states persons of 18 years may dispose of personal property only: Alabama, Arkansas, Missouri, Oregon, Rhode Island, Virginia, West Virginia; in Georgia any one over 14 years and in Louisiana any one over 16 years is competent to make a will. In Colorado persons of 17 years, and in New York males of 18 and females of 16 years may dispose of personalty.

NOTE.—In many of the states it is impossible to place a fixed amount on personal property exempt. In the table above these states have no amount given in the personal property column.

LABOR LAW AND LEGISLATION—The Labor Contract.—The relation of employer and employee arises from contracts concerning labor, the right to make such contracts being a property right in which both parties are interested, and in which they are protected by constitutional guaranties. Special rules of common law govern such contracts, embodying the results of numerous decisions of the courts. An employer is presumed to employ his workmen lawfully, to compensate them fairly, and to have due regard for their health and safety. The workman is presumed to be reasonably competent, to be ready to obey reasonable orders, and to use ordinary care in the performance of his work. As a result largely of modern industrial conditions, the inequality between employers and employees as regards the making of contracts has become so conspicuous that statutes have been enacted regulating in various ways the conditions of employment, and in so far taking the matter out of the hands of the immediate parties to the contract. These regulations, as well as the rules of common law, form a part of every labor contract to which they are applicable. Subject thereto, adults of competent mental capacity may contract freely, and be held mutually to the standards indicated.

Enforcement. — There is not, generally speaking, any specific performance of a labor contract enforceable at law, and either party may terminate such a contract at any time, for any reason or without reason, being liable only in damages for the breach of a contract for a fixed term. A statute of Colorado attempts an exception to this rule by forbidding the discharge of a workman between the ages of eighteen and sixty solely on account of age, but such a law is doubtless without value.

Breach. — A few states have enacted laws for the punishment of the breach of labor contracts as for a crime, where on the strength of such contracts advances of money or supplies have been procured and the contract is then fraudulently broken. The states having laws of this class are Alabama, Arkansas, Florida, Georgia, Louisiana, Michigan, Minnesota, New Mexico, North Dakota and South Carolina. The laws of most of these states look mainly to agricultural employment, though in Michigan, Minnesota and North Dakota they seem to have reference mainly to the fraudulent procurement of money advances for transportation to the place of employment. A special class of employees is embraced in laws which provide a penalty for the abandonment of locomotives or trains at other than terminal or division points, while more general laws of New York and Washington prohibit any abandonment of employment that would knowingly jeopardize life or limb, or expose valuable property to destruction.

Notice of Termination. — If the employer contracts with his employees for a notice of their purpose to leave service, he may be required by statute to give corresponding notice, under like forfeiture, of his intention to discharge. Laws to this effect are found in Maine, Massachusetts, New Jersey, Pennsylvania, Rhode Island and Wisconsin.

Clearance Cards. — The giving of a recommendation or clearance card at the termination of employment is not obligatory on the employer, even though a new employer may demand such certificate before employing an applicant for service. A few states have enacted laws directing such cards to be furnished, but such laws are of at least doubtful validity. The states having them are Florida, Indiana, Missouri, Montana, Ohio and Texas. The courts of Georgia and Kansas have declared such laws unconstitutional, while a Texas court of appeals upheld the law of that state.

Interference with Contracts.—Third parties interfering with a contract of employment, unjustifiably inducing the breach thereof by either employer or employee, are liable to the injured person in damages, even though the contract was terminable at will by either of the parties to it. There must be knowledge of the contract, and a mere attempt without damage will support no action. Knowingly interfering with a contract for service by hiring or enticing away an employee is made a penal offense in Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina and Tennessee. The attempt entails the same penalty as the performance in Alabama and Georgia. There is a federal statute making it an offense to procure workmen in government arsenals or armories to leave their employment during the term of their contract, or to retain such a workman after notice of such contract. Other forms of interference will be noted under the heading of strikes.

The giving of discounts or bonuses to employees who make purchases for the employers, or giving gratuities to employees, to influence them in regard to their employers' business, is against the law in Connecticut, Iowa, Massachusetts, Michigan, Nebraska, New Jersey, New York, Rhode Island, South Carolina, Virginia, Washington and Wisconsin. A like law in Indiana is restricted to employees of railroad companies. The Washington statute prohibits the tipping of employees of public houses or public service corporations. Asking or accepting gratuities is also forbidden by the above statutes.

Civil and Political Rights of Employees.—Voting.—Most states of the Union provide a penalty for employers interfering with or seeking to coerce employees in the exercise of their rights as voters, either by posting notices or printing them on pay envelopes, or threatening dismissal, reduction of wages, or the closing of the plant in case of the success of any designated candidate or party. The law of Minnesota protects employees in the exercise of any natural right or any right or privilege of citizenship. The Wyoming statute mentions the candidacy of employees, while in Colorado no employer, foreman or manager of a railroad, mining or manufacturing work carried on in the precinct, may act as judge, clerk or watcher at the polls in any election. Many of these laws direct the allowance of time to vote without loss of wages.

Freedom as Traders, etc.—Freedom of workmen in the selection of their places of trade is the object of laws of Colorado, Florida, Indiana, Iowa, Kentucky, Maryland, Massachusetts, Nevada, New Jersey, New Mexico, Ohio, Oregon, Tennessee, Texas, Utah, Washington and West Virginia. Free choice of boarding or lodging houses is provided for in the laws of Massachusetts, Montana, Nevada, Oregon and Utah, while in Michigan the same protection is extended to employees in the choice of life or accident insurance, and in Tennessee to the choice of the family physician, and the withholding of any part of an employee wages to pay a company doctor without the full consent of such employee is forbidden.

Principles of Wages. — The matter of wages is primarily one for determination by contract, as regards the rate, and the time, place, and medium of payment. At common law the court will, in the absence of a specified rate, order the payment of such a sum as the services rendered are shown to be reasonably worth; if the contract is entire, payment can be demanded only on the completion of the work; if separable, at such times as are shown to be reasonable, or at times fixed by the custom of the community or the trade. No wages can be recovered for service rendered in violation of law; as for work on Sunday, when Sunday labor is prohibited; or for services as an engineer when the workman is without the license required by law; or for work in excess of eight hours when the statute restricts the time to eight hours.

Payee. — The payee will usually be the workman or his personal representative, though statutes of Albama, Arizona, Georgia, Mississippi, New Jersey and Pennsylvania authorize the payment of wage debts not in excess of a specified sum directly to the heirs of a deceased employee. Payments to one demanding from the employer the wages of a workman on the claim that the latter is indebted to the claimant can be made only after all legal formalities are complied with, or the employer will be liable to the employee regardless of the payment made to the claimant. In every state there are statutes reserving to workmen (in many only to those having dependents) a certain amount or percentage of their wages, which is not subject to garnishment while in the hands of the employer. In a number of states assigning claims or taking or sending them outside the state in order to avoid the exception laws in favor of wage earners is forbidden.

Recovery. — Another law that is found in practically every jurisdiction, and in the federal statutes, is one that makes a debt for wages for labor a preferred claim in the settlement of the estate of a deceased or insolvent employer. Mechanics' liens are likewise universally granted by statute. Where the enforcement of such liens is not convenient, as in the case of public works or railroad construction work, contractors are in a number of states required to give bond for the payment of wages due their workmen; or failure to pay wages out of current receipts may be penalized.

Wage suitors are favored by the laws of some states, as by allowing a successful claimant of wages an attorney's fee (a law as to the constitutionality of which the courts differ); by prohibiting a stay of execution on a judgment for a wage debt; by declaring no property exempt from execution under such a judgment; or by placing wage suits at the head of the trial docket.

Assignments.—Assignments of future earnings are restricted in the interests of the workman, and especially of his family. Such laws have been upheld, though they undoubtedly restrict the freedom of con-

tract. The law may require that the assignment shall be recorded, or that the employer shall be notified of the assignment or shall accept or consent to the same, or that the wife or husband of a married person making an assignment shall join therein; discounts or interest rates may also be limited. Except for the laws that merely require recording, these statutes are of recent enactment. States having laws embodying these provisions in whole or in part are Colorado, Delaware ,Indiana, Iowa, Louisiana, Maryland, Massachusetts, Minnesota, New Jersey, New York, Pennsylvania, Rhode Island, Tennessee, Washington, Wisconsin and Wyoming. Assignments to secure loans or future advances are declared void in Georgia and Massachusetts; and a law of Indiana declaring all assignments of future earnings void has been held valid.

Rates—Rates of wages on public works are fixed by statute in a few states, either at the current rate in use for work of the sort that is to be done, or at an amount named in the law. The states having such laws are California, Delaware, Indiana, Maryland, Nebraska, Nevada, New York and Oklahoma. A Virginia statute orders a reasonable amount to be paid as salvage in the case of wrecked goods, and provides for arbitrators where the laborer and the owner of the goods do not agree, but there is no nearer approach than this to the direct determination of wages in private undertakings. Indirectly the matter is regulated by forbidding deductions by way of fines for imperfect work (Massachusetts), or "for any reason" (Indiana). The same object is in view where, when coal mining is paid for by weight, the law forbids the screening of coal before weighing, or directs that all coal mined shall be weighed. Alabama, Arkansas, Colorado, Iowa, Kansas, Missouri, Ohio, Oklahoma, Pennsylvania, Washington, West Virginia and Wyoming have laws of this sort.

Time of Payment. — Statutes regulating the time of the payment of wages have been held constitutional, though not uniformly. These laws may be of general application, or restricted to classes of employment, or to corporations, or they may apply only where the number of employees exceeds a given minimum. The following states have laws directing employers to pay wages monthly: Arizona, Colorado (railroads), Missouri (railroads), Tennessee (mining, manufacturing, railroad construction), Virginia (mining, manufacturing). In the following, semi-monthly or bi-weekly payments are prescribed: Arkansas (corporations), Colorado (corporations except railroads), Indiana (mining and manufacturing), Iowa (coal mines), Kentucky (mining), Maine (corporations), Maryland (mining, manufacturing, transportation), Missouri (mining, manufacturing), New Jersey, New York (railroads), Oklahoma (mining, manufacturing), Pennsylvania, West Virginia (mining, manufacturing), Wyoming (coal mining). The following have a weekly pay day: Connecticut (corporations), Kansas (except railroad and farm corporations), Massachusetts, New Hampshire, New York (except railroads), Rhode Island, Vermont. In Wisconsin a weekly or bi-weekly pay day is prescribed unless there is a written contract.

A few states direct that wages due discharged employees shall be paid them without waiting for the regular pay day. These are Arizona, Arkansas, Colorado, Massachusetts, Oregon, and South Carolina.

The place of payment is restricted by the law of a single state, California, which forbids the payment of wages in any place where liquor is sold.

Payment in Scrip, etc. — The medium of payment is the subject of a number of laws which either prohibit the use of scrip, tokens or store orders, as in Colorado, Maryland, Montana, New Jersey and New York; or require that if issued they shall be redeemable in money, as in Arizona, Arkansas, Georgia, Illinois, Indiana, Iowa, Kansas, Louisiana, Michigan, Nevada, New Mexico, Oklahoma, Oregon, South Carolina, Tennessee, Vermont, Virginia, West Virginia and Wisconsin. The North Carolina statute on this subject directs that scrip or tokens shall be redeemable at face value and transferable, but this is held not to require orders for merchandise to be redeemed in money. So a statute of Kentucky directing wages to be paid in lawful money does not preclude the issue of orders for merchandise between pay days, nor require such orders to be redeemed in cash. A Pennsylvania statute levies a twenty per cent tax on all scrip not redeemed within thirty days after its issue. Courts rule diversely as to the validity of statutes forbidding the use of scrip, but the Supreme Court has upheld a law requiring its redemption in money at face value.

Company stores, or the "truck system" of wage payment, may also be prohibited, as in Colorado, Maryland and Pennsylvania; or their operations may be regulated by forbidding the charging of a higher cost to employees than to others, or of a higher rate than is charged by other stores, as by the laws of Connecticut, Indiana, New Jersey, Ohio and Virginia.

Hours of Labor — In General. — The length of a day's work for adult males is in general a matter of contract with which the law can interfere only on the ground that the public welfare requires its statutory regulation. A number of states have laws declaring the number of hours that constitute a day's work generally, but as these laws do not interfere with contracts for longer service, they are of no practical effect.

Public Works. — On public works it is competent for the state to declare the length of time workmen may labor, even though they are employed by contractors, since the state has the right to fix the terms on which work may be done for it, or on which persons may deal with it. A number of states and the federal government have laws or provisions in their constitutions fixing the hours of labor, mainly prescribing eight as the limit. The states are California, Colorado, Delaware (city of Wilmington), District of Columbia, Idaho, Indiana, Kansas, Kentucky, Maryland (city of Baltimore), Massachusetts, Minnesota, Montana, Nebraska (cities of the second class), Nevada, New York, Oklahoma, Oregon, Pennsylvania, Utah, Washington, West Virginia, Wisconsin, and Wyoming. All these laws provide for the eight-hour day except Massachusetts, where nine hours is the limit unless municipalities by special vote adopt the eight-hour day. Other states have laws relating to highways only, but these apply less to the employment of labor than to the working out of taxes.

Railroads.—Considerations of public safety validate laws limiting the hours of labor of employees on railroads. The federal statute makes sixteen hours out of any twenty-four the maximum work time of employees engaged in the movement of interstate trains or trains in the District of Columbia, and nine hours the maximum for train dispatchers and telegraph or telephone operators whose employment affects the movement of such trains. The periods fixed by state laws vary, but obviously where interstate traffic is affected no labor in excess of that allowed by the federal statute will be permitted. The courts differ as to whether the prescription by state law of a shorter work day is valid. The maximum hours of service in any twenty-four hour period permitted in the movement of trains are twenty-four in Michigan, eighteen in Nebraska, sixteen in Arizona, Arkansas, Colorado, Indiana, Iowa, Kansas, Minnesota, Missouri, Montana, New York, North Carolina, North Dakota, South Dakota, Texas, Washington and Wisconsin; fifteen in Ohio, fourteen in Oregon, and thirteen in Flordia and Georgia. Train dispatchers and telegraph operators and operators of block signals have the same hours in several of the above states, but are limited to eight hours service per day in Arkansas, Connecticut, Maryland, Nevada, New York, North Carolina, Texas, West Virginia and Wisconsin. In a number of states a period of rest after service is prescribed, the hours to be consecutive. These are fixed at ten in Colorado, Georgia, Iowa and Oregon, and in Texas if there have been sixteen hours of continuous service; at nine in Arizona, and at eight in Arkansas, Florida, Indiana, Kansas, Michigan, Minnesota, Missouri, Montana, Nebraska, New York, North Dakota, Ohio, South Dakota, Texas (if there has been an aggregate of sixteen hours of service in any twenty-four hour period), Washington, and by the federal statute.

Street Railways.—The hours of labor on street railways are regulated by statute in several states, as follows: twelve in California, Maryland, New Jersey, Pennsylvania and South Carolina; and ten in Louisiana, Massachusetts, New York, Rhode Island and Washington. In New Jersey and New York the service must be rendered during consecutive hours, and in Massachusetts and Rhode Island within twelve consecutive hours. This law has also been said to provide for public safety and is supported on that ground.

Mines, Smelters, etc. — The hours of labor in underground mines, smelters and reduction works are restricted to eight per day in Arizona, California, Colorado, Idaho, Missouri, Montana, Nevada, Oklahoma, Oregon, Utah, Washington and Wyoming. The Nevada statute applies also to work in open cut mines and in plaster and cement mills. A New York law regulates the hours of labor of workmen in compressed air, the limit ranging from eight hours in twenty-four where the pressure does not exceed 28 lbs. to the square inch, to two hours out of twenty-four, divided by an interval of four hours where the pressure exceeds 46 lbs. but does not exceed 50 lbs. No employment is permitted under a pressure in excess of 50 lbs.

Sundry Employments.—The hours of labor of drug clerks are limited to ten per day and 60 per week in California,

and to 70 hours in one week and 136 hours in two weeks in New York. A New Jersey statute also limits the hours of labor of employees in bakeries to 60 per week. In Arizona work in laundries is restricted to eight hours per day; while nine hours is a day's work for telephone operators in Montana.

Eight-Hour Day. — The following summary presents the present result of the movement for the eight-hour day. It is adopted for employment on public works in nineteen states, the District of Columbia and for the federal government; by Delaware and Maryland for their chief cities; and by Massachusetts for municipalities adopting it in accordance with state law; for work in mines in twelve states, in smelters and reduction works in nine states, and for train dispatchers and telegraph operators in nine states.

Women and Children.—Age and Working Time of Children.—A majority of the states have laws regulating the employment of children, fixing the minimum age of employment, the maximum hours of labor per day, restricting or forbidding employment in certain occupations, and providing particularly for the safety and sanitation of their working places. Some states include adult females in their laws governing some of these details, while in others the laws as to the two classes are separate. The power of the state to regulate the employment of children is unquestioned.

The table (See Page 977) shows for children the age below which employment in industry is unlawful, the age to which the indicated protection in the matter of the length of the working day applies, the daily hours of labor permitted, and the restrictions as to night work, if any. The restrictions set forth in the table mentioned are relaxed in a number of states where the child has a widowed mother, invalid parents, or is dependent on its own efforts for support. Relaxation of the law on one or more of these grounds is found in the states of Arkansas, California, Colorado, Delaware, District of Columbia, Georgia, Kentucky, Minnesota, Missouri, Nebraska, North Dakota, Ohio, Rhode Island, South Carolina, Texas, Virginia and Washington.

Hazardous or Injurious Employments. —Danger to life, limb or health, and exposure to immoral or otherwise injurious influences, are reasons for forbidding the employment of children in certain occupations. Thus employment in mines is the subject of special laws in some states, though it is more commonly included with other industrial employment. The cleaning of moving machinery or work with or about designated forms or classes of dangerous machinery or in certain hazardous employments is forbidden by several states, as follows: below the age of 21, Louisiana (cleaning moving machinery only); 18, Michigan, Pennsylvania; 16, Illinois, Indiana (18 for females), Iowa, Kentucky, Minnesota, Missouri, Nebraska, New Jersey, New York, North Dakota, Ohio, Oklahoma, Rhode Island, Wisconsin; 14, Massachusetts. Employments injurious to morals, including acrobatic and mendicant occupations are forbidden up to 18 in Michigan (21 for females), Minnesota, New Jersey and Washington; to 16 in California, Idaho, Iowa, Kentucky, Maine, Montana, Nebraska, New York and Rhode Island; to 15 in Delaware, Indiana (18 for mendicant employment), Louisiana, Massachusetts, Pennsylvania (18 for mendicancy); to 14 in Colorado, District of Columbia, Florida, Illinois, Kansas, Maryland, Missouri, New Hampshire, Ohio, Oklahoma, Virginia, Wisconsin and Wyoming; and to 12 in Connecticut and Georgia. A few states regulate street trades, as the sale of newspapers, shoe blacking and messenger service, by special laws; employment in bar rooms is similarly restricted in some states, though in many this is classed with occupations dangerous to morals.

Hours of Labor of Women. — While women have equal rights with men as to the making of contracts and suffrage, their physical structure and a regard to the welfare of the race warrant limitations as to their employment which would not be, valid as to adult males. Thus their hours of labor are limited by several states, and laws of this sort are constitutional. The limit of employment is 9 hours per day in Pennsylvania; 11 hours in South Carolina; 10 in Connecticut, Illinois, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Nebraska, New Jersey, Oregon, Rhode Island, Virginia and Washington; 9 hours and 40 minutes in New Hampshire and 9 hours in New York. Women cannot be employed more than 9 hours per day or 54 hours per week in New York. In some of these states the total number of hours per week allowed is less than six times the maximum per day, while in a few only the weekly maximum is named. This results in the following limitations: 54 hours per week in Pennsylvania, South Carolina and Tennessee; 58 hours in Connecticut, Maine and Minnesota; 56 hours in Massachusetts and Rhode Island; 55 in New Jersey; and 54 hours in Michigan and Missouri. Night work by women is prohibited in New Jersey between 6 p. m. and 7 a. m., Connecticut after 10 p. m., Missouri, between 10 p. m. and 5 a. m., and Indiana, Massachusetts and Nebraska between 10 p. m. and 6 a. m. Night work is prohibited in New York for women between the hours of 10 p. m. and 6 a. m.

Seats.—Female employees are to be supplied with seats and allowed such use of them as their employment will reasonably permit, according to laws of Alabama, California, Colorado, Connecticut, Delaware, District of Columbia, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, Tennessee, Utah, Virginia, Washington, West Virginia, Wisconsin, and Wyoming.

Employers' Liability.—At common law the employer is charged with the exercise of a reasonable degree of care for the safety of his workmen, which failing he becomes responsible for the injuries resulting from his neglect. What such degree of care is depends upon the nature of the undertaking, more hazardous ones involving a greater degree and *vice versa*. The measure is generally said to be that degree of care that a reasonably prudent man would take to protect himself in like circumstances. Tools and appliances must be reasonably safe and suitably adapted to their intended use. The same test applies to the working place, though the employer is held to a stricter accountability for this than for the condition of appliances. At common law, an employer may in general carry on his business in his own way if only the employee is capable of contracting and knows and appreciates the dangers of the situation. He must not use unreasonably dangerous methods or appliances, however, and it has been said that dangerous work should be undertaken only after the adoption of all known reasonable precautions.

Statutes Fixing Standard of Care.—Factory inspection laws, railroad safety appliance laws, mine regulations, and the like, address themselves to the standard of safety to be secured by the employer, and in so far restrict the freedom allowed him by the common law in this respect. When the law fixes such a standard, it is negligence to come short of it, and an employer doing so will generally be liable in damages for the resultant injury, if any. In some states the courts allow the plea of assumed risks in such cases, though the better rule is to the contrary. Maintenance and repair stand on the same footing as the original provision and the Supreme Court has held that the duty of conforming to the provisions of the federal law as to drawheads and automatic couplers on railroad trains is an absolute one, and the exercise of ordinary care is not sufficient to excuse a failure in this regard.

Defenses.—An employer sued for damages for injuries to an employee may offer in defense that the workman assumed the risks of the undertaking, that the injury was the result of the negligence of a fellow-servant, or that, even if the employer was himself negligent, the employee by his own contributory negligence was in such measure responsible for the injury as to relieve the employer from liability therefor. The risks assumed are those arising from the ordinary incidents of employment, of which the workman was aware or which he could have known if he had exercised ordinary care, and existing after the employer has performed his duty as to the exercise of care in behalf of his employees; this includes the risk of injury from the negligent acts of fellow-servants who have been selected with ordinary care, An employee who represents the employer is not a fellow-servant to his subordinates. Where the employee's own negligence contributed to the injury, no attempt will ordinarily be made to apportion fault and make a partial award of damages, but any degree of contributory negligence will vitiate entirely the claim of the injured person.

Statutes Affecting Defenses.—These defenses have been modified or abrogated by numerous statutes, to such an extent that, as was recently said by a justice of the Supreme Court, there is hardly a jurisdiction in which they exist unmodified. Thus a statute of Colorado abrogates entirely the defense of fellow-service; while a number of states have done away with it in its application to railroad employment, to mine labor, or more generally. The British employers' liability law of 1880 is a pattern for laws enacted in several states, specifically charging liability for defects in the condition of ways, works, or machinery; for the negligence of employees exercising superintendence or giving orders; and for the acts of certain employees on railroads. The principal effect of these laws is in changing the rule as to fellow-service. They exist in Alabama, California, Colorado, Idaho, Indiana, Maine, Massachusetts, Michigan, New Jersey, New York, Pennsylvania, and Texas.

The modification or abrogation of the other defenses is sometimes general, but is more frequently connected with statutes prescribing safety appliances, the employer not being allowed to plead these defenses where he fails to conform to the provisions of the statute. Instead of allowing the contributory negligence of the injured employee to bar him entirely from recovery of damages, the federal liability law and a number of state laws embody a doctrine of comparative negligence, by virtue of which there is to be an admeasurement of the negligence of the employer and the contributory negligence of the employee, and where the former is gross in comparison with the latter, damages shall not be entirely withheld, but only reduced proportionally. Such laws are found in Iowa, Mississippi, Nebraska, Nevada, North Dakota, Ohio, South Dakota, Texas, and Wisconsin, and in a modified form in Georgia. All these laws are of very recent enactment, but the principle has been held to be constitutional.

Employees' Waivers.—Employers frequently secure contracts from their employees waiving their rights to damages for injuries due to the former's negligence. Courts construe such contracts diversely, and a number of state statutes and the federal statute above mentioned prohibit them, either generally, or in connection with statutes charging a particular duty. The states having such laws are Alabama, Arkansas, California, Colorado, District of Columbia, Florida, Georgia, Indiana, Iowa, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, South Carolina, South Dakota, Texas, Virginia, Wisconsin, and Wyoming. Such laws have been declared constitutional.

Relief and Compensation for Injured Employees.—Employers, either singly or in association, may organize systems of relief available for employees injured in the course of employment. These funds may be supplied entirely by the employer, the benefits being available to all employees or they may be supplied by the employer and employee jointly, only those employees being entitled to benefits who become members of the association and contribute to its funds. The acceptance of benefits is usually made a bar to suits for damages, and the bringing of a suit likewise cuts off the benefits. Agreements that acceptance shall so operate, if made in advance of the receipt of the injury, are commonly construed as only putting the employee to his election, and are valid only to that extent, though a few statutes do not permit the receipt of benefits to go further than to effect a reduction of the amount of the judgment against the employer in proportion to the amount of his contribution to the benefit fund. Such provisions exist in laws of Georgia, Iowa, Michigan, Nebraska, Nevada, New Jersey, New York, North Dakota, South Dakota, and Texas, and in the federal employers' liability law.

A Montana statute requires coal mine operators and employees to maintain a mutual fund from which injured employees are to be paid, the system being designated one of insurance, and requiring the payment of fixed amounts, according to the degree of injury. A similar law of Maryland relates to coal and clay miners in its chief mining counties.

Compensation Systems.—As distinguished from the system of liability, in which the employee must prove the employer to have been at fault, is the method of compensation covering not only accidents caused by the fault of the employer, but also those that are the result merely of the trade risk, frequently called inevitable, the burden of which is, under the liability system, assumed by the party least able to bear it, *i. e.*, the workman. Most industrial countries other than the United States have adopted compensation as the method of dealing with industrial accidents, while the liability system is chiefly in use in this country. Since August 1, 1908, laborers and artisans in the employment of the Government of the United States in manufacturing establishments, forts, arsenals, navy yards, on river and harbor and reclamation work, and on the Isthmian canal are compensated for injuries without reference to the fault of the employer or to the doctrine of fellow-service or of assumption of risks. The negligence or misconduct of the injured person will debar him from benefits, which are the continuation of wages during disability for a period not exceeding one year. The compensation for death is one year's earnings of the deceased employee, payable to his dependents.

A statute of Massachusetts authorizes employers to draft schemes which, when approved by the state board of conciliation and arbitration, may be offered to the employee as a substitute for the liability provisions of the state law, and which, when accepted, shall be binding upon both parties; such schemes must propose a more liberal relief than merely to meet the employer's legal liability. The New York legislature of 1910 enacted laws providing for compensation according to schemes embodied in the laws themselves, one law proposing an elective scheme, applicable to industries generally, and one embodying a compulsory system, applicable to designated dangerous employments. The amount of compensation payable to dependents of a workman dying as the result of injury is determined by the amount of his earnings, but may not exceed three thousand dollars. Incapacity, partial or total, temporary or permanent, is provided for according to its nature and degree and to the earnings of the employee, but may not exceed ten dollars weekly for a term of eight years.

Physical Conditions of Employment.—Factories. — The rule of common law that the employer is to use ordinary care for the safety of his workmen is supplemented or superseded in many states by laws fixing a standard of safety, or prescribing the use of certain protective appliances. Thus fire escapes on factories and other places of employment are required in most jurisdictions of the United States, and in a number the use of doors that open outwardly or of sliding doors is directed. Laws requiring dangerous machinery to be guarded are found in Colorado, Connecticut, Illinois, Indiana, Iowa, Kansas, Kentucky, Massachusetts, Michigan, Minnesota, Missouri, Nevada, New Jersey, New York, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, Tennessee, Washington, West Virginia, and Wisconsin. Belt shifters, and a provision of cut-offs and switches for the prompt and safe starting and stopping of machinery are required by the laws of some of the above states. Guards or barriers about elevator shafts, well-holes, and vats of hot liquid or kettles of molten metal may also be prescribed, and the construction of stairways is regulated. The storage and use in workrooms, etc., of inflammable or explosive oils and the like are regulated by statute in Iowa, Maryland, Massachusetts, Missouri, New Jersey, and Pennsylvania.

Sanitation, including heating and lighting, whitewashing or painting, and the sweeping and scrubbing of floors and the washing of walls at fixed periods; and ventilation, calling for a prescribed amount of air space per employee, the installation of fans, hoods, etc., for conducting dust from buffing and polishing wheels, and fumes from vats, etc., giving off injurious or offensive odors and gases, are provided for in several states. Laws covering part or all these points are found in Alabama, Arizona, California, Colorado, Connecticut, Delaware, Illinois, Indiana, Iowa, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Jersey, New York, Ohio, Oregon, Pennsylvania, South Dakota, Tennessee, Virginia, Washington, West Virginia, and Wisconsin.

A statute of Illinois prohibits the taking of food into workrooms where poisonous dusts or gases may affect it. Water closets and wash rooms, with separate provisions for the sexes, are frequently provided for, as in Alabama, California, Colorado, Connecticut, Delaware, District of Columbia, Illinois, Indiana, Iowa, Kentucky, Louisiana, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, New Jersey, New York, Ohio, Oklahoma, Pennsylvania, Rhode Island, Tennessee, Virginia, Washington, West Virginia, and Wisconsin.

Sweat Shops or Tenement Factories are regulated by special laws in Connecticut, Illinois, Indiana, Maryland, Massachusetts, Michigan, Missouri, New Jersey, New York, Ohio, Pennsylvania, and Wisconsin. These laws may prescribe the amount of air space, light, ventilation, sanitation, and safety, and in some states require licenses and registration of all workrooms used for such purposes, or lists of all persons to whom work is given out, with their place of residence.

Food Products.—Bakeries, confectionaries, etc., where food products are made or handled, are subjects of specific regulation in some states, partly for the benefit of the workmen employed therein, and partly for the sake of the public health. The states having such laws are California, Connecticut, Illinois, Indiana, Massachusetts, Minnesota, Missouri, Nebraska, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Tennessee, Washington, and Wisconsin.

A number of these laws forbid the use of cellars or basements below a certain level, prohibit sleeping in shop or storage rooms, and forbid the employment of persons affected with tuberculous or other infectious or contagious diseases.

The enforcement of these laws is intrusted in most states having them to officers appointed or elected for the purpose; in a few, however, it is in the hands of the ordinary law-enforcement officers, in which case not much can usually be said as to the efficiency of enforcement. In a few states the inspection of bakeries, confectionaries, etc., is placed in the hands of health officers.

Mines.—The operation of mines is regulated in thirty-one, or practically all the states having mines, and by federal statute for the territories. These laws contain requirements that maps of all workings shall be prepared and filed with an officer of the state, that escape shafts shall be provided, travel ways be timbered and lighted and safety holes or places of refuge from passing cars supplied; and that timbers for the use of men in their working places be provided in suitable lengths and amounts. Blasting, including drilling, tamping, and the firing of shots, may be regulated, as well as the opening and storage of boxes of explosives, the storage of oil, hay, and other inflammables, and the insulation of electric wires. Methods of working, the construction and protection of hoisting shafts and cages, the use of safety lamps, the employment of qualified foremen, fire-bosses, and shot-firers, the daily inspection of dangerous places, and other details are embraced in these laws with greater or less completeness. Except in California, Oregon, and the Territories (which are under the control of federal inspectors) the commonwealths having mining laws have state officials specially charged with their enforcement.

Railroads.—The provision of train brakes subject to the control of the engineer, of safety couplers, grab-irons, and switch signals, the blocking of frogs, the placing of tell-tales or warning strings at the approach to bridges or tunnels, and the height of wires, bridges and tunnel roofs above the track are matters of regulation affecting the railways of many states. A few states also require the block system of operating trains to be used, and some prescribe the candle power of the locomotive headlight.

These points are considered in the laws of Arkansas, Colorado, Connecticut, Delaware, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New York, North Carolina, Ohio, Oklahoma, Oregon, Rhode Island, South Carolina, South Dakota, Texas, Vermont, Virginia, Washington, Wisconsin, and Wyoming, and in federal statutes applicable to interstate commerce. Inspectors to enforce railroad regulations are provided for by the laws of Illinois, Massachusetts, Michigan, Nebraska, Ohio, and Washington.

The construction of caboose cars has been specially legislated on in Illinois, Michigan, Minnesota, Montana, New York, North Dakota, Ohio, Virginia, Washington, and Wisconsin. The laws usually prescribe the length of the car, its equipment with double trucks, platforms with guard rails and steps, and other provisions for the safety and comfort of the train crew. A number of states designate the minimum train crew that may be employed, Arizona, Arkansas, Connecticut, Indiana, Maine, Maryland, Nebraska, Nevada, North Dakota, Ohio, South Carolina, Texas, and Wisconsin having laws of this sort. Shelters over repair tracks are prescribed in Arkansas, Kansas, Oklahoma, and Texas.

Street railway employees are protected by laws requiring the platforms on which motormen stand to be inclosed, either all the year, or during the winter months. Such laws exist in Colorado, Connecticut, District of Columbia, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oregon, South Carolina, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, and Wisconsin. Power brakes or other adequate brakes are prescribed either for all street cars, or for those of designated types or weight, in California, Connecticut, Iowa, New Hampshire, Ohio, and Wisconsin. In Connecticut, New Jersey, and Oregon, seats are to be furnished drivers or motormen on street railways.

Building Operations.—The erection, destruction, and repair of buildings expose workmen to hazards against which employers are required by law to furnish protection in a number of states. These laws relate to the construction, strength, barricading, and in a few states, to the shielding, of scaffolds; to the laying of permanent or temporary flooring or the placing of secondary scaffolds as the building progresses; to the guarding of hoist-ways or shafts, the construction and operation of hoists and cranes, and the protection of workmen from falling objects. These provisions are more or less fully embodied in laws of California, Connecticut, Illinois, Indiana, Kansas, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, New York, Ohio, Oklahoma, Pennsylvania, and Wisconsin.

Accidents.—Of the thirty-two laws regulating employment in mines, nineteen require accidents to be reported. In twenty-three states and by the federal statute accidents on railroads are directed to be reported; while ten states impose a similar duty on proprietors or managers of factories, stores, etc. Six states, Illinois, Indiana, Kansas, Minnesota, Missouri, and Wisconsin, require accidents to employees generally to be reported to state or local officials. By a number of these laws, official investigations and reports are authorized. Surgical and medical supplies as means of aid to injured employees must, according to statute, be kept available in mines in Alabama, Arkansas, Illinois, Indiana, Maryland, Ohio, Oklahoma, Pennsylvania, Utah, Washington, and Wyoming; in iron foundries in Michigan; and in factories generally in Massachusetts.

Restrictions on Employment.—Either the public welfare or the safety of the workman and his co-employees may warrant a preliminary determination of his fitness to engage in certain kinds of labor. To this end examinations and registration of persons wishing to engage in such occupations may be required. Color blindness of men employed in certain capacities on railroads, and infectious or contagious diseases as well as lack of skill in laborers, are illustrations of disqualifications for service. Laws requiring evidence of qualification, and usually registration as well, are found in a number of states, as follows:

For employees on railroads, in Alabama, Georgia, Indiana, Massachusetts, Ohio, and Texas; for motormen on street railways, in New York and Washington; for steam engineers, either generally or in designated capacities, in Alabama, District of Columbia, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nevada, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Washington, and by federal statute; for stationary firemen, in Massachusetts, Montana, and New York; elevator operators in Minnesota; mine managers or foreman, fire bosses, etc., in mines, in Alabama, Illinois, Indiana, Iowa, Kentucky, Missouri, Montana, Ohio, Oklahoma, Pennsylvania, Tennessee, Utah, and Wyoming; for all miners in Illinois, and for anthracite miners in Pennsylvania; for plumbers in California, Colorado, District of Columbia, Illinois, Kansas, Louisiana, Maine, Maryland, Massachusetts, Michigan, Missouri, Nebraska, New Hampshire, New York, Oregon, Pennsylvania, Texas, Virginia, and Wisconsin (such a law was declared unconstitutional in Washington); for electricians in Minnesota (such a law was recently declared unconstitutional in Louisiana); for horseshoers in Colorado, Maryland, Michigan, Minnesota, and Ohio (declared unconstitutional in Illinois, New York, and Washington); for barbers in Colorado, Connecticut, Delaware, Illinois, Maryland, Michigan, Minnesota, Missouri, North Dakota, Oregon, Rhode Island, Utah, Washington, and Wisconsin; moving picture machine operators, Maryland and New York; and chauffeurs, New York.

Alien Labor.—An argument in support of legislation of the kind above noted is that it limits competition, and particularly that of unskilled or unqualified labor. The federal Chinese exclusion acts and the acts forbidding the importation of immigrant laborers under contract are designed directly to limit competition of a sort especially likely to lower rates of wages and the standard of living. The employment of aliens on public works is prohibited, or a preference for citizens expressed, by statutes of California, Idaho, Indiana, Louisiana, Maine, Massachusetts, New Jersey, New Mexico, New York, Pennsylvania, Utah and Wyoming.

Convict Labor.—The same reasons operate to restrict convict labor and to prevent or limit its output and the sale of convict labor products in the open market. Such laws are not directly labor laws, and the effort to regulate the sale of the goods after they once become the subject of commerce, and particularly of interstate commerce, has generally been found to be beyond the power of state legislatures.

Employment Offices conducted by the state, rendering free services to persons seeking employment and to employers wishing to hire employees, are provided for by statutes of Colorado, Connecticut, Illinois, Indiana, Kansas, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Ohio, Oklahoma, Rhode Island, West Virginia, and Wisconsin. Central and branch offices are provided for in some of these states, with weekly or otherwise periodical exchanges of lists of applications.

Private Employment Offices are now regulated by statute in a number of states; these statutes may fix the rate of charges, require receipts to be given and open registers to be kept, prohibit the conduct of the business in connection with boarding houses or saloons, require evidence of bona fide vacancies, provide penalties for fraud or for sending females to places of immoral resort, require a license, for which a fee is charged, and otherwise regulate the conduct of the business. Laws of this nature exist in California, Colorado, Connecticut, District of Columbia, Idaho, Illinois, Indiana, Iowa, Kentucky, Louisiana, Maine, Massachusetts, Minnesota, Missouri, Montana,

Nevada, New Hampshire, New Jersey, New York, Ohio, Oklahoma, Pennsylvania, Rhode Island, Tennessee, Utah, Virginia, Washington, West Virginia, and Wisconsin. The provision limiting fees was declared unconstitutional in California, as unwarrantably interfering with the freedom of contract.

Bureaus of Labor.—Bureaus or departments of the state government charged with the duty of administering the laws relative to labor, including the inspection of factories and other working places, the collection of labor statistics, the investigation and mediation of labor disputes, and of seeking to further the interests of industrial workers and industry generally, are provided for by statutes of California, Colorado, Connecticut, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, Texas, Virginia, Washington, West Virginia and Wisconsin. There is also a federal office charged with such of these duties as are appropriate. Besides the above, these bureaus are in some states charged with the duty of conducting free public employment offices and of enforcing the laws relative to private offices.

Statutes Relating to Labor Organizations. — Labor organizations may incorporate under the general corporation laws of a state applicable to associations of like nature; in a number of states, however, and by federal statute, provision is made by special laws for their incorporation. The states are Iowa, Louisiana, Maryland, Massachusetts, Michigan, Nebraska, New Jersey, New York, Ohio, Pennsylvania, Texas and Wyoming. That labor agreements are not conspiracies is declared by statute in California, Colorado, Maryland, Minnesota, New Jersey, New York, North Dakota, Oklahoma, Pennsylvania, Texas, and West Virginia. Statutes applicable to labor organizations but not restricted to them are found in most states giving to unincorporated associations a right to sue or be sued with reference to their funds, or which determine in general how actions affecting such associations may be brought.

The badges, cards or insignia of labor organizations are protected from unwarranted or fraudulent use by laws of California, Connecticut, Georgia, Massachusetts, Minnesota, New York, Pennsylvania, Rhode Island, Texas, Virginia, and Wisconsin. The union label is protected from imitation or fraudulent or unauthorized use in forty-two states. Maryland, Montana and Nevada have laws directing that public printing shall bear the union label; such laws have generally been held unconstitutional.

Laws prohibiting discrimination against workmen on account of their membership in labor organizations, either by discharging them or by requiring them to agree not to join, have been enacted by the legislatures of several states and by Congress, but wherever a test has been made of this law in the higher courts, it has been declared unconstitutional, and it has been so held by the Supreme Court. Laws of this sort still stand on the statute books of California, Colorado, Connecticut, Idaho, Indiana, Kansas, Massachusetts, Minnesota, Mississippi (for telegraph operators only); Nevada, New Jersey, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, and Wisconsin. Laws addressed to labor organizations and forbidding them to discriminate against members or applicants for membership on account of their belonging to or joining the National Guard are found in New York and Wisconsin.

Labor organizations are specifically exempted from the operation of anti-trust laws in California, Louisiana, Michigan, Montana, Nebraska, and Wisconsin; of insurance laws in Massachusetts; and of laws governing beneficial associations in Kansas. Laws of Maine and New Jersey authorize them to take out collective insurance in behalf of their members, for which insurance companies may also make special rates. The bribery of representatives of labor organizations is specially penalized by a New York statute

Strikes.—Though strikes are legal everywhere under the common law as construed in this country, two states, Pennsylvania and Texas, have laws specifically legalizing them; while in Minnesota it is declared that the fact of engaging in a strike more than one year prior to hiring shall not be made the subject of inquiry in employing workmen. Where employers advertise for workmen while there is a strike in their establishment, the fact must be stated in the advertisement, according to laws of Illinois, Massachusetts, Montana, Oregon, and Tennessee.

Several states have laws to direct the conduct of strikers where the operation of railroads is affected. These laws prohibit the obstruction of the operation of trains, the intimidation of employees on trains, and the abandonment of engines or trains at other than division points or the point of regular schedule destination. These provisions are found partly or in their entirety in laws of Connecticut, Delaware, Illinois, Kansas, Kentucky, Maine, Mississippi, New Jersey, New York, Pennsylvania, and Texas. The Maine statute covers other public service corporations as well as railroads.

Picketing, Boycotts and Black Lists.—Two states, Alabama and Colorado, prohibit picketing. Boycotts are declared unlawful by laws of Alabama, Colorado, Illinois, Indiana, and Texas; while blacklisting is prohibited by statutes of Alabama, Arkansas, Colorado, Connecticut, Florida, Illinois, Indiana, Iowa, Kansas, Minnesota, Mississippi (telegraph operators only); Missouri, Montana, Nevada, North Carolina, North Dakota, Oklahoma, Oregon, Texas, Utah, Virginia, Washington, Wisconsin, and by a federal statute applicable to interstate railway service. Intimidation or other interference with employment is prohibited under penalty in Alabama, Connecticut, Delaware, Georgia, Idaho, Illinois, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, New Hampshire, New Jersey, New York, North Dakota, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Texas, Utah, Vermont, Washington, West Virginia, and Wisconsin. Conspiracy against employees is specifically forbidden in Alabama, Florida, Georgia, Kansas, Minnesota, Mississippi, New York, North Dakota, and Washington.

Arbitration of Labor Disputes.—Provision for conciliation or arbitration in cases of disputes between employers and employees through the instrumentality of boards, either existing as permanent state boards or appointed locally for the occasion, exists in a number of states. When special boards are to be appointed it is frequently provided that one member shall be named by the employer, one by the labor union representing the employees, and the third by these two. State or local officials may offer their services as mediators, or may convey information to standing boards as to the existence or threatened occurrence of a strike, whereupon mediation may be attempted or arbitration proposed. Investigations and awards may be made, and the results published; awards may be made a matter of record as of a finding of a court. State boards are provided for by laws of Connecticut, Illinois, Louisiana, Maine, Michigan, Missouri, Oklahoma, and Utah; local boards in Colorado, Kansas, Maryland, Nevada, Pennsylvania, Texas, Washington, and by federal statute; a combination of state and local officials are to form the boards in Idaho and Indiana; while provision is made for state boards, with the alternative that special boards may be appointed to act locally in lieu thereof, in California, Massachusetts, Minnesota, Montana, New York, Ohio, and Wisconsin.

COMPULSORY EDUCATION AND CHILD LABOR LAWS

Statutory provisions relating to compulsory attendance and child labor, prepared by the United States Bureau of Education.

Compulsory Education				Child Labor	
State	Age	Annual Period	Penalty on Parents for Neglect	Age Under Which Specified Employments Are Forbidden	Educational Restrictions on Child Labor
Alabama	8–16	100 days	Not less than $5 nor more than $50 or 30 days imprisonment.	14 years, in any mill, factory, or manufacturing establishment.	No child, 12 to 16, may work in any mill, etc., unless attends school 8 weeks each year employed.
Arizona	*a*8–14	Full term.	$5 to $25		No child under 14 may be employed during school hours.
Arkansas	*dd*8–16	Not less than half the full term. Applies to certain counties.	$10 to $25	12 years, in all cases in manufacturing establishments, except canning industries in vacation; 14, unless to support a parent or self, as specified by law; 14, in mines; females not at all in mines. Applies to certain counties only.	No child, 14 to 18, unable to write, may be employed in a manufacturing establishment unless he has attended school 12 weeks the preceding year.
	*gg*8–14	Not less than one-half full term. Applies to certain other counties.	$5 to $25		

COMPULSORY EDUCATION AND CHILD LABOR LAWS—Continued

Compulsory Education				Child Labor	
State	Age	Annual Period	Penalty on Parents for Neglect	Age Under Which Specified Employments Are Forbidden	Educational Restrictions on Child Labor
California	8–16	Full term	First, not over $10 or 5 days' imprisonment; subsequent, $10 to $50 or 5 to 25 days, or both.	14 years, in any mercantile or manufacturing establishment, workshop, hotel, or as messenger, etc. Children 12 to 15, upon permit, may work if parents incapacitated, or during vacation.	Children who hold permits to work shall be subject to compulsory attendance upon part time classes if between 16 and 18 years of age, and persons under 21 who cannot speak, write or read the English language adequately.
Colorado	*b*8–14	12 weeks of each year—8 of which must be consecutive.	$5 to $25	14 years in any underground works, mine, shelter, mill, or factory. No female may be employed in a coal mine.	Unlawful to employ children under 14 during school hours unless they have complied with the school-attendance law; under 16, unable to read and write, unless attending day or night school.
Connecticut	*c*7-16	Full term	Not exceeding $5 each week of absence.	14 years, in any mechanical, mercantile, or manufacturing establishment.	Children under 14 may not be employed while school is in session. Children 14 to 16 can not leave school to be employed, unless their education is satisfactory to the local or state board.
Delaware	7-14	5 months (may be reduced by districts to 3).	First, not over $2; after, not over $5. On default imprisonment 2 to 5 days.	14 years, in any factory, workshop, or manufacturing establishment, except in canning industry, etc., or to support widowed mother.	No child 14 to 16 may be so employed, unless he has attended day or night school 12 weeks the preceding year.
District of Columbia	8-14	Full term	Not exceeding $20	14 years in any factory, workshop, store, office, hotel, theater, as messenger, etc. Children 12 to 14 may get permit to work in certain cases.	Children under 14 may not do any work for wages during school hours, nor under 16 in preceding employments, unless can read, write, and attended school 130 days preceding year.
Florida	8–14	Not less than 80 days of each year.	Subject to fine.	Children under 15 may not be employed more than 60 days without consent of legal guardian.	
Georgia	8–14	4 months of each year.	$10 first offense, $20 subsequent offenses.	10 years, in or about any manufacturing establishment; 12 years after Jan. 1, 1907, except for support of self or parents in specified cases.	After Jan. 1, 1908, no child under 14 may be employed as in preceding column (with the exception there noted) unless able to write and has attended school 12 weeks the preceding year; under 18, unless so attending school.
Idaho	*d*8-18	Full term	Not over $300 or imprisonment not over 6 months, or both.	14 years, in any mine, factory, workshop, mercantile establishment, laundry, hotel, etc., except over 12 during vacations.	No child under 14 may be employed in any way during school hours.
Illinois	*e*7-16	Full term, to be not less than 6 months.	$5 to $20 and costs, and stand committed until paid.	14 years, in any mercantile institution, factory, office, theater, elevator, etc., or as messenger or driver; 16, in or about any mine. No female may work in or about a mine.	No child 14 to 16 unable to read and write may be employed unless attending an evening school, if there is one. No child under 14 may be employed at any work for wages during the school term.
Indiana	*f*7-16	Full term	$10 to $200; and in discretion of court, imprisonment not exceeding 60 days or both.	Under age of 14 no minor shall be employed or permitted to work in any gainful occupation other than farm labor or domestic service. No female may work in a mine.	Children under 14 may not be employed in any way during school hours. Between 14-18 cannot leave school to be employed unless education is satisfactory to local board.
Iowa	*f*7-14	24 consecutive weeks; first and second class city boards may require full term.	$3 to $20	14 years, in any mine, factory, mill, shop, laundry, packing house, elevator, or store where more than 8 persons are employed.	
Kansas	8-15	Full term *g*	$5 to $25	14 years, in any factory, workshop, theater, packing house, or in or about any mine; 16, in any dangerous, etc., employment.	Under 14 may not be employed in any way during school hours. No minor under 16 may work in a coal mine unless he can read and write and has attended school 3 months in the year.
Kentucky	*h*7-14	8 consecutive weeks; full term in cities of first, second, third, and fourth classes	First, $5 to $20; subsequent, $10 to $50.	14 years, in any mine, workshop, factory, store, office, hotel, as messenger, etc.	Under 14 may not be employed in any way during school term; nor from 14 to 16 in stated occupations unless can read and write, and attended school 100 days preceding year.
Louisiana	7–14	140 days or full session.	$10 or 10 days in prison or both.	14 years, in any manufacturing or mercantile establishment, mine, laundry, carrying messages, etc.	Children under 14 may not be employed in foregoing employments nor in clothing, dressmaking, or millinery establishments unless they have attended school 4 months in preceding year.
Maine	*ee*7-15	Full term	Not exceeding $25, or imprisonment not exceeding 30 days.	14 years, in any manufacturing or mechanical establishment.	Children under 15 shall not be employed in any manufacturing or mechanical establishment, except during vacation, unless they have attended school 16 weeks during preceding year.
Maryland	*j*8-12	Full term	Not exceeding $5	14 years, in mills and factories (except canning establishments), unless self, widowed mother, or invalid father solely dependent upon such employment. 19 counties exempt from law. 14 years, day messenger service; 16 years, night messenger service; 21 years, messenger duty to house of ill repute.	No minor 12 to 16, unable to read and write English, may be employed where there is an evening school unless attending that or another school.

COMPULSORY EDUCATION AND CHILD LABOR LAWS—Continued

Compulsory Education				Child Labor	
State	Age	Annual Period	Penalty on Parents for Neglect	Age Under Which Specified Employments Are Forbidden	Educational Restrictions on Child Labor
Massachusetts	(*k*)	Full term	Not exceeding $20	14 years, in factories, workshops, or mercantile establishments; 21 years, dangerous occupations.	Children under 14 may not be employed at any work for wages during school hours; from 14 to 16 may not be so employed in any factory, workshop, or mercantile establishment if unable to read and write. *l*
Michigan	7-16	Full term	Fine of $5 to $50, or imprisonment 2 to 90 days, or both.	14 years, in any manufacturing or mercantile establishment, workshop, laundry, store, office, hotel, messenger service, etc.	Children 14 to 16 may not be employed unless they have attended school 100 days preceding year, and can read and write and know the elements of arithmetic.
Minnesota	*f*8-16	Full term	Not over $50, or imprisonment not over 30 days.	14 years, in factories, mills, workshops, or mines.	Children under 14 years may not be employed in any service during school term; under school age (16 years), in any occupation during school term unless they have attended school the prescribed period; under 16, unable to read and write English, in any indoor occupation (except in vacation) unless attending day or evening school.
Mississippi				12 years, in any mill, factory, or manufacturing establishment.	
Missouri	*m*8-14	Not less than ¾ of term. Full term in cities of over 500,000.	$10 to $25, or imprisonment 2 to 10 days, or both.	14 years, in any gainful occupation except agriculture and domestic service; 16 years, in dangerous and unwholesome occupation; no females in mines or dramshops	No child between 14 and 16 may be employed unless he has regularly attended school and is able to read and write English.
Montana	*n*8-14	Full term; in no case less than 16 weeks.	$5 to $20	16 years, in mines or underground works.	Children under 14 not to be employed during school sessions unless they have completed the studies required by law; from 14 to 16, if unable to read and write English.
Nebraska	*o*7-15	Two-thirds of school term; in no case less than 12 weeks. Full term in cities.	$5 to $25 (on truant officer).	14 years, in any manufacturing or mercantile establishment, office, hotel, etc.	No child under 14 may be employed in any service during school hours.
Nevada	8-16	Full term	First, not over $10 or imprisonment not over 5 days; subsequent, $10 to $50, or imprisonment 5 to 25 days, or both.		
New Hampshire	*p*8-14	Full term	First, $10; subsequent, $20.	12 years, in any manufacturing establishment.	No child under 14 may be employed during school sessions, nor under 16 if unable to read and write English. No minor unable to read and write English may be employed unless attending day or evening school, if any is held.
New Jersey	*q*7-17	Full term	Punishable as a disorderly person.	14 years, in factories, workshops, mills, or manufacturing establishments, also mines; 15 years until July 4, 1911, 16 years thereafter, in factories, etc., between 6 p. m. and 6 a. m.	Children under 15 must have attended school 12 weeks the preceding year as a condition of employment.
New Mexico	7-14	Full term	$5 to $25, or imprisonment not exceeding 10 days.		
New York	7-16	Full term (not less than 160 days) in districts of over 5,000 population having a superintendent, for children 7-16 *r*; elsewhere, for children 8-16, Oct. 1 to June 1. *r*	First, not over $5 or imprisonment 5 days; subsequent, not over $50 or imprisonment 30 days, or both.	14 years, in factories; if 14 to 16, the child must have attended school 130 days the preceding year, and be able to read and write English, and cipher. Similar provisions apply, in places of over 3,000 population, to work in mercantile establishments, business offices, restaurants, hotels, express or messenger service, except for children over 12 in small places during vacation. For work in or about mines 16 years is the minimum. No female may work in a mine. *s*	Unlawful to employ in any business or service child under 14 during school term; or one 14 to 16 in city of first or second class, unless he has an employment certificate (having certificate and not having completed elementary course, must attend evening or trade school) or one 14 to 16 elsewhere, in any factory, etc., unless has employment certificate, or in any service unless has certificate of school attendance, etc.
North Carolina	*t*8-14	16 weeks	$5 to $25	13 years, in any factory or manufacturing establishment (does not apply to oyster canning and packing); 12 years, in mines employing over 10 men (boys); children 12 to 13 may be employed in factories only as apprentices.	Apprentices 12 to 13 years must have attended school 4 months in preceding 12.
North Dakota	8-15	Full term	$5 to $20 (on school official).	14 years, in mines, factories, workshops, mercantile establishments, etc.	Children under 14 may not be employed in any manner during school term, or those 14 to 16 unless they have attended school 120 days preceding year and know the elementary branches.
Ohio	*u*8-14	Full term; in no case less than 28 weeks.	$5 to $20; on default, imprisonment from 10 to 30 days.	14 years, in any factory, workshop, business office, mercantile establishment, hotel, as messenger, etc.; 18 years, messenger service between 9 p. m. and 6 a. m.	No child between 14 and 16 may be employed in foregoing occupations without a schooling certificate.
Oklahoma	8-16	3 to 6 months. *v*	$10 to $50	16 years, in mines (no girls in mines).	
Oregon	*w*9-14	Full term	$5 to $25 fine, or imprisonment 2 to 10 days, or both.	14 years, in any factory, store, workshop, in or about any mine, or in the telegraph, telephone, or public messenger service.	Foregoing employments forbidden to any child 14 to 16 unless attended school 160 days preceding year and can read English. No child under 14 may be employed in any work for compensation during school hours.

COMPULSORY EDUCATION AND CHILD LABOR LAWS—Continued

State	Compulsory Education: Age	Compulsory Education: Annual Period	Compulsory Education: Penalty on Parents for Neglect	Child Labor: Age Under Which Specified Employments Are Forbidden	Child Labor: Educational Restrictions on Child Labor
Pennsylvania	*x*8–16	Full term; but the school board of each district has power to reduce this to not less than 70 per cent of the term.	First, not exceeding $2; subsequent, not exceeding $5; on default, imprisonment; first, not over 2 days; subsequent, not over 5.	14 years, in any employment, except domestic or farm labor. Girls may not work in or about coal mines.	No child 14 to 16 may be employed unless he can read and write English and has complied with the school laws.
Rhode Island	*y*7–15	Full term	Not exceeding $20	14 years, in any factory, manufacturing or business establishment.	Children under 13 may not be employed except during school vacations.
South Carolina				12 years, in any factory, mine or textile establishment, except that certain self-dependent children may work in the latter.	Children may work in textile establishments in June, July, and August if they have attended school 4 months during the year and can read and write.
South Dakota	*f*8–14	Full term; but districts may reduce it to 16 weeks, 12 consecutive.	$10 to $20 and costs; stand committed till paid.	14 years, in mines	No child 8 to 14 to be employed during school hours unless he has attended school 12 weeks during the year.
Tennessee *z*	8–14	4 months or 80 days consecutively.	First offense, $1 for each day of absence.	14 years, in workshops, factories, or mines.	
Texas				12 years, in mills, factories, manufacturing or other establishments using machinery; 16 years in mines, distilleries, or breweries.	Unlawful to employ children 12 to 14 who can not read and write English, in mills, factories, etc., certain self-depe dent children excepted.
Utah	8–16	20 weeks, 10 consecutive; in cities of the 1st and 2d class 30 weeks, 10 consecutive.	First, not exceeding $10; subsequent, not exceeding $30, with costs.	14 years in mines (constitution of state).	
Vermont	*a*8–15	Full term	$5 to $25	12 years, for any railroad company or in any mill, factory, quarry, or workshop, or carrying messages.	No child under 16 who has not completed the 9-year school course may be employed in any railroad, factory, mine, or quarry work, or in delivering messages, except out of school hours.
Virginia *bb*	8–12	12 weeks	First, $2 to $10; subsequent, $5 to $20.	13 years, after March 1, 1909; 14 after March 1, 1910, in any factory, workshop, mercantile establishment, or mine, except in certain cases of need over 12. *cc*	
Washington	8–16	Full term	Not over $25	14 years (boys), 16 years (girls), at any labor not connected with house or farm work; 16 years in mines (girls not at all).	Children under 15 may not be employed during school hours unless excused by the school superintendent.
West Virginia	8–14	20 weeks	First, $2; subsequent, $5	12 years, in factories, workshops, mercantile or manufacturing establishments; 14 in mines (no girls may work in mines).	No child under 14 shall be so employed during school term if it hinders regular attendance.
Wisconsin *cc*	7–14	Full term in 1st class cities; in 2d class cities not less than 8, elsewhere not less than 6 school months.	$5 to $50 and costs, or imprisonment not over 3 months, or both.	12 years, in any occupation; 14, in factories, workshops, mines; 14 to 16, in any occupation without specified written permit.	Children 12 to 14 may not be employed in any occupation, except during school vacations by specified written permit, in stores, offices, hotels, mercantile establishments, laundries, or public messenger service, where they reside (does not apply to farming or other outdoor work).
Wyoming	*f*7–14	Full term	Not exceeding $25	14 years, in mines; females may not work in mines. (Constitution.)	
United States laws (for territories).				12 years, in the underground workings of any mine.	

a To 16, if unable to read and write English.
b Children 14 to 16 whose labor is necessary to their own or parents' support are excused.
c Not applicable to children over 14 lawfully employed to labor at home or elsewhere.
d Except children over 14 who have completed eighth grade, or have to support themselves or parents, or have other good cause to be exempt.
e Children 14 to 16 necessarily and lawfully employed are exempt.
f Inclusive.
g 8 weeks for children over 14 who can read and write English and are at work to support themselves or others.
h To 16 in cities of first, second, third, and fourth classes; holders of employment certificates excepted.
i The provisions tabulated for Maryland (except in fifth column) are of the act of 1902, whose operation is limited to Baltimore city and Allegany county.
j To 16 unless regularly employed to labor at home or elsewhere.
k To 16 if wandering about public places without lawful occupation, or if unable to read and write.
l Must be able to so read and write as is required to enter the second grade in 1906, third in 1907, and fourth in 1908 and after.
m To 16 years for children not lawfully, regularly, and usefully employed.
n To 16 if unemployed.
o To 16 years in cities.
p To 16 if unable to read and write English.
q Inclusive. Does not apply to children over 15 who have finished grammar-school course and are regularly employed; otherwise must attend grammar, or high, or manual-training school. Children over 14 may be employed in cases of necessity.
r Does not apply to children 14 to 16 lawfully employed.
s Other forbidden employment: under 16, on certain machines in box factories; under 21, night messenger service in certain cities; under 16, in bowling alleys and in places of amusement at night.
t Law does not take effect in any county until voted by the county; does not apply to children over 12 lawfully employed at home or elsewhere.
u To 16 if not legally employed or if unable to pass fifth grade test in required subjects. Children in cities who have not completed eighth grade may be required to attend until they are 16.
v In the discretion of school boards.
w To 16 if unemployed.
x Not applicable to children over 13 who can read and write English and are regularly employed in useful service.
y Not applicable to children over 13 who are lawfully employed.
z The compulsory attendance act applies to 18 counties, in addition to which 13 counties are under special laws.
aa Children over 15 or under 8, when once enrolled, must attend the full term they are enrolled for.
bb Compulsory attendance law optional with the voters of any county, city, or town.
cc Children under 17 may not be sent to immoral resorts.

DICTIONARY OF POLITICAL SCIENCE TERMS

Alien.—One who is "of another country," consequently, a person residing in a country, who is not a natural born citizen, or who has not been naturalized, is an alien in that country. A child born in a country takes the citizenship of his father. In United States a person born out of the jurisdiction of the United States who has not been naturalized is an alien.

Anarchism.—The socialist contends that society needs more government; the anarchist believes that there should be less government. The fundamental principle of anarchism is that if man were left unhampered by the restrictions of government and were properly developed by education, he would develop in such a way that the best interests of every one would be taken care of in an ideal way.

Cabinet.—In carrying on his duties the President is aided by executive officials, ten of whom form an advisory Cabinet, a body not mentioned in the written Constitution. At present, the Cabinet consists of the Secretaries of State, Treasury and War, Attorney-General, Postmaster-General and the Secretaries of the Navy, Interior, Agriculture, Commerce and Labor.

Caucus.—A political caucus is a meeting of members of a political party to determine what stand the party will take toward local, state or national problems. From the above it appears that a caucus may be a meeting of national leaders to determine what person is the most promising individual for President, or a meeting of ward politicians in any city to determine the party policy on any petty issue.

Citizenship.—Often the terms "citizen" and "voter" are confused. A voter is a person who is allowed by law to take part in the government. A citizen is a member of the nation. A citizen of the United States is a member of the large society which we call the United States of America.

In the United States citizenship is defined in the Fourteenth Amendment to the Constitution as: "All persons born or naturalized in the United States and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside."

Civil Law.—In civil cases the individual who has been offended brings action before the court. The State has no concern in such cases except to see that justice is done. The subjects upon which suits may be brought are innumerable. Perhaps the most important branch of the law has to do with property—the holding of land and the transfer of title by sale, inheritance or will. Other important considerations are the collection of debt, the rights of public utilities and the rights of corporations.

Commission Government.—A large number of cities in the United States, chiefly of medium size, have sought to remedy the defects in municipal government by a radical change in municipal organization. In place of a council with a mayor, these cities select a body of commissioners, usually five in number, who become the governing body of the city. The commissioners are elected at large and afterwards assigned to different departments of the city's administration. The commission is both a legislative and an administrative body.

Common Law.—Crimes are usually defined by statute; however, when no distinct statutes have been passed, offences in most states may be punished under common law—that is the nature of the offence and penalty are to be ascertained from the practice of the courts in England and America. In this way, law is built up and developed by judicial precedents.

Conservative.—A conservative is one who is fully satisfied with present day conditions. He wishes to conserve the present and has a morbid fear of change, for he has a feeling that any change is apt to bring ruin to our social and political structure.

Criminal Law.—Each state determines just what is crime and in a criminal case, the state is always the prosecutor. Cases may be suggested by the injured person or his friends, but must be tried by a public prosecutor. The usual penalty for crime is a fine or imprisonment, or both; and in most states the death penalty for the most serious crimes.

Economic Interpretation of History.—The theory of the economic interpretation of history rests upon the concept that social progress in general is the result of contending economic interests in society—some favorable, others opposed to change.

Eminent Domain.—The state enjoys and often makes use of the right of eminent domain, by which private real estate may be appropriated for public purposes on payment of a reasonable sum. If an owner of real estate will not accept a price which the government considers reasonable the state submits the matter to a court and lets the court decide what is a suitable price. The right of eminent domain belongs to the states and also to the federal government for federal purposes. The states also allow the local governments to exercise this power for their needs.

Ex-post Facto Law.—For many centuries in England and Continental Europe, people were punished for acts which were not forbidden by law when the act was committed. This caused much injustice. To prevent this in the United States a clause in the Constitution states that no ex-post facto law can be passed either by Congress or the State Legislatures.

Federal Courts.—The Constitution of the United States makes only slight provision for the structure of the federal courts. It merely states that the judicial power of the Federal Government shall be vested in one Supreme Court and in such inferior courts as Congress may from time to time ordain and establish.

All federal judges are nominated by the President and appointed by and with the advice and consent of the Senate. All federal judges hold office during good behavior and, therefore, cannot be removed except by impeachment.

Congress has set up the following courts:

(1) The Supreme Court is composed of nine judges,—a Chief Justice and eight Associate Justices. Six judges must be present at each trial and a majority is necessary for a decision. The salary of the Chief Justice is $15,000 yearly and of the associate justices $14,500. The most important business of this court is questions of Constitutional law brought up from lower federal courts or from state courts.

(2) Immediately under the Supreme Court is a Circuit Court of Appeals in each of the nine circuits into which the United States is divided. In the circuits which have a large amount of business, there are four judges, in the smaller circuits two judges and in the remainder three judges. Each of the Justices of the Supreme Court is allotted to one of the nine circuits.

This Court has the right to review the decisions in the lower District courts and its decision is final in practically all cases, in which no question of Constitutional law is involved. However, the Circuit Court may ask the Supreme Court for instructions on any point of law.

(3) The lowest federal tribunal is the District Court. The whole country is divided into some eighty or ninety districts and in each there are one, two, three or four judges, according to the business to be transacted. The jurisdiction of this court is over all questions of federal law, which can not originate in the Circuit Court of Appeals or in the Supreme Court.

In close relation to the judiciary are the Department of Justice and the United States Attorneys and Marshals. The head of the Department of Justice is the Attorney-General of the United States.

Gerrymander.—In order that the majority party may secure as many members in Congress as possible, resort has been made to a method of creating Congressional districts called "Gerrymandering." This is done by massing the voters of the opposing party in a small number of districts, giving them overwhelming majorities there, while allowing the dominant party to carry the other districts by very small minorities. The same process is often followed in state and municipal politics.

Habeas Corpus.—Any person who thinks that he or another person is unjustly imprisoned may represent the facts to a court, which may then issue a writ of habeas corpus, directing whoever may have in custody the person described in the writ to produce such person in open court (unless charged with treason or felony) and state the reason for his detention.

Under our system whenever there is a conflict between the state and federal authorities the matter is settled by the United States Supreme Court.

Habeas Corpus may be suspended in case of civil war or of foreign war; it was suspended during the Civil War and more than thirty thousand people were arrested on the responsibility of President Lincoln. Many authorities are of the opinion that the writ can be legally suspended only by an Act of Congress.

Impeachment.—A special method of determining the guilt or the innocence of public officers charged with crime is impeachment. The process is distinctly set forth in the federal Constitution. Under it the House of Representatives "impeaches," that is, by a majority vote it presents articles of accusation. The Senate then tries the officer accused by the House.

Impeachment is the process of bringing an official to trial for removal from office and may either succeed or fail at removal. Thus President Andrew Johnson was impeached, but not convicted. This process is employed in the state governments as well as the national government.

Income Tax.—Because of the difficulties of assessing direct taxes and apportioning them among the states, the Constitutional limitation became almost a prohibition. However, in 1913, after a long agitation over the matter, the Sixteenth Amendment to the Constitution was adopted, authorizing Congress to lay taxes upon private

incomes from all sources without reference to any census or enumeration. After the Underwood tariff act was passed in 1913, which materially reduced the federal income, Congress levied a tax on incomes to replenish the national treasury.

Initiative.—The initiative is a system by which a given number of voters may on petition require the legislature to pass a statute of a designated kind and submit it to popular vote, or may actually draw up a bill in detail and demand a vote upon it.

Injunction.—The writ or bill of injunction is an order of court giving orders concerning a matter, and the violation of the order is regarded as contempt of court. Sometimes the injunction takes the form of an order to persons or a corporation to perform certain acts; sometimes the injunction takes the form of a temporary restraining order forbidding a party to alter the existing condition of things in question until the merits of the case may be decided; again it is in the form of a permanent order directing a party not to perform some act, the results of which can not be remedied by any proceeding in law.

Organized labor is opposed to the use of injunctions, because this legal process has been employed so often in labor disputes.

I. W. W.—The I. W. W., or Industrial Workers of the World, is a radical organization of international scope, which has for its object the improvement of the social and economic conditions of labor. This organization adheres to the principle that the end justifies the means. When occasion demands, intimidation, force or even violence may be employed to accomplish an end that the organization has in view. The method of operation of this organization stands out in contrast to those organizations which favor social and political reform through the orderly process of education.

Juries.—A grand jury is composed of a number of citizens ranging from twelve to twenty-three. It holds its sessions either for the purpose of investigating the causes of crimes which have been committed, bringing indictments against those whom jury believes guilty or in order to investigate the conditions of some department of the government.

A petit jury is usually composed of twelve citizens before whom evidence is submitted in a trial and who render a decision, or verdict, on the basis of the evidence presented. The decision or verdict must be unanimous.

Juvenile Courts.—In many of our large cities special courts called Juvenile Courts have been set up for hearing of cases brought against minors. In a Juvenile Court, the child is not treated as a criminal.

The child, with his accuser and sponsors, meet the judge in a rather informal way. The judge has a heart to heart talk with the offender, if the judge thinks the child is guilty. If found guilty, the youthful offender is placed upon probation and an effort is made to care for him in such a way that he will develop into a useful citizen.

Lobbying.—By the lobby is meant those men, and sometimes women, who make it their business to argue with legislators and to solicit their votes. Some of these lobbyists are paid attorneys of corporations; many of them are former members of Congress, who understand the inner workings of the body. The same influence is often exerted in state and municipal legislative bodies.

National Banking System of the United States.—In addition to gold and silver coins, we have in use several kinds of paper money. Some of these, called gold and silver certificates, are paper substitutes for gold and silver, which is too heavy and bulky for ordinary use. Another form of paper money which is being retired as rapidly as possible, consists of United States notes, or greenbacks, which were originally issued during the Civil War.

Much of our paper money at present consists of bank notes issued by banks which have been chartered by the national government. Our present national banking system was established in 1863 for the purpose of creating a market for bonds of the United States in order to secure additional funds to finance the Civil War. National banks are permitted to issue notes on the United States bonds which they have bought and deposited with the Treasurer of the United States. Since these notes are secured by government bonds, which are of unquestioned value, they have excellent stability. However, they lack elasticity, for there is a limit to the volume of bonds which the banks have bought and may buy. In order to provide elasticity, which is necessary when much currency is required to move the crops in the autumn, etc., the Federal Reserve Act was passed in 1913. Under this act all notes issued by individual banks will be gradually retired and by 1935 they will no longer be in circulation.

The Federal Reserve Act provides for a single Federal Reserve Board, consisting of the Secretary of the Treasury, the Controller of the Currency and five other members appointed by the President and Senate for a term of ten years each. This board has supervision of the Federal Reserve Banks and the administration of the Federal Reserve Act.

The United States is now divided into twelve districts, as shown on the map in our Atlas. In each of these divisions there is a Federal Reserve Bank, which may issue notes in large quantities, but these notes are safe-guarded against depreciation by good security. These banks do not do business with the public, but with banks which are members of the Federal Reserve System.

In 1916 a law was passed creating twelve Land Loan Banks, which were placed under a single Federal Board. These banks loan money to associations of farmers at comparatively low rates of interest, to be repaid in installments over a long period of time.

National Nominating Conventions. — Political parties and all of the machinery of the parties are extra-legal political institutions. By that we mean that they are not created by any national or state law. They are not recognized as such by law.

The national conventions of the different parties meet in some conveniently located city of importance usually in June or July. The day and place are decided by the national committee, which consists of one member from each state, elected by the delegates from that state to the national convention, which nominates the candidates for President and Vice-President. In fact, the national committee really manages the convention, because if any state sends two sets of delegates to the same party convention, it decides in advance which delegates are entitled to seats in the convention. In doing this it usually favors its friends.

After the convention has adopted a platform setting forth the principles of the party the roll of the states is called in alphabetical order and nominations are then made. Even when there is no doubt about which Presidential candidate will be selected, the names of favorite sons from different states are often placed in nomination out of respect for them. Usually from five to ten names are placed, each of which is nominated in a laudatory speech, usually followed by prolonged applause. After the nominations have been closed the roll of the states is again called and the chairman of each delegation announces its vote. After the Presidential candidate has been selected the convention proceeds to choose a nominee for Vice-President.

The Republican convention requires only a majority vote of the delegates to elect, while the Democratic requires two-thirds. If no nominee receives the requisite majority on the first ballot the process is repeated until some one secures the proper number of votes.

Naturalization. — Naturalization is the acquirement of citizenship. In the United States an alien can become an American citizen in five years. At any time he may declare his intention of becoming a citizen. He must do this before a federal court. Not less than two years later, nor more than seven years later, if he has resided in this country at least five years altogether, he must go before a federal court or a state court of record, forswear his allegiance to the country of which he was formerly a citizen and prove to the satisfaction of the court that he is of good moral character, not an anarchist and is attached to the constitution. His naturalization includes his wife and minor children. Since 1922 a wife may be naturalized on her own account by fulfilling the usual requirements, provided her husband is eligible to become naturalized.

Political "Boss."—The "boss" in politics is a man who concerns himself very little with policies and very much with the bringing together of a majority which will enable him to keep his friends in office. He has no concern for the service which the government should render to the public. He is interested in government in order to get out of it all that he can for himself and his friends.

Political Parties.—The political forces by which our government is operated are the political parties. In all forms of popular government, wherever men are striving to govern themselves and to realize government by the people, political parties exist. People divide according to their views on public measures. Our parties of today have for their purpose the solving of our national and state problems by putting into operation the principles for which the party stands, which are fundamental for our peace and prosperity. The state and national platforms of each party formulate the principles each party holds toward the political problems of the country.

Presidential Succession.—On the death of the President of the United States he is succeeded by the Vice-President and the Vice-Presidency remains vacant until the next Presidential election. In case of death or disability of the Vice-President the Presidency is filled by a member of the Cabinet in the following order: Secretary of State, Treasury, War, the Attorney General, the Postmaster-General, the Secretary of the Navy, Interior, Agriculture, Commerce and Labor.

Primaries.—At the present time practically all states of the United States provide that nominations for elective officers shall be made, not by conventions of party delegates nor by a caucus of political leaders, but by the voters in direct elections.

A few weeks before an election, on a day set by law, an election is held similar to a regular election. Instead of having a single ballot for all parties, each party has a separate ballot and in some states, separate dates for the primary election. Only those voters are allowed to take part in this election who have affiliated themselves openly with some party. The object of the direct primary is to place more responsibility in selecting public officials in the hands of the voters and less power in the hands of politicians.

Progressive.—A progressive is an individual who believes that the proper solution of political and social problems is to be found by gradually improving present conditions.

Radical.—A radical is one who believes that political development should be made by extreme departure from the present political and social notions. The radical contends that our present political ideals and institutions are the product of an unscientific past and that there should be a complete readjustment in harmony with the latest discoveries of political and social science.

Referendum.—The referendum is the process whereby laws may be enacted or unpopular laws done away with by the direct vote of the people. If a state law has been proposed by initiative and the legislature has neglected to act upon it a referendum vote on it may be taken at the next election. On the other hand, if the legislature has passed a law which is disapproved by many people they can, on petition, temporarily suspend the law and compel the state to submit it to popular vote. The State of Oregon has made the most use of the referendum.

Short Ballot.—Since it is practically impossible for even the most intelligent voter to inform himself on the merits of so many candidates as we now have for public offices, there has been in recent years a strong tendency to simplify the ballot. The short ballot advocates believe that public officials whose duties are entirely administrative should be appointed by some responsible person who can judge the fitness of the applicants for that work better than it can be determined by the average voter. Of course, the public under this system retains indirect control of these administrative officials inasmuch as it elects the person who appoints them.

Single Tax.—It is a well known fact that the value of ground in our large cities increases with astonishing rapidity, not through the effort of the owners, but through the growth of industry and population. In view of this fact Mr. Henry George advocated the idea that a single tax on the unearned increase on land values would be the most equitable form of taxation and would solve many of the economic problems of today. Some authorities on taxation today advocate a single tax on incomes.

Socialism.—Socialism is the political doctrine that advocates the further extension of the authority of the state, until the state owns all means of production and re-shapes human society upon new and better lines for the well being of all the people.

Spoils System and Civil Service Reform.—From the time of President Jackson to President Arthur the whole Civil Service was demoralized every four years by wholesale political removals, and even more recently the federal service has been weakened by unnecessary removals from office. However, since 1871, the President has been authorized to prescribe regulations for the admission of persons into the Civil Service and to ascertain the fitness of each candidate. Under the new system an employee can not be removed except for cause.

The several states in varying degrees have followed the example set by the National Government.

State Courts.—The state courts are the great tribunals of the citizen for the protection of his personal and property rights.

At the bottom of the state judiciary, stand the justices of the peace, who have jurisdiction over civil cases involving very small amounts and over petty offences. In large cities, the police courts handle petty criminal matters and the municipal civil courts take care of minor civil actions.

In most states there are county courts. They have jurisdiction over actions involving considerable sums and usually are appellate courts from the justices of the peace. They usually have jurisdiction over most criminal matters of a serious nature.

Often there is a superior, circuit or district court immediately above the county court, which has unlimited original jurisdiction and may try all cases over which the lower courts have no jurisdiction.

At the head of the judiciary of each state, stands the appellate court of last resort, which ordinarily deals only with appeals on points of law and not of fact. Various names are applied to this court in different states, such as, supreme court, court of appeals, court of errors and appeals, or supreme judicial court.

Suffrage.—Under our Constitutional system, the regulation of the suffrage is left to the states. The federal Constitution avoided the creation of a uniform national suffrage by requiring that voters for Presidential electors and representatives should be the same as those for the most numerous branch of the state legislatures. Under this arrangement every enlargement of the state suffrage was a corresponding extension of national suffrage in that state. Of course, the Nineteenth Amendment to the Constitution grants suffrage to women in every state.

In the states there are three practically universal requirements for voters. The first is residence which provides that a person must be a bona fide resident of the precinct, county and state in which he wishes to cast his vote. The second is an age requirement of twenty-one years. The third requirement is that of citizenship.

All classes on which the right to vote is not directly conferred are debarred from voting. In addition, persons who are insane or incompetent or convicted of crime are denied the right of voting. Some states require all voters to be able to read and write. A few Southern states have adopted "grandfather clauses," to exclude negroes from voting. These states provide that any person who failed to meet the requirements for voting—ability to read or possession of property—should not be excluded, if he or one of his ancestors had voted before 1867.

Tariff.—Alexander Hamilton, as first Secretary of the Treasury of the United States, secured the passage of a tariff for the protection of American industries and brought money into the empty federal treasury. The farming and planting South, except a few of the large towns, presented an almost solid front against the tariff. Here we have the beginning of the tariff controversy, which has lasted to our day. On the one hand, we find the industrial sections favoring a high protective tariff; on the other, the agrarians and producers of raw material are in favor of a low tariff. The Republican party at present champions a high protective tariff, while the Democratic party advocates a tariff primarily for revenue, with slight protection to American business interests.

The Trust.—The popular conception of a trust is a large business organization that has control of some important industry. Legally and historically this is not true.

In 1892, a group of oil interests founded an organization, placing all their stocks in the hands of trustees, among whom was John D. Rockefeller. The trustees, in turn, issued certificates representing the share to which each participant was entitled and took over the management of the entire business. This was the origin of the "trust."

Legally there is no such thing as a "trust" at the present time, for the Supreme Court has declared that a combination that creates monopoly, unless the monopoly is under control of the government, is illegal.

CONSTITUTION OF THE UNITED STATES

The Constitution originally consisted of a Preamble and seven Articles, and in that form was "Done in Convention by the Unanimous Consent of the States present the Seventeenth Day of September in the Year of our Lord one thousand seven hundred and Eighty seven and of the Independence of the United States of America the Twelfth." The Constitution was declared in effect on the first Wednesday in March, 1789. The signers of the original Constitution, by virtue of their membership in Congress, were:

Go. WASHINGTON, *President and deputy from Virginia.* New Hampshire—John Langdon, Nicholas Gilman. Massachusetts—Nathaniel Gorham, Rufus King. Connecticut—Wm. Saml. Johnson, Roger Sherman. New York—Alexander Hamilton. New Jersey—Wil. Livingston, David Brearley, Wm. Patterson, Jona. Dayton. Pennsylvania—B. Franklin, Robt. Morris, Thos. Fitzsimons, James Wilson, Thomas Mifflin, Geo. Clymer, Jared Ingersoll, Gouv. Morris. Delaware—Geo. Read, John Dickinson, Jaco. Broom, Gunning Bedford, jun., Richard Bassett. Maryland—James McHenry, Danl. Carroll, Dan. of St. Thomas, Jenifer. Virginia—John Blair, James Madison, Jr. North Carolina—Wm. Blount, Hu. Williamson, Richd. Dobbs Spaight. South Carolina—J. Rutledge, Charles Pinckney, Charles Cotesworthy Pinckney, Pierce Butler. Georgia—William Few, Abr. Baldwin. Attest: William Jackson, *Secretary.*

The Constitution was ratified by the thirteen original States in the following order:

Delaware, December 7, 1787, unanimously.
Pennsylvania, December 12, 1787, vote 46 to 23.
New Jersey, December 18, 1787, unanimously.
Georgia, January 2, 1788, unanimously.
Connecticut, January 9, 1788, vote 128 to 40.
Massachusetts, February 6, 1788, vote 187 to 168.
Maryland, April 28, 1788, vote 63 to 12.
South Carolina, May 23, 1788, vote 149 to 73.
New Hampshire, June 21, 1788, vote 57 to 46.
Virginia, June 25, 1788, vote 89 to 79.
New York, July 26, 1788, vote 30 to 28.
North Carolina, November 21, 1789, vote 193 to 75
Rhode Island, May 29, 1790, vote 34 to 32.

THE CONSTITUTION

Preamble

We, the people of the United States, in order to form a more perfect Union, establish justice, insure domestic tranquility, provide for the common defence, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish the Constitution for the United States of America.

ARTICLE I.

Section 1—(Legislative powers; in whom vested.)

All legislative powers herein granted shall be vested in a Constitution of the United States, which shall consist of a Senate and House of Representatives.

Section 2—(House of Representatives, how and by whom chosen. Qualifications of a Representative. Representatives and direct taxes, how apportioned. Enumeration. Vacancies to be filled. Power of choosing officers, and of impeachment.)

1. The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislature.

2. No person shall be a Representative who shall not have attained to the age of twenty-five years and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

3. Representatives and direct taxes shall be apportioned among the several States which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual

enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of Representatives shall not exceed one for every thirty thousand, but each State shall have at least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose 3; Massachusetts, 8; Rhode Island and Providence Plantations, 1; Connecticut, 5; New York, 6; New Jersey, 4; Pennsylvania, 8; Delaware, 1; Maryland, 6; Virginia, 10; North Carolina, 5; South Carolina, 5, and Georgia 3.*

4. When vacancies happen in the representation from any State, the Executive Authority thereof shall issue writs of election to fill such vacancies.

5. The House of Representatives shall choose their Speaker and other officers, and shall have the sole power of impeachment.

Section 3—(Senators, how and by whom chosen. How classified. State Executive, when to make temporary appointments, in case, etc. Qualifications of a Senator. President of the Senate, his right to vote. President pro tem., and other officers of the Senate, how chosen. Power to try impeachments. When President is tried, Chief Justice to preside. Sentence.)

1. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six years; and each Senator shall have one vote.

2. Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the Senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the Legislature of any State, the Executive thereof may make temporary appointment until the next meeting of the Legislature, which shall then fill such vacancies.

3. No person shall be a Senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

4. The Vice-President of the United States shall be President of the Senate, but shall have no vote unless they be equally divided.

5. The Senate shall choose their other officers, and also a President pro tempore, in the absence of the Vice-President, or when he shall exercise the office of President of the United States.

6. The Senate shall have the sole power to try all impeachments. When sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present.

7. Judgment of cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law.

Section 4—(Times, etc., of holding elections, how prescribed. One Session in each year.)

1. The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by law make or alter such regulations, except as to places of choosing Senators.

2. The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall by law appoint a different day.

Section 5—(Membership. Quorum. Adjournments. Rules. Power to punish or expel. Journal. Time of adjournments, how limited, etc.)

1. Each House shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members in such manner and under such penalties as each House may provide.

2. Each House may determine the rules of its proceedings, punish its members for disorderly behavior, and with the concurrence of two-thirds expel a member.

3. Each House shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may in their judgment require secrecy; and the yeas and nays of the members of either House on any question shall, at the desire of one-fifth of those present, be entered on the journal.

4. Neither House, during the session of Congress, shall, without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two Houses shall be sitting.

Section 6—(Compensation. Privileges. Disqualification in certain cases.)

1. The Senators and Representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the Treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the session of their respective Houses, and in going to and returning from the same; and for any speech or debate in either House they shall not be questioned in any other place.

2. No Senator or Representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States which shall have been created, or the emoluments whereof shall have been increased during such time; and no person holding any office under the United States shall be a member of either House during his continuance in office.

Section 7—(House to originate all revenue bills. Veto. Bill may be passed by two-thirds of each House, notwithstanding, etc. Bill, not returned in ten days, to become a law. Provisions as to orders, concurrent resolutions, etc.)

1. All bills for raising revenue shall originate in the House of Representatives, but the Senate may propose or concur with amendments, as on other bills.

2. Every bill which shall have passed the House of Representatives and the Senate shall, before it becomes a law, be presented to the President of the United States; if he approve, he shall sign it, but if not, he shall return it, with his objections, to that House in which it shall have originated, who shall enter the objections at large on their journal, and proceed to reconsider it. If after such reconsideration two-thirds of that House shall agree to pass the bill, it shall be sent, together with the objections, to the other House by which it shall likewise be reconsidered; and if approved by two-thirds of that House it shall become a law. But in all such cases the votes of both Houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each House respectively. If any bill shall not be returned by the President within ten days (Sundays excepted) after it shall have been presented to him, the same shall be a law in like manner as if he had signed it, unless the Congress by their adjournment prevent its return; in which case it shall not be a law.

3. Every order, resolution, or vote to which the concurrence of the Senate and House of Representatives may be necessary (except on a question of adjournment) shall be presented to the President of the United States; and before the same shall take effect shall be approved by him, or being disapproved by him, shall be repassed by two-thirds of the Senate and the House of Representatives, according to the rules and limitations prescribed in the case of a bill.

Section 8—(Powers of Congress.)

The Congress shall have power:

1. To lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defence and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States.

2. To borrow money on the credit of the United States.

3. To regulate commerce with foreign nations, and among the several States, and with the Indian tribes.

4. To establish an uniform rule of naturalization and uniform laws on the subject of bankruptcies throughout the United States.

5. To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures.

6. To provide for the punishment of counterfeiting the securities and current coin of the United States.

7. To establish post-offices and post-roads.

8. To promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive rights to their respective writings and discoveries.

9. To constitute tribunals inferior to the Supreme Court.

10. To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations.

11. To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water

12. To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years.

13. To provide and maintain a navy.

14. To make rules for the government and regulation of the land and naval forces.

15. To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions.

16. To provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress.

17. To exercise exclusive legislation in all cases whatsoever over such district

*See Article XIV., Amendments.

(not exceeding ten miles square) as may, by cession of particular States and the acceptance of Congress, become the seat of Government of the United States, and to exercise like authority over all places purchased by the consent of the Legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, drydocks, and other needful buildings.

18. To make all laws which shall be necessary and proper for carrying into execution the foregoing powers and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof.

Section 9—(Provision as to migration or importation of certain persons. Habeas Corpus. Bills of attainder, etc. Taxes, how apportioned. No export duty. No commercial preference. Money, how drawn from treasury, etc. No titular nobility. Officers not to receive presents, etc.)

1. The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by the Congress prior to the year one thousand eight hundred and eight, but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.

2. The privilege of the writ of habeas corpus shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

3. No bill of attainder or ex post facto law shall be passed.

4. No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken.

5. No tax or duty shall be laid on articles exported from any State.

6. No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another, nor shall vessels bound to or from one State be obliged to enter, clear, or pay duties in another.

7. No money shall be drawn from the Treasury but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

8. No title of nobility shall be granted by the United States. And no person holding any office of profit or trust under them shall, without the consent of the Congress, accept of any present, emolument, office, or title of any kind whatever from any king, prince, or foreign state.

Section 10—(States prohibited from the exercise of certain powers.)

1. No State shall enter into any treaty, alliance, or confederation, grant letters of marque and reprisal, coin money, emit bills of credit, make anything but gold and silver coin a tender in payment of debts, pass any bill of attainder, ex post facto law, or law impairing the obligation of contracts, or grant any title of nobility.

2. No State shall, without the consent of the Congress, lay any impost or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws, and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the Treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

3. No State shall, without the consent of Congress, lay any duty of tonnage, keep troops or ships of war in time of peace, enter into agreement or compact with another State, or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II.

Section 1—(President; his term of office. Electors of President; number and how appointed. Electors to vote on same day. Qualification of President. On whom his duties devolve in case of his removal, death, etc. President's compensation. His oath of office.)

1. The Executive power shall be vested in a President of the United States of America. He shall hold his office during the term of four years, and, together with the Vice-President, chosen for the same term, be elected as follows:

2. Each State shall appoint, in such manner as the Legislature thereof may direct, a number of electors equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative or person holding an office of trust or profit under the United States shall be appointed an elector.

3. The electors shall meet in their respective States and vote by ballot for two persons, of whom one at least shall not be an inhabitant of the same State with themselves. And they shall make a list of all the persons voted for, and of, the number of votes for each, which list they shall sign and certify and transmit, sealed, to the seat of the Government of the United States, direct to the President of the Senate. The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted. The person having the greatest number of votes shall be the President, if such number be a majority of the whole number of electors appointed, and if there be more than one who have such a majority, and have an equal number of votes, then the House of Representatives shall immediately choose by ballot one of them for President; and if no person have a majority, then from the five highest on the list the said House shall in like manner choose the President. But in choosing the President, the vote shall be taken by States, the representation from each State having one vote. A quorum, for this purpose, shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. In every case, after the choice of the President, the person having the greatest number of vot s of the electors shall be the Vice-President. But if there shall remain two or more who have equal vote, the Senate shall choose from them by ballot the Vice-President.

4. The Congress may determine the time of choosing the electors and the day on which they shall give their votes, which day shall be the same throughout the United States.

5. No person except a natural born citizen, or a citizen of the United States at the time of the adoption of this Constitution, shall be eligible to the office of President; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years and been fourteen years a resident within the United States.

6. In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice-President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice-President, declaring what officer shall act accordingly until the disability be removed or a President shall be elected.

7. The President shall, at stated times, receive for his services a compensation which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them.

8. Before he enter on the execution of his office he shall take the following oath or affirmation:

"I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect, and defend the Constitution of the United States."

Section 2—(President to be Commander-in-Chief. He may require opinions of Cabinet officers, etc., may pardon. Treaty-making power. Nomination of certain officers. When President may fill vacancies.)

1. The President shall be Commander-in-Chief of the Army and Navy of the United States, and of the militia of the several States when called into the actual service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offences against the United States except in cases of impeachment.

2. He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur; and he shall nominate and by and with the advice and consent of the Senate shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States whose appointments are not herein otherwise provided for, and which shall be established by law; but the Congress may by law vest the appointment of such inferior officers as they think proper in the President alone, in the courts of law, or in the heads of departments.

3. The President shall have power to fill all vacancies that may happen during the recess of the Senate by granting commissions, which shall expire at the end of their next session.

Section 3—(President shall communicate to Congress. He may convene and adjourn Congress, in case of disagreement, etc. Shall receive ambassadors, execute laws, and commission officers.)

He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may, on extraordinary occasions, convene both Houses, or either of them, and in case of disagreement between them with respect to the time of adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

Section 4—(All civil offices forfeited for certain crimes.)

The President, Vice-President, and all civil officers of the United States shall be removed from office on impeachment for and conviction of treason, bribery or other high crimes and misdemeanors.

ARTICLE III.

Section 1—(Judicial powers. Tenure. Compensations.)

The judicial power of the United States

shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the Supreme and inferior courts, shall hold their offices during good behavior, and shall at stated times receive for their services a compensation which shall not be diminished during their continuation in office.

Section 2—(Judicial power; to what cases it extends. Original jurisdiction of Supreme Court. Appellate. Trial by jury, etc. Trial, where.)

1. The judicial power shall extend to all cases in law and equity arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States, between a State and citizens of another State, between citizens of different States, between citizens of the same State claiming lands under grants of different States, and between a State; or the citizens thereof, and foreign states, citizens, or subjects.

2. In all cases affecting ambassadors, other public ministers, and consuls, and those in which a State shall be party, the Supreme Court shall have original jurisdiction. In all the other cases before mentioned the Supreme Court shall have appellate jurisdiction both as to law and fact, with such exceptions and under such regulations as the Congress shall make.

3. The trial of all crimes, except in cases of impeachment, shall be by jury, and such trial shall be held in the State where the said crimes shall have been committed; but when not committed within any State the trial shall be at such place or places as the Congress may by law have directed.

Section 3—(Treason defined. Proof of. Punishment of.)

1. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or confession in open court.

2. The Congress shall have power to declare the punishment of treason, but no attainder of treason shall work corruption of blood or forfeiture except during the life of the person attained.

ARTICLE IV.

Section 1—(Each State to give credit to the public acts, etc., of every other State.)

Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

Section 2—(Privileges of citizens of each State. Fugitives from justice to be delivered up. Persons held to service having escaped, to be delivered up.)

1. The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States.

2. A person charged in any State with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall, on demand of the Executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime.

3. No person held to service or labor in one State, under the laws thereof, escaping into another shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

Section 3—(Admission of new States Power of Congress over territory and other property.)

1. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the jurisdiction of any other State, nor any State be formed by the junction of two or more States, or parts of States, without the consent of the Legislatures of the States concerned, as well as of the Congress.

2. The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this Constitution shall be so construed as to prejudice any claims of the United States, or of any particular State.

Section 4—(Republican form of government guaranteed. Each State to be protected.)

The United States shall guarantee to every State in this Union a Republican form of government, and shall protect each of them against invasion, and, on application of the Legislature, or of the Executive (when the Legislature cannot be convened), against domestic violence.

ARTICLE V.

(Constitution; how amended. Proviso.)

The Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the Legislature of two-thirds of the several States, shall call a convention for proposing amendments, which in either case, shall be valid to all intents and purposes, as part of this constitution, when ratified by the Legislatures of three-fourths of the several States, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided that no amendment which may be prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the Ninth Section of the First Article; and that no State, without its consent, shall be deprived of its equal suffrage in the State.

ARTICLE VI.

(Certain debts, etc., declared valid. Supremacy of Constitution, treaties, and laws of the United States. Oath to support Constitution, by whom taken. No religious test.)

1. All debts contracted and engagements entered into before the adoption of this Constitution shall be as valid against the United States under this Constitution as under the Confederation.

2. This Constitution and the laws of the United States which shall be made in pursuance thereof and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land, and the judges in every State shall be bound thereby, anything in the Constitution or laws of any state to the contrary notwithstanding.

3. The Senators and Representatives before mentioned, and the members of the several State Legislatures, and all executive and judicial officers, both of the United States and of the several States, shall be bound by oath or affirmation to support this Constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII.

(What ratification shall establish Constitution.)

The ratification of the Conventions of nine States shall be sufficient for the establishment of this Constitution between the States so ratifying the same.

AMENDMENTS TO THE CONSTITUTION OF THE UNITED STATES

The following amendments to the Constitution, Articles I. to X. inclusive, were proposed at the First Session of the First Congress, begun and held at the City of New York, on Wednesday, March 4, 1789, and were adopted by the necessary number of States. The original proposal of the ten amendments were preceded by this preamble and resolution:

"The conventions of a number of the States having, at the time of their adopting the Constitution, expressed a desire, in order to prevent misconstruction or abuse of its powers, that further declaratory and restrictive clauses should be added, and as extending the ground of public confidence in the Government will best insure the beneficent ends of its institution.

"*Resolved*, By the Senate and House of Representatives of the United States of America, in Congress assembled, two-thirds of both Houses concurring, that the following articles be proposed to the Legislatures of the several States, as amendments to the Constitution of the United States; all or any of which articles, when ratified by three-fourths of the said Legislatures, to be valid to all intents and purposes, as part of the said Constitution, namely:"

THE TEN ORIGINAL AMENDMENTS.

(They were declared in force December 15, 1791.)

ARTICLE I

Religious Establishment Prohibited. Freedom of Speech, of the Press, and Right to Petition.

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble and to petition the Government for a redress of grievances.

ARTICLE II.

Right to Keep and Bear Arms.

A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed.

ARTICLE III.

No Soldier to Be Quartered in Any House, Unless, Etc.

No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law.

ARTICLE IV.

Right of Search and Seizure Regulated.

The right of the people to be secure in

their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V.

Provisions Concerning Prosecution, Trial and Punishment.—Private Property Not to Be Taken for Public Use, Without Compensation.

No person shall be held to answer for a capital or other infamous crime unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war or public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

ARTICLE VI.

Right to Speedy Trial, Witnesses, Etc.

In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which districts shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ARTICLE VII.

Right of Trial By Jury.

In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

ARTICLE VIII.

Excessive Bail or Fines and Cruel Punishments Prohibited.

Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

ARTICLE IX.

Rule of Construction of Constitution.

The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

ARTICLE X.

Rights of States Under Constitution.

The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

The following amendment was proposed to the Legislatures of the several States by the Third Congress on the 5th of March, 1794, and was declared to have been ratified in a message from the President to Congress, dated Jan. 8, 1798.

ARTICLE XI.

Judicial Powers Construed.

The Judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States, by citizens of another State, or by citizens or subjects of any foreign state.

The following amendment was proposed to the Legislatures of the several States by the Eighth Congress on the 12th of December, 1803, and was declared to have been ratified in a proclamation by the Secretary of State, dated September 25, 1804. It was ratified by all the States except Connecticut, Delaware, Massachusetts, and New Hampshire.

ARTICLE XII.

Manner of Choosing President and Vice-President.

The Electors shall meet in their respective States, and vote by ballot for President and Vice-President, one of whom at least shall not be an inhabitant of the same State with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President; and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which list they shall sign and certify, and transmit, sealed, to the seat of the Government of the United States, directed to the President of the Senate; the President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted; the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of Electors appointed; and if no person have such majority, then from the persons having the highest number, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President shall be the Vice-President if such number be a majority of the whole number of Electors appointed, and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

The following amendment was proposed to the Legislatures of the several States by the Thirty-eighth Congress on the 1st of February, 1865, and was declared to have been ratified in a proclamation by the Secretary of State dated December 18, 1865. It was rejected by Delaware and Kentucky; was conditionally ratified by Alabama and Mississippi; and Texas took no action.

ARTICLE XIII.

Slavery Abolished.

1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

2. Congress shall have power to enforce this article by appropriate legislation.

The following, popularly known as the Reconstruction Amendment, was proposed to the Legislatures of the several States by the Thirty-ninth Congress on the 16th of June, 1866, and was declared to have been ratified in a proclamation by the Secretary of State, dated July 28, 1868. The amendment got the support of 23 Northern States; it was rejected by Delaware, Kentucky, Maryland, and 10 Southern States. California took no action. Subsequently it was ratified by the 10 Southern States.

ARTICLE XIV.

Citizenship Rights Not to Be Abridged.

1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

Apportionment of Representatives in Congress.

2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of Electors for President and Vice-President of the United States, Representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male members of such State, being of twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

Power of Congress to Remove Disabilities of United States Officials for Rebellion.

3. No person shall be a Senator or Representative in Congress, or Elector of President and Vice-President or holding any office, civil or military, under the United States, or under any State, who having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State Legislature or as an executive or judicial officer of any State, shall have engaged in insurrection or rebellion against the same, or given aid and comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each House, remove such disability.

What Public Debts Are Valid.

4. The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection and rebellion, shall not be ques-

tioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

5. The Congress shall have power to enforce by appropriate legislation the provisions of this article.

The following amendment was proposed to the Legislatures of the several States by the Fortieth Congress on the 27th of February, 1869, and was declared to have been ratified in a proclamation by the Secretary of State, dated March 30, 1870. It was not acted on by Tennessee; it was rejected by California, Delaware, Kentucky, Maryland, and Oregon; ratified by the remaining 30 States. New York rescinded its ratification January 5, 1870. New Jersey rejected it in 1870, but ratified it in 1871.

ARTICLE XV.

Equal Rights for White and Colored Citizens.

1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

2. The Congress shall have power to enforce this article by appropriate legislation.

The following amendment was proposed to the Legislatures of the several States, by the Sixty-first Congress on the 12th day of July, 1909, and was declared to have been ratified in a proclamation by the Secretary of State, dated February 25, 1913. The income tax amendment was ratified by all the States except Connecticut, Florida, Pennsylvania, Rhode Island, Utah, and Virginia.

ARTICLE XVI.

Income Taxes Authorized.

The Congress shall have power to lay and collect taxes on incomes, from whatever sources derived, without apportionment among the several States, and without regard to any census or enumeration.

The following amendment was proposed to the Legislatures of the several States by the Sixty-second Congress on the 16th day of May, 1912, and was declared to have been ratified in a proclamation by the Secretary of State, dated May 31, 1913. It got the vote of all the States except Alabama, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Rhode Island, South Carolina, Utah, and Virginia.

ARTICLE XVII.

United States Senators to Be Elected By Direct Popular Vote.

1. The Senate of the United States shall be composed of two Senators from each State, elected by the people thereof, for six years; and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislatures.

Vacancies in Senatorships, When Governor May Fill by Appointment.

2. When vacancies happen in the representation of any state in the Senate, the Executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the Legislature of any State may empower the Executive thereof to make temporary appointment until the people fill the vacancies by election as the Legislature may direct.

3. This amendment shall not be so construed as to affect the election or term of any Senator chosen before it becomes valid as part of the Constitution.

The following amendment was proposed to the Legislatures of the several States by the Sixty-fifth Congress, December 18, 1917; and on January 29, 1919, the United States Secretary of State proclaimed its adoption by 36 States, and declared it in effect on January 16, 1920.

Early in 1920, the validity of the Eighteenth Amendment was upheld by the Supreme Court of the United States, in suits to void, brought by the States of Rhode Island and New Jersey, and by various brewers and distillers.

ARTICLE XVIII.

Liquor Prohibition Amendment.

1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

The following amendment was proposed to the Legislatures of the several States by the Sixty-fifth Congress, having been adopted by the House of Representatives, May 21, 1919, and by the Senate, June 4, 1919. On August 26, 1920, the United States Secretary of State proclaimed it in effect, having been adopted (June 10, 1919-August 18, 1920), by three-quarters of the States. The Tennessee House, August 31, rescinded its ratification, 47 to 24.

ARTICLE XIX.

Giving Nation-Wide Suffrage to Women.

1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex.

2. Congress shall have power, by appropriate legislation, to enforce the provisions of this article.

BOOK XIII.

USEFUL MISCELLANY

LEO. L. TULLY, A. M.

Air is the gaseous substance which fills the atmosphere surrounding our planet. It is elastic, and is destitute of taste, color, and smell. It contains by weight, oxygen 23.10 parts, and of nitrogen 76.90; and by volume, of oxygen 20.90, and of nitrogen 79.10; or of 10,000 parts there are in perfectly dry air, of nitrogen 7,912, oxygen 2,080, carbonic acid 4, carbureted hydrogen 4, with a trace of ammonia. But air never is dry; it has always in it a varying amount of watery vapor. When exhaled from the lungs it is saturated with moisture, and contains about 4.35 parts of carbonic acid. The prevalence of this latter gas in abnormal quantity is prejudicial to human life, while air with a high percentage of oxygen in it is healthful and invigorating.

The density of air being fixed at the round number 1,000, it is made the standard with which the specific gravity of other substances is compared. If water be made unity, then the specific gravity of dry air is .0012759. At 62 degrees Fahr. it is 810 times lighter than water, and 11,000 times lighter than mercury. At the surface of the sea the mean pressure is sufficient to balance a column of mercury 30 inches, or one of water 34 feet in height.

The exact height of the atmosphere is unknown. At 2.7 miles above the surface of the earth half its density is gone, and the remainder is again halved for every further rise of 2.7 miles. Some small density would remain at 45 miles high. At 80 miles this would have all but disappeared. But from sundry observations, made at Rio Janeiro and elsewhere, on the twilight arc, M. Liais infers that the extreme limit of the atmosphere is between 198 and 212 miles. In the lower strata of the atmosphere the temperature falls at least a degree for every 352 feet of ascent; hence, even in the tropics, mountains of any considerable elevation are snowcapped. The atmosphere appears to us blue, because absorbing the red and yellow solar rays, it reflects the blue ones. It revolves with the earth, but being extremely mobile, winds are generated in it, so that it is rarely long at rest. The atmosphere always contains free electricity, sometimes positive and sometimes negative.

Almighty Dollar.—In this phrase, coined by Washington Irving, we have a personification of the supposed object of American worship. It is intended as a satire on the mad race for wealth that has at different times and in divers places characterized the American people.

> The almighty dollar, that great object of universal devotion throughout our land, seems to have no genuine devotees in these peculiar villages.—*The Creole Village.*

American Rhine.—The Hudson River, "unrivalled among American rivers for picturesque and magnificent scenery." Though destitute of the numerous architectural remains of bygone ages that crowd with interesting reminiscences the banks of its Old World namesake, the Hundon is equally enriched by Nature, and is not without its share of legendary lore.

Apostles, Fate of.—It is generally believed that only one of Christ's Apostles, John escaped martyrdom.

Matthew is supposed to have been slain with a sword in Ethiopia.

James, son of Zebedee, was beheaded at Jerusalem.

James, the brother of our Lord, was thrown from a pinnacle of the Temple and then beaten to death with a fuller's club.

Philip was hanged up against a pillar at Hieropolis, a city of Phrygia.

Bartholomew was flayed alive at Albanapolis, in Armenia.

Andrew suffered matyrdom on a cross at Patræ, in Achaia.

Thomas was run through the body with a lance at Coromandel, in the East Indies.

Thaddeus was shot to death with arrows.

Simon Zelotes was crucified in Persia.

Peter was crucified, head downward it is said, during the Neronian persecution.

Matthias was first stoned and then beheaded, and Paul was beheaded at Rome by the tyrant Nero.

Judas Iscariot, after the betrayal of our Lord, hung himself.

April Fool's Day.—The origin of the custom of April fooling cannot be traced with any degree of certainty. In the literature of the eighteenth century there are found many references to it, and yet beyond that it is scarcely possible to go. One suggestion is that the custom of playing tricks on the first day of April, was derived from some ancient pagan custom, such as the Huli festival among the Hindus, or the Roman Feast of the Fools. One fact, however, we do know, and that is that the practice prevails in many countries, under various names, which would seem to indicate that it dates away back to the early history of the race. There is a tradition among the Jews that the custom of making fools on the first of April arose from the fact that Noah sent out the dove on the first of the month corresponding to our April, before the water had abated. To perpetuate the memory of the great deliverance of Noah and his family, it was customary on this anniversary to punish persons who had forgotten the remarkable circumstance connected with the date, by sending them on some bootless errand similar to that on which the patriarch sent the luckless bird from the windows of the ark.

Astral Spirits.—The spirits of the stars. According to the mythology of the Persians, Greeks, Jews, etc., each star had its special spirit, which may be termed its soul, or vital principle. Paracelsus maintained that every man had his attendant star, which received him at death, and took charge of him till the great resurrection.

Anatomy and Physiology, Interesting Facts About.—The following facts of human anatomy and physiology have been gathered from a number of authentic sources:

Blood—An adult has ordinarily 28 pounds of blood; at each pulsation of the heart, 10 pounds are sent through the arteries and veins. The pulsations average 120 per minute in infancy, 80 in manhood, and 60 in old age, and are rather more rapid in women than in man.

Temperature of the Human Blood

Good Health	98.6 (Fahrenheit).
Fever	101.3 (Fahrenheit).
Strong Fever (morning)	102.2 (Fahrenheit).
Strong Fever (evening)	104.0 (Fahrenheit).

Brain—According to Bastian and others, the following brain-weights are given of different nationalties:

Scotch	50.0 oz.
Germans	49.6 oz.
English	49.5 oz.
French	47.9 oz.
Zulus	47.5 oz.
Chinese	47.2 oz.
Pawnees	47.1 oz.
Italians	46.9 oz.
Hindus	45.1 oz.
Gypsies	44.8 oz.
Bushmen	44.6 oz.
Esquimaux	43.9 oz.

Capacity of Brain-Case—

Anglo-Saxon	105 cu. in.
German	105 cu. in.
Negro	96 cu. in.
Ancient Egyptian	58 cu. in.
Hottentot	58 cu. in.

The average weight of the human brain, as given by Quain, is 49½ ounces avoirdupois for males, and 44 ounces for females. This general result was obtained by comparing and combining the tables prepared by Sims, Clendinning, Tiedemann, and Reid. The number of male brains weighed was 278, and of female brains, 191. In males, the minimum weight was 34 ounces, and the maximum, 65 ounces. In females, the minimum weight was 31 ounces, and the maximum, 56 ounces. In new-born infants, the brain weighs about 11.65 ounces for the male, and 10 ounces for the female.

In both sexes, the weight of the brain generally increases rapidly up to the seventh year, then more slowly to between 31 and 40 at which time it reaches its maximum point. Beyond that period, there appears a slow but progressive diminution in weight of about one ounce during each subsequent decennial period; thus confirming the opinion that the brain diminishes in advanced life.

Table of Brain Weights.—

Cromwell, aged 59 (not accepted by physiologists)	82.29 oz.
Byron, aged 36 (not accepted by physiologists)	79.00 oz.
Bricklayer, aged 38; fair intelligence, but could neither read nor write (reported by Dr. James Morris)	67.00 oz.
Cuvier, aged 63 (Archives generales de medecine, 1832)	64.33 oz.
Abercrombie, aged 63 (reported by Dr. Adam Hunter)	63.00 oz.
Congenital epileptic idiot (reported by Dr. Tuke)	60.00 oz.
Ruloff, aged 53; above medium stature; executed for murder in 1871; well versed in languages, imagining that he had discovered new and important principles in philology (reported by Dr. George Burr)	59.00 oz.
James Fisk, Jr., killed in New York, in 1872; illiterate, but said to possess great executive ability; notor-	

ious for colossal and unscrupulous financial speculations (reported by by Dr. Marsh)..... 58.00 oz.
Spurzheim (Medico-Chirurgical Review, 1836)..... 55.06 oz.
Adult man; an idiot since two years of age (Wagner)..... 54.95 oz.
Daniel Webster, aged 70 (reported by Dr. John Jeffries)..... 53.50 oz.
Executed criminal, aged 45; medium stature; of less than ordinary intelligence, and uncultivated (Lelut) 53.12 oz.
Dupuytren, aged 58 (Cruveilhier, Husson, and Bouillaud)..... 49.68 oz.
Day-laborer, aged 49 (Wagner)..... 48.85 oz.
Celebrated philologist, aged 54; 5 feet 7 ½ inches tall (Wagner)..... 47.90 oz.
Executed criminal, aged 34; small stature; intelligence developed and cultivated (Lelut)..... 47.79 oz.
Celebrated mineralogist, aged 77; above medium stature (Wagner)... 43.24 oz.
Man, 44 years of age; idiocy very profound; a little below medium stature (Lelut)..... 34.39 oz.

A careful study of the weights given in this table shows the impossibility of applying to individuals an absolute rule that the greatest brain-power is connected with the greatest amount of brain-substance.

Coughing—We cough because the respiratory organs are excited by the presence of some body foreign or unnatural to them. A cough is an effort on the part of the air tubes to free themselves from some source of irritation. And so important are the organs of breathing to the welfare of the body, that the muscles of the chest, back, and abdomen, *unite in the endeavor to get rid of the exciting substance.*

Hair—The number of hairs on an adult's head averages from 129,000 to 150,000.

Hiccough is caused by a spasmodic twitching of the diaphragm, a thin muscular membrane which divides the chest from the abdomen. It generally arises from sympathy with the stomach; and it is highly probable that the muscular twitches and jerks are so many efforts on the part of the diaphragm to *assist the stomach to get rid of some undigested matter.*

Laughter—Laughing is caused by the very opposite influences that produce sighing. The nervous system is highly excited by some external cause. The impression is so intense, and the mind so fixed upon it, that the respiratory process is irregular, and uncontrolled. Persons excited to a fit of laughter generally hold their breath until they can hold it no longer, and then suddenly there is a quick expiration causing eccentric sounds, the mind being too intently fixed upon the cause of excitement *either to moderate the sounds, or to control the breathing.*

Pulse—The beat or shock felt in any artery when slight pressure is made on it, caused by the systole of the heart. At birth the number of beats are about 140, at the end of the first year 120, at the end of the second 110; during middle life between 70 and 80, and in old age usually a little more. It is slower in man than in woman, and is also affected by the position of the body, being about five beats more in the sitting than in the recumbent posture, and 10 more per minute in the standing than in the sitting posture.

Co-relation of Pulse and Temperature—As a general rule the co-relation of pulse and temperature may be stated as follows, namely:—

An increase of temperature of one degree above 98 degrees Fahr. corresponds with an increase of 10 beats of the pulse per minute, as in the following table:—

Temperature of 98° corresponds with a pulse of 60.
Temperature of 99° corresponds with a pulse of 70.
Temperature of 100° corresponds with a pulse of 80.
Temperature of 101° corresponds with a pulse of 90.
Temperature of 102° corresponds with a pulse of 100.
Temperature of 103° corresponds with a pulse of 110.
Temperature of 104° corresponds with a pulse of 120.
Temperature of 105° corresponds with a pulse of 130.
Temperature of 106° corresponds with a pulse of 140.

Respiration—Respiration is the act of inhaling air into the lungs, and again expelling it. The quantity of carbonic acid gas exhaled in 24 hours is as follows:

Person	Age	Ounces Exhaled
Girl	10	9
Boy	10	10
Woman	19	12
Boy	16	16
Man	28	17

Frequency of Respiration.—

Respiration and pulsation in the adult female is usually a trifle faster than in the male, especially during pregnancy.

Two months to two years.....35 per minute
Two to six years.....23 per minute
Six to twelve years.....20 per minute
Twelve to fifteen years.....18 per minute
Fifteen to twenty-one years, 16-18 per minute

Sighing—The action of sighing arises from very similar causes to those of yawning. But in sighing, the nervous depression is caused by *grief;* while in yawning, it is the result of *fatigue.* In sighing, the effect is generally caused by an *expiration*—in yawning by an *inspiration.* The mind, wearied and weakened by sorrow, omits for a few seconds to continue the respiratory process; and then suddenly there comes an involuntary expiration of the breath, causing a faint sound as it passes the organs of the voice.

Sleep is understood to be that state of the body in which *the relation of the brain to some parts of the body is temporarily suspended.*

There are some parts of the body that *never sleep;* such are the heart, the lungs, the organs of circulation, and those parts of the nervous system that direct their operations.

But when sleep overtakes the system, it seems as if the *relations* of those parts under the control of the will were temporarily suspended; as if, for instance, those nerves which move the arms, the legs, the eyes, the tongue, etc., were all at once unfastened, just as the strings of an instrument are relaxed by the turning of a key, or the throwing down of a bridge over which they were stretched.

What is meant by the suspension of the relation of the brain to some parts of the body, may be thus explained. Notice a man when he sits dozing in a chair; at first his head is held up, the brain controlling the muscles of the neck, and keeping the head erect. But drowsiness comes on, the brain begins to withdraw its influence, and the muscles of the neck becoming as it were "unstrung," the head drops down upon the breast. But the sleep is unsound, and disturbed by surrounding noises. The brain is therefore frequently excited to return its influence to the muscles, and draw up the head of the sleeper. He gives a sudden start, every muscle is tightened in an instant, up goes the head, the eyes open, the ears listen, until a feeling of security and composure returns; the sleep again deepens, *the nervous connection is again withdrawn,* and then down drops the head as before.

Sneezing—We sneeze because particles of matter enter the nostrils and excite the nerves of feeling and of smell. In sneezing, as in coughing, the effort is to free the parts affected from the intrusion of some matters of an objectionable nature. And in this case, as in the former one, there is a very general sympathy of other organs with the part affected, and an energetic effort to get rid of the evil.

Snoring is caused by air sweeping through the passages that lead from the mouth through the nostrils, and which, in our waking moments, are capable of certain muscular modifications to adapt them to our breathing. But as in sleeping the nervous control over them is withdrawn, they are left to the action of the air which, in sweeping by them, *sets them in vibration.*

Weight.—The following scale of normal weights for height is given by Banting:

61 in.	120 lbs.	67 ins.	148 lbs.
61 ins.	120 lbs.	67 ins.	148 lbs.
62 ins.	126 lbs.	68 ins.	155 lbs.
63 ins.	133 lbs.	69 ins.	162 lbs.
64 ins.	136 lbs.	70 ins.	169 lbs.
65 ins.	142 lbs.	71 ins.	174 lbs.
66 ins.	145 lbs.	72 ins.	178 lbs.

Chemical Composition of Man.—Huxley's table on the "Chemical composition of man of the average weight of 154 pounds" was for years the standard, but it has recently been superseded by a new one given out by the French Academy of Sciences. The table is appended.

Elements	Pounds	Ounces	Grains
Oxygen	111	8	0
Hydrogen	21	6	0
Carbon	21	0	0
Nitrogen	3	10	0

Ashes.—When a tree grows it takes up from the earth, by means of its roots, certain minerals called salts. These salts, which all plants need as much as they do air, become a part of the wood of the tree. When a stick of wood is burned, most of it is turned into gas, and goes off into the air. All that is left is the ashes, which cannot burn, as they are only the salts which the tree took up from the earth when growing. If the ashes be spread over the ground, the salts will go back into the earth again, and this is the reason why wood ashes make good manure for land: the salts which have been taken from it by growing plants are given back to it in the ashes, and help other trees and plants to grow. Some kinds of wood give more ashes when burned than others. Willow wood gives more than twice as much as oak, and about one-fourth more than elm. The bark of all trees makes more ashes than the solid wood. The salts found in ashes are valuable and are much used in the arts.

Astrology.—A term originally applied to the science of the heavenly bodies and their supposed influence over human affairs. At the present day, however, the word is limited in its meaning to the doctrine of the influence of the stars over the destinies of men. Astrology is one of the oldest of superstitions, and has been sedulously cultivated by the Egyptians, Chaldæans, Hindus, Chinese, and Etruscans. The Arabs also pursued the study with great zeal from the seventh to the thirteenth century, and it was in great vogue in Italy and France during the sixteenth century. In England it was cultivated by Bede (673-745) and Roger Bacon (1214-1292). Queen Elizabeth (1558-1603) was a dupe of the astrologer Dee, and Lord Burleigh is said to have calculated the nativity of the "Virgin Queen." Sir William Lilly was frequently consulted by Charles I. (1625-1649). Nostradamus was the great astrologer of the sixteenth century, after which time this pseudo-science failed to attract superior minds. The discoveries of Copernicus, Kepler, and Galileo were death-blows to astrology, which, however, continues to exist even at the present day. Astrological almanacs are still published, and fortune-tellers still drive a thriving trade among the ignorant and superstitious.

Aurora Borealis, or northern lights, the bright clouds of light which are often seen in the northern sky in the night. *Aurora* is a Latin word meaning the light of the dawn or morning, and *borealis*, also Latin, means northern; and the two together mean the northern morning-light, because it often looks like the daybreak in the east. It would be better to call it the polar light, because it is seen at the south pole as well as at the north pole. The aurora is sometimes very beautiful, forming across the sky great arches of light through which flash bright streaks of red, blue, green, purple, and yellow flame. It is supposed to be made by electricity or lightning passing through bodies of air of different thickness. A similar appearance may be produced by sending electric sparks through a glass vessel filled with rarefied air.

Barber's Pole.—The spiral red stripe on a barber's pole is said to symbolize the winding of a ribbon or bandage around the arm of a patient upon whom the barber had operated in the capacity of surgeon. In former times, when the operation of bleeding was extensively practiced, blood-letting formed a part of the duties of a barber.

Bay State, Old.—Massachusetts, whose shores are washed by Cape Cod Bay. Prior to the adoption of the United States Constitution Massachusetts was known as "the Colony of Massachusetts Bay."

When first the pilgrims landed on the Bay State's iron shore.
The word went forth that slavery should one day be no more.—*Lowell.*

Beacon Hill.—A famous locality in Boston, Mass. "The old beacon, shown in all the early plans of the town, and which gave the name to Beacon Hill, was erected in 1634-1635 to alarm the country in case of invasion. It stood near the present State House, the exact spot being the southeast corner of the reservoir formerly standing on Temple Street. It was a tall mast, standing on cross timbers placed upon a stone foundation, supported by braces, and was ascended by treenails driven into it; and, 65 feet from the base, projected a crane of iron, from which an iron skeleton frame was suspended, to receive a barrel of tar or other combustibles.

Bears and Bulls.—Words often used in connection with the purchase and sale of stocks. The "bears" are those who seek to depress the value of stocks and securities, while the "bulls" are those whose interests prompt them to act in the other direction.

Birth Stones.—

January, the jacinth or garnet, symbolizing constancy and fidelity.

February, the amethyst, symbolizing peace of mind and sobriety.

March, the bloodstone or jasper, symbolizing courage and success in dangerous enterprise.

April, the sapphire and diamond, symbolizing repentance and innocence.

May, the emerald, symbolizing success in love.

June, the agate, symbolizing long life and health.

July, the carnelian, symbolizing cure of evils resulting from forgetfulness.

August, the sardonyx or onyx, symbolizing conjugal felicity.

September, the chrysolite, symbolizing preservation from folly, or its cure.

October, the aquamarine, opal, or beryl, symbolizing hope.

November, the topaz, symbolizing fidelity and friendship.

December, the turquoise or ruby, symbolizing brilliant success.

Blarney Stone, The.—Blarney is a village in Ireland, in the County of Cork, about five miles from the far-famed city of that name. It is chiefly celebrated as giving the name to a peculiar kind of eloquence which is said to be characteristic of the light-hearted natives of the Emerald Isle. The old castle at Blarney contains the identical stone, the kissing of which is believed to give the person peculiar skill in speech. It is one of those superstitions which can be traced back until the mind of man runneth not to the contrary.

Blue Laws, The Famous Connecticut.—These laws, enacted by the people of the "Dominion of New Haven," became known as the blue laws because they were printed on blue paper. They were as follows:—

The governor and magistrates convened in general assembly are the supreme power, under God, of the independent dominion. From the determination of the assembly no appeal shall be made.

No one shall be a freeman or have a vote unless he is converted and a member of one of the churches allowed in the dominion.

Each freeman shall swear by the blessed God to bear true allegiance to this dominion and that Jesus is the only king.

No dissenter from the essential worship of this dominion shall be allowed to give a vote for electing of magistrates or any officer.

No food or lodging shall be offered to a heretic.

No one shall cross a river on the Sabbath but authorized clergymen.

No one shall travel, cook victuals, make beds, sweep houses, cut hair, or shave on the Sabbath Day.

No one shall kiss his or her children on the Sabbath or feasting days.

The Sabbath Day shall begin at sunset Saturday.

Whoever wears clothes trimmed with gold, silver, or bone lace above one shilling per yard shall be presented by the grand jurors and the selectmen shall tax the estate £300.

Whoever brings cards or dice into the dominion shall pay a fine of £5.

No one shall eat mince pies, dance, play cards, or play any instrument of music except the drum, trumpet or jewsharp.

No gospel minister shall join people in

marriage. The magistrate may join them, as he may do it with less scandal to Christ's church.

When parents refuse their children convenient marriages, the magistrate shall determine the point.

A man who strikes his wife shall be fined £10.

A woman who strikes her husband shall be punished as the law directs.

No man shall court a maid in person or by letter without obtaining the consent of her parents; £5 penalty for the first offence; £10 for the second, and for the third imprisonment during the pleasure of the court.

Blue Stockings.—The term "blue stocking" originated in England about a century ago. Its invention is traced to the days of Doctor Johnson and was applied then as now to ladies who cultivated learned conversation, and found enjoyment in the discussion of questions which had been monopolized by men. It is said by Dr. John Doran, who, in his work "A Lady of the Last Century," gave an account of Mrs. Montagu and the "blue stockings" of her time, that in 1757 it was quite the thing for ladies to from evening assemblies, when they might participate in talk with literary and ingenious men. One of the best known and most popular members of one of these societies was said to have been a Mr. Stillingfleet, who always wore blue stockings, and when at any time he happened to be absent from these gatherings it was usually remarked that "we can do nothing without blue stockings"; and by degrees the term "blue stockings" was applied to all clubs of the kind described, and eventually to the ladies who attended their meetings.

Books, Sizes of.—The name indicates the number of pages in the sheet, thus: in a folio book, 4 pages or 2 leaves = 1 sheet; a quarto, or 4to, has 8 pages or 4 leaves to a sheet; an octavo, or 8vo, 16 pages or 8 leaves to a sheet. In a 12mo, 24 pages or 12 leaves = one sheet, and the 18mo, 36 pages, or 18 leaves = 1 sheet, and so on. The following are the approximate sizes of books:—

Royal Folio	19	inches ×	12
Demy	18	inches ×	11
Super Imp. Quarto (4to)	15 ½	inches ×	13
Royal 4to	12 ½	inches ×	10
Demy 4to	11 ½	inches ×	8 ½
Crown 4to	11	inches ×	8
Royal Octavo	10 ½	inches ×	6 ½
Medium 8vo	9 ½	inches ×	6
Demy 8vo	9	inches ×	5 ½
Crown 8vo	7 ½	inches ×	4 ½
Foolscap 8vo	7	inches ×	4
12mo	7	inches ×	4
16mo	6 ½	inches ×	4
Square 16mo	4 ½	inches ×	3 ½
Royal 24mo	5 ½	inches ×	3 ¼
Demy 24mo	5	inches ×	2 ¾
Royal 32mo	5	inches ×	3
Post 32mo	4	inches ×	2 ½
Demy 48mo	3 ¾	inches ×	2 ¼

Bride, Throwing Shoe after.—The custom of throwing a shoe after a departing bride and groom originated so far back in the dim and mystical past that the memory of man stretcheth not back to its beginning. It is by some thought to typify an assault, and is a lingering trace of the custom among savage nations of carrying away the bride by violence. Others claim that it has a likeness to a Jewish custom mentioned in the Bible. Thus, in Ruth, when the kinsman of Boaz gave up his claim to the inheritance of Ruth, and to Ruth also, he indicated his assent by plucking off his shoe and giving it to Boaz. Also, we read in Deuteronomy that when the brother of a dead man refused to marry his widow she asserted her independence of him by "loosing his shoe."

Bridge.—A roadway over a stream, a valley, or low ground. A bridge for carrying a canal or water to supply a city is called an *aqueduct* (water leader); one over which a railway passes is sometimes called a viaduct (road leader). The first bridges were made of wood by laying beams from one bank of a stream to the other, or, when these were too wide apart, resting them on posts or stone piers in the middle. The Chinese built bridges at a very early date, but it is supposed that the Romans were the first to construct stone bridges, and some of them, more than 2000 years old, are still in use.

Geographical necessities in a country intersected by large and rapid streams compelled the Romans to give much attention to the building of bridges. A splendid bridge was built by Augustus, near Narnia, on the Flaminian road, about 60 miles from Rome. Some of the arches, as is attested by one which is still standing, had a span of 150 and a height of 100 feet; but the greatest of all Roman bridges was that of Trajan across the Danube. It rested on twenty piers 150 feet in height from their foundation, and 170 feet apart, its width being 60 feet. This bridge was destroyed by the next emperor, Hadrian, who pled for his act the danger that the barbarians might get possession of it.

After the fall of the Roman empire not much was done in the way of bridge-building for some centuries. In the twelfth century the order of the Fréres Pontiers was established, and by them the great bridge of Avigon, since destroyed, was built. It was about 3,000 feet long and rested on 18 arches. A bridge built over the Allier in 1454 had an arch 184 feet in span, almost the greatest reached by any existing stone bridge. The span of the Rialto of Venice is 98½ feet. Perronet's bridge over the Seine, at Neuilly, consists of five arches each of 128 span, with a rise of 32 feet.

As wooden bridges are apt to catch fire, those made of iron and steel are now taking their place on railway lines. Among the most wonderful of these are the wrought iron bridge over the Menai Strait, called the Britannia bridge, and the Conway bridge, both in Great Britain, and the Victoria bridge over the St. Lawrence River at Montreal, Canada. These are all what are called tubular bridges, being made of great iron tubes or pipes, through which railway trains run. The Victoria bridge is a huge square iron tube, two miles long, supported on great stone piers.

Among the most remarkable bridges are those not held up from below, but hung on some kind of ropes or chains, and called therefore suspension bridges (Latin *suspendere*, to hang). The Chinese in very ancient times constructed this kind of bridge of iron chains and the Peruvians made them of bark ropes. Modern suspension bridges are built of large and strong cables, of many small wires twisted together. Among the most celebrated suspension bridges are those of Fribourg, which has a span of 880 feet, of Pesth, over the Danube, with a span of 666 feet, of Menai, by Telford, with a span of 570 feet, and that of Niagara, over the St. Lawrence, constructed by Roebling, with a span of 821 feet.

Bridges are sometimes made so that they can be moved in order to let a vessel pass. These are of various kinds; drawbridges are made to raise and lower; swing bridges to turn round on a pivot; and rolling or sliding bridges, to roll backward and forward on little wheels or rollers. Bridges that are to be used for only a little while, like those built by soldiers to cross rivers in time of war, are sometimes made by fastening many small boats together and laying a floor over them. Casks and rafts have also been used for the same purpose. Military bridges are usually supported by floats called pontoons, made of frames of timber covered with copper, tin, leather, tarred sail-cloth, or india-rubber cloth, or of copper cylinders. The pontoons are laid from bank to bank and securely fastened, and the bridge platform is then placed upon them.

Notable Bridges of the World.

Albany, N. Y.—(over the Hudson). Iron drawbridge; length of draw, 400 feet.

Berne, Switzerland.—Over the river Aar, main span, 367 feet.

Blackwell's Island, N. Y. — Crosses East River, steel cantilever, 7,636 feet long; cost $12,500.000.

Bear Mountain Bridge, crossing Hudson River, north of Peekskill, N. Y. for vehicles. Length 2,258 feet. Span 1,632 feet. Completely built in one year, eight months and two days. Cost $6,000,000. Completed 1924.

Britannia Tubular Bridge, carrying the Chester and Holyhead railway across the Menai straits, consists of two parallel rectangular wrought-iron tubes resting on three piers. There are two central spans of 459 feet, and two shore spans of 230 feet. The central pier is built on the Britannia rock, and its erection was begun 1846. The height of the tube within is 30 feet at the center, diminishing to 23 feet at the shore ends. The bridge has a clear headway above high-water of 103¼ feet. The four tubes of the central spans were floated into position and gradually raised to the required height by hydraulic presses.

Brooklyn Bridge.—A wire cable suspension bridge connecting New York with Brooklyn; designed by John A. Roebling, and built by his son, W. A. Roebling. It has a total length of carriageway, 5989 feet, and including extension, 7580 feet, a central span of 1595½ feet, two side spans of 930 feet each, with a clear headway under the center of the bridge of 135 feet above high water; total height of towers above high-water, 278 feet; there are four suspension cables, composed of 5296 galvanized steel wires, bound together, but not twisted; width of bridge, 85 feet; cost, $17,900,000; bridge begun 1870; opened May, 1883.

Cabin John's Bridge, D. C.—Stone aqueduct with span of 220 feet; constructed, 1857-1864 at which time it was the longest stone arch in the world.

Cairo, Ill.—Over Ohio River; steel, 10,560 feet, embracing 50 spans.

Chicago, Ill.—(1) Halsted Street Bridge over Chicago River; most noted lift bridge built, with towers of steel framework, and a suspended truss span. (2) Michigan Avenue bridge, erected in 1918-20, at a cost of fifteen million dollars. It is the largest general traffic double-deck, two leaf bascule bridge in the world. The bridge is 92 feet wide, 340 feet long and weighs 10,000 tons.

Cincinnati and Covington (over the Ohio).—Built 1867; reconstructed, 1897; length, 2,720 feet; suspension.

Cincinnati Iron Truss Railway Bridge (across the Ohio River).—Planned for a double-track railroad and two roadways and two sidewalks in addition. Total structure one mile in length; the center span 550 feet, and two spans flanking the main channel 490 feet each. Caissons sunk in 1887; completed, 1890.

Cleveland, high level bridge crossing Cuyahoga river, 96 feet above water level. Two deck bridge 81½ feet wide, 2,880 feet long, upper level road way 45 feet wide. Twelve concrete arches central span of steel 174 feet between arches.

Clifton, now known as the Upper Arch (over Niagara River). Length, 1,268 feet. Longest single steel arch span in the world. Blown down 1889, rebuilt in 1898, replacing the Niagara and Clifton suspension.

Clifton Suspension Bridge.—A chain bridge cross-

bridge, which was taken down in July, 1862. It is said to have the longest span of any chain bridge in the world (702 feet), and is 250 feet above high-water. Begun in 1862; opened December, 1864.

Danube (near Stadlan, Austria).—Iron suspension; length, 2520 feet.

Douro Bridge, an arched iron structure near Oporto, Portugal, total length, 1150 feet, span of arch, 520 feet, height from low-water to crown of arch, 198 feet.

Delaware River Bridge (Philadelphia).—533-foot span.

Bridge of the Holy Trinity (at Florence, Italy).—Was built in 1569. It is 322 feet long, constructed of white marble, and stands unrivaled as a work of art.

Forth Bridge.—Over the Firth of Forth, Scotland; cantilever; iron and steel; length, nearly two miles, including approaches. Opened March, 1890; cost $15,800,000.

Frieburg Suspension Bridge.—Over the Sarine valley, Switzerland. 870 foot span; 167 feet above the river; built by N. Chaley, 1833-34.

Garabit Viaduct.—Over the Truyere, in the south of France. The total length is 1849 feet; the main portion, 1469 feet in length, is of steel, and consists of five openings of from 170 to 182 feet, spanned by lattice girders and a trellis parabolic arch with a span of 541 feet, and a clear height above the river of 356 feet. The rail level is 401 feet above the river. (Highest bridge in the world.) Designed by M. Eiffel and built without scaffold. Begun, 1879, completed, 1884.

Harlem River Aqueduct (High Bridge). — Stone; length, 1450 feet; semi-circular arch.

Hells Gate Bridge.—17,808 feet long, crossing East River in New York City from Manhattan to Brooklyn. Longest steel arch in the world. Main span 997½ feet. Cost $15,000,000.

Interstate, a vertical lift bridge crossing the Columbia River at Vancouver, between States of Oregon and Washington. It is 3,531 feet long, 150 feet in height. The main span is 275 feet. Completed 1917.

Karlsbrucke (Charles' Bridge), over the Moldau at Prague. Built by Emperor Charles IV. of Germany, 1384. 1855 feet long. Gate towers at either end, ornamented with groups of statuary. Greatly damaged by flood, September, 1890; since repaired.

Kinzua Viaduct (R. R.).—On Bradford branch of New York, Lake Erie and Western R. R., near Bradford, Pa., iron; height, 301 feet; length, 2050 feet.

Loa Viaduct, a lattice girder iron bridge by which the Antofagasta railway of Bolivia crosses the canyon of Loa at an altitude of 10,000 feet above the sea level. The bridge was put together in nine months under the supervision of Peter and John Fisher, who went from England for the purpose.

London Bridge.—One is said to have existed, 978. A bridge built of wood, 1014, was partly burned in 1136. The old London bridge was the first stone bridge. It was commenced in 1176, and completed in 1209. Its founder, Peter of Colechurch, was buried in the crypt of the chapel erected on the center pier.

New London Bridge, designed by John Rennie, and built by his sons, John and George; total cost $7,291,000; length of central span, 152 feet. The first pile was driven 200 feet to the west of the old bridge, March, 1824; the first stone was laid by the lord mayor, alderman Garratt, June, 1825; opened by William IV. and his Queen, August, 1831.

Louisville, Ky. (Over the Ohio).—Length, 5310 feet.

Luxemburg, Germany.—Stone, containing span of 277 feet; largest single arch stone bridge in the world.

Maintenon Aqueduct.—Stone; length 16,367 feet; semi-circular arch.

Manhattan.—A suspension bridge crossing the East River in New York City, 134 feet above high-water. Length is 6855 feet; main span 1470 feet. Cost $17,000,000. Opened for traffic 1909.

Minneapolis Suspension Bridge.—Completed, 1876; length, with approaches, one mile.

Montpellier Aqueduct.—Stone; length, 3214 feet; semi-circular arch.

Niagara Cantilever.—Steel bridge over the Niagara River; length, 910 feet.

Niagara Suspension.—(Now replaced by steel and known as the Lower Arch.) Total length, about 2220 feet; width of span, 821 feet; height above river, 245 feet.

Niagara Falls Suspension Bridge.—Across the gorge, two miles below the falls. Built by John A. Roebling. Length of span between towers, 800 feet; supported by four wire cables, each containing 3640 No. 9 wires; height of track above the water, 245 feet; carriage-way beneath the track; cost of bridge, $400,000; work begun, 1852; first locomotive crossed, March, 1855.

Philadelphia-Camden.—Suspension, Length 8,126 feet; height 135 feet; span 1,750 feet. Cost $29,000-000. Completed 1926.

Poughkeepsie, N. Y. (Over the Hudson River). — Iron cantilever; length, 6767 feet; opened in 1889.

Queensborough, N. Y.—Iron cantilever, 7636 feet in length; here crosses East River; largest cantilever bridge in the world, bearing traffic; cost over $17,-000,000; has four elevated railroad tracks, two promenades, four trolley tracks. Opened, 1909.

Quebec.—Cantilever bridge at Quebec, Canada. Length, 3,240 feet; height, 150 feet; span, 1,800 feet. Completed 1917, at cost of $9,000,000.

Rockville Bridge.—Near Harrisburg, Pa., is the largest four-track stone railway bridge in the world. Length, 3810 feet. It contains forty-eight 70-foot stone arches and cost $1,000,000.

St. Louis (Across the Mississippi).—Minnesota and North Western R. R.; iron; 1825 feet long, draw span 412 feet long, the latter being one of the largest and heaviest in the world. The width on top, between rails, is 50 feet. The piers rest on the bedrock of the river, 136 feet below high-water mark. Captain James B. Eads was the engineer; cost, $10,000,000.

St. Louis Municipal Bridge.—Simple truss, crossing the Mississippi River at St. Louis, Mo. Length is 17,922 feet, length of main span is 668 feet. Height 65 feet. Opened 1913.

Sukkur Cantilever Bridge, crossing the Rori branch of the Indus at Sukkur, with a single span of 790 feet; opened, June, 1889.

Tay Bridge, the longest girder bridge in the world, crosses the Tay at Dundee, Scotland. The original bridge consisted of 85 spans, some over 90 feet above water level, and has a total of length 10,612 feet. Engineer, Sir Thomas Bouch. Over 20 lives lost during its construction. Work commenced, June, 1871; completed, August, 1877; and opened, May, 1878. Partly destroyed by a gale while a N. British mail-train was passing over it; the train and 75 to 90 passengers disappeared, none escaping. A gap of about 3000 feet was made in the bridge.

Tower Bridge.—Steel and masonry draw-bridge across the Thames. A bascule bridge crossing the Thames below London bridge. It has a central opening of 200 feet between two high towers, connected near the top by a fixed foot-bridge 139½ feet above the river and reached by elevators or stairways in the towers. There are two side spans of 270 feet covered by chain suspension bridges, and between the towers, at a height of 29½ feet above high-water, a double bascule, each leaf 100 feet in length and forming a flat arch when down, at a level with the main bridge. Foundation laid in 1886; opened in 1894. Cost, $7,786,400.

Victoria Bridge over the Thames at Pimlico, London, consists of four very wide wrought-iron arches. Begun, 1859; completed, 1860; and widened, 1865-66.

Victoria Bridge, Montreal, one of the most famous in the world, is nearly two miles in length. Was erected by James Hodges under the superintendence of Robert Stephenson and A. M. Ross, engineers. It is about two miles in length and rests on 24 piers, the height being 60 feet above summer level of the river; cost, $3,000,000; work begun, May, 1854; bridge damaged by floating ice while under construction, January, 1855; formally opened by the Prince of Wales, August, 1860. Replaced, 1898-1899, by a pin-connected truss bridge of 25 spans; and in 1906 by a new steel bridge.

Washington Bridge (Across Harlem River valley, N. Y.); two steel arches of 510 feet span; roadway 80 feet wide; length, 2375 feet; height above the Harlem River, 136 feet; built, 1886-89. Cost, $2,850,000.

Waterloo Bridge (Over the Thames at London.) Length within abutments, 1242 feet; width within balustrades, 42 feet; span of each arch, of which there are nine, 120 feet. It was opened on the anniversary of the Battle of Waterloo, the duke of Wellington and others being present, June, 1817. Cost, 2,400,000.

Westminster Bridge.—Old bridge was built of Portland stone, after a design of M. Labelye. Begun, 1738; opened for passengers, 1750; length, 1223 feet; cost $2,150,000; commissioners of works empowered to rebuild, 1853; one-half of the bridge opened early in 1860, the whole, 1862.

Williamsburg.—Across East River, connecting Manhattan and Brooklyn. Total length, 7308 feet; main span, 1600 feet; width, 118 feet; height above mean-high water, 135 feet; cost, $12,000,000, exclusive of real estate. Begun, 1897.

British Lion.—This term symbolizes the spirit of pugnacity of the British nation, as opposed to "John Bull," which symbolizes the substantiality, obstinacy, and solidity of the British nation, with all its prejudices and national peculiarities. To rouse John Bull is to tread on his corns; to rouse the British lion is to blow the war-trumpet in his ears.

Brother Jonathan is a collective personification of the people of the United States. When General Washington, after being appointed commander of the army of the Revolutionary war, came to Massachusetts to organize it and make preparations for the defense of the country, he found a great want of ammunition and other means necessary to meet the powerful foe he had to contend with, and great difficulty to obtain them. If attacked in such condition, the cause at once might be hopeless. On one occasion, at that anxious period, a consultation of the officers and others was had, when it seemed no way could be devised to make such preparation as was necessary. His excellency, Jonathan Trumbull, the elder, was then governor of the state of Connecticut, on whose judgment and aid the General placed the greatest reliance, and remarked: "We must consult Brother Jonathan on the subject." He did so, and the governor was successful in supplying many of the wants of the army. When difficulties afterward arose, and the army was spread over the country, it became a by word, "We must consult Brother Jonathan."

Bunker Hill Monument.—The corner stone of this monument was laid on the fiftieth anniversary of the battle of Bunker Hill, June 17, 1825, by Lafayette, and the oration was pronounced by Daniel Webster. It is a square shaft of Quincy granite, 221 feet high, 31 feet square at the base, and 15 feet at the top. Inside the shaft is a round, hollow cone, 7 feet wide at the bottom, and 4 feet 2 inches at the top, encircled by a winding staircase containing 224 stone steps, which lead to a chamber 11 feet in diameter immediately under the apex. The chamber has four windows, and contains two cannons, named Hancock and Adams, respectively, which were used in the war. The monument was completed and was dedicated June 17, 1843.

Bury the Hatchet.—Let by-gones be by-gones. The "Great Spirit" commanded the North American Indians, when they smoked the calumet or peace-pipe, to bury their hatchets, scalping-knives and war-clubs in the ground, that all thought of hostility might be buried out of sight.

Buried was the bloody hatchet;
Buried was the dreadful war-club;
Buried were all warlike weapons,
And the war-cry was forgotten:
Then was peace among the nations.

LONGFELLOW, *Hiawatha*

Carpet-baggers.—Corrupt and often ignorant politicians—mostly from the North—who flocked to the South during the era of reconstruction. They were uniformly "on the make," and were responsible for much of the venality and rascality that disgraced that period of the history of the South.

Caste Among the Hindoos.—Caste is a term applied to the division into social classes in India. To each of these classes certain pursuits are limited by the Laws of Manu, B. C., 960.

1. The *Brahmans* or sacerdotal class, which "issued from the mouth of Brahma."

2. The *Chuttree* or military class, which "sprang from the arm of Brahma."

3. The *Bais* or mercantile class, which "sprang from the thigh of Brahma."

4. The *Sudras* or servile class, which "sprang from the foot of Brahma."

The *Pariahs* and *Chandalas* are nobodies or worse, for it is a pollution to be touched by such "scum of the earth."

CALENDAR FOR READY REFERENCE

For ascertaining any Day of the Week for any given Time within Two Hundred Years from the introduction of the New Style, 1753 to 1952, inclusive.

YEARS 1753 TO 1952								Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.

Note.—The letters in the list of "Years from 1753 to 1952," refer to the table headed with the Month, the figures in which refer to the same figures at the head of the table of Days. For example: To know on what day July 4, 1911, fell, look for 1911 in the table of Years. The letter "f" is attached. Look for the same letter in the table of Months and in a parallel line under July is the figure 6, which directs to column 6 in the table of Days below, in which it will be seen that July 4, 1911, fell on Tuesday.

TABLE OF DAYS

Wednesday	31	Thursday	31	Friday	31	Saturday	31	SUNDAY	31	Monday	31	Tuesday	31

Center of Area and Population of the United States.—The center of area of the United States, excluding Alaska and Hawaii and other recent accessions, is in northern Kansas, in approximate latitude 39 degrees, 55 minutes, and approximate longitude 98 degrees, 50 minutes.

The center of population, indicated below, is, therefore, about three-fourths of a degree south and more than thirteen degrees east of the center of area.

Date	Center of Population Approximate Location of Important Towns	Westward Movement During Preceding Decade Miles
1790	23 miles east of Baltimore, Md.	..
1800	18 miles west of Baltimore, Md.	41
1810	40 miles northwest by west of Washington, D. C.	36
1820	16 miles north of Woodstock, Va.	50
1830	19 miles W. S. W. of Moorfield, in the present State of W. Va.	39
1840	16 miles south of Clarksburg, in the present State of W. Va.	55
1850	23 miles S. E. of Parkersburg, in the present state of W. Va.	55
1860	20 miles south of Chillicothe, Ohio	81
1870	48 miles east by north of Cincinnati, Ohio	42
1880	8 miles west by south of Cincinnati, Ohio	58
1890	20 miles east of Columbus, Ind.	48
1900	6 miles southeast of Columbus, Ind.	14
1910	Bloomington, Ind.	39
1920	1.9 miles west of Whitehall, Ind.	9.8

Chalk, a soft kind of limestone or carbonate of lime. It is composed almost entirely of the shells of little sea animals, which in the course of ages have become packed together so closely, and in such immense numbers, that in some parts of the world they form vast cliffs twenty times the height of a house. Though generally yellowish-white, it is sometimes snow-white in color. It is usually soft, but is often hard enough to be employed for building purposes. When burned it makes excellent lime for *mortar*, and a good manure; and when ground and purified by washing it is called whiting or Spanish white, with which metals and glass are polished. Chalk is given as a medicine, and is used for cleaning the teeth, as well as for marking on black-boards.

Character by the Month.—Here is an old astrological prediction, said to indicate, with tolerable certainty, the character of the girl according to the month she happens to be born in:

If a girl is born in January, she will be a prudent housewife, given to melancholy, but good-tempered.

If in February, a humane and affectionate wife and tender mother.

If in March, a frivolous chatterbox, somewhat given to quarreling.

If in April, inconstant, not intelligent, but likely to be good-looking.

If in May, handsome and likely to be happy.

If in June, impetuous, will marry early, and be frivolous.

If in July, passably handsome, but with a sulky temper.
If in August, amiable and practical, and likely to marry rich.
If in September, discreet, affable, and much liked.
If in October, pretty and coquettish, and likely to be unhappy.
If in November, liberal, kind, of a mild disposition.
If in December, well proportioned, fond of novelty, and extravagant.

Christmas Tree.—The Christmas Tree, which has become an almost universal symbol, and is by most persons supposed to have originated in Germany, had its origin in Egypt at a period long before the Christian era. The palm-tree is known to put forth a branch every month, and a spray of this tree, with 12 shoots on it, was used in Egypt at the time of the winter solstice, as a symbol of the year completed.

Cities, Soubriquets of.—Certain cities have received popular appellations because of their identification with particular religious beliefs, observances, educational or literary pre-eminence, topography, resemblances to other cities, location, dominant industries, surroundings, and other reasons. Among such are the following:

Aberdeen, Scotland.—Granite City, from the prevalence and use of this stone.

Agra, India.—Rome of Hindustan. It was the seat of the Mohammedan empire in India, and its ancient structures are on a scale of great magnificence.

Alexandria, Egypt.—(1) Delta City, from the delta of the Nile. (2) Mother of Books, because there was deposited the largest collection of books ever gathered together prior to the invention of printing.

Allahabad, India.—Holy City of the Indian Mohammedans.

Amiens, France.—Little Venice, because it is so intersected by different branches of the Somme and the numerous bridges over them, as to have moved Louis XI. to bestow on it the above name.

Antioch.—(1) Queen of the East, because it was formerly the capital of Syria, and the place of residence of the Macedonian kings and Roman governors. (2) Mother of Christian Mission. From thence (Acts xiii, 1-3) Paul started on his first missionary journey.

Aquiljar, Austria.—Second Rome, because in the time of the Romans it was the entrepôt and commercial centre of northern and western Europe, and the Emperor Augustus often resided there. It was taken and burned by Attila, at which time its population was reckoned at 100,000.

Athens, Greece.—(1) The Violet Crowned, so named by Pindar, in allusion to the violet crowns offered to the god at the Dionysiac festivals. It soon became a stock phrase, and, according to Aristophanes, every stump orator could win over his audience by judicious use of "violet-crowned city," or "ancient violet-crowned Athens."

(2) Religious City, a name given by the old writers. It is said that there were thirty thousand temples, statues, and sacred places dedicated to worship of the heathen gods.

(3) Eye of Greece, because the most renowned of Greek Cities.

> Athens the eye of Greece, mother of arts
> And eloquence, native to famous wits
> Or hospitable.
>
> Milton, *Paradise Regained*, Book iv.

Atlanta, Ga.—The Gate City, so named by Jefferson Davis during the Civil war, it being, in his estimation, the most important inland position, from a military point of view, in the South.

Baalbec, Syria.—City of the Sun, the Heliopolis of the Greeks, is often referred to by this title, which is a translation of its two names. It is celebrated for its superb ruins, yet extant, of an ancient temple dedicated to the sun.

Bagdad, Arabia.—City of Peace.

Balkh (the ancient Bactra), Central Asia.—Mother of Cities, so named by Orientals in allusions to its great antiquity. The modern town covers but a fraction of the surface embraced by the ancient city, the remains of which cover a space twenty miles in circumference.

Baltimore, Md.—Monumental City. It contains the Washington and Battle monuments and many others; whence its title.

Berlin, Prussia.—City of Intelligence, from its numerous intellectual institutions.

Binghampton, N. Y.—Parlor City; name given by its admirers because finer homes and better kept lawns are seldom seen than line some of its streets.

Birmingham, Ala.—Magic City, so named on account of its rapid rise into size and prominence.

Birmingham, England.—The Midland Capital, from its geographical location.

Bokhara, Asia.—Treasury of Sciences, from its position as an Asiatic center of learning. It has 103 colleges with 10,000 students, besides a host of schools and 360 mosques.

Bologna, Italy.—The Fat City. In the days of the Italian Republics the city of Bologna was so named.

Boston, Mass.—(1) Athens of America, because famed alike for its institutions of learning and for the high order of the intelligence and culture of its citizens.

(2) City of "Notions," numerous manufactured articles of all kinds commanding a large sale.

(3) Tri-Mountain City, from the three hills on which it was originally built.

(4) Hub of the Universe; a humorous appellation popularly applied, originated with Dr. O. W. Holmes.

> Boston State-house is the hub of the solar system. You couldn't pry that out of a Boston man if you had the tire of all creation straightened out for a crowbar.—*The Autocrat of the Breakfast-table.*

Batavia, in Java.—Queen of the East, being the metropolis of the Dutch East Indian possessions.

Benares, India.—Holy City of the Hindus.

Brighton, England.—Queen of Watering Places, "London-super-Mare."

Brisbane, Australia.—Montpellier of Australia, so named on account of the salubrity of its climate.

Brooklyn.—City of Churches, from the number of churches it contains.

Buffalo, N. Y.—Queen City of the Lakes, because of its commanding position on the great lakes, and of much commercial importance.

Calcutta, India.—City of Palaces, from the large number of elegant residences.

Chicago.—(1) Garden City, from the number and beauty of its private gardens; (2) Windy City from the constant winds blowing from the lakes.

Cincinnati.—Queen City, so called when it was the commercial metropolis of the Middle West.

Cleveland.—Forest City from the number of trees on its streets.

Cologne, Germany.—(1) City of the Three Kings, in reference to the old legend which makes Cologne the burial place of Balthazar, Melchoir, and Jasper, the "wise men of the East."

(2) Rome of the North, so called (says Hope) in the Middle Ages, from its wealth, power, and ecclesiastical foundations.

Columbus, Ohio.—The Arch City.

Constantinople.—City of the Golden Horn.

Cordova, Spain.—Athens of the West; under its Mohammedan rulers it attained great eminence in the domain of letters.

Cork, Ireland.—Athens of Ireland, because it was the domicile or the birthplace of many erudite and eminent Irishmen.

Cusco, Peru.—Holy City of the Ancient Incas.

Denver, Colo.—Queen of the Plains.

Detroit.—City of the Straits, from its location on the straight connecting Lake St. Clair and Lake Erie.

Dresden, Saxony.—(1) Elbe Florence, so called from the important part which the river Elbe plays in the city's life and topography.

(2) German Florence, so named for its wealth in works of art and scientific treasures.

Duluth, Minn.—Zenith City of the Unsalted Seas; thus named by Proctor Knott in a famous speech in Congress.

Edinburgh.—(1) Auld Reekie, so named on account either of (a) its filthy and ill-smelling thoroughfares, or (b) the canopy or cloud of smoke that seems to overhang the city when viewed from a distance.

(2) Maiden Town. An old legend has it that it was to this place the fair daughters of the Pictish monarchs were consigned for safety in time of war.

(3) Modern Athens. It is the headquarters of learning in Scotland; as a literary town it is second only to London, and it is the seat of the supreme courts of Scotland. The good taste and culture of its people are marked. It contains a great university and many schools, and it is famed for the many distinguished men who have been born or who have resided there. Lastly, its topographical situation is very similar to that of its ancient namesake.

Florence, Italy.—(1) Lily of the Arno; (2) The Gentle. In the palmy days of the Italian republics Florence was so named. "In the mouth of an Italian this adjective includes all the amenities and agreeableness resulting from a high state of civilization."

Galway, Ireland.—City of the Tribes, because, in 1235, there settled here thirteen clans, named Athy, Blake, Browne, Budkin, Burke, D'Arcy, Ffont, Joyce, Kirwan, Lynch, Martin, Morris and Skerrett.

Geneva, Switzerland.—Rome of Protestantism. Under the guidance of Calvin and his associates it became a stronghold of the Reformation.

Hannibal, Mo.—Bluff City, from its location on the bluffs of the Missouri River.

Holyoke, Mass.—Paper City. It has the most extensive paper mills in the world.

Iglesias, Sardinia.—City of the Mines, on account of the magnitude of its mining operations.

Indianapolis.—Railroad City, from its being a great railroad center.

Italian Cities.—In the days of the Italian republics the chiefs of the sisterhoods of cities were known by some special epithet, supposed to be descriptive of their peculiar charms or of the idiosyncrasies of their inhabitants. Thus we have Naples, the Beautiful; Rome the Eternal City; Genoa, the Superb; Lucca, the Industrious; Padua, the Learned; Bologna, the Fat; and Florence, the Gentle.

Jerusalem.—(1) City of Peace; its ancient name, Salem, signifies "peace;" (2) Holy City of the Jews and Christians; (3) City of the Great King, so named in the Scriptures; (4) City of David, so named by King David, who captured it from the Canaanites, 1049, B. C.

Keokuk, Iowa.—Gate City, from its situation at the foot of the Mississippi Rapids.

Liverpool.—The Modern Tyre.

Lhasa, Thibet.—Rome of Buddhism. It is the "holy city" of the Buddhists in Asia.

London.—(1) City of Masts, so named from the spectacle presented by its vast array of shipping.

(2) Modern Babylon. In point of size it is the greatest in the modern world, as Babylon is believed to have been of the ancient. But there is also an allusion in the term to the luxury and licentiousness common to both cities.

(3) Lud's Town. So called after Lud, a mythical king of Britain.

> And on the gates of Lud's town set your heads.—Shakespeare, *Cymbeline.*

Louisville, Ky.—Falls City, from the falls of the Ohio River, here located.

Lowell, Mass.—City of Spindles, from its large manufacturing interests.

Lucknow, India.—City of Roses, because embowered with them.

Lynchburg, Va.—Hill City; Tobacco City; tobacco is one of the chief staples of trade.

Manchester, England.—Cottonopolis, on account of its extensive manufactures of cotton.

Mecca, Arabia.—Holy City of the Mohammedans.

Medina, Arabia.—Prophet's City. To this place Mohammed fled for refuge during the Hegira, July 16, 622, and here is his tomb.

Mero, Turkestan.—Queen of the World, because of its pre-eminent situation.

Milan, Italy.—Little Paris, in allusion to its similarity to the Gallic capital in point of gaiety and dissipation.

Minneapolis.—Flour City, from its extensive flour mills.

Montreal, Canada.—Island City. It is built on an island of the same name.

Moscow, Russia.—Holy City of the Russians or Slavs.

Nashville, Tennessee.—City of Rocks, from its natural surroundings.

New Haven.—City of Elms, from the great number of these trees it contains.

New Orleans.—Crescent City, from its position on a curve of the Mississippi.

Newport, R. I.—(1) City by the Sea, famous as a fashionable summer resort; (2) City of Mansions.

New York.—(1) Empire City, from its being the chief city of the United States.

(2) Gotham, a colloquial term applied in "Salmagundi" by Washington Irving and James K. Paulding, and is supposed to hint sarcastically at the worldly wisdom of its inhabitants.

Paris.—City of the Lily, or City of Louis.

Pernambuco, Brazil.—City of the Reef; the harbor is protected by an extensive reef of rocks.

Perth, Scotland.—The Fair City, because elegantly built and picturesquely situated.

Philadelphia.—(1) City of Brotherly Love, from the meaning of the name.

(2) Quaker City, planned and colonized by William Penn and other members of the Society of Friends.

(3) City of Homes. So named on account of the large number of private dwellings it contains, and the almost total absence of tenement-houses.

Pittsburg, Pa.—Iron City, from the extent of its iron manufactures; and Smoky City, from the smoke which overhangs it.

Portland, Me.—Forest City, from the number of trees in its streets.

Rochester, N. Y.—Flower City, from the profusion of flowers and extensive nurseries there.

Rome.—(1) Holy City; (2) City of Seven Hills; (3) Mistress of the World; (4) Imperial City; (5) City of Palaces.

Santa Fe.—City of the Holy Faith.

San Francisco.—City of the Golden Gate.

Salt Lake City.—City of the Saints; here is located the headquarters of the Mormon hierarchy, "the Church of Latter-Day Saints of Jesus Christ."

Seattle, Wash.—Queen City of Puget Sound.

Seven Cities, The.—Egypt, Jerusalem, Babylon, Athens, Rome, Constantinople, and either London or Paris. They are often grouped under this title, as embodying wealth, antiquity, greatness and magnificence.

Sheraz, Persia.—Athens of the East. It has numerous colleges, and anciently was the home of poetry and the arts. It gave birth to more distinguished Persian poets than any other Persian city.

If Mohammed had tasted the pleasures of Sheraz, he would have begged of Allah to make him immortal there.—*Persian Saying.*

St. Louis, Mo.—Mound City, from the artificial mounds found there.

St. Petersburg.—(1) City of Perspectives; its streets and quays are famous for the long vistas they present; (2) City of Snow; for nine months in every year it is shrouded in a canopy of snow.

Springfield, Mass.—City of Homes, from the many people who own their own homes.

Springfield, Ohio.—Flower City, from the beauty of its surroundings.

Thessalonica (Modern Salonica).—Orthodox City. It was for centuries a bulwark of Christianity, but in 1430 was captured by Amurath II.

Venice.—City of St. Mark; City of the Seventy Isles.

Washington.—City of Magnificent Distances, from its being laid out on a large and regular scale.

Worcester, Mass.—The Faithful City, so called from its motto: *Floreat Semper Civitas Fidelis.*

Coal.—A carbonaceous mineral substance, black, shiny or dull, easily broken, often splintery, inflammable, and used for fuel. It is composed of carbon (75 per cent), hydrogen, oxygen, and some nitrogen, with siliceous and other earthy impurities (ash). It consists of compressed and chemically altered vegetable matter, chiefly extinct kinds of lycopodiaceous trees. As the successive jungle-growths accumulated their stems, leaves, and spores, hydrogen and oxygen were evolved with some of the carbon. The relative proportion of carbon in the mass was increased, the woody fiber reduced in volume to one-ninth, or even one-fifteenth, of its original bulk, and the mass became black, shiny hydrocarbons, with imbedded charcoal ("mother-coal"), due to decomposition of trees lying exposed to the air, or dull black hydrocarbons, resulting from the consolidation of decomposed vegetable pulp, like soft peat.

Dana divides what may be called the species, termed by him Mineral Coal, into the following varieties: (1) Anthracite, (2) Native Coke, (3) Caking Coal, (4) Non-caking Coal, (5) Cannel Coal (Parrot Coal), (6) Torbanite, (7) Brown Coal (Lignite), (8) Earthy Brown Coal, (9) Mineral Charcoal. The first variety has only three-forty-sixths per cent of bituminous matter, the second has none, and the rest vary in this respect.

Coke.—There are two kinds of coke—gas coke and coke which is made in heaps or ovens. Coke is charred bituminous coal, just as charcoal is charred wood, and it consists only of carbon mixed with some earthy matters. When it is charred in heaps the coal is piled up in a stack, which is sometimes round and sometimes oblong, with openings left for the air. Fire is then set to it, and it is allowed to burn until smoke no longer rises from it. The air holes are then stopped by covering the heap with coal dust, and the coke is left to cool. During the burning, smoke, watery vapor, coal gas, and coal tar are given off, and the remainder is coke. A better way to make coke is to char the coal in great ovens built of firebrick for the purpose. The coal is put in at the top, and a little air let in at openings in the front. As soon as the smoky vapor ceases to pass off, the oven is tightly closed and allowed to cool for a day. The coke is then raked out, and if still aglow the fire is put out with water.

Coke is lighter than coal, and porous, or full of little holes. When used as a fuel it gives a great and steady heat without smoke, and leaves but little ashes. It is largely used in countries where anthracite coal is lacking, in furnaces for smelting metals and in furnaces where smoke is not wanted.

Congressional Gold Medals.—Awarded by Special Act of Congress.

George Washington.—The Capture of Boston 1776
Horatio Gates.—Surrender of the British Army 1777
Anthony Wayne.—Capture of Stony Point 1779

Crescent.—According to tradition, "Philip, father of Alexander, meeting with great difficulties in the siege of Byzantium, set the workmen to undermine the walls, but a crescent moon discovered the design, which miscarried; consequently the Byzantines erected a statue to Diana, and the crescent became the symbol of the state." By another legend, Othman, the sultan, saw in a vision a crescent moon, which grew until it reached from east to west, whereupon he adopted the crescent for his standard.

Death Sentence Passed Upon Jesus Christ.—The following is a copy of the most memorable judicial sentence which has ever been pronounced in the annals of the world—namely, that of death against the Savior, the knowledge of which must be interesting in the highest degree to every Christian. The sentence is word for word as follows:—

SENTENCE PRONOUNCED BY PONTIUS PILATE, INTENDENT OF THE PROVINCE OF LOWER GALILEE, THAT JESUS OF NAZARETH SHALL SUFFER DEATH BY THE CROSS. IN THE SEVENTEENTH YEAR OF THE REIGN OF THE EMPEROR TIBERIUS AND ON THE 25TH OF THE MONTH OF MARCH, IN THE MOST HOLY CITY OF JERUSALEM, DURING THE PONTIFICATE OF ANNAS AND CAIAPHAS, PONTIUS PILATE, INTENDANT OF THE PROVINCE OF LOWER GALILEE, SITTING IN JUDGMENT IN THE PRESIDENTIAL SEAT OF THE PRÆTORS, SENTENCES JESUS CHRIST OF NAZARETH TO DEATH ON A CROSS BETWEEN TWO ROBBERS, AS THE NUMEROUS AND NOTORIOUS TESTIMONIALS OF THE PEOPLE PROVE:—1. JESUS IS A MISLEADER. 2. HE HAS EXCITED THE PEOPLE TO SEDITION. 3. HE IS AN ENEMY TO THE LAWS. 4. HE CALLS HIMSELF THE SON OF GOD. 5. HE CALLS HIMSELF FALSELY THE KING OF ISRAEL. 6. HE WENT INTO THE TEMPLE FOLLOWED BY A MULTITUDE CARRYING PALMS IN THEIR HANDS. ORDERS:—THE FIRST CENTURION, QUINTUS CORNELIUS, TO BRING HIM TO THE PLACE OF EXECUTION, FORBIDS ALL PERSONS, RICH OR POOR, TO PREVENT THE EXECUTION OF JESUS. THE WITNESSES WHO HAVE SIGNED THE EXECUTION AGAINST JESUS ARE:—1. DANIEL

The sentence is engraved on a plate of brass in the Hebrew language, and on its sides are the following words:—"A similar plate has been sent to each tribe." It was discovered in the year 1280 in the city of Aquill (Aquilla,) in the kingdom of Naples, by a search made for the discovery of Roman antiquities, and remained there until it was found by the Commissaries of Art in the French army of Italy. Up to the time of the campaign in

*Order in which they signed. †Age at death.

Southern Italy it was preserved in the sacristy of the Carthusians, near Naples, where it was kept in a box of ebony. Since then the relic has been kept in the Chapel of Caserta. The Carthusians obtained by their petitions that the plate might be kept by them, which was an acknowledgment of the sacrifices which they made for the French army. The French translation was made literally by members of the Commission of Arts. The above account still obtains some currency, but is without any historical basis.

Dew.—Moisture condensed from the atmosphere upon the surface of certain bodies. The higher the temperature the more aqueous vapor can the atmosphere retain in solution. The diminution, therefore, of heat, which takes place when day is succeeded by night, in many cases renders the air incapable of retaining some of the moisture which it held in the form of vapor during the day. This is deposited on any bodies which at the time are colder than the adjacent atmosphere. It scarcely ever happens that the air is saturated with vapor, or, as it is more correctly worded, that the aqueous vapor is in the condition of greatest possible density for the temperature. As Aristotle long ago observed, dew is deposited chiefly on calm and serene nights. It is more plentiful in spring and autumn than in summer. A cloudy night interferes with the condensation, for the clouds intercept radiation from the earth, and, in many cases, prevent the temperature falling to the dew-point. Dew when congealed becomes hoar-frost.

in the custom of finding two sureties on arresting a person, who were bound over in heavy penalties that the Pursuer should prove the justice and the legality of his claim; otherwise, the Pursued should receive indemnity from the parties thus bound over. This custom, however, in process of time, degenerated into the mere nominal recognizances or sureties of "John Doe and Richard Roe." In 1852, these two celebrated characters ceased to have any legal existence.

Dollar Mark, $.—Writers are not agreed as to the derivation of this sign to represent dollars. Some say it comes from the letters U. S., which after the adoption of the Federal Constitution, were prefixed to the federal currency, and which afterward, in the hurry of writing, were run into one another, the U being made first and the S over it. The more probable explanation is that it is a modification of the figure eight, and denotes a piece of eight reals, or, the dollar which was formerly divided into eight parts. It was then designated by the figures 8-8.

Dixie.—Popularly applied to the States south of Mason and Dixon's line, the former boundary of slavedom. Also, in folklore, a fabulous realm of peace, plenty, and indolence, whose charms form the burden of many a negro melody. Brewer says that a Mr. Dixie was a slaveholder of Manhattan Island, compelled by public opinion to remove his human chattels to the South. In their new abode they had to toil ceaselessly, and often sighed for their old home at the North, which lapse of time and distance invested with a halo of paradisaic pleasures. This "Dixie Land" became to the entire colored race in the South a species of Utopia, similar to the Scottish "Land 'o the Leal" or the Fortunate Islands of the ancients.

Doe, John, and Roe, Richard.—Formerly, two well-known names representing a species of legal fiction. They originated

Draconian Laws.—In modern parlance, statutes of unusual severity. The laws of Draco, enacted by him when archon of Athens (B. C. 621), on account of their rigor were said to be written in blood. This code was set aside by the laws of Solon B. C. 594, which were founded on the principle of making *property*, not *birth*, the title to the honors and offices of the state.

Eagle.—Is chosen to support the lectern, or reading-desk, in churches, because the eagle is the natural enemy of the serpent. The two Testaments correspond to the outspread wings of the eagle. In royal banners, we find it as the ensign of the ancient kings of Babylon and Persia, of the Ptolemies, Seleucides, and Romans. The French under the empire adopted the same device. The *two-headed eagle* signifies a double empire, assumed by Austria, which claims to be the successor of the Caesars and Charlemagne; in 802 the second head was added to her standard, on the union of Rome and Germany. Russia, by virtue of uniting Poland to her possessions, has the same emblem. It was first used by Constantine. The *golden eagle* and the *spread eagle* descend to us from the Crusades, where they were first employed by the emperors of the East.

Earthquake.—A quaking, vibratory, undulating, or other movement of a portion of the earth's crust produced by forces acting from beneath. Certain premonitory symptoms are believed to herald the approach of a great earthquake. These are: irregularities in the seasons, sudden gusts of wind interrupted by dead calms; violent rains at unusual seasons, or in countries where they rarely occur; a reddening of the sun's disc and a heaviness in the air continuing, it may be, for months; an evolution from the soil of electric matter, inflammable gas, with sulphurous and mephitic vapors; subterranean noises like those of carriage-wheels, artillery, or thunder; cries of distress emitted by animals; and drowsiness with a feeling of seasickness in men.

When the fatal moment arrives, the ground at some spot is heaved up, and becomes the center of vibration or undulations, reminding us of those produced by the ripple wave propagated in a continually enlarging circle around the spot where a pebble has been cast into a pond. The earth swells and heaves like a rolling sea; cracks and rents are produced in all directions, like those on a window pane. Great funnel-like holes yawn open. New lakes are formed. The houses and other erections may, with their inhabitants, be destroyed over the greater part of a city in a few moments, though it is a suggestive fact that this destruction is often limited to those built on one geological stratum. Precipitous cliffs fall into adjacent seas or rivers, in the latter case more or less damming them up and producing floods. Landslips take place with similar consequences. Cattle feeding on cliffs fall into the sea and are drowned. The sea becomes agitated, and after first receding from the land, then rolls in upon it with a wave of enormous height. This is more especially the case if the focus of agitation be beneath the sea. The sensation on board ship when an earthquake occurs is as if the vessel had struck a rock.

There are certain regions to which both the points of volcanic eruption and the movements of great earthquakes are confined. The two, therefore, have probably a common origin, steam, molten matter, etc. which have forced exit to the external atmosphere, generating a volcano, and similar explosive material still seeking for vent, producing an earthquake. Connected with the latter, as with the former, are such phenomena as the ejection from the ground of torrents of water discolored by mud, and emitting mephitic vapors which, if intense, are fatal to animal life. Not uncommonly, an old volcano goes into eruption, or, more rarely, its upper part and crater fall in and a new one is generated in the midst of an earthquake. Great upheavals of land are its normal effects, though in exceptional cases there are subsidences instead of elevation.

It is supposed that, on a very moderate estimate, an earthquake occurs somewhere every day. What runs up the number of such occurrences is that there is generally a series of shocks at a place instead of a single one. Most of these are on a small scale; but others affect a wide area, and are most destructive.

Notable Earthquakes.

B. C.
- One which made Euboea an Island..... 425
- Ellice and Bula, in Peloponnesus, swallowed up..... 372
- One at Rome, when, in obediance to an oracle, M. Curtius, armed and mounted on a stately horse, leaped into the dreadful chasm it occassioned (*Livy*)..... 358
- Duras, in Greece, buried, with all its inhabitants; and twelve cities in Campania also buried..... 345
- Lysimachia and its inhabitants totally buried..... 283

A. D.
- Ephesus and other cities overturned.... 17
- One accompanied by the eruption of Vesuvius; the cities of Pompeii and Herculaneum buried..... 79
- Four cities in Asia, two in Greece, and two in Galatia overturned..... 107
- Antioch destroyed..... 115
- Nicomedia, Cæsarea, and Nicæa overturned..... 126
- In Asia, Pontus, and Macedonia, 150 cities and towns damaged..... 357
- Nicomedia again demolished, and its inhabitants buried in its ruins..... 358
- One felt by nearly the whole world..... 543
- At Constantinople; its edifices destroyed, and thousands perished..... 557
- In Africa; many cities overturned..... 560
- Awful one in Syria, Palestine, and Asia; more than 500 towns were destroyed and the loss of life surpassed all calculations..... 742
- In France, Germany, and Italy..... 801
- Constantinople overturned; all Greece shaken..... 936
- One felt throughout England..... 1089
- One at Antioch; many towns destroyed, among them Mariseum and Mamistria..... 1114
- Catania, in Sicily, overturned, and 15,000 persons buried in the ruins... 1137
- One severly felt at Lincoln..... 1142
- At Calabria; one of its cities and all its inhabitants overwhelmed in the Adriatic Sea..... 1186
- One again felt throughout England; Glastonbury destroyed..... 1274
- In England; the greatest known there.. 1318
- At Naples, 40,000 persons perished..... 1456
- At Lisbon; 1,500 houses and 30,000 persons buried in the ruins; several neighboring towns ingulfed with their inhabitants..... 1531
- On felt in London; part of St. Paul's and the Temple churches fell..... 1580
- In Japan; several cities made ruins, and thousands perished..... 1596
- Awful one at Calabria..... 1638
- One in China, when 300,000 persons were buried in Pekin alone..... 1662
- One severely felt in Ireland..... 1690
- One at Jamaica, which totally destroyed Port Royal, whose houses were ingulfed forty fathoms deep, and 300 persons perished..... 1692
- One in Sicily, which overturned fifty-four cities and towns, and 300 villages. Of Catania and its 18,000 inhabitants not a trace remained; more than 100,000 lives were lost..... 1693
- Palermo nearly destroyed; 6,000 lives lost..... 1726
- Again in China; and 100,000 people swallowed up at Pekin..... 1731
- In Hungary; a mountain turned round. 1736
- One at Palermo, which swallowed up a convent; but the monks escaped..... 1740
- Lima and Callao demolished; 18,000 persons buried in the ruins..... 1746
- In London; a slight shock, February 8th; but severer shock, March 8th..... 1750
- Adrianople nearly overwhelmed..... 1752
- At Grand Cairo; half of the houses and 40,000 persons swallowed up..... 1754
- Quito destroyed..... 1755
- Great earthquake at Lisbon. In about eight minutes most of the houses and upward of 50,000 inhabitants were swallowed up, and whole streets buried. The cities of Coimbra, Oporto, and Braga suffered dreadfully, and St. Ubes was wholly overturned. In Spain, a large part of Malaga became ruins. One-half of Fez, in Morocco, was destroyed, and more than 12,000 Arabs perished there. About half of the Island of Madeira became waste; and 2,000 houses in the Island of Mytilene, in the Archipelago, were overthrown. This awful earthquake extended 5,000 miles; even to Scotland 1755
- In Syria, extended over 10,000 square miles; Baalbec destroyed..... 1759
- At Martinico, 1,600 persons lost their lives..... 1767
- At Guatemala, which, with 8,000 inhabitants, was swallowed up..... 1773
- A destructive one at Smyrna..... 1778
- At Tauris; 15,000 houses thrown down, and multitudes buried..... 1780
- Messina and other towns in Italy and Sicily overthrown; 40,000 persons perished..... 1783
- Archindschan wholly destroyed, and 12,000 persons buried in its ruins.... 1784
- At Borgo di San Sepolcro; many houses and 1,000 persons swallowed up..... 1789
- Another fatal one in Sicily..... 1791
- In Naples; Vesuvius overwhelmed the city of Torre del Greco..... 1794
- In Turkey, where, in three towns, 10,000 persons lost their lives..... 1794
- The whole country between Santa Fe and Panama destroyed, including Cusco and Quito, 40,000 people buried in one second..... 1797
- At Constantinople, which destroyed the royal palace and an immensity of buildings, and extended into Romania and Wallachia..... 1800
- A violent one felt in Holland..... 1804
- At Frosolone, Naples, 6,000 lives lost.. 1805
- At the Azores; a village of St. Michael's sunk, and a lake of boiling water appeared in its place..... 1810
- Awful one at Caraccas (*which see*)..... 1812
- Several throughout India; district of Kutch sunk; 2,000 persons buried.... 1819
- Genoa, Palermo, Rome, and many other towns greatly damaged; thousands perish..... 1819
- One in Calabria and Sicily..... 1826
- In Spain; Mercia and numerous villages devastated; 6,000 persons perish..... 1829
- In the Duchy of Parma; no less than forty shocks were experienced at Borgotaro; and at Pontremoli many houses were thrown down, and not a chimney was left standing..... 1834
- In Calabria; Cosenza and villages destroyed; 1,000 persons buried..... 1835
- In Calabria; 1,000 buried at Rossano, etc. 1836
- In many cities of Southern Syria, by which hundreds of houses were thrown down, and thousands of lives lost.... 1836
- At Martinique; nearly half of Port Royal destroyed; nearly 700 persons killed, and the whole island damaged 1839
- At Ternate; the island made a waste, and thousands of lives lost..... 1840
- Awful and destructive earthquake at Mount Ararat, in one of the districts of Armenia; 3,137 houses were overthrown, and several hundred persons perished..... 1840
- Great earthquake at Zante, where many persons perished..... 1840
- At Cape Haytien, St. Domingo, which destroyed nearly two-thirds of the town; between 4,000 and 5,000 lives were lost..... 1842
- At Point à Pitre, Guadaloupe, which was entirely destroyed..... 1843
- At Rhodes and Macri, when a mountain fell in at the latter place, crushing a a village, and destroying 600 persons 1851
- At Valparaiso, where more than 400 houses were destroyed..... 1851
- In South Italy; Melfi almost laid in ruins; 14,000 lives lost..... 1851
- At Philippine Isles; Manila nearly destroyed..... 1852
- In northwest of England, slight..... 1852
- Thebes, in Greece, nearly destroyed.... 1853
- St. Salvador, South America, destroyed 1854
- Amasca, in Japan, and Simoda, in Nippon, destroyed; Jeddo much injured. 1854
- Broussa, in Turkey, nearly destroyed... 1855
- Several villages in Central Europe destroyed..... 1855
- Jeddo nearly destroyed..... 1855
- Moluccas, nearly 3,000 lives lost.... 1856
- In the Mediterranean; at Candia, 500 lives lost; Rhodes, 100; and other islands, 150..... 1856
- Calabria, about 22,000 lives lost in a few seconds..... 1857
- Corinth nearly destroyed..... 1858
- Quito; about 5,000 killed, immense amount of property destroyed.... 1859
- Erzeroum, Asia Minor; above 1,000 persons said to have perished..... 1859
- At San Salvador; many buildings destroyed, no lives lost..... 1859
- In Cornwall, slight.....1859-1860
- Mendoza, South America; about two-thirds of the city and 7,000 lives lost 1861
- Greece; North Morea, Corinth, and other places injured..... 1861
- Guatemala; 150 buildings and fourteen churches destroyed..... 1862
- Manila, P. I., great destruction of property..... 1863
- Cities of Arequipa, Iquique, Tacna, and Chincha, and many small towns in Peru and Ecuador destroyed; about 25,000 perished..... 1868
- Cities in Guatemala destroyed..... 1874
- Java and neighboring Isles desolated. 1883
- Several Spanish towns destroyed.... 1884
- Province of Granada, Spain; 690 perished..... 1885
- Charleston, S. C., 41 lives and $5,000,000 worth of property lost. 1886
- Severe shock in southern Europe, especially in the Riviera; estimated that 2,000 perished..... 1887
- Japan; 4,000 perished, 50,000 houses destroyed..... 1891
- Islands of Zante and Stromboli; great loss of lives and property at Zante 1893
- Assam, India; many killed..... 1897
- Severe shocks in California, San Francisco wrecked. Greatest fire in history, lasting two days. $300,000,000 property destroyed; 300,000 homeless.....April 18, 1906
- Large part of Kingston, Jamaica, destroyed..... 1907
- Sicily and Calabria, Messina and Reggio destroyed..... 1909
- Cartago, Costa Rica; 1,500 lives lost. 1910
- Guadalajara, Mexico; great part of city destroyed..... 1912
- Turkey; 3,000 lives lost, 6,000 persons injured, 40,000 homeless..... 1912
- Japan; 43 killed, 855 houses, 20,000 made destitute..... 1914
- Sicily; 200 killed, 1,000 injured..... 1914
- Central Italy; 29,978 killed. Avezzana destroyed, 372 communes damaged 1915
- Guatemala, Guatemala; 2,500 killed. 1917
- Porto Rico; 100 killed..... 1918
- Mugello Valley, Italy; 100 killed... 1919
- Giane and Codadinple destroyed.... 1920
- Kausu province, China; 100,000 killed; 10 cities destroyed..... 1920
- Mendoza province, Argentina Republic; 100 killed in city of La Valle 1920
- Orizaba district, Mexico; 3,000 killed. 1920
- Southern Albania; 42 killed..... 1920
- Elbassan, Albania; 14 killed..... 1921
- Chile; 900 killed. Copiapo partly destroyed; Oralle, Coquimbo, Vallena, Chanaral and San Fernando damaged..... 1922
- Chile; 1,800 killed..... 1923
- Japan; 200,000 killed, 125,000 injured, $900,000,000 loss of property 1923

Echo.—The repetition of a sound in the air, caused by its being reflected from some obstacle. A very sharp, quick sound can produce an echo when reflecting surface is 55 feet distant. At 112.5 feet off monosyllables can be reflected; at twice that distance dissyllables; at three times as far off trisyllables; and so on for greater distances.

Execution in Various Countries.

Country	Mode	Publicity
Austria	Gallows	Public
Bavaria	Guillotine	Private
Belgium	Guillotine	Public
Brunswick	Ax	Private
China	Sword or Cord	Public
Denmark	Guillotine	Public
Ecuador	Musket	Public
France	Guillotine	Public
Great Britain	Gallows	Private
Hanover	Guillotine	Private
Italy	Sword or gallows (1)	Public
Netherlands	Gallows	Public
Oldenberg	Musket	Public
Portugal	Gallows	Public
Prussia	Sword	Private
Russia	Musket, gallows, or sword	Public
Saxony	Guillotine	Private
Spain	Garrote	Public
Switzerland—		
Fifteen cantons	Sword	Public
Two cantons	Guillotine	Public
Two cantons	Guillotine	Private
United States (other than N. Y., Ohio, Mass., Nev. and Dist. of Columbia)	Gallows	Mostly Private
N. Y., Ohio, and Mass.	Electricity	Private
Nevada	Gas	Private

(1)Capital punishment abolished in 1876.

WHY DO WE HAVE EYEBROWS?

Eyebrows.—Eyebrows call attention to our eyes which are things of great beauty. Secondly, eyebrows prevent perspiration from getting into the eyes from the forehead.

WHY DO EXPLOSIONS BREAK WINDOWS?

Explosion.—An explosion hurls back the air in huge waves, similar to the waves of the ocean. When these waves come into contact with an object there is a contest, and the weaker side is crumpled up and pushed back by the other. Large panes of glass whose only support and protection are the extreme edges, present an easy mark for air-waves. Therefore, powerful explosions often break many windows. The ground beneath, the walls and roof of a building, all receive the effects of these air-waves exactly like the windows. However these being much stronger than the windows are usually strong enough to overcome the air-waves.

Fire.—Burning mostly the union of oxygen with something else. When this union takes place slowly, heat is made, but we see no fire or light; when it takes place quickly, both heat is felt and fire or flame is seen. When iron rusts it is the same kind of burning as when wood blazes in the fire; but the oxygen of the air unites with the iron so slowly that the heat is not enough to be felt. If the union be made to take place quickly, both heat will be felt and light will be seen. When the heel of your boot strikes a stone, you often see a spark fly from it. This is burning iron. The iron nail in your heel strikes the stone, a bit of it is knocked off, and heat enough is made by the blow to cause the iron to unite with the oxygen of the air, and thus we see it burn. A piece of iron or steel may easily be heated enough to make it burn in a jar of oxygen, and a most brilliant light will be given off by it. When wood or coal is set on fire, it gives out both heat and light; but if we could give it still more oxygen it would burn still brighter. We do this when we blow a fire with the bellows, and this is the reason why it then blazes up and burns more briskly. Some things take fire—that is, unite with oxygen much more easily than others. When we scratch a match it at once bursts into flame. This is because it has a little phosphorus on the end, and this has such a liking for oxygen that it has usually to be kept in water to keep it from uniting with it. The phosphorus on the end of the match is mixed with glue, which keeps it from taking fire; but when the match is scratched on any rough thing heat enough is made to cause the phosphorus to unite quickly with the oxygen of the air, and it bursts into flame. Wood and coal have not so great a liking for oxygen as phosphorus, and need much more heat to make them unite with oxygen.

Fires, Great and Historic.—

London, 1912.—Began at London Bridge on the Southwark side, extended to the other side and hemmed in crowd.

London, Sept. 2-6, 1666.—89 churches, 13,200 houses destroyed; 400 streets laid waste, 200,000 persons homeless. Ruins covered 436 acres.

Richmond, Va., Dec. 26, 1811.—Governor and many leading citizens perished.

New York, Dec. 16, 1835.—600 buildings; loss $20,000,000.

Washington, D. C., Dec. 15, 1836.—General post-office and patent office destroyed, with 10,000 valuable models, drawings, etc.

New York, Sept. 6, 1839.—$10,000,000 worth of property.

Pittsburgh, April 10, 1845.—1000 buildings; loss, $6,000,000.

Philadelphia, July 9, 1850.—400 buildings; loss, $1,500,000; 39 persons killed.

St. Louis, May 4, 1851.—Large proportion of the city burned; loss, $15,000,000.

San Francisco, May 3-5, 1851.—2,500 buildings; loss, $3,500,000.

Washington, D. C., Dec. 24, 1851.—Congressional library, 35,000 volumes, with works of art burned.

Santiago (Spain), Dec. 8, 1863.—A fire in the church of the Campania; 2000 persons killed, mostly women.

Charleston, S. C., Feb. 17, 1865.—Almost totally destroyed, with large quantities of naval and military stores.

Richmond, Va., April 2 and 3, 1865.—Great part destroyed by fire at time of Confederate evacuation.

Portland, Me., July 4, 1866.—Almost entirely destroyed; loss, $15,000,000.

Chicago, Oct. 8-9, 1871.—Three and one-half square miles laid waste; 17,450 buildings destroyed; 200 persons killed; 98,500 made homeless; loss over $200,000,000.

Great forest fires in Michigan and Wisconsin, Oct. 8-14, 1871.—2000 lives lost.

Boston, Nov. 9-11, 1872.—800 buildings; loss $73,000,000; 15 killed.

Chicago, July 14, 1874.—Another great fire; loss $4,000,000.

Fall River, Mass., Sept. 19, 1874.—Great factory fires; 60 persons killed.

St. John, N. B., June 20, 1877.—Loss, $12,500,000.

Brooklyn Theater burned, Dec. 5, 1876.—300 lives lost.

Seattle and Spokane, Wash., 1889.—About $10,000,000 each.

Jacksonville, Fla., May 3, 1901.—Property loss $10,000,000.

Iroquois Theatre, Chicago, Dec. 30, 1903.—Entailed a loss of 639 lives.

Baltimore, Md., Feb. 7-8, 1904.—Financial loss, $85,000,000.

Rochester, N. Y., Feb. 26, 1904.—Fire in business center, loss, $2,700,000.

Toronto, Canada, April 9, 1904.—Destruction in business district of $12,000,000.

San Francisco, Cal., April 18-19, 1906.—Fire and earthquake (see earthquakes); loss, $350,000,000; most disastrous fire recorded.

Iloilo, Island of Panany, P. I., April 19, 1907.—20,000 homeless.

Coney Island, N. Y., July 28, 1907.—Loss $1,500,000.

Boyerstown, Pa., January 13, 1908.—25 persons burned in a theatre.

North Collinwood, Cleveland, Ohio, 1908.—167 children burned in a public school.

Chelsea, Mass., April 12, 1908.—Loss, $6,000,000.

Kootenay Valley, B. C., Aug. 4, 1908.—Forest fires burned three towns and $6,000,000 worth of property.

New Orleans, La., Aug. 30, 1908.—Loss $1,500,000.

Albany, N. Y., 1911.—State Capitol Bldg., $1,500,000 loss.

Coney Island, N. Y., 1911.—Amusement Park; $2,725,000 loss.

Porcupine District, Ont., 1911.—Mining property, lumber mills, etc., $3,500,000 loss.

Houston, Tex., 1912.—Business district, $4,500,000 loss.

New York City, 1912.—Equitable Bldg., $3,000,000 loss.

Salem, Mass., 1914.—1,700 buildings destroyed, $14,000,000 loss.

Jersey City, N. J., 1916.—Railroad terminal warehouses and steamer; $11,000,000 loss.

New York Harbor, 1916.—Black Tom Island; $11,000,000 loss.

Ottawa, Can., 1916.—Parliament Bldgs., $3,000,000 loss.

Halifax, N. S., 1917.—1,500 killed. Explosion of war materials and fire; 20,000 homeless; 4,000 injured; $50,000,000 loss.

Kingsland, N. J., 1917.—Munition factory; $12,000,000 loss.

Minnesota, 1918.—Forest fires; $35,000,000.

Morgan Station, N. J., 1918.—Munition plant; $20,000,000 loss.

St. Louis, Mo., 1918.—Government warehouse; $3,000,000 loss.

Long Island, N. Y., 1919.—Oil works and other plants; $4,250,000 loss.

Savannah, Ga., 1919.—Fertilizer factory, cotton and railroad terminals; $4,000,000 loss.

Galveston, Tex., 1920.—Morgan line piers and warehouses, $3,250,000 loss.

Old Point Comfort, Va., 1920.—Chamberlin Hotel; $2,000,000 loss.

Hoboken, N. J., 1921.—4 piers, 20 lighters; $6,000,000 loss.

Tokyo, Japan, 1921.—1,000 houses in residence district; $12,500,000 loss.

Symrna. Asia Minor, 1922.—Great loss of life. City almost completely destroyed. 100,000 homeless; $12,500,000 loss.

Berkeley, Cal., 1923.—600 residences covering 35 blocks; $5,000,000 loss.

Mexicali, Mexico, 1923.—30 killed. Fire started in theatre; $5,000,000 loss.

Jersey City, N. J., 1924.—$8,000,000 loss on waterfront.

Flag, United States.—On June 14, 1777, the United States Congress passed a resolution declaring "that the flag of the thirteen United States be stripes alternate red and white; that the union be thirteen stars, white in a blue field, representing the new constellation." In 1794, Congress decreed that after May 1, 1795, "the flag of the United States be fifteen stripes, alternate red and white, and that the union be fifteen stars white in a blue field." This change was made to mark the admission of Vermont and Kentucky into the Union. The stars and stripes were then equal and a star and stripe were to be added with the admission of each new state. It was realized, however, that the addition of a stripe for each new state would soon render the flag too large, and a resolution was accordingly passed by Congress, April 4, 1818, reducing the number of stripes to thirteen—representing the original Union—and making the stars twenty in number. It was furthermore enacted that a new star should be added for each new state admitted into the Union. The flag now contains

forty-eight stars, corresponding to the forty-eight states.

According to tradition the first flag, known as the "Stars and Stripes," was made by Mrs. Betsy Ross of Philadelphia, about whom succeeding years have thrown a glamour of patriotic romance.

Floods and Inundations, Great.—

Sea at Dort.—drowned 72 villages and 100,000 people..... 1421
Severn overflowed 10 days..... 1483
Holland; 400,000 drowned..... 1530
At Catalonia.—50,000 persons perished..... 1617
Part of Zealand overflowed; 1300 drowned; vast damage at Hamburg 1717
Yorkshire.—A dreadful inundation. 1771
In Navarre.—2000 persons drowned. 1787
Inundation of the Liffey.—Immense damage in Dublin..... 1802
Lorca, a city of Murcia, in Spain.... 1802
Hungary.—24 villages destroyed by Danube..... 1811
Inundations in Hungary, Austria, and Poland, summer of..... 1813
In Silesia.—6000 inhabitants perished; the ruin of Macdonald's French army accelerated by the floods; in Poland 4000 lives supposed to have been lost..... 1813
In Germany.—Great loss of life and property..... 1816
In England.—5000 acres deluged in the Fen countries..... 1819
At Dantzic.—The Vistula breaking dykes; 10,000 head of cattle and 4000 houses destroyed; numerous lives lost..... 1829
At Vienna.—The dwellings of 50,000 under water..... 1830
Avignon.—100 houses swept away, 228 at LaGuillotiere; about 300 at Vaise, Marseilles, and Nimes... 1840
Inundation in the center, west, and southwest of France; numerous bridges, with the Orleans and Vierzon viaduct (cost 6,000,000 francs) swept away. The damage exceeded 100,000,000 francs..... 1846
Great inundation at New Orleans, La.—1600 houses flooded..... 1849
Bursting of the Bradfield reservoir (Sheffield).—About 250 persons drowned..... 1864
England, in Yorkshire, Lancashire, and Derbyshire.—Farms destroyed, mines flooded, mills thrown down. 1866
Italy.—Thousands of people unhoused..... 1872
Mill River valley (near Northampton, Mass.)—Several villages destroyed, 144 perished..... 1874
Eureka, Nevada.—30 drowned..... 1874
Western Pennsylvania.—220 persons drowned..... 1874
Toulouse, Garonne.—1000 lives lost. 1875
Szegedin, Hungary.—Town nearly destroyed; of 6566 houses, only 331 stood; 77 persons drowned..... 1879
Murcia, Spain.—1000 lives lost, about 2000 houses destroyed..... 1879
Floods in Iowa, Kans., Minn., Mo.. 1881
Ohio and Mississippi valleys flooded. —Feb. $15,000,000 loss..... 1882
In Pennsylvania, Ohio, and Kentucky. —Very severe at Cincinnati..... 1883
Ohio River.—15 deaths and 5000 homeless..... 1884
Floods in Pennsylvania, New York, and New England.—Great loss of property..... 1886
Storm and flood in Texas.—Houses in Galveston washed away; 38 lives lost and more than $5,000,000 damage. 1886
Johnstown, Pa.—Several small towns and the city of Johnstown swept away, 2235 persons perished..... 1889
The Galveston flood.—7,000 lives being lost, and $30,000,000 worth of property destroyed, 3,000 buildings destroyed..... 1900
Kansas City, Mo. and Mississippi River towns.—Many lives lost.... 1903
Hepner, Oregon.—300 drowned..... 1903
Hong Kong, China.—10,000 drowned 1906
Paris, France.—$200,000,000 damage 1910
Mississippi Valley.—200 drowned, 200,000 homeless, $45,000,000 damage..... 1912
Dayton, Ohio.—84 drowned. City nearly destroyed. $128,000,000 damage..... 1913
Japan.—1,100 drowned..... 1913
Ohio and Indiana.—730 drowned. $180,873,000 damage, 60,000 buildings destroyed..... 1913
China.—2,000 drowned, $90,000,000 damage in province of Kwangtung, Kwangsi and Kiangsi..... 1915
Gulf coast.—300 drowned, $20,000,000 damage..... 1915
Shanghai, China.—500 lost, $5,000,000 loss..... 1915
Cabin Creek Valley, W. Vir. — 100 lost, 5,000 homeless; $5,000,000 damage..... 1916
South Atlantic Coast.—50 lost, $15,000,000 damage..... 1916
Tientsin, China.—Millions homeless, $50,000,000 damage, 15,000 miles inundated..... 1917
Porto Rico.—116 lost, $3,500,000 loss 1919
Pueblo, Colo.—120 lost, 140 missing. $20,000,000 loss..... 1921

Frost, crystals of frozen dew. When the watery vapor in the air is so cool that it cannot condense, or turn to water, without going below the freezing point (32 degrees Fahr.), it will fall to the earth in the shape of frost crystals instead of dew. This is called *Hoar Frost*, and sometimes white frost. This is different from freezing, commonly called frost, which is simply the hardening of water and moisture from the cold of winter. The frost work on the inside of window panes in warm rooms in cold weather, which sometimes takes the form of ferns or feathers of ice, is also a freezing and not a true frost. Moisture from the warm air of the room gathers on the glass, just as dew falls on grass, and is cooled and frozen there. But true frost is not frozen dew, that is, moisture which falls as dew and freezes afterward, but moisture which falls already formed in ice crystals. *Black Frost* is caused by a cold so severe that plants freeze and turn black, without showing any signs of hoar frost on the outside.

Gardens of the World, Popular.—

Garden of Eden.—(1) First abode of man, supposed to be located near the city of Babylon. (2) A name often applied to Eden Park, Cincinnati, Ohio.
Garden of England.—The Isle of Wight, and the counties of Worcestershire and Kent have all been so named.
Garden of Erin.—Carlow in Leinster, Ireland.
Garden of Europe.—Italy; an appellation well deserved on account of its healthful climate, picturesque scenery, astonishing fertility, and the great variety of its agricultural products.
Garden of France.—The Department of Indre-et-Loire, a district noted for its rich soil and lovely landscapes.
Garden of Gethsemane.—East of Jerusalem, near the Brook Kedron.
Garden of Helvetia.—Name given to Thurgau, Switzerland.
Garden of Hesperides. In the western part of the mythological world.
Garden of India.—Oude.
Garden of Italy.—The Island of Sicily, which bears the same relation to Italy, in respect of beauty and fertility, that Italy bears to the rest of Europe.
Garden of Kentucky.—Bourbon County, in that State.
Garden of Scotland.—Morayshire has been so named.
Garden of Spain.—Andalusia. It is fertile to the highest degree.
Garden of South Wales.—The southern division of Glamorganshire.
Garden of the West.—A name sometimes applied to the whole of that vast arable district west of the Mississippi, on account of its generous yield of grain, but more particularly applied to Kansas.
Garden of the World.—An appellation often bestowed on that vast expanse of country watered by the Mississippi and its tributaries—a region whose soil is of unsurpassed productiveness.
Garden of Argentina.—Turcuman, a province of Argentina.
Garden of the East.—Ceylon and Burmah. Both so called. Ceylon is also called "The Resplendent"; the "Jewel of the Eastern Sea;" the "Gem of Paradise." Its climate and productions are quite unrivaled.

Gas.—The common gas which we burn for light is obtained from coal. It can be made very easily by breaking a piece of bituminous or soft coal into little bits, filling the bowl of a tobacco pipe with them, and covering the mouth over with moist clay. When the clay is well dried the bowl of the pipe should be put into the fire, where it will heat red hot. In a short time a kind of yellow smoke will issue from the stem of the pipe, which when lighted will burn with a bright flame.

This smoke is coal gas, but it is not pure like that which we burn in our houses. If the end of the pipe stem be put under water, the gas will rise up through the water in bubbles. These bubbles of gas can be collected in a small bottle or other vessel in a very simple way. Fill the bottle full of water and turn it upside down in a bowl of water. The water will not run out of the bottle, because the pressure of the air on the water in the bowl will keep it in its place. If now the end of the pipe stem be put under the mouth of the bottle, the bubbles of gas will ascend into it, and gradually push the water down; if there be gas enough in the pipe bowl, it will fill the bottle, taking the place of the water. Thus will have been obtained a bottle of gas, which will burn when lighted. All the coal gas used in cities and towns is made and collected in the same way, only the coal is heated in great brick or iron ovens, instead of in tobacco pipes, and the gas is collected in immense iron gas-holders instead of in bottles.

If now the clay be removed from the pipe, some coke will be found in the bowl. This is some of the carbon of the coal; a part only of the carbon having gone off with all the hydrogen to make the gas, and this being all that is left. When we burn

coal in the open air we get from it flame and ashes, but when it is consumed in tight ovens, gas and coke are obtained. In making gas the coal is not really burned, but distilled, and the gas passes from the coal without making any flame. The ovens for distilling coal are called retorts. Several are usually built together, so that they may all be heated by one furnace, for there must be a fire outside the retort to heat the coal inside. When the retorts are filled with coal, the doors are closed tightly and the coal inside is heated red hot, when it gives off air, steam, tar, ammonia and gas. All these pass off by means of a great pipe at the back of the retorts; the tar and ammonia run off into cisterns, and the hot gas goes into coolers, where it is cooled. It is next purified by passing over lime, which takes up all the acids in it, and lastly it is put into the gasometers for use.

Geysers.—Certain intermittent hot springs in various portions of the earth, the most notable specimens being those in the Yellowstone region of the Rocky Mountains and those of the southwestern division of Iceland, about 30 miles from Mount Hecla. Nearly 100 of the latter are said to break out within a circle of two miles. Few of them play longer than five or six minutes at a time, although sometimes they go on for half an hour. The largest is called the Great Geyser. It has a pipe 78 feet in vertical depth, and from eight to ten feet in diameter, but gradually widening as it rises into the basin. The latter is 56 feet long by 46 feet broad, and is lined with an incrustation of silica deposited from the hot water, the process being aided by the alkali soda, which, with minute quantities of various salts, exists in the water. When the geyser is about to act, subterranean noises are heard like the distant firing of cannon, and the earth is slightly shaken; then a column of the liquid element is thrown up to the height of 100 or 200 feet. Steam after a time makes its way out of the rent, and the fountain ceases to play. The second in size is the Strokkur. If stones or turf be thrown down its pipe, an eruption will follow in a few minutes and eject them with great force. Geyser action is produced by the heating of the lower part of the geyser tube, as Professor Tyndall was able to show experimentally.

There are geysers in New Zealand, in the Northern Island, as remarkable as those of the Yellowstone Park or of Iceland. They are on three parallel lines running in a direction north 36 degrees east by the compass.

Giant's Causeway.—A remarkable group of basaltic rocks on the north coast of County Antrim, Ireland, eight miles east by north east of Portrush. It consists of a vast number of columns, generally pentagonal or hexagonal. The causeway proper is a low promontory formed of closely packed columns. Altogether there are about 40,000 pillars, fitting into each other most perfectly, and jointed horizontally. Various more or less detached groups are known as the Giant's Loom, Giant's Organ, Lady's Fan, etc. East of the causeway proper is the Giant's Amphitheatre, a small bay with cliffs 350 feet high, formed in its upper part of two tiers of basaltic columns from 60 to 80 feet in height. Beyond this is Spanish Bay, the scene of the wreck of an armada vessel; and still farther east the noble promontory of Pleaskin Head, 400 feet high, with double tiers of lofty columns separated by a band of ochre. The peculiar columnar structure of the causeway rocks is shown by geologists to result from the contraction in cooling of the lava of which they are composed. The Giant's Causeway derives its name from the legend which ascribes its construction to Finn M'Coul or Fingal, who bridged the channel between Ireland and Scotland, in order that the giants might pass from Antrim to Staffa.

Glacier.—A river of ice slowly descending a mountain side. A glacier commences primarily as a frozen mass of snow, formed above the line of perpetual congelation, and consolidated partly by pressure and partly by the freezing of water infiltered into it from its surface. In the Swiss Alps the glaciers are between 20 and 30 miles long, their greatest breadth two or three miles, and their depth more than 600 feet. Why the glacier descends has been a very disputed question. Saussure attributed it to its weight, aided by the water beneath it. Charpentier and Agassiz to dilatation produced by the freezing of water in the interstices, a view which Hopkins opposed on mathematical and mechanical grounds. Agassiz and Prof. James Forbes discovered that the glacier, like an ordinary river, moved faster on the surface than below, and in the middle than at the sides. Forbes therefore believed that viscosity was the cause of the glacier's action. Tyndall attributed it chiefly to regelation, that is, to parts of it melting and freezing again. When, in descending a mountain-side, the glacier has to force its way through a narrow channel, the brittle ice is crushed and broken, but by virtue of "regelation" it freezes anew when it has cleared the obstruction. Prof. Tyndall has imitated the whole process artificially on a small scale, and his is now the accepted explanation of glacier-movement. As a glacier descends, it carries with it stones, which, on its melting, are deposited in a moraine. By these moving beneath it, and projecting from it, the subjacent rocks are polished and scored with parallel furrows. It makes also a dome-shaped mass of smoother rock, called in Switzerland *roches moutonnées*. It scoops out lakes. If it reach the sea, and descend into it, huge masses of it float off as icebergs.

Gunpowder.—Gunpowder consists of nitre or *saltpetre*, *charcoal*, and *sulpher*, and all nations prepare it in nearly the same way, using about 75 pounds of nitre, 15 pounds of charcoal, and 10 pounds of sulphur for 100 pounds of gunpowder. The materials are first made as pure as possible, the nitre being soaked in spring water, then boiled and cooled, then filtered through canvas bags and allowed to harden again. This is done twice until it becomes perfectly white. The sulphur is also purified twice by being kept melted for several hours in gun-metal pots. The charcoal, which is made from dog-wood, alder, or willow, is burned in large vessels of iron instead of in the open air, as in the case of most charcoal, and must be thoroughly charred and soft.

The three substances are first ground separately to a fine powder, and are then ground together with a little water until they are thoroughly mixed. The mixture, now called "millcake," is next pressed very hard in a hydrostatic press into thin smooth cakes, called "presscake," which is afterward broken up between toothed rollers and rubbed through sieves until it is made into grains of the right sizes. The next thing is glazing, which is done by putting the grains into canvas bags or into a barrel, which is turned round very fast. The grains, by rubbing against each other, are thus worn round and smooth, and get a glaze or polish. This is very important, because glazed powder keeps dry and bears shaking better than other powder. After glazing, the powder is dried in rooms heated by steam pipes.

The manufacture of gunpowder is very dangerous, because it is liable to explode and blow up the mill. When gunpowder explodes, that which was a solid is suddenly turned into a gas, and takes up about 2000 times as much room as it did in its previous state. As this gas must find room for itself, it drives everything out of its way; it blows up a house in which it is stored, splits open rocks in a quarry or mine, or forces a ball out of a cannon. In making *fireworks* gunpowder is used in many different forms.

Halloween, is the night of October 31st, the eve of All Saints', all All-hallows Day, which is November 1st, and is probably a relic of pagan times or of mediæval superstitions, as it has nothing whatever to do with the church festival. In England and Scotland it is especially selected as the time for trying spells and divinations in love affairs. The superstitious tradition regarding it is that it is the night of all others when supernatural influences prevail; when spirits of the invisible and visible world walk abroad, for on this mystic evening it was believed that the human spirit was enabled, by the aid of supernatural power, to detach itself from the body and wander through the realms of space. There is a similar superstition in Germany concerning "Walpurgis night"—the night preceding the first of May. On this night, the German peasants believe that there is a witch festival, or gathering of evil spirits, on the summit of the Brocken in the Hartz Mountains, and the malign influence of this convocation was believed to be felt all over the surrounding country. It was an old custom, and still observed in some places, to light great bonfires of straw or brush on that night, to drive away the spirits of darkness supposed to be hovering in the air. Considering that All Saints' Day was originally kept on May 1st, there would appear to be but little doubt that Allhallow eve and Walpurgis night have a common origin, which, doubtless, dates back to the earliest belief in a personal and all-powerful Evil One—the Chaldean's Power of Darkness.

Hail.—There are two kinds of hail; the small grains, like fine shot, which often fall in winter, but rarely in summer, and which generally come before snow; and larger hail, which falls usually in hot weather, and is most severe in very hot hot climates. The first is caused by the freezing of rain drops as they pass in falling through colder air than that from which they started; the second, or common hail, results from the meeting of two currents of air, one very warm and loaded with vapor, and the other very cold.

It is known, by going up in balloons and in other ways, that the air is not all of the same heat, but is divided into cold and warm parts or layers, a layer of very cold air, much below freezing, often lying between two warm parts. When bodies of warm damp air move upward into one of these layers of cool dry air, the damp air is at once changed into ice, and hail falls. Sometimes the hailstones thus formed are very small, and sometimes many meet and freeze together into large masses. They are usually not much larger than a walnut or a pigeon's egg, but some have been seen

as large as an orange. In 1860, during a storm which took place while an English ship was off the Cape of Good Hope, hailstones of the size of half a brick fell and hurt many of the sailors. Hailstones often do great harm to crops, especially in France, Germany, and India.

Harp of Ireland.—The origin of the harp in the arms of Ireland, is said to be as follows:—On Henry the Eighth being presented by the Pope with the harp of Brian Borhu, he was induced to change the arms of Ireland, by placing on her coins a representation of the relic of her most celebrated native king.

Highest Buildings, Monuments, etc.—

	Feet
Eiffel Tower, Paris	984
Woolworth, New York, N. Y.	792
Terminal Tower Building, Cleveland, O.	708
Metropolitan, New York, N. Y.	700

Washington Monument, Baltimore	210

Ice.—Water congealed so as to be rendered solid by cold. Dana ranks water as a mineral species, and notes that its crystals are hexagonal and occur usually in compound stellate forms. Ice is transparent owing to the close contact of the crystals which compose it; this makes the individual particles so blend as to render the mass optically, as well as mechanically, continuous. Its specific gravity is 0.194. Water freezes at 32 degrees of Fahr., at zero (0) Centigrade. Its greatest density is at about 40 degrees Fahr., four or five degrees Centigrade, hence ice floats on water. The surface of sheets of water is frozen while their mass remains liquid. Ice one inch and a half thick will support a man; four inches thick will support cavalry; five inches thick will support an 84 pound cannon; 10 inches thick will support a multitude; 18 inches thick will support a railroad train.

Iceberg.—A hill of ice which is either floating in the ocean or has somewhere taken the ground. The genesis of an iceberg is generally on the shore; it exists first as a glacier but when this in its onward progress reaches the cliffs and glides down them into the ocean, it loses the name of glacier and takes that of iceberg. Scoresby counted 500 of them drifting between latitude 69 degrees and 70 degrees north. The magnitude of some icebergs is very great. Captain Sir John Ross saw several of them together in Baffin's Bay aground in water 1,500 feet deep. One seen off the Cape of Good Hope was two miles in circumference and a 150 feet high. Others were from 250 to 300 feet above the sea. For every cubic foot above there must be at least eight below. The rotation of the earth makes the icebergs which escape from the North Polar regions in proximity to Europe drift partly to the westward and they rarely reach Britain, though Cowper has a poem "On the Ice-islands seen floating in the German Ocean, March 19, 1799." Many impinge upon the eastern shores of Iceland; escaping that island they are born away in the direction of the eastern shores of America. They do not approach the equator nearer than about 40 degrees north and 36 degrees to nine degrees south. When an iceberg reaches a coast and melts, it generates chilling fogs, and so reduces the temperature as temporarily to deteriorate the climate of the adjacent land. They carry with them earth, rocks, etc., obtained when they were in the glacier state. These, when the ice melts, fall to the bottom of the sea and form moraines. When they scrape their way over the bed of the ocean they score the several rocks over which they pass. They often transport animals and seeds of plants to great distances.

John Bull.—A collective nickname for the English people, first used in Arbuthnot's ludicrous "History of Europe." It is now also applied to characteristic English traits.

Labyrinth.—One of the wonders of ancient Egypt. It consisted of 12 palaces, beneath which were vast subterraneous excavations, equal in size to the palaces above, in which were preserved the bodies of the kings who constructed them, and the sacred crocodiles which the Egyptians worshipped as deities.

Liberty Bell was cast in London in 1752 by order of the Pennsylvania Assembly, for use in their State House. The bell reached Philadelphia the following year, but it cracked without any apparent reason when it was rung to test the sound, and it was necessary to have it recast. This was done by Philadelphia workmen, and in June, 1753, it was again hung in the belfry of the State House. On July 4, 1776, when the Continental Congress declared the colonies independent of Great Britain, the bell was rung for two hours, so the story goes, by the old bellman, who was so filled with enthusiasm and excitement that he could not stop. It was taken down when the British threatened Philadelphia in 1777, and removed to Allentown, Pa., but was returned to the State House in 1778, and a new steeple was built for it. On July 8, 1835, it cracked tolling for John Marshall's death and although an attempt has been made to restore its tone by sawing the crack wider, it has been unsuccessful. During the World's Fair in New Orleans in 1885, the bell was sent there for exhibition. It left Philadelphia, January 24th, in charge of three custodians appointed by the mayor of the city, who did not leave it day or night until it was returned in June of the same year. The train carrying the bell was preceded over the entire route by a pilot engine. The following words are inscribed around it: "By Order of the Assembly of the Province of Pennsylvania, for the State House, in the City of Philadelphia, 1752," and underneath, "Proclaim liberty through all the land unto all the inhabitants thereof—Levit., xxv. 10." Its weight is about 2,000 pounds.

Lightning.—The dazzling light emitted by a large spark darting from clouds charged with electricity. In the lower regions of the atmosphere it is white, in the upper one somewhat violet, as is the spark of an electrical machine in a vacuum. It does not uniformly take the zigzag form conventionally represented. It is seen sometimes like a sharp and rugged antler standing upright, and across it a line of gleaming circles like a series of huge golden coins or a string of illuminated beads, and other forms. In the upper regions of the sky, where the air is rarefied, it tends to take the form of sheet-lightning, sometimes called heat lightning; in the lower regions it becomes more concentrated and moves in lines. As a rule lightning strikes objects from above, though occasionally ascending lightning has been seen. The loftiest buildings are most in danger from its effects, and so are tall trees, especially oaks and elms; the resin of pines, interfering with their efficiency as conductors, makes them more safe. When it sinks deeply into the ground, it sometimes vitrifies the rocks, producing fulgurites. Light travels with such speed that a flash is seen the instant it occurs. Thunder, which is simply the noise of the explosion, takes about five seconds to travel a mile, hence the distance of any flash, followed by thunder, may be calculated. If a mile distant, the danger is but slight.

Longevity, Human.—The following list of instances of remarkable longevity is given on the authority of Prichard, Whitehurst, Bailey, and others.

	Died	Age
Apollonius of Tyana	99 A. D.	130
St. Patrick	491 A. D.	122
Attila	500 A. D.	124
Llywarch Hên	500 A. D.	150
St. Coemenge	618 A. D.	120
St. Mongah of Kentigern	781 A. D.	185
Piastus, King of Poland	861 A. D.	120
Countess of Desmond	1612 A. D.	145
Thomas Parr	1635 A. D.	152
Thomas Damme	1648 A. D.	154
Dr. Mead, Hertfordshire	1652 A. D.	148
James Bowles, Kenilworth	1656 A. D.	152
Henry Jenkins	1670 A. D.	169
William Edwards	1688 A. D.	168
Petrarch Czartan	1724 A. D.	185
Margaret Patten	1739 A. D.	137
John Roven	1741 A. D.	172
Mrs. John Roven	1741 A. D.	164
John Effingham, Cornwall		144
Thomas Winslow, a captain under Cromwell	1766 A. D.	146
Draakenburg, a Dane	1772 A. D.	146
Jonas Warren, Ballydole	1787 A. D.	167

Demetrius Grabowsky, Poland	1830 A. D.	169
Bridget Devine	1845 A. D.	147

Lynch Law.—Summary punishment without form of law; mob law; or, as in the case of the Vigilance Committee of the Far West, the mode of ridding an outraged community of its incorrigible offenders. There are various accounts of the origin of the term. One, which is perhaps as probable as any, is to the effect that the name of "Lynch Law" was derived from a native of Campbell Co., Va., old Colonel

Lynch, who was in the habit of administering summary punishment to miscreants of every description without paying any attention to the ordinary processes of law. Hence he was called "Judge Lynch;" and this, it is said, is the true origin of the terms "lynching" and "lynch law."

Maelstrom, The, which means, literally, "grinding stream," is situated on the Norwegian coast, southwest of the Loffoden Isles, and is the most remarkable whirlpool in the world. It runs between the Island of Moskenes and a large solitary rock in the middle of the straits. The strong currents, rushing between the Great West Fjord and the outer ocean, through the channels of the Loffoden Isles, produce a number of whirlpools, of which the maelstrom is by far the most dangerous. During severe storms from the west, for instance, the current runs continually to the east at the rate of six knots an hour, without changing its direction for rising or falling tide, and the stream will boil and eddy in such mighty whirls that the largest steamer could hardly contend successfully, with the waters. The depth of the Whirlpool is only 20 fathoms, but just outside the straits soundings reach from 100 to 200 fathoms.

Mammoth Cave.—The largest known cavern in the world, situated in Edmonson County, Kentucky, 99 miles from Louisville; discovered in 1809. The immediate district is one abounding in large caves and the surface is characterized by thousands of sinkholes. It is estimated that there are 4000 sinkholes and 500 open caverns. An area of 8000 square miles in Kentucky and Tennessee is more or less marked by this character. There is almost no surface drainage, the surface water immediately finding its way into the sinks and through the subterranean caverns and channels that everywhere abound. Green river, which gathers most of these waters, flows from 300 to 600 feet below the general level of the upland country and many of the caverns reach down to this underground water level. This action is now known to be the origin of the caves and sinks. The Oolitic sub-carboniferous limestone in which most of them occur has been dissolved along its joints by the percolating water, a not unusual process in other limestones regions.

Mammoth Cave is in reality a complex series of more than 200 so-called rooms, chambers, domes, abysses, pits, grottoes, avenues, and galleries extending nine miles underground. In certain of the lower caverns there are rivers, cataracts, and lakes, varying in volume with local rain supply.

The most remarkable portions are the great pits and domes, which are caverns of unusual vertical extent. They are in reality the same, pits extending downward and domes upward from the main points of observation. Crevice Pit with Klett's Dome, which is a part of it, is 150 feet in total vertical measurement. The Bottomless Pit is 105, and Scylla is 135 feet deep. Cleveland Avenue is two miles long, and Silliman's is one and one-half, and in places 200 feet wide. Many parts of the cave are beautifully incrusted with gypsum and other deposits, while stalactites and stalagmites are abundant in some of the lower portions. Where these crusts are covered with crystals, their sparkling is especially impressive, as in Star Chamber.

The Dead Sea, Lake Lethe, the Styx, and the Roaring and Echo rivers are the largest stretches of water.

The outer galleries of the cave are inhabited by millions of bats. There are two species of blind fish, crayfish, crickets with abnormally long antennæ, and a few insects. All of these are believed to have descended from former normal surface types and to have become modified by their subterranean environment.

Man in the Moon.—This is one of the most ancient as well as one of the most popular superstitions. It is supposed to have originated in the account given in the Book of Numbers, of a man punished with death for gathering sticks on the Sabbath-day. In one of the drawings representing this extraordinary and familiar character, he appears as a man with a staff over his shoulder, on which he carries his fatal bundle of sticks, followed by a dog.

Mardi-Gras.—The Mardi-Gras is the festival preceding the first day of Lent, or Ash Wednesday. Most of the distinctive ceremonies now annually performed in New Orleans were originally introduced by the French population as early as 1827. The day is a legal holiday, and the entire city is for the time ostensibly placed under the control of a king of the carnival, the great "Rex." There are two principal pageants. The first, in the daytime, is the escort of the "beloved Rex," through his favorite city; the other, or night pageant, is known as the "Mystic Krewe of Comus." This has a character altogether unique. The first display was in 1857. On Twelfth night (January 6), the "Knights of Momus" have a display analogous to the Mardi-Gras, but more exclusively burlesque, and in which they satirize the follies of the age. The arrangements for these celebrations come within the control of quite an elaborate organization. The Mardi-Gras is held on Shrove Tuesday, a day of pleasure in most Roman Catholic countries. It is the carnival of the Italians, the Mardi-Gras of the French, and the Pancake Tuesday of former times in England.

Mayflower's Passengers.—The following is a true list of the male passengers landed at Plymouth in the Mayflower, 1620.

Isaac Allerton,	William Mullins.
Jno. Alden.	Edmund Margeson.
Jno. Allerton.	Degony Priest.
William Bradford.	Thomas Rogers.
William Brewster.	John Rigdale.
John Billington.	Edward Fuller.
Peter Brown.	Moses Fletcher.
Richard Britterage.	John Goodman.
John Carver.	Richard Gardiner.
Francis Cook.	George Soule.
James Chilton.	Capt. Miles Stanish.
John Crackton.	Edward Tilly.
Richard Clarke.	John Tilly.
Edward Dotey.	Thomas Tinker.
Francis Eaton.	John Turner.
Thomas English.	Edward Winslow.
Samuel Fuller.	William White.
John Howland.	Richard Warren.
Stephen Hopkins.	Thomas Williams.
Edward Leister.	Gilbert Winslow.
Christopher Martin.	

Servants as follows:

Carter.	More.
Cooper.	Power.
Ely.	Sampson.
Holbeck.	Story.
Hooke.	Thompson.
Langmore.	Trevore.
Latham.	Wilder.
Minter.	

Mason and Dixon's Line.—A name given to the southern boundary line of the free state of Pennsylvania which formerly separated it from the slave states of Maryland and Virginia. It was run—with the exception of about 22 miles by Charles Mason and Jeremiah Dixon, two English mathematicians and surveyors, between November 15, 1763, and December 26, 1767. During the excited debate in Congress, in 1820, on the question of excluding slavery from Missouri, the eccentric John Randolph of Roanoke made great use of this phrase, which was caught up and re-echoed by every newspaper in the land, and thus gained a celebrity which it still retains.

Metals, Value of.—The following table gives the names and prices of all the known metals of pecuniary worth:—

	Price, Av. Pd.
Radium	$23,294,000.00
Glucinium	1,751,000.00
Lanthanum	5,900.00
Iridium	5,100.00
Germanium	4,500.00
Indium	3,700.00
Tantalum	3,700.00
Rubidium	3,200.00
Niobium	2,900.00
Thorium	2,800.00
Didymium	1,600.00
Strontium	1,500.00
Gallium	1,450.00
Lithium	1,400.00
Yttrium	1,350.00
Vanadium	1,300.00
Titanium	1,200.00
Platinum	1,150.00
Osmium	950.00
Rhodium	800.00
Palladium	750.00
Ruthenium	700.00
Gold	300.00
Beryllium	250.00
Molybdenum	20.00
Potassium	20.00
Zirconium	15.00
Thallium	10.00
Silver	8.17
Cobalt	3.25
Selenium	3.00
Calcium	3.00
Tellurium	3.00
Bismuth	2.50
Magnesium	2.00
Sodium	1.00
Cadmium	.85
Tin	.60
Tungsten	.50
Aluminum	.25
Copper	.13
Antimony	.12
Zinc	.06
Lead	.06
Arsenic	.04

Missing Link.—The link between the monkey and man. According to Darwin, the present host of animal life began from a few elemental forms, which developed, and by natural selection propagated certain types of animals, while others less suited to the battle of life died out. Thus, beginning with the larvæ of ascidians (a marine mollusk), we get by development to fish lowly organized (as the lancelet), thence to ganoids and other fish, then to amphibians. From amphibians we get to birds and reptiles, and thence to mammals, among which comes the monkey, between which and man is a "Missing Link."

Molly Maguires.—The first organization of this name was formed in Ireland, with the object, it is believed, of generally misusing process-servers and others engaged in the prosecution and eviction of tenants, and was composed of young men who, in some localities, assumed women's clothing, blackened their faces, and otherwise disguised themselves. It remained, however, for the American "Mollies" to terrorize whole counties, and leave a blood-red trail behind them in the coal regions of Pennsylvania. To give even a record of the murders and

outrages they committed would require an entire volume; but they were numbered by hundreds, and the unfortunate victims were, in most cases, well known and respected men. The American organization was composed of the restless and reckless element drawn to the coal region through the opening of the coal fields. There is no recorded instance where the disguise of women's clothes was assumed in the United States. Through the effort of James McParlan, a detective, the secrets of the order were finally revealed, and many of its members were brought to justice.

Moonshiners.—Those who distill illicit whisky and evade the payment of the government excise tax, their operations being carried on chiefly at night. The term arose in the mountains of North Carolina and Tennessee, where this practice is very common.

Mourning.—

Black. The color of mourning in Europe, also in ancient Greece and Rome.

Black and white striped. Expressive of sorrow and hope combined; worn by the South Sea Islanders.

Grayish brown. The color of the earth; worn in Ethiopia.

Pale brown. The color of withered leaves; worn in Persia.

Sky blue. Expressive of hope for the deceased; worn in Syria, Cappadocia and Armenia.

Deep blue. The mourning of Bokhara, in Central Asia; worn also by the Romans under the republic.

Purple and violet. Denotes royalty: worn for cardinals and the kings of France. *Violet* is the mourning of Turkey.

White. Mourning of China. Henry VIII. wore white for Anne Boleyn. Until 1498 it was the mourning of Spain.

Yellow. Mourning worn in Egypt and Burmah. Anne Boleyn wore yellow for Catherine of Arragone. Yellow may be regarded as a token of exaltation.

Naval Academy.—The United States Naval Academy is located at Annapolis, Md. The appointments of midshipmen are made by the President, Senators, Representatives and Delegates. The law authorizes one hundred appointments each year by means of competitive examination. The course of study is four years. Candidates must be unmarried and upon becoming married will be dismissed. Each candidate before admission is required to sign articles binding himself to the U. S. Navy during the pleasure of the President of the U. S. His pay is $780.00 a year, while a student.

Niagara Falls.—Four of the Great Lakes of the St. Lawrence river system differ little in elevation. Superior, the first of the series, lies at 602 feet, and Erie, the last of these four, at 573 feet above sea level. But Ontario, the fifth, lies in a broad valley 300 feet below the upper plain on which Lake Erie rests, the difference between the two bodies of water being 326 feet. The upland plain joins the low valley along a bold escapement of 200 feet or more that extends east and west continuously through western New York, passing between the two lakes into Canadian territory.

The connecting stream between all of the lakes have rapids or river characters, but that connecting Lakes Erie and Ontario, because of their great difference of level and the presence of this escarpment, had developed a cataract and series of rapids that form one of the natural wonders of the world. The stream is Niagara river and the cataract Niagara Falls.

Niagara river is only about 28 miles in length, and for about 19 miles of that distance, from Buffalo to Niagara Falls, it flows as a broad, smooth stream with low drift banks, presenting no unusual characters. There the rapids begin, and for half a mile, in which distance the descent amounts to 50 feet, the waters become a boiling torrent. In this portion several islands appear, the largest one, Goat Island, dividing the river into two unequal parts. Both plunge over the precipice into a narrow, deep gorge, which turns away almost at a right angle and with a succession of foaming rapids and whirlpools finally reaches the open, low valley at its bordering escapement seven miles below. One sharper turn than the others is known as the Great Whirlpool.

The separation by Goat Island makes two falls. The smaller lies to the American side and is known as the American Fall. It has a crest of 1,060 feet, a depth of less than 10 feet and a fall of 167 feet. Under the ledges which form the chief support the spray has succeeded in forming cavernous recesses, one of which is accessible and is known as the "Cave of the Winds." The part between Goat Island and the Canadian shore is much the larger. It forms a great curve with a crest 3,010 feet long, known as the Canadian or "Horseshoe Fall." The amount and depth of water pouring over this crest are much greater than at the American Fall, but its fall is somewhat less—158 feet. A further descent of 104 feet is reached by the seven miles of rapids through the gorge.

The average flow of water over both falls is estimated by the United States engineers, from the mean flow of water over a period of 40 years from Lake Erie at Buffalo, to be 222,400 cubic feet per second. This volume of water has a potential value of probably more than 3,800,000 horsepower. The American side shows a recession of half a foot per year; the Horseshoe Falls recedes two to four feet.

The Falls were discovered in 1678 by Father Hennepin, whose description and estimates of proportions are somewhat extravagant. The first accurate surveys were conducted by James Hall in 1842. Since that time several have been made and it is on these instrumental observations that the rate of recession is based. New York established a reservation of 107 acres on the American side at an expense of $1,500,000. A somewhat larger reservation has been secured by Ontario for the Canadian side. Several great bridges cross the gorge and river. Eight hundred thousand people visit this place annually to see the cataract.

Old Dominion. Virginia. In colonial days acts of Parliment relating to the Virginian settlements (which at that time included all the British dominions in North America) always designated them as the "Colony and Dominion of Virginia." In the maps of the time this colony was described as "Old Virginia," is contradistinction to the New England settlements, which were called "New Virginia." The transition from "Old Virginia" to "Old Dominion" would be an easy and a natural one.

POSTAGE RATES

First-Class: Letters and written and sealed matter, 2 cents for each ounce.

Government post cards, 1 cent each.

Private mailing or post cards, 1 cent each.

Air Mail: Five cents for the first ounce and 10 cents for each additional ounce or fraction thereof.

Second-Class: Newspapers, magazines, and other periodicals containing notice of second-class entry, 1 cent for each 2 ounces regardless of weight or distance.

Third-Class (limit, 8 ounces): Circulars and other miscellaneous printed matter, also merchandise, 1½ cents for each 2 ounces.

Books (including catalogs) of 24 pages or more, seeds, cuttings, bulbs, roots, scions, and plants, 1 cent for each 2 ounces.

Fourth-Class (over 8 ounces): Merchandise books, printed matter, and all other mailable matter not in first or second class—

ZONES	First Pound (Including 2 Cents Service Charge). *Cents.*	Additional Pounds.
Local....	7	1 cent each 2 pounds.
1 and 2..	7	1 cent each pound.
3.....	8	2 cents each pound.
4.....	8	4 cents each pound.
5.....	9	6 cents each pound.
6.....	10	8 cents each pound.
7.....	12	10 cents each pound.
8.....	13	12 cents each pound.

Passion Flower.—So called by early Spanish settlers, who fancied it to be a representation of our Lord's passion.

The *leaf* is symbolic of the spear that pierced his side.

The five *anthers*, the marks of the wounds.

The *tendrils*, the cords or whips.

The column of the *ovary*, the upright of the cross.

The *stamens*, the hammer.

The three *styles*, the nails.

The *filamentous process*, the crown of thorns.

The *calyx*, the glory or halo.

The *white* tinge, purity.

The *blue* tint, heaven.

It remains open for three days, and typifies his three years' ministry.

Patron Saints.—This designation was given during the Middle Ages to those saints that were supposed to watch over and protect the interests of particular persons, places and trades. The following is a list of some of the more prominent of these:

Aberdeen, St. Nicholas.
Antwerp, St. Norbert.
Austria, Sts. Colman and Leopold.
Brussels, St. Gudule.
Cologne, St. Ursula.
Edinburgh, St. Giles.
England, Sts. George and Mary.
Flanders, St. Peter.
France, Sts. Mary, Michael and Denis.
Genoa, St. George.
Germany, Sts. Martin, Boniface and George.
Holland, St. Mary.
Ireland, St. Patrick.
Italy, St. Anthony.
Lisbon, St. Vincent.
Milan, St. Ambrose.
Naples, St. Januarius.
Paris, St. Genevieve.
Portugal, Sts. Sebastian, James and George.
Prussia, Sts. Mary, Adalbert and Andrew
Rome, Sts. Peter and Paul.

Russia, SS. Nicholas, Andrew, Wladimir, and Mary.
Scotland, St. Andrew.
Spain, SS. James the Great, Michael, Thomas à Becket, and Edward.
Venice, SS. Mark, Justina, and Theodore.
Vienna, St. Stephen.
Wales, St. David.

Pawnbroker's Sign, Origin of.—It is generally held that the three golden balls used by pawnbrokers as a sign were adopted from the armorial bearings of the Medici family of Italy by the Lombard merchants, among whom were several representatives of that family. This sign was used in London in very early times by some of those merchants who had emigrated from Italy and established the first money-lending establishments in England.

Peat.—A deposit formed in bogs by the decay of vegetable matter, frequently consisting almost entirely of Sphagnum, or bog-moss. In composition it differs from coal only in the relative proportion of its constituents. Thus, peat contains: Carbon, 55.62; hydrogen, 6.88; oxygen and nitrogen, 37.50; while coal consists of: Carbon, 88 to 94 per cent; hydrogen, 2.5 to 5.5; oxygen, 2.5 to 6.0. It forms extensive deposits in various parts of northern Europe, and notably in parts of Ireland, where it is commonly known as turf, and is largely used as fuel.

Phrenology.—A system of Physics-psychology founded by Dr. Gall (1758-1828), a German physician, and afterward expounded and developed by his pupil, Dr. Spurzheim. It is based on four fundamental principles:

(1) The brain is the organ of the mind.

(2) The mental faculties can be analyzed and reduced to a definite number.

(3) Different parts of the brain are appropriated to these different mental faculties.

(4) Capacity and character are indicated by the external form of the skull.

According to phrenologists, the mind is commonly divided into 35 faculties, associated with a corresponding number of areas on the cranium. These faculties are as follows:

Amativeness. Philoprogenitiveness. Inhabitiveness or Concentrativeness. Adhesiveness. Combativeness. Destructiveness and Alimentiveness. Secretiveness. Acquisitiveness. Constructiveness. Self-esteem. Love of Approbation. Cautiousness. Benevolence. Veneration. Firmness. Conscientiousness. Hope. Wonder. Ideality. Wit. Imitation. Individuality. Form. Size. Weight. Coloring. Locality. Number. Order. Eventuality. Time. Tune. Language. Comparison. Causality.

Anatomy and physiology have proved that the exterior surface of the brain is by no means an index to mental processes or characters; still less is such a guide furnished by the minute variations in the shape of the skull, which in a general way correspond to the exterior surface of the brain. Size of brain does not correspond directly to mental power of activity; nor is the superficial conformation the most important feature of the brain. Parts of the external surface known to have functions other than those attributed by phrenologists; the frontal sinus of the skull is sometimes large enough to occupy the region allotted to four or five phrenological organs; and there are many esteological differences in the various bones of the skull which obviously have nothing to do with brain-functions or mental processes.

Plymouth Rock.—On December 22, 1620, the Pilgrim Fathers first set foot on a bare rock on the bleak coast of Massachusetts Bay, "while all around the earth was covered with deep snow." This rock became known as "Plymouth Rock," and is to New England what the Palladium was to ancient Troy, or the shield of Minerva to Athens. In course of time the rock became broken into two pieces. One part remained in its original position at Hedge's Wharf, Plymouth; the other was taken to the center of the town and surrounded by an iron railing. In 1880 this portion which had been dragged into Plymouth by 20 yoke of oxen in 1774, and over which the Whigs erected a liberty-pole was returned to its original position.

Potter's Field.—"Potter's Field" was a piece of ground which, according to the statement in Matthew, xxvii. 7, was purchased by the priests with the 30 pieces of silver rejected by Judas, and converted into a burial-place for Jews not belonging to the city. Here is the passage: "And they took counsel and bought with them the potter's field to bury strangers in." With us the term "potter's field" denotes the ground where unidentified persons and the bodies of unclaimed paupers are buried; and the term undoubtedly had its origin in the transaction alluded to by Matthew.

Printer's Devil.—The origin of this term is ascribed to the fact that in the early days of printing the apprentice's duties included the inking of the forms with bags containing ink or besmeared with it. In the performance of this work his face and hands became so daubed with ink that in appearance he suggested the devil. Hence the name.

Rain.—The fall of water in drops from the clouds, or the drops which fall. A cloud consists of aqueous vapor, the individual vesicles of which are very small. When by the constant condensation of fresh aqueous vapor these vesicles become large and heavy, and several of them unite, they are unable to resist the action of gravity and fall as rain.

Rainbow.—A luminous bow or arch appearing in the clouds opposite to the sun when they are resolved into rain. Theoretically several bows may co-exist; generally, however, there is but one. Sometimes there are two, very rarely three or even four—the largest number authentically on record. Every rainbow exhibits the prismatic colors. When there are two bows, the lower, or primary, is very bright, and has the red highest; the outer, or secondary, is more faint, and has the violet the highest color. They are produced chiefly by the refraction and dispersion of the light in passing through the raindrops, partly also by its reflection from the back of the drops, without which the appearances would not reach the eye. The secondary bow ceases to be visible when the sun is 54 degrees above the horizon.

Rubicon, the ancient name of a small stream—thought to be the modern Fiumicino—which formed the boundary between Italy and Cisalpine Gaul. It is celebrated from Cæsar's having hesitated about crossing it with his army, and initiating civil war, in the year 49 B. C. When he came to the river he paused upon the brink, but finally saying, "The die is cast," he spurred on his horse, and dashed into the water. Hence, "To pass the Rubicon" has become a proverbial phrase, to denote the taking of the first step in a momentous undertaking, from which one cannot or will not recede.

Sabbath Day's Journey.—"A Sabbath day's journey, according to Dr. Adam Clark, was seven and one-half furlongs, or about 1,650 yards. The Rabbins fix it at 2,000 cubits, which is about 1,350 yards. Josephus says that the Mount of Olives was five stadia, or 625 paces, from Jerusalem, which would make the allowable Sabbath day's journey about 1,050 yards."

St. Valentine's Day.—The custom of sending valentines can, without doubt, be traced, in origin, to a practice among the ancient Romans. At the feast of the Lupercalia, which was held on the 15th of February, in honor of the great god Pan, the names of all the virgin daughters of Rome were put in a box and drawn therefrom by the young men, and each youth was bound to offer a gift to the maiden who fell to his lot, and to make her his partner during the time of the feast. This custom became allied to the name of St. Valentine, probably, only through a coincidence in dates. St. Valentine was bishop of Rome during the third century. He was of most amiable nature, and possessed remarkable gifts of eloquence, and was so very successful in converting the pagan Romans to Christianity that he incurred the displeasure of the Emperor, and was martyred by his order February 14, A. D. 270. When the saint came to be placed in the calendar, his name was given to the day of his death, and this was made a festival to offset that of the Lupercalia, and an effort was made to substitute the names of saints for those of girls in the lottery, but naturally without success. Many other customs of mediæval and later times, which have become allied in name to a holy saint of the church, are unquestionably of purely secular, even pagan, origin.

Salutes, United States National and International.—Salute to the Union. This is one gun for each state, and is commemorative of the Declaration of Independence. It is fired at noon of the Fourth of July, at every military post, and on board commissioned naval vessels belonging to the United States.

The National Salute, 21 guns. This is the salute for the national flag, the President of the United States, presidents of foreign republics, or sovereigns of foreign states, visiting the United States.

Vice-President of the United States, American and foreign ambassadors, 19 guns.

The President of the Senate, Speaker of the House of Representatives, Members of the Cabinet, the Chief Justice, a Congressional Committee, Governors within their respective states or territories, Viceroy or Governor General of provinces belonging to foreign states, General of the Army, Admiral of the Navy, and same ranks in foreign armies and navies, 17 guns.

American or foreign Envoys, or Ministers Plenipotentiary, Assistant Secretaries of the Navy or War, Lieutenant General, or a Major General commanding the army and corresponding ranks in the navy, and foreign armies and navies, 15 guns.

Ministers-Resident accredited to the United States, Major General, Rear Admiral, and corresponding ranks of foreign armies and navies, 13 guns.

Charges d' Affaires, Brigadier General, Commodore, and corresponding ranks in foreign armies and navies, 11 guns.

Consul Generals accredited to the United States, 9 guns.

Salutes are only fired between sunrise and sunset, and not on Sundays, except in international courtesies. The national colors are always displayed at the time of saluting. The salute of the flag is the only

calute which is returned, and this must be done within twenty-four hours. United States vessels do not return salute to the flag in United States waters if there is any fort or battery there to do it, nor do United States vessels salute United States forts or posts.

If there are several batteries or forts within sight or six miles of each other, one of them is designated as the saluting fort, and returns all salutes of foreign men-of-war. In New York, Castle William, on Governor's Island, is the saluting fort.

Santa Claus.—The children's Christmas deity is known in the United States by this name, the Dutch form *Santa Klaas*, being simply the abbreviation of Nicholas, a patron saint of unquestionable Holland ancestry.

Science, The Five Follies of.—These are usually said to be the following: The squaring of the circle; the establishment of perpetual motion; the philosopher's stone; charmation, or the discovering of secrets by magic; and judicial astrology.

Scylla and Charybdis.—Two geographical sobriquets frequently met in ancient and modern literature. Scylla is a rocky cape on the west coast of South Italy, jutting out boldly into the sea so as to form a small peninsula just at the northern entrance to the Straits of Messina. About the beginning of the fifth century B. C. a fort was built upon the rock (which is about 200 feet high, and much hollowed out below by the action of the waves), and in course of time a small town grew up, straggling down the slopes toward the sea. The navigation at this place was looked upon by the ancients as attended with immense danger, which, however seems to have been much exaggerated, for at the present day the risk is no more than attends the doubling of any ordinary cape. Charybdis (modern name Galofaro) is a celebrated whirlpool in the Straits of Messina, nearly opposite the entrance to the harbor of Messina in Sicily, and in ancient writings always mentioned in conjunction with Scylla. The navigation of this whirlpool is, even at the present day, considered to be dangerous, and must have been exceedingly so to the open ships of the ancients.

Smoke.—Any volatile, and specially any carbonaceous matter escaping from a burning substance. When wood or coal is in process of combustion, it emits, not merely minute particles of unconsumed carbon, but invisible gaseous matter. Appliances for consuming smoke aim simply at preventing the rise of the carbonaceous particles, ignoring the unseen gases. They turn on the furnishing of a supply of air containing an abundance of oxygen, the absence of which is the reason why any carbon escapes unconsumed.

Sphinx, Riddle of.—A famous enigma of antiquity. The story runs that Juno sent a monster named the Sphinx to ravage the territory of Thebes. This monster had been taught riddles by the Muses, and she propounded one to the Thebans: "What is that which has one voice, is four-footed, two-footed, and at last three-footed;" or, as some have it, "What animal is that which goes on four feet in the morning, on two at noon, and on three at evening." An oracle told the Thebans that they would not be delivered from her until they had solved her riddle. They often assembled to try their skill, but as often failed, when the Sphinx always carried off and devoured one of their number. At length Odipus came forward and gave the correct answer, "Man," who when an infant creeps on all fours, at manhood stands erect on two legs, and in old age hobbles about with the aid of a crutch.

Tammany, Society of, or Columbian Order was formed in 1789, being the effect of a popular movement in New York, having primarily in view a counterweight to the so-called "aristocratic" Society of the Cincinnati. It was essentially anti-Federalist or Democratic in its character, and its chief founder was William Mooney, an upholsterer, and a native-born American of Irish extraction. It took its title from a noted, ancient, wise, and friendly chief of the Delaware tribe of Indians, named Tammany, who had, for the want of a better subject, been canonized by the soldiers of the Revolution as the American patron saint. The first meeting was held May 12, 1789. The act of incorporation was passed in 1805. The Grand Sachem and thirteen Sachems were designed to typify the President and the Governors of the thirteen original States. The society is nominally a charitable and social organization, and is distinct from the general committee of the Tammany Democracy, which is a political organization.

Thunder.—The violent report which follows a flash of lightning. It commences the same moment as the flash; but, as the sound travels only at the rate of about 1100 feet a second, while light does so at the rate of 200,000 miles, the flash of the lightning is the first to be perceived, and thus a means is afforded of calculating the distance of the lightning. The noise of the thunder arises from the disturbance produced in the air by the electric discharge, but why the sound should be so prolonged has been differently explained. The old hypothesis was that the sound was echoed from every precipice, from every building, and from every cloud in the sky. Another is that the lightning itself is a series of discharges, each producing a particular sound according to the distance at which it commences, and the varying densities of the portions of air which it traverses before reaching the ear. A third conjecture is that the noise arises from the zigzag movement of the electric fluid, the air at each salient angle being at its maximum compression.

Train Management.—Standard Code.—A train while running must display two green flags by day and two green lights by night, one on each side of the rear of the train.

After sunset, or when obscured by fog or other cuase, must display headlight in front, and two red lights in rear.

Two green flags by day and two green lights by night, displayed in the places provided for that purpose on the front of an engine, denote that the train is followed by another train running on the same schedule, and entitled to the same time-table rights as the train carrying the signals.

Two white flags by day or two white lights by night, carried in the same manner, denote that the train is an extra.

A blue flag by day and a blue light by night, placed on the end of a car, denotes that car inspectors are at work under or about the car or train, and that it must not be coupled to or moved until the blue signal is removed.

Colored Flag or Lantern Signals—Torpedoes. Standard Code.—Red signifies danger.

Green signifies safety.

White signifies caution, go slowly.

Green and white signifies stop at flag stations for passengers or freight.

One cap or torpedo on rail means stop immediately.

Trees, Noted

Burgoyne Elm.—At Albany, N. Y., associated with that ill-fated British general, during the War of Independence.

Cary Tree.—Planted by the roadside in 1832 by Alice and Phœbe Cary, is a large sycamore, standing on the turnpike from College Hill to Mount Pleasant, Hamilton County, Ohio.

Charter Oak, The.—A tree celebrated in American (legendary) history, which formerly stood in Hartford, Conn. According to tradition, when Governor Andros came to Hartford in 1687 to demand of the Assembly the surrender of the colonial charter, the debate in that body over the governor's demand was prolonged beyond daylight, when suddenly the lights were extinguished, and in the darkness a patriot, Captain Wadsworth, escaped with the charter and hid it in a hollow oak. There is, however, no contemporary record of this event. The Charter Oak was overthrown by a storm in 1856.

Elm, Old Liberty.—A famous tree on Boston Common, which stood near the "long walk," at the foot of Flagstaff Hill, and was in its day considered the "oldest inhabitant" of Boston. It was a tree of unknown age, and was believed to have stood there before the settlement of the town in 1630. It was already decrepit as long ago as 1755. It was over seventy-two feet high, and measured twenty-two and a half feet in circumference one foot above the ground. After resisting many a storm, it was blown down in the winter of 1876. An iron fence surrounds the spot where it stood.

Fairlop Oak.—A giant oak-tree in Hainault Forest, Essex, England, whose girth was forty-eight feet, and beneath whose widely spreading branches an annual fair was held on the first Friday in July. The tree was blown down in February, 1820.

Judas Tree.—A corruption of Kuamos tree; *i. e.*, the leguminous or bean tree. The corrupt name has given rise to the tradition that it was upon one of these trees that Judas Iscariot hanged himself.

Mather's Willow.—The weeping-willow over the grave of Cotton Mather in Cop's burying-ground, near Bunker Hill, taken from a tree that shaded the grave of Napoleon at St. Helena.

Mt. Vernon Ashes.—The immense ash trees planted by General Washington at Mount Vernon, and now the admiration of visitors.

"Old Moses."—The largest tree in the world is one discovered, in 1874, in a grove near Tule River, in California. Though the top has broken off, it is 240 feet high, and the diameter of the tree where it has been broken is 12 feet. This giant of the forest is called "Old Moses," from a mountain in the neighborhood, and is calculated to be 4840 years old! The hollow of its trunk, which is 111 feet, will hold 150 persons, and is hung with scenes of California, is carpeted, and fitted up like a drawing room, with table, chairs, sofa, and pianoforte. A section of this tree, 74 feet round and 25 feet across, was exhibited in New York, in 1879.

The Washington Elm still stands at Cambridge, Mass. It is on Garden street, a short distance from the colleges, and is a large, well-preserved tree. An iron fence is built around it, and on a stone in front is the following inscription: "Under This Tree George Washington Took Command of the American Army, July 3, 1775."

"Uncle Sam,"—The practice of calling the United States Government "Uncle Sam" is believed to have originated in the following manner: During the Revolutionary war a man named Samuel Wilson was a beef inspector at Troy, N. Y., and was very popular with the men in his employ, who always called him Uncle Sam. After the inspection of the beef, it was shipped by him to a contractor named Elbert Anderson, and was always marked "E. A. U. S." A joking workman, being asked what those letters were the abbreviations of, replied that he did not know, unless they were for Elbert Anderson and "Uncle Sam." The joke was kept up and spread, until it became common to refer to all packages

marked "U. S." as belonging to "Uncle Sam."

Union Jack.—The origin of the term Union Jack has never been precisely ascertained. It would appear, however, that the word "union" arose from the union of the three kingdoms into one great political power. As an alteration in the banner of St. George occurred in the reign of James the First, it may, with great probability, be supposed to have been a rendering of the word "Jacobus," abbreviated into Jack.

Vision, Limits of.—Vary with elevation, conditions of the atmosphere, intensity of illumination, and other modifying elements in different cases. On a clear day an object one foot above a level plain may be seen at a distance of 1.31 miles; one ten feet high, 4.15 miles; one twenty feet high, 5.86 miles; one 100 feet high, 13.1 miles; one a mile high, as the top of a mountain, 95.23 miles. This allows seven inches; or, to be exact, 6.99 inches, for the curvature of the earth, and assumes that the size and illumination of the object are sufficient to produce an image.

Washington Monument.—Notwithstanding the fact that the plan of a monument to General Washington was approved by Congress in the latter part of December, 1799, nothing was done in the matter until 1833, when an association of prominent persons undertook the raising of the needed funds by subscription, and on July 4, 1848, had so far succeeded in their undertaking that the cornerstone of a monument was laid, and during the succeeding eight years the shaft was carried to a height of 156 feet. The work was then suspended, at first for lack of funds, then because of the Civil War, and finally because the foundations were believed to be insecure. In 1876 Congress undertook the completion of the monument. The base was first strengthened, and the work of rebuilding the shaft was resumed in August, 1880, and was finished August 9, 1884. The shaft is 555 feet high, and the entire height of the monument, including the foundations, is 592 feet. The base is 55 feet 1½ inch square. At 500 feet above the ground the monument has four sides, each of which is 35 feet wide. Its area at this point is that of a comfortable six-room house, each room of which might be 12x61 feet. This square forms the base of the pyramidal top which runs from it 55 feet until it terminates in a metallic point. This point is constructed of the largest piece of aluminium ever made. The stones of which the monument is constructed are great blocks of crystal marble from Maryland, and in some cases are nine feet long, two feet thick, and three or more feet wide. There are more than 18,000 of them.

Watches of the Night.—The Jews, like the Greeks and Romans, says the Rev. Dr. William Smith in his "Bible Dictionary," divided the night into watches instead of hours, each watch representing the period for which sentinels or pickets remained on duty. The proper Jewish reckoning recognized only three such watches, entitled the first or "beginning of the watches" (Lamentations ii, 19), the middle watch (Judges vii, 19), and the morning watch (Exodus xiv, 24; I Samuel xi, 11). These would last, respectively, from sunset to 10 o'clock P. M., from 10 o'clock P. M. to two o'clock A. M., and from two o'clock A. M. to sunrise. After the establishment of the Roman supremacy the number of the watches was increased to four, which were described either according to their numerical order, as in the case of the "fourth watch" (Matthew xiv, 25), or by the terms "even," "midnight," "cockcrowing," and "morning" (Mark xiii, 35). These terminated, respectively, at nine o'clock P. M., midnight, three o'clock A. M., and six o'clock A. M.

Weather Forecasting.—Almanac predictions can be nothing but conjecture, the earth's subjection to many unknowable and undeterminable forces rendering such calculations impossible. It is practicable, however, by the following rules, drawn from actual results during very many years and applied with due regard to the subjects of solar and lunar attraction with reference to this planet, to foresee the kind of weather most likely to follow the moon's change of phase.

Prognostications.

If New Moon, First Quarter, Full Moon or Last Quarter Happens	In Summer	In Winter
Between midnight and 2 A. M...	Fair.....(1 and 2)	Frost, unless wind is S. W. (7).
Between 2 and 4 A. M...	Cold and showers....	Snow and stormy.
Between 4 and 6 A. M...	Rain.....	Rain.
Between 6 and 8 A. M...	Wind and rain.....	Stormy.
Between 8 and 10 A. M...	Changeable.....	Cold rain if wind W., snow if E.
Between 10 and 12 A. M...	Frequent showers. (3)	Cold and high wind.
Between 12 and 2 P. M...	Very rainy.....(4)	Snow or rain.
Between 2 and 4 P. M...	Changeable.....(5)	Fair and mild.
Between 4 and 6 P. M...	Fair.....	Fair.
Between 6 and 8 P. M...	Fair if wind N. W....	Fair and frosty if wind N. or N. E.
Between 8 and 10 P. M...	Rainy if S., or S. W..	Rain or snow if S. or S. W.
Between 10 and midnight..	Fair.....	Fair and frosty.

Observations.—1. The nearer the moon's change, first quarter, full and last quarter to midnight, the fairer will be the weather during the next seven days.

2. The space for this calculation occupies from ten at night till two next morning.

3. The nearer to midday or noon the phase of the moon happens, the more foul or wet weather may be expected during the next seven days.

4. The space for this calculation occupies from ten in the forenoon to two in the afternoon. These observations refer principally to summer, though they affect spring and autumn in the same ratio.

5. The moon's change, first quarter, full and last quarter happening during six of the afternoon hours, *i. e.*, from four to ten, may be followed by fair weather, but this is mostly dependent on the wind, as is noted in the table.

6. Though the weather, from a variety of irregular causes, is more uncertain in the latter part of autumn, the whole of winter and the beginning of spring, yet, in the main, the above observations will apply to these periods also.

7. To prognosticate correctly, especially in those cases where the wind is concerned the observer should be within sight of a vane where the four cardinal points of the compass are correctly placed.

Water.—A clear, colorless, transparent liquid, destitute of taste and smell, and possessing a neutral reaction. It is one of the most important and most widely-distributed substances in nature, occurring universally in one or other of its three physical states—liquid, solid, or gaseous. As a liquid it constitutes the great mass of the oceans, rivers, and lakes, which cover nearly three-fourths of the earth's surface in the solid state it exists permanently in the form of ice or snow in the polar regions; and as a vapor is a constituent of the aerial envelope of the earth, and the exhalations of volcanoes and boiling springs. It occurs in combination in many mineral substances, and also in organic bodies, animals and plants containing from 80 to 90 per cent. Water is the most efficient of all solvents, there being few substances which are not, to some extent, affected by it, hence natural waters never occur absolutely pure, but contain in solution more or less of the constituents of the strata through which they have passed.

Rain-water contains substances derived in minute quantities from the atmosphere, such as ammonia, nitrate of ammonia, carbonic acid, nitrous and sulphurous acids.

Spring-water always contains a much larger proportion of dissolved substances than rain-water. When this is so highly charged with saline or gaseous constituents as to have a peculiar taste or smell, and is unfitted for ordinary use, it is called mineral water, and when the amount of these constituents does not sensibly affect its taste, etc., it is described as fresh-water.

Sea-water is essentially a mineral water, its saline constituents consisting of the chlorides and sulphates of sodium, potassium, magnesium, and calcium, together with minute quantities of silica, bromine, iodine, phosphoric acid, etc. The total solid contents of sea-water in mid-ocean varies from 30 to 40 grms. per litre, being largest near the equator and smallest near the poles.

A cubic inch of fresh water at 42 degrees weighs .036126 pounds. A cubic foot weighs 62.321 pounds. A cubic foot contains 6.2321 gallons. One gallon weighs 10 pounds. A ton comprises 35.943 cubic feet. Salt water is slightly heavier than fresh.

Water was long regarded as an element, but toward the end of the seventeenth century it was shown by Lavoisier to be a compound, and to consist of two parts by weight of hydrogen to sixteen of oxygen, or two volumes of hydrogen to one of oxygen. When pure it is free from taste and smell, and at ordinary pressure is liquid between 0 degrees and 100 degrees, boils at 100 degrees, and freezes at 0 degrees C, expanding to the extent of one-eleventh of its volume. The quantity of heat absorbed in the melting of ice is sufficient to raise the temperature of an equal weight of water 79.2 degrees, and the quantity of heat rendered latent by water at 100 degrees becoming vapor would raise the temperature of water 5.37 times as much as from 0 degrees to 100 degrees. Water is 825 times heavier than air, and when converted into steam expands to nearly 1,600 volumes. One cubic centimetre at four degrees, and under a pressure of 760 mm. of mercury, weighs 15.432349 grains, or one gramme, the unit of weight in the metric system.

Water in its gaseous form. It is a colorless, invisible gas, quite distinct from the visible cloud which issues from a kettle,

etc., which is composed of minute drops of water produced by the condensation of the steam as it issues into the colder air. Under ordinary atmospheric pressure, water boils in an open vessel at a temperature of 212 degrees, and the steam always has this temperature, no matter how fast the water is made to boil.

West Point.—The United States Military Academy is situated on the Hudson river at West Point, N. Y. The maximum authorized strength of the Corps of Cadets is 1,338. The candidates are nominated by U. S. Senators, Representatives, the Vice-President and the President. Some come from honor military schools and some from the regular army. Appointments are made only to fill vacancies. The course of study is four years which is largely mathematical and professional. The location is made memorable by the Treason of Benedict Arnold. The buildings and grounds are valued at $25,000,000.

Wedding Anniversary

At end of First Year comes the	Cotton Wedding
Second Year	Paper Wedding
Third Year	Leather Wedding
Fifth Year	Wooden Wedding
Seventh Year	Woolen Wedding
Tenth Year	Tin Wedding
Twelfth Year	Silk and Fine Linen Wedding
Fifteenth Year	Crystal Wedding
Twentieth Year	China Wedding
Twenty-fifth Year	Silver Wedding
Thirtieth Year	Pearl Wedding
Fortieth Year	Ruby Wedding
Fiftieth Year	Golden Wedding
Seventy-fifth Year	Diamond Wedding

Wedding Ring had its origin in the most remote antiquity. The ring was used anciently as binding ceremonies, making agreements, grants, etc., and evidently extended to the most solemn of engagements—marriage. The ancient Greeks held that a small nerve runs from the ring finger to the heart; and that therefore it was honored with the office of bearing the ring because of its connections with that master mover of the vital function. A Roman writer claimed that a small artery connected the ring finger with the heart.

What Makes a Bee Hum?—A bee's wings move very rapidly, vibrate and cause the air to move, which brings about the humming sound.

What Makes Water Boil?—When water is sufficiently heated it becomes gas. This gas is called steam. Bubbles which result are bubbles of water gas or water vapor.

What are Dreams?—A dream is a collection of ideas which come to the mind when we are asleep. When we are dreaming we do not have control over the trend of our thoughts, and the principle of suggestion is in control. The images that appear in dreams are usually completely lacking in coherency, but we are not surprised at this in our dreams. Sometimes however, our minds develop wonderful brilliancy during sleep. It is generally accepted that dreams result from natural causes. Internal bodily impression or the preceding state of mind or body usually cause and mould a dream. Dreams therefore, look backward over time past, instead of anticipating the future, and yet throughout the world in all the ages, many people have interpreted dreams as prophesying future events.

What Makes a Stick Float?—By the force of gravity the earth pulls everything toward the center of the earth. The heavier an article, the harder is this pull. Water is heavier than a wooden stick and therefore the pull of the water toward the center of the earth is greater than the pull of the stick. That is why the stick remains at the top of the water.

What Causes a Lump in the Throat?—When food passes into the throat it is not merely dropped into the stomach, but there is a nine or ten inch series of rings in our throat, that passes and squeezes the food from one set of muscle rings to another. These muscle rings work both up and down.

Upper Yosemite Falls

© E. M. Newman

When vomiting is caused, the muscles work upward, and force the material from the stomach.

When frightened a hollow feeling comes into the stomach, and these muscle rings of the stomach work upward. Pressing against the wind-pipe they cause one to feel as if there is a lump in the throat.

What Makes Milk Sour?—The particles of dust etc., fall from the air into milk. These carry microbes, which turn the sugar into an acid, causing the milk to become sour.

What Causes a Whirlpool?—A whirlpool is caused by the meeting of two currents of water going in different directions. The more rapid and powerful these currents are the larger is the whirlpool.

What is Smoke?—Smoke is a mixture of finely divided particles of solid matter suspended in the air. Although much smoke is made up of particles of carbon, the composition of smoke depends on what is burned.

What Makes Our Teeth Chatter?—Cold often causes a spasm of shivering which the brain cannot control. This causes the muscles of the jaw to quickly contract, thus allowing the jaw to fall of its own weight. Rapidly occurring over and over again, is what causes the teeth to chatter.

The two kinds of spasms are called "tonic" and "clonic." In a "tonic" spasm the muscles contract steadily and uniformly and remain contracted. In a "clonic" spasm the muscles relax and contract alternately and rapidly, producing an appearance of agitation.

What Causes Stars to Twinkle?—The light from the stars is constant and steady, but some rays are delayed in their long

trip from the stars to us and thus in one instant we see the light from the stars and the next instant we do not.

Whence Came the Name Black Maria?—The Black Maria is a conveyance used to transport criminals and disorderly persons to jail. The name Black Maria originated in Colonial days. Maria Lee, a negress, was the proprietress of a sailors' boarding house in Boston. Being tremendously large and strong, and holding the lawless element in great fear of her, she greatly aided the officials in keeping the peace. Black Maria often aided the police in taking unusually troublesome persons to jail. Alone she is reported at one time to have taken three drunken sailors to the station house. She aided in so many similar cases that the words "Call Black Maria" meant "Arrest the person."

Whence Came Masonic Signs?—Freemasonry began in the Middle Ages. Skilled Masons went from one place to another assisting in building magnificent churches, cathedrals, etc. In the Middle Ages it was necessary for these Masons to have some signs whereby they could be recognized by strangers as highly trained craftsmen, and not imposters. This was the beginning of Masonic signs.

Whence Comes the Expression "Showing the White Feather?"—When people act cowardly, we say they "show the white feather", because a white feather shows that a bird is a cross-breed. A good fighting gamecock is never a cross breed.

Whence Came Thanksgiving Day?—The President of the United States and the Governors of the various States usually name the last Thursday in November Thanksgiving Day. In the summer of 1621, the Pilgrim Fathers, after landing at Plymouth had a very poor harvest. Although in great need, after getting the harvest in, they gathered together and thanked God for what He had given them.

Thanksgiving Day was annually recommended by Congress during the Revolutionary War, but was discontinued from 1784 until 1789, when Congress recommended Washington to name a day of Thanksgiving for the adoption of the Constitution. In 1795 President Washington appointed a Thanksgiving Day upon the suppression of insurrection. In 1815 President Madison, upon recommendation from Congress, named a Thanksgiving Day in honor of peace. In 1863 and 1864 President Lincoln named a Thanksgiving Day and recommended that these be held annually. Since then Thanksgiving Day has been an annual event.

Whence Came the Name X-Rays?—When Professor Wilhelm Conrad Roentgen of the University of Wurzburg, Germany, was not certain of their exact nature, he titled them "X-Rays" because unknown quantities are usually called "X".

Where is the Highest Cross of Gold in the World?—The highest cross on any building in the world is tipping the spire of the Chicago Temple building at Chicago, Ill. From the pavement, 556 feet below, the cross appears of no size. But in reality it is twelve feet high and six feet wide, made of bronze, plated with copper, then covered with gold leaf. It weighs 250 pounds. It is illuminated.

White House.—The residence of the president of the United States is officially known as the Executive Mansion, which means that it is the residence of the head of the executive branch of the government; but it is seldom called, in ordinary talk, either by those who live in it, or by the American people in general, anything but the White House. This is a very unpretentious title, and it is interesting to note how the residence of the president, in a country which is full of white houses, came to bear this simple name as its special property.

The explanation is easily found. The first Executive Mansion at Washington was occupied in 1800. It was built of freestone, and was unpainted; but in 1814 the British army occupied Washington, and burned, with other public buildings, the president's house, leaving it a blackened ruin.

The house was rebuilt on the same site, and the same walls were used in its construction; but they were so discolored by smoke that, on the suggestion of General Jackson, they were painted white, not only to improve their appearance, but in token of the successful defiance of British fire by the American Republic.

The mansion soon became the "White House" in the mouths of the people, on account of its dazzling color, and from that day to this it has been repainted white every ten years. Its name commemorates a patriotic feeling, therefore, as well as serves to describe the appearance of the mansion, for the original coat of white paint was a sort of protest against the vandalism of the British, and every subsequent coat has served to perpetuate the protest.

White House Weddings.—The first wedding to occur in the White House was that of Miss Todd, a relative by marriage of President Madison. Then, in their order, came the weddings of Elizabeth Tyler, a daughter of President Tyler; John Quincy Adams, Jr.; Miss Easten and Miss Lewis, both during General Jackson's administration; Martha Monroe; Nellie Grant; Emily Platt, a niece of President Hayes; President Cleveland; Miss Alice Roosevelt; Jessie Woodrow Wilson; and Eleanor Randolph Wilson.

Why is a Married Man Called a "Benedict?"—In the Shakespearian play "Love's Labour Lost," Benedict was the name of a humorous character who in the end was married to Beatrice.

Why Does a Ball Bounce?—Because of elasticity. A thing is elastic when it can be made to change its shape and resume it again. The amount of force required to bounce an article is not important in determining the elasticity of that article. To bounce, an article must flatten when it strikes, then spring back to its former shape.

Why Does a Cold Glass Crack if We Put Hot Water in It?—A cold glass or tumbler is contracted. All the tiny particles that make up the glass have contracted and drawn together. When the hot water is put in, particles composing the inside of the tumbler begin to expand while the outside particles remain contracted and they pull away from each other and force the glass to crack.

Why Do Some People Freckle?—The action of the sun's rays on certain kinds of skin causes small parts of the second layer to give out a yellowish brown pigment. Persons of fair complexion and hair generally are more subject to freckles. Other people, because of a different kind of skin, do not freckle regardless of exposure to the sun. Though some freckles are permanent, in most cases cold weather causes them to disappear.

Why Are Glasses Touched Before Drinking?—As athletes usually shake hands before the beginning of a contest, in the olden days persons who fought duels paused before their fighting and drank a glass of wine. To make sure that there was no poison in either glass, the habit was formed of pouring some of the wine from each glass into the other, so that if one contestant

was poisoned, the other would be, too.

This practice still continues, although there is no longer thought of poison, and hence wine is no longer actually poured from one glass to the other. Merely the act of touching the glasses is sufficient to express friendliness and good will.

Thus touching glasses together in drinking, before a conference, is nick-named "hob-nobbing" because of the material used in that action long ago. The flat part of the open hearth where water and syrup were warmed was called a "hob" and a "nob" was the small table at which people sat when so engaged.

breathe as deeply as we should and our blood does not have enough oxygen from the air in it. When our brain learns that there is not enough oxygen in our blood it orders us to take a great deep breath, or to stretch, or both. This great big breath is called a yawn. Thus yawning and stretching are real helps to the body. They are not nice in front of other people because they show that we are tired of the other people's company.

World's Famous Highways.—It is of interest to motorists to know that the highest thoroughfare in the world is Main street, Denver; the widest is Market street, Philadelphia; the narrowest street is the Via Sol, Havana, Cuba, which has a width of 47 inches; the shortest is the Rue Ble, in Paris. The dirtiest is that of Tchangsti, Nankin, China; the cleanest is the Via Castile, in Seville, Spain; the richest is Fifth avenue, New York City; the most aristocratic is Grosvenor place, in London; the most beautiful is the Avenue des Champ Elysees, Paris; and the oldest is the Appian Way, built by Julius Caesar in the days of the Romans, and still in use and good repair.

Wax Model Showing Various Cuts of Beef
American Museum of Natural History, N. Y.

Why Does The Kettle Sing?—Steam arises from boiling water. Steam is a powerful force. Being forced out of the spout it causes the air to vibrate and tremble. This trembling air upon striking the ear drum causes it to tremble and thus a singing sound is produced. In the same way a stick rapidly twirled in the air sings.

Why Is The Right Hand Always Used For Shaking Hands?—Shaking hands with the right hand started in the days when everyone carried a knife or a sword. In those ancient days it was customary, to indicate a friendly feeling, to hold out the right hand, showing that there was no sword or knife therein for attack.

Why Is The Sky Blue?—In the sky are many tiny dust particles. The rays of the sun are white in color, and what appears to be white light is in reality a combination of all the various colors. These rays of light from the sun striking the specks of dust in the sky are largely absorbed. However, short rays of light are reflected from these dust particles to us and these short waves are blue. Thus the sky appears to us blue.

Why Do We Sneeze?—Because of some foreign object which irritates the membrane of the nose. Nature has an automatic way of expelling such irritating objects, by sneezing. Usually this irritation can be stopped by pressing on each side of the nose, about half-way down where the bone stops.

Why Are Tears Salt?—Because salt when properly mixed with water makes a perfect wash for the eyes and Nature makes the proper solution. Pure water is injurious to all delicate living things.

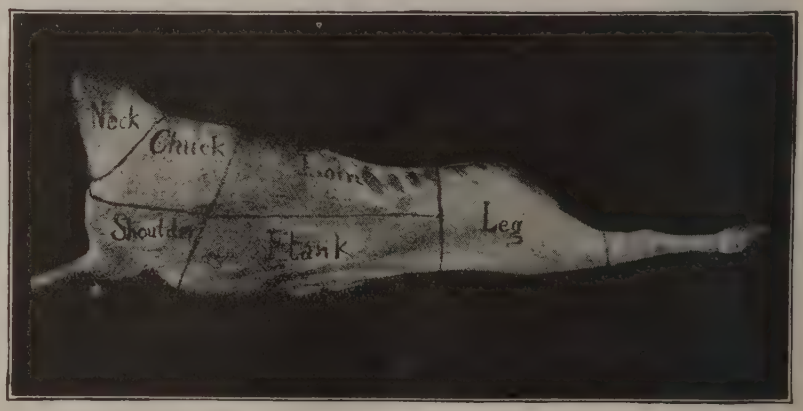
Why Do We Yawn and Stretch?—When we are bored or sleepy or tired, we do not

Wind.—A current of air moving in the atmosphere in any direction or with any velocity. Winds are produced by variations of temperature in different latitudes, or at different portions of the same latitude.

Heated air tends to ascend, and, to prevent a void from arising in the lower portion of the atmosphere from which it has ascended, a current of air, colder, and therefore denser, takes its place. This phenomenon is most obvious in tropics, from which hot rarefied air is ever ascending, one part toward the northern, and the other toward the southern Pole. From these two regions, cold currents of air proceed near the surface of the ground or the ocean to supply the threatened void. Were the earth at rest, the hot currents would depart from, and the cold currents strike the equator at right angles, but owing to the rotation of the earth from west to east, more quickly than its friction can carry the atmosphere with it, the latter is somewhat deflected to the westward, the hot currents leaving and the cold one striking the equatorial line at an oblique instead of a right angle. As the circles to be traversed by the rotating sphere or spheroid vary in magnitude in every latitude, cyclones tend to be generated which rotate in one direction, when they arise to the north, and in another when they are generated south of the equator.

The heat of the vertical, or nearly vertical, sun rarefies the atmosphere in the tropics over both land and water, not, however, to the same extent. Land is easily heated during the day and cooled during the night. Water is less easily changed in temperature, hence every tropical island is like a separate furnace, at work during the day rarefying the air and sending it upward, while, falling below the temperature of the ocean during the night, it modifies, suspends, or reverses the process, especially if the absence of clouds make radiation great. Hence, land and sea breezes arise; the former blowing during the day from the sea to the land, the latter during the night in a contrary direction.

Next, every high mountain is a refrigerating apparatus, capable of sending down its slope cooled air on all its sides, and consequently from every point of the compass.



Wax Model of Lamb Showing Parts Used for Meat
American Museum of Natural History, N. Y.

Even apart from these local complications, the higher the heated air which ascends from the tropics rises, the colder the atmospheric region into which it enters; it therefore ultimately parts with the caloric which enabled it to ascend and begins to fall, while the cold polar currents blowing toward the equator become heated, especially where their course is over the land, and ascend.

Observation shows that in consequence of these causes, there are eight principal directions in which winds blow: From the north, the northeast, the east, the southeast, the south, the southwest, the west, and the northwest. A north wind is one which blows from the north, not one blowing to that region, and so with the others. Classified according to the direction in which they blow, winds are divided into Regular, Periodical, and Variable Winds. The first are winds which blow all the year round in the same direction, as the Trade winds; the second those which blow regularly at the same seasons and the same hours of the day, as the monsoons, the land and sea breezes, and the simoon, the third, which blow sometimes in one direction and sometimes in another, as the prevalent winds of the temperate and arctic zones. The direction of the wind is easily ascertained by a vane.

World's Seven Wonders.—The seven wonders of the ancient world are: The Pyramids, the Colossus of Rhodes, Diana's Temple at Ephesus, the Pharos of Alexandria, the Hanging Gardens at Babylon, the Statue of the Olympian Jove, and the Mausoleum by Artemisia at Halicarnassus.

The Pyramids are numerous, and space forbids anything like even a list of them. The great piles were constructed of blocks of red or syenitic granite, and of a hard calcareous stone. These blocks were of extraordinary dimensions and their transportation to the sites of the pyramids and their adjustment in their places, indicate a surprising degree of mechanical skill. The Great Pyramid covers an area of between twelve and thirteen acres. The masonry consisted originally of 89,028,000 cubic feet, and still amounts to about 82,111,000 feet. The present vertical height is 450 feet, against 479 feet originally, and the present length of the sides is 746 feet, against 764 feet originally. The total weight of the stone is estimated at 6,316,000,000 tons.

The City of Rhodes was besieged by Demetrius Poliorcetes, King of Macedon, but, aided by Ptolomy Soter, King of Egypt, the enemy were repulsed. To express their gratitude to their allies and to their tutelary deity, they erected a brazen statue to Apollo. It was 105 feet high, and hollow, with a winding staircase that ascended to the head. After standing fifty-six years, it was overthrown by an earthquake, 224 years before Christ, and lay nine centuries on the ground, and then was sold to a Jew by the Saracens, who had captured Rhodes, about the middle of the seventh century. It is said to have required nine hundred camels to remove the metal and from this statement it has been calculated its weight was 720,000 pounds.

The Temple of Diana, at Ephesus, was built at the common charge of all the Asiatic States. The chief architect was Chersiphon, and Pliny says that 220 years were employed in completing the temple, whose riches were immense. It was 425 feet long, 225 broad, and was supported by 125 columns of Parian marble (60 feet high, each weighing 150 tons) furnished by as many kings. It was set on fire the night of Alexander's birth by an obscure person named Erostratus, who confessed on the rack that the sole motive which prompted him was the desire to transmit his name to future ages. The temple was again built, and once more burned by the Goths in their naval invasion, A. D. 256.

The Colossal Statue of Jupiter in the temple of Olympia, at Elis, was by Phidias. It was in gold and ivory, and sat enthroned in the temple for 800 years, and was finally destroyed by fire about A. D. 475.

World's Seven Modern Wonders.—The seven wonders of the modern world are:

1. Wireless Telegraphy, Telephone and Radio.
2. Automobile.
3. Aeroplane.
4. Radium.
5. Antitoxin.
6. Spectrum Analysis.
7. Xray.

Section I

General Hygienic Care of the School Child.

Introduction.

Factors determining the child's health.

1. Heredity (brief discussion).
2. Hygienic Care of Growing Child.
   a. Food and Nutrition.
   b. Air and Sunshine.
   c. Cleanliness.
   d. Play and Exercise.
   e. Sleep and Rest.
   f. Mental Hygiene and Moral Control.

Careful discussion of each of these subheadings.

HEALTH AND HYGIENE OF THE SCHOOL CHILD

(Illustration from Health Education No. 6)

"What is Health?

Health is not merely freedom from illness.

Health is not merely *sufficient* vigor.

Health means the possession of a *reserve force* of strength and energy.

Reserve force is necessary to meet the emergencies of life.

Reserve force is the capital which is so large a factor in success.

Health may be defined as that abundance of life and overflowing vigor which is the foundation of success and happiness.

Childhood is the time to build up this reserve" Health Education.—Bulletin No. 6—Federal Bureau of Education.

No such examination, of course, was made of our young women, but there is every reason to suppose that the results would have been much the same.

Since the war, largely as a result of these findings and increased appreciation of the preciousness of human life, there has sprung up all over the country a great movement to guard and conserve more adequately the health of our children.

The most natural and the strongest of these agencies will always be the combination of *parent, physician* and *school.*

One of the objects of this discussion is to show how the parent and the school, with the physician's aid, can best work together to conserve child health.

One of the questions which is likely to arise in the minds of parents and teachers at this point is—what factors determine in general the kind of health a given child will have?

These may be summed up under two great headings:

1. Heredity—that very marvelous process by which all living things tend to reproduce traits possessed by their ancestors.

2. Hygienic care of growing child.

The subject of Heredity in human beings is a very profound one and by no means completely understood. It is recognized, however, that all children tend to reproduce both the physical and mental traits of the parents and more remote ancestors.

Once your child is born of course you are powerless to influence this factor,

Protection of the Child against Disease.

1. General hygiene and the teaching of Health Habits.
2. Vaccination.
3. Routine Health Exam. and follow-up Work.
4. Care of the Teeth, and Why.
5. Care of the Nose and Throat.
6. Care of the Eyes and Ears.
7. Prevention and Care of Common Colds.
8. Care of Elimination.
9. After-care in the Infectious Diseases of Childhood.
10. Care of Cuts, Wounds and Abrasions.

Conclusion.

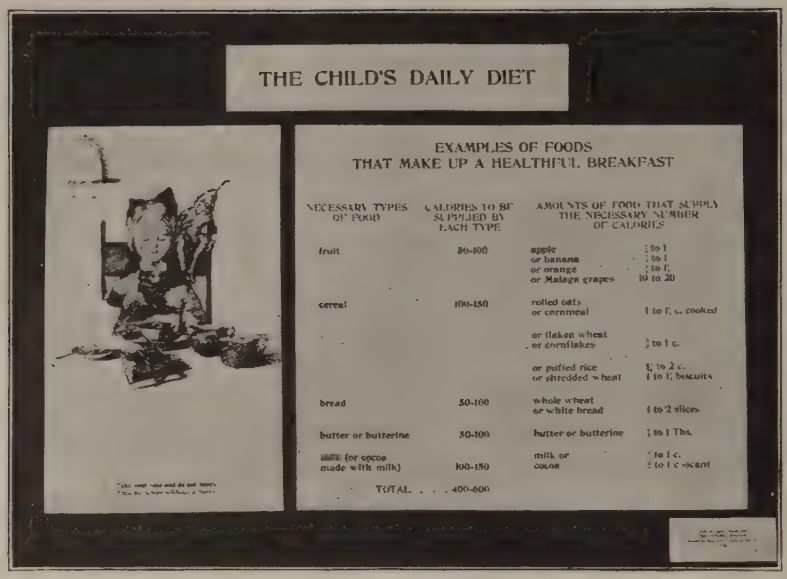
Section I.

GENERAL HYGIENIC CARE OF THE SCHOOL CHILD

(Dealing especially with children between the ages of 6 and 14.)

Introduction and General Considerations.—One of the most surprising results of the physical examination of the drafted men during the war was the record showing that about three out of every ten were unfit for duty because of some physical defect—such as poor vision, bad teeth, poor hearing, being much under weight, etc.

Most of these defects could have been prevented entirely by the proper care of the boy during the years of childhood.



indeed you have only a limited power before its birth—but you have left to you that other all important factor—Hygienic Care.

Our point of view about heredity has changed somewhat in the last ten years—the tendency being to lay less stress upon it than hitherto. For instance, many diseases used to be considered hereditary which we know now are not, the outstanding example here being tuberculosis.

This disease is never hereditary, tho, of course, the child of tubercular parents may show more *tendency* to contract it than the child of normal parents.

There are very few diseases, today, with which a child may be born—but the child may and does inherit *tendencies* to certain diseases if those tendencies or the actual diseases have been present in the parents.

However, even if your child has inherited say a tendency to poor digestion, that is no reason for you to expect and accept it as a fact that he will always be so hampered.

It is reason, however, for you to be especially on your guard about his food and general health regime. If tuberculosis has been the stalking spectre in your ancestral line that is no reason to be pessimistic about your child. Only let it constitute a warning to you that this child needs extra air, extra sunshine and careful feeding.

It would be false indeed to underestimate the importance of heredity in the make-up of your child; and in health teaching among older boys and girls there is no stronger appeal for them to keep themselves strong and well than the benefit such fitness will bring to their future children. But to overestimate its importance is likely to prove misleading and pessimistic.

Even with very bad heredity in a given child surprisingly good results can be obtained by good hygienic care.

Fortunately the kind of hygienic care the child is to receive can be to a very considerable extent determined by the parent. So that after all, parents can to a very large extent determine the kind of health their children are to have.

The question to be answered at this point is, what constitutes good hygienic care?

It is a very big subject and includes almost every influence, both physical and mental, which touches the child during the period of growth.

The chief factors concerned are as follows:

1. Food and Nutrition.
2. Air and Sunshine.
3. Cleanliness of body, clothes and surroundings.
4. Play and exercise.
5. Sleep and rest.
6. Mental hygiene and parental control.

Let us discuss briefly each of these major divisions as they affect the health of the child.

1. **Food and Nutrition.**—Proper feeding during the years of growth is generally recognized as fundamental to the health of every child.

The kind of food your child has today determines to a large extent the kind of man he will be tomorrow. It then behooves every parent to understand the principles which are involved in proper child feeding.

Let us consider first a little about food and the human body in general.

Food, of course, as everyone knows, gives us the following things:

1. Fuel for body activities—enabling us to work both mentally and physically; to play and to keep us warm. In order for our life processes to go on normally our bodies must maintain a certain temperature—the heat for this comes entirely from the food we eat.

2. Food supplies material to repair the parts of us which become worn out by working and playing.

3. Food supplies material for growth.

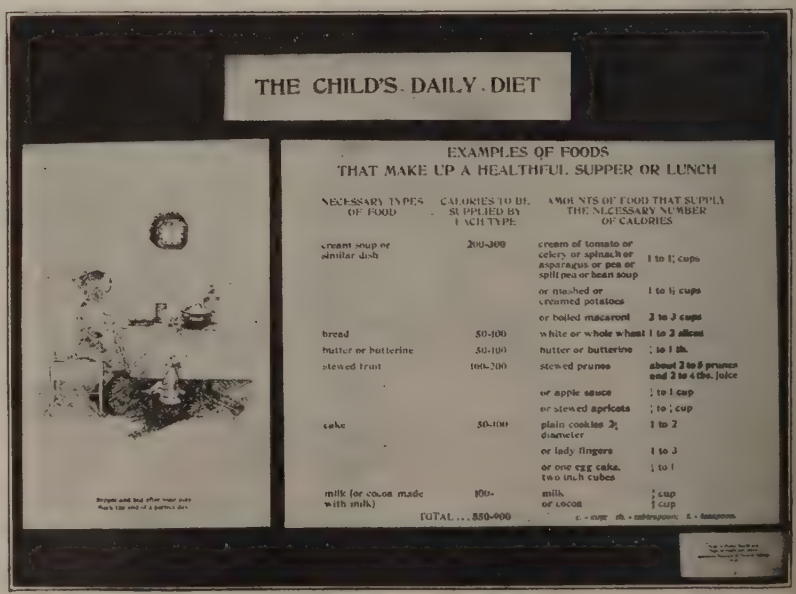
With these three great general uses of food in mind let us make a simple classification of food materials.

1. **Fuel Foods—these include:** (A) All Fats—such as butter, cream, olive oil, fat of meats, etc. (b) All Starches and Sugars—such as bread, cake, crackers, cereals, desserts and pastries, all vegetables and all fruits.
2. **Foods for Growth and Repair—these include:** All the so called *protein* foods of which eggs, milk, cheese, fish, lean meat and the grains are the most important.
3. **Mineral Salts—these include:** Salts of iron, of lime, of sodium and many others. They are found pretty well distributed thru all of our food, some foods being rich in one and some in another.

Iron salts, for instance, are especially abundant in oatmeal, whole wheat flour, raisins, etc. The salts of lime are very abundant in milk—and as it is these which aid young children chiefly in forming bone one very good reason for the free use of milk with growing children will be seen.

Iron salts are an indispensable constituent of normal blood.

4. **Vitamines.**—Food substances not completely understood but which are vitally necessary to the normal growth and health of every child.



(a) Those found in fresh fruits and leafy vegetables such as cabbage, spinach, lettuce. Tomatoes are also rich in this vitamine.
(b) Those found in milk and dairy products.
(c) Those found in the cereals and grains.

We do not understand completely what the vitamines do for us but we do know that some of them have a very important influence on growth. It has been shown, for instance, that young rats fed an abundance of fat, sugar, protein and water, but with vitamines of a certain type extracted from this food, will live but cease growing entirely until the special vitamine is restored.

The lack of certain other vitamines will produce very definite diseases—an example of this is scurvy—a disease from which sailors and explorers used to suffer frequently. It is now occasionally seen in badly fed young children. It is caused by the absence of the vitamine contained in fresh fruit and leafy vegetables. It can be cured by treating the sufferer with doses of fresh orange juice or tomato juice —either fresh or canned.

Another disease caused by lack of vitamines is seen in the Orient among poor coolies of Japan and China. The chief article of diet there is rice, of course. This is a very good food provided some of the outer husks of the rice grain are left in the milling process. Because it is in these husks that the precious vitamine of the rice resides. If the coolies are fed on the so-called polished rice—that with all the outside husks removed—they soon develop a serious disease called beriberi. This can be cured if they are changed quickly to the unpolished rice. Polished rice is used in America but our diet is so varied, as a rule, that we have other sources of vitamines.

What is true of the rice grain in respect to the location of its vitamine is also true of the other grains—wheat, oats, rye, etc. Fine white flour made from any of these is very low in vitamine content compared to coarser, darker flours. This is one of the reasons why whole wheat and brown bread are much more wholesome and should always be provided for children at least part of the time.

Tradespeople and advertising specialists are beginning to make capital of the term *vitamine*. Yeast, for instance, is widely advertised and recommended as a vitamine food. It is perfectly true that yeast contains vitamines but there is no logical reason why anyone should resort to yeast for these substances when they are found in such abundance in attractive foods like oranges, lettuce, cabbage, milk, butter, cereals, etc. A good mixed diet contains all the vitamines any child needs, and in the best possible form.

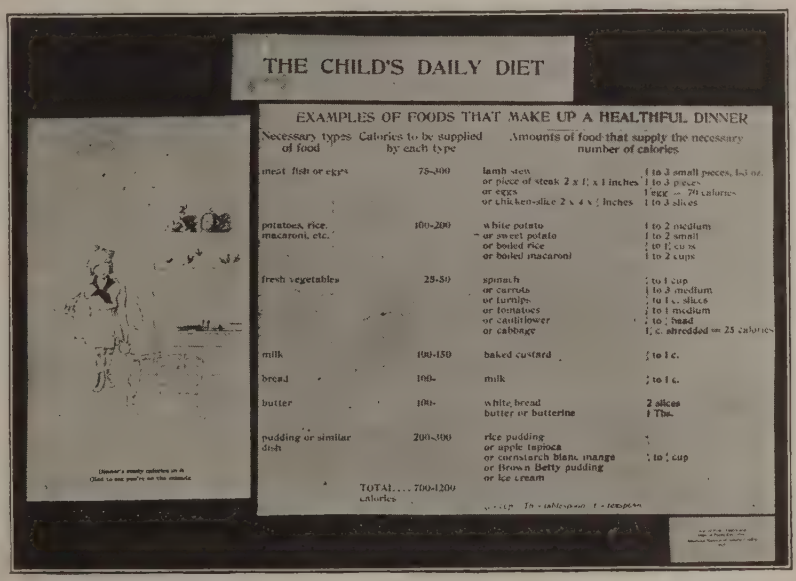
5. **Water.**—This is frequently not classed as a food because it does not give energy, nor repair waste or supply growth. It is, however, necessary in order that all the above named processes should go on. All children of from 6 to 14 need from 4 to 8 glasses of water daily.

At the close of this food classification a word of caution may be necessary. Very few foods are purely and solely of one type. Thus bread, which we have classed as a starchy food, is also rich in protein and when made from darker flour is also rich in vitamines. Milk, usually classed as protein, contains every food element required by the child, making it the one perfect food for children.

Foods like butter, olive oil, cream and sugar, on the other hand, consist practically entirely of one kind of food substance.

The great majority of food substances tho are highly complex.

With this simple classification of foods in mind let us proceed to the feeding of our child.



The first question to be asked here is: how does the feeding of children between the ages of 6—14 differ from the feeding of adults?

1. Most children of these ages are more active muscularly than adults.

2. The child is growing.

The conclusions reached from these two statements are:

1. His greater activity requires proportionately a greater total quantity of food than the adult.

2. The child's diet needs a greater proportion of protein food (growth food) than the adult.

Let us consider first the question of how much food the child needs. This is determined by several factors.

1. The individuality of the child—very active, highly strung children usually require more food than the more passive types.

2. The weight and height of the child—larger children require more food.

3. Age—the amount of food required increases from the 6th year, till at 13—16 it is more actually than the adult requirement.

4. Sex—to a limited extent.

During the first year of life both male and female children require about the same amount of food and in proportion to the size of their little bodies more food than they will ever require again.

From the second to the twelfth year the food requirements of boys and girls of the same body weight is about the same.

At this point the girl shoots ahead of the boy in growth and so requires more food than the boy. But from fourteen to sixteen the boy shoots ahead of the girl in growth and requires considerably more than she does at this time.

The usual method of measuring food quantities in relation to nutrition is by the calorie.

A calorie is really a certain amount of heat. In this connection one calorie represents enough heat to raise the temperature of about 1 quart of water 1°F.

The reason the calorie is chosen as the unit for measuring foods accurately is because all of the major classes of foods, i.e., fats, starches, sugars and proteins, are transformed into heat in our bodies. (The proteins have in addition the special power of providing new substance for repair and growth). Therefore it seems appropriate that since practically all of the food we eat may be transformed into heat within us the unit for measuring it should be a certain amount of heat, i.e., the calorie. By very careful experiments, it has been determined how many calories equal amounts of each of the major food substances will yield. Thus—

1 gram of pure protein completely turned somewhat as it is in the body will yield 4 calories.

1 gram of pure starch or sugar likewise treated will yield 4 calories.

1 gram of pure fat treated the same will yield 9 calories.

A gram may be thought of roughly as the amount of powdered sugar that could be held on the nail of one's little finger.

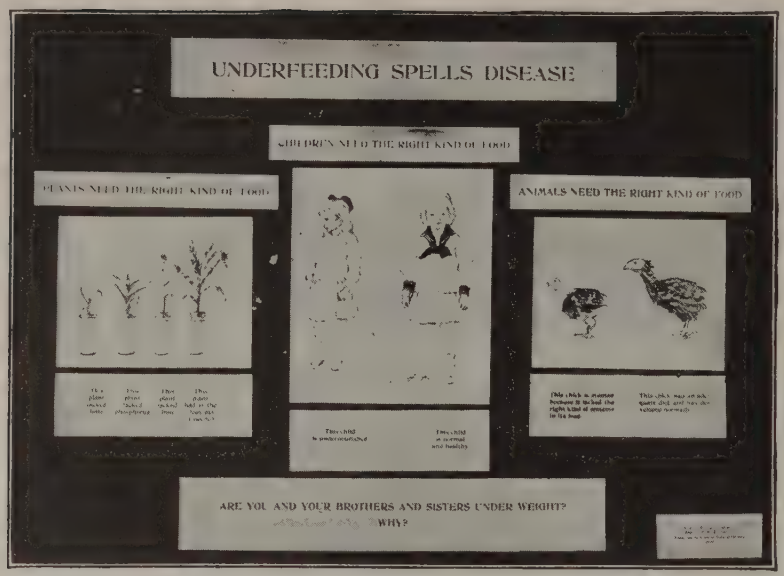
It will be seen from the above figures that starches, sugars and proteins are the same in their heat yield, while fats are much more caloric.

Using these figures, then, one could calculate the number of calories in any given amount of any food provided the proportions of fat, starch, sugar and protein in it were known.

Thus as a sample problem—How many calories could be derived from a glass of milk which contained in its solid part (water has no caloric value) 7 grams of protein, 6 grams of fat and 5 grams of sugar?

1 gm. protein—4 calories x 4—16 cal.
1 gm. fat —9 calories x 9—81 cal.
1 gm. sugar —4 calories x 5—20 cal.

This particular glass of milk—117 calories or would yield over 100 calories. This would be rich milk high in butter fat. Poorer milk yields only about 100 calories or less.



Fortunately it is not necessary for us to spend time working out caloric values as there are many excellent tables all worked out for our use giving calories per table portion. The one appended here was worked out by Dr. Emmett Holt, the eminent specialist in child feeding.

Now that we have some idea of the meaning of the term calorie the next question is how much per day or how many calories does a given child require?

This is determined roughly by age and body weight.

Between the ages of 6 and 14 we allow approximately 40-50 calories for every pound of body weight.

Thus a boy of ten weighing 70 lbs. would require at least 2,800 calories per day. The same would be true for the girl of this age, as there is not much difference between them, nutritinely speaking, till the eleventh year.

Here again it is not necessary for the parents to puzzle unduly over total calories; as the Federal Bureau of Education, Department of Health, has worked out excellent menus which give correct quantities for children from 7—12 years. They are included here.

After total quantity of food required is settled in a general way the next important question to be determined is the proper protein requirement.

We said sometime back it will be remembered that children require more protein then adults because of growth. Roughly speaking; 15% of their total daily calories should be derived from protein food. In the table of menus appended the protein food included is in this proportion. So, here again tedious calculations are unnecessary. What is necessary at this point, however, is that the parent shall choose the child's protein food with good judgment.

The best all-around protein food for the growing child is milk.

Every child 6—14 should drink at least a pint a day. Dr. Graham Lusk, the great nutrition specialist, says that no family of 5—father, mother and three children—should buy any meat at all until they are regularly using 3 quarts of milk each day. "No other food can take the place of milk," says the Federal Bureau of Health Education. "Milk should not be given too cold; warm milk is more easily digested. If children rebel against drinking milk alone it may be given in the form of cocoa, custards, milk soup, etc. Where it is impossible to get fresh milk, dried or evaporated milk may be used tho they are not so good.

"Tea and coffee should not be given to growing children at all." Not only are they stimulating and non-nutritious, but their stronger taste spoils the child for the milder, blander tasting milk.

The first food a family should buy is milk. The last food to be dispensed with is milk.

After milk, eggs, simple cheese and cereals are also preferable to meat. A very small piece of meat or fish once each day is the most required by any child.

The Food Bulletin of the Bureau of Federal Education says here:—"Where plenty of milk and an egg a day are included in the diet of the child very little meat need be given before the 7th year.

"Allow not more than two ounces of meat daily for the child from 7—10, and not more than 3 ounces daily from 7—14, (an ounce here is a rounded tablespoonful).

"The broth from stews may be given in vegetables and bread. Very fat gravies should be avoided as meat fat is hard for most children to digest.

"Breads, cereals and the grain products, should furnish one-third of the child's total food intake."

Remember that the darker, coarser breads are always to be preferred.

Cooked cereals are more nourishing than the cold ones.

Vegetables form a very essential part of the diet. There is little danger of feeding a child too many vegetables. They are important in helping to counteract constipation.

Potatoes, baked, boiled or mashed, should be given every day.

Lettuce, spinach, beet greens, carrots, cooked onions and all the dried vegetables should be generously served. Cabbage is very wholesome, but most children need to have it cooked.

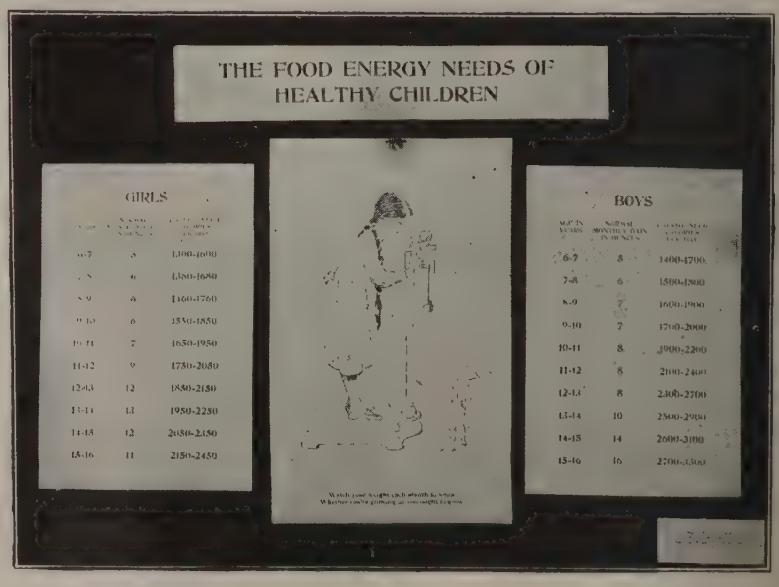
Many children find corn and cucumbers difficult to digest so these had best not be used till after the 12th year.

"There should be some fruit eaten every day—fresh or dried. Fresh fruit should be very ripe; uncooked bananas should not be eaten before the 10th year." All the simple stewed fruits are good. Excessive amounts of sugar should be avoided. A small amount of simple candy, like milk chocolate, may be eaten directly after a meal. Eating of candy between meals should never be permitted. Eating between meals of any thing should always be discouraged—if absolutely necessary, it should be bread and butter.

Children 5—7 years, should not have more than 1 tablespoonful of sweets in addition to sugar in the diet.

Those 7—12 not more than 2 tablespoonfuls daily.

Fat is a necessary part of every child's diet. Butter and cream are the most wholesome. Substitute butters are not injurious, but it is better not use to them



with children as they contain little or no vitamine. Olive oil and small amounts of nuts are wholesome. Children should not be given cooked fat, except bacon, as they are harder to digest.

All fried foods and pastry should be avoided.

Every child should have 3 well-planned meals each day.

If lunch is eaten at school one hot dish at least, such as soup or cocoa, should be included. If a basket lunch is carried it should consist of two or three nutritious sandwiches of egg or raisin or lettuce or peanut butter, with a few simple cookies and some fruit. Meat sandwiches are not necessary.

Breakfast is a very important meal for the school child. No properly disciplined child should ever be allowed to leave the house without breakfast. For good breakfast menus see the chart. The Federal Bureau of Education recommends the following so-called Good Food Habits:—

1. Meals should be eaten at regular times.

2. A glass of water, not too cold, may be taken with each meal. We know now that drinking water slowly at meals does not interfere with digestion.

3. Children often have to be taught to like foods which are good for them—vegetables such as carrots, or spinach or lettuce. Be patient but firm in teaching a child to like new foods. Begin by giving a small amount of the new food, give but one new food at a time and repeat it regularly until the child learns to like it.

4. Children should never be forced to eat when not hungry. Forced feeding causes more harm than light eating for a few days.

5. Children should be happy while eating—let the mealtime be a joyous occasion, with no undue excitement just before, during or after eating.

6. Plenty of time should be allowed for meals with reasonably slow chewing.

How is one to know if a child is properly nourished? The best test is does he weight the correct amount for his age and height? Every school child should be weighed once each month thru out the year and a record kept. In many schools now this is done routinely—the class weight record hanging on the wall. The child sees from the chart how much he should weigh for his age and height and how much he should gain each month. This is a point which the home and school should work together always.

Reproductions of the weight charts gotten out by the Federal Bureau of Education are to be found on this page.

We are just beginning to realize how extensive and far reaching are the results of faulty nutrition in our school children. Dr. Emmett Holt gives very interesting data concerning the relation of nutrition to school progress and retardation. His conclusion, based on extensive study of many statistics, somewhat as follows:

1. Children in advanced grades for their ages are found to be taller and heavier than children who are average age for the grade.

2. Tall and heavy boys and girls are physiologically older and further advanced in school progress than those who are small and light.

3. School progress goes hand in hand with physical development.

4. Bright children are as a rule better developed physically and heavier for their height than retarded ones.

The general conclusion to be drawn here is that mental development parallels physical development *as a rule.*

Good physical development—good nutrition.

Excellence in school progress is dependent upon good nutrition.

A child must be well nourished to attain more than average grade or go faster than his fellows.

Poorly nourished children in the school tend to show the following:—

1. They lack energy and are easily tired.
2. They show marked inattention—it is very hard to hold their interest.
3. Poor memory.
4. Slow comprehension.
5. Restlessness.

Poor nutrition is generally conceded to be one of the chief causes of retardation, or backwardness, in our school children today.

The following results were obtained in 1921 in the city of Detroit as a result of a study of backward and bright children in relation to nutrition:

The weight of boys retarded 1 year was 1.5 per cent below the average weight for the grade.

The weight of boys retarded 2 years was 2.6 per cent below the average weight for the grade

The weight of boys retarded 3 years was 4.9 per cent below the average weight for the grade.

The weight of boys retarded 4 years was 8.1 per cent below the average weight for the grade.

The weight of boys accelerated 1 year was 2.6 per cent above the average weight for the grade.

The weight of boys accelerated 1½ years was 5 per cent above the average weight for the grade.

The weight of boys accelerated 2 years was 7.1 per cent above the average weight for the grade.

The weight of boys accelerated 2½ years was 10.2 per cent above the average weight for the grade.

From "Food, Health and Growth"
—By Dr. L. E. Holt.

Another very fundamental result of faulty nutrition is that it predisposes the child to all kinds of infectious diseases—the most dreaded of which is tuberculosis.

The conclusion to be drawn from the foregoing is that every thoughtful, earnest parent will give the careful and painstaking attention to the feeding of her children.

2. Air and Sunshine.—These are just as necessary for the growing child as food. The so-called open air movement in America today, including sleeping porches, summer camps, Boy and Girl Scout activities in the open, will undoubtedly make for a stronger, finer race.

Oxygen, the most important constituent of the air we breathe, is as necessary to life and nutrition as is food itself. Without it life is impossible—diminished oxygen supply always means reduced health and vigor. Witness the difference in the occurrence of colds, coughs and pneumonia in the winter, when we are huddled indoors, as compared with the summer, when we spend more time outdoors.

Oxygen supply for children usually takes care of itself in summer but during the long winter months spent indoors special care must be exercised at all times to see that sufficient air is secured by ventilation.

1. Every child should be trained to sleep with at least one window open all winter—being of course very warmly covered.

2. Most careful attention should be given to the ventilation of the school room—the child himself being trained to appreciate good ventilation. In our large cities, where over-crowding is the rule and many children suffer acutely from lack of air, the open air school is being established to care for the weaker ones, and with most encouraging results—children gaining in weight and mental alertness.

In observations made on the children in the open air schools of Philadelphia it was found that in practically every instance they could accomplish almost twice as much school work in a given time under the open conditions as was possible in the closed room.

The following is quoted from Dr. Walker Cornell's report on a study of open air schools—

"Children taught in fresh air learn with avidity and directly. They do not require the perpetual reviews and drills so common in our hot, dry schools. They are happier and grown more rapidly in cold air. The discipline of a school is reduced to a simple problem when the air is right.

"After eight weeks of cold air work in the two rooms first opened for demonstration, the school physician found that the nasal discharge, which is very common in all primary schools in cold weather, was entirely absent in the two rooms open to the fresh air. One child with catarrh was found in each room, but both had been out of school and returned the day of inspection. He found in two similar rooms where the air breathed was like that supplied in the very best schools of Chicago and other progressive cities that over 40 per cent of the pupils had nasal discharge, although his examination was held before the severest weather had been experienced."

In most places where open air schools have been established they are for the benefit of badly nourished and tubercular children. But we are progressing so in our appreciation of health that the time is not far distant when every new school house will have at least partial open air facilities and equipment.

SAMPLE SUMMER DIET FOR A WEEK FOR CHILDREN 7 TO 12 YEARS.

BREAKFAST	DINNER	SUPPER
Oatmeal, ½ to ¾ cup, with milk. Stewed fruit, 2 to 3 tablespoonfuls. Bread and butter, 2 to 3 slices. Milk to drink, 1 glass.	Lamb stew, with vegetables, small portion. Squash or string beans, 2 to 3 tbsps. Bread and butter, 2 to 3 slices. Bread pudding, 2 tbsps.	Potato soup, with milk, 1 cup. Poached egg and toast. Brown bread and butter, 2 to 3 slices. Stewed prunes, 4 to 5. Milk to drink, 1 glass.
Force or cornflakes, 1 cup, with milk. Egg. Brown bread and butter, 2 to 3 slices. Milk to drink, 1 glass.	Chicken with rice, small portion. Mashed potato, 2 to 3 tbsps. Dandelion greens, or boiled onions, 2 to 3 tbsps. Stewed fruit, 2 to 3 tbsps. Bread and butter, 2 to 3 slices.	Spinach soup with milk, 1 cup. Corn bread and syrup, 2 to 3 pieces. Cottage cheese, 1 level tbsp. Ginger cookies, 1.
Hominy, ½ to ¾ cup, with milk. Toast and butter, 2 to 3 slices. Baked banana, 1. Milk to drink, 1 glass.	Bacon, 1 slice. Poached egg and spinach. Spaghetti with tomatoes, 2 to 3 tbsps. Green peas or string beans, 2 to 3 tbsps. Bread and butter, 1 to 2 slices.	Cornflakes, 1 to 2 cups, with milk. Puree of lima beans, ⅔ cup. Ginger cookies, 1 to 2. Milk to drink, 1 glass.
Cornmeal, ½ to ¾ cup, with syrup. Scrambled egg, 1. Bread and butter, 2 to 3 slices. Milk to drink, 1 glass.	Rice pudding, 1 to 2 tbsps. Hamburg steak, 1 small ball. Stewed potatoes, 2 to 3 tbsps. New beets and beet-top greens, 2 to 3 tbsps. Stewed fruit, 2 to 3 tbsps. Bread and butter, 2 to 3 slices.	Milk toast or rice, ½ cup, with milk. Baked potato, 1. Bread and butter, 2 to 3 slices. Milk to drink, 1 glass.
Shredded wheat, 1, with milk. Corn bread and butter, 2 pieces. Apple sauce or stewed pears, 2 to 3 tbsps. Milk to drink, 1 glass.	Fish or clam chowder, ¾ cup, or egg. New beets or spinach, 2 to 3 tbsps. Boiled potato. Bread and butter, 2 to 3 slices. Custard or junket, ½ cup.	Oatmeal soup, 1 cup. Squash, chard, or carrots, 2 to 3 tbsps. Stewed fruit, 2 to 4 tbsps. Bread and butter, 2 slices. Milk to drink, 1 glass. Plain cookies, 1.

SAMPLE WINTER DIET FOR A WEEK FOR CHILDREN 7 TO 12 YEARS.

Oatmeal, ⅔ cup, with milk. Bread and butter, 2 to 3 slices. Stewed prunes or figs, 3 to 4. Cocoa with milk, 1 glass.	Beef stew with vegetables, small portion. Bread and butter, 3 to 4 slices. Rice pudding or custard, 2 to 3 tbsps.	Corn bread and syrup, 2 to 3 pieces. Soft egg. Bread, 2 to 3 slices, and peanut butter, ½ tbsp. Cocoa with milk, 1 glass.
Force or cornflakes, 1 to 2 cups, and milk. Bread and butter, 2 to 3 slices. Soft egg and bacon. Milk to drink, 1 glass.	Chicken, small slice. Potato soup with milk, 2 to 3 cups. Creamed carrots or onions, 2 to 3 tbsps. Ginger bread and thin cream, 1 small piece. Bread and butter, 2 to 3 slices.	Milk toast, 2 to 3 slices. Cottage cheese, 1 tbsp. Stewed prunes, 4 to 5. Cookies, milk to drink, 1 glass.
Pettijohn or malt breakfast food, ⅔ cup, with milk. Bread and butter, 2 to 3 slices. Soft egg. Milk to drink, 1 glass.	Creamed or fresh broiled fish, small portion. Baked sweet potato. Bread and butter, 2 to 3 tbsps. Baked apple, 1.	Spinach or bean soup, 1 cup. Baked potato, 1. 1 corn bread and butter, 2 pieces. Milk to drink, 1 glass.
Cornmeal, ⅔ cup, and milk. Toast and butter, 2 to 3 slices. Stewed dried peaches, 2 to 3 tbsps. Cocoa with milk, 1 cup.	Lamb stew with vegetables, small portion. Boiled potato, 1. Bread or rice pudding, 2 to 3 tbsps. Bread and butter, 2 to 3 slices.	Celery soup with milk, 1 cup. Bread and butter, 2 to 3 slices. Custard or junket, ½ cup. Ginger cookies, 1 to 2. Milk to drink, 1 glass.
Stewed dried peaches, 2 to 3 tbsps.	Bread or rice pudding, 2 to 3 tbsps.	Custard or junket, 3 cup. Milk to drink, 1 glass.

From Diet for the School Child, No. 2. Federal Health Education.

COMPARING FOOD VALUES AT A GLANCE

Copyright, Denoyer-Geppert Co.

The graph at top left shows the percentage of protein (red), fat (yellow), carbohydrate (blue), water (green) and mineral (purple). Milk is an almost perfectly balanced food. Compare the band representing milk with those of the other foods.

The amount of heat necessary to raise the temperature of 1 liter of water from 0° to 100° Centigrade (from freezing to boiling) is 100 calories. Each portion around the vessel is the equivalent of 100 calories.

At bottom left are twin chicks; the sturdy one had a vitamin diet, while the other had no vitamins. The three squares indicate diet requirements: in iron (red), in calcium (blue); in phosphorus (yellow). The three rectangles show how cooking breaks down the indigestible capsules which enclose the starch granules in our starchy foods: the first rectangle shows with no cooking; the next, with a little cooking; the third, when thoroughly cooked. At lower right is depicted the balanced meal amid pleasant surroundings.

	Quantity	Total Calories
Meats		
Beef, roast, very lean	1 tbsp.	22
Beef, round, fat removed	1 tbsp.	37
Beefsteak, tenderloin	1 tbsp.	57
Lamb, roast	1 tbsp.	40
Lamb chop, tenderloin only	1 tbsp.	40
Chicken, roast	1 tbsp.	36
Turkey, roast	1 tbsp.	57
Beef juice	1 tbsp.	8
Gravy, thick	1 tbsp.	62
Bacon, beechnut, cooked dry (raw slice, 13 grams)	1 slice	25
Fish		
Bluefish	1 tbsp.	30
Cod	1 tbsp.	20
Trout, brook	1 tbsp.	23
Shellfish		
Clams, long	6	79
Oysters, medium size	6	44
Soups		
Consomme, canned	4 tbsps.	14
Pea, cream soup	4 tbsps.	162
Other cream soups (average of five)	4 tbsps.	126
Vegetable soup	4 tbsps.	43
Tomato soup	4 tbsps.	49
Dairy Products and Eggs		
Milk, whole, 3.5%	1 tbsp.	20
Skimmed milk, fat free	1 tbsp.	10
Buttermilk, fat free	1 tbsp.	9
Cream, light, 20%	1 tbsp.	62
Cream, heavy, 40% fat	1 tbsp.	116
Condensed milk, sweetened	1 tbsp.	123
Butter	1 level tbsp.	40
Egg, whole (Wt. with shell, 58 grams.)	1	85
Egg, yolk	1	65
Egg, white	1	20
Vegetables		
Baked beans, home-made	1 tbsp.	66
Lima beans, whole	1 tbsp.	32
String beans	1 tbsp.	7
Beets	1 tbsp.	14
Cabbage	1 tbsp.	10
Carrots	1 tbsp.	6
Cauliflower	1 tbsp.	6
Turnips	1 tbsp.	12
Spinach	1 tbsp.	12
Corn (cut off ear)	1 tbsp.	30
Onions	1 tbsp.	9
Peas	1 tbsp.	28
Asparagus tips, mashed	1 tbsp.	7
Potato, white	1 tbsp.	32
Potato, sweet	1 tbsp.	38
Potato, baked, medium size	1	79
Celery, one stalk	4 in. long	2
Tomato, medium size	1	23
Lettuce	1 leaf	2
Bread		
White, baker's slice 3x4x½ in.	1	80
Whole wheat, slice 3x4x½ in.	1	106
Rolls, French, 4x2x1½ in.	1	112
Corn bread, piece 3½x4x½ in.	1	104
Zwieback, small piece	1	34

About What a BOY Should Gain Each Month

AGE		AGE	
5 to 8	6 oz.	12 to 16	16 oz.
8 to 12	8 oz.	16 to 18	8 oz.

©. 1918, by Child Health Organization

All parents should see to it that the children of school age spend at least two hours in the open air every day—properly protected, of course, against cold and wet.

Once our children come to really love fresh air our work along this line is done. The overheating of homes and schools should be guarded against, 68-70°F being the desired temperature.

Colds, sore throats and even coughs and T. B. follow readily long hours spent in close over-heated, unventilated rooms.

One of the chief arguments against taking children to crowded moving picture houses is that the air is usually bad. After spending three hours in a stuffy, crowded place, all too often watching most distorted and over stimulating pictures, the child is brought out on the cold wet street, quantities of candy having been meanwhile added to the evening's dissipation. The morning is very likely to show a cross, irritable child whose tongue is coated, who does not want his breakfast and who may, in addition, show the first signs of a cold or sore throat.

This, of course, is no argument against the right kind of moving pictures in well ventilated places.

The development of "outdoor-mindedness" in parents, teachers, and children is one of the fundamentals of health. Practically every moment of a child's vacation days should be spent outdoors. Where it is possible children should be encouraged to sleep outdoors in a sleeping porch. For this kind of sleeping in winter they must be provided with warm flannel night clothes, including caps and bed socks. It may also be necessary to screen them from strong draughts. Sleeping out in the winter must be done with care, but it will prove a great benefit especially to under-nourished children who take cold easily.

In the summer time country children, and even city children, possessing a small lawn, may derive much fun and benefit from a little canvas army tent. It may be used as a playhouse in the day time and as sleeping quarters at night.

3. Cleanliness.—Of all the agencies which have come to the aid of modern science in stamping out disease there is perhaps no single one so important as cleanliness—both of person and surroundings.

Every child of school age should have at least two warm body baths each week and should be taught to sponge quickly to the waist each morning in cool water—as cold as can be born. This of course depends somewhat on the room temperature available. There are two chief results to be obtained from bathing—

1. Cleanliness—ridding the skin of dust and bacteria.

2. Stimulation to the circulation—especially after rubbing with a coarse towel. This is most beneficial.

Washing the hands before each meal is a habit every child should be taught very early in life. This prevents bacteria from being carried into the mouth with the food.

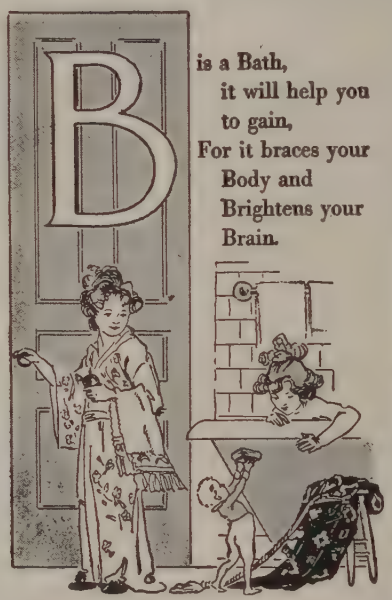
Cleanliness of the mouth is especially important. A very large proportion of infectious diseases gain entrance to the body via the mouth, hence the careful use of the tooth brush should be insisted on. Teeth should be brushed at least twice each day—in the morning and before bed. If a third time can be managed it is of course advisable. A simple paste powder should be used once each day. The hair should be washed with warm soap and water every two or three weeks. Dirty hair may readily carry germs of disease.

Every school child should have clean underclothing at least twice a week.

Except for very delicate children woolen underclothing seems to be no longer necessary—moderate weight cotton mesh with plenty of top clothes—the latter removed indoors seems to give adequate protection.

Warm stockings and sturdy footwear should be provided for every child in winter. The fashion of rolling the stockings below the knees on small children in cold weather, I think, has nothing to recommend it, tho this fashion is very comfortable and attractive in summer.

4. Play and Exercise.—All healthy young animals must play and the child who does not care to play is not a normal child. As a rule a healthy child given one to two hours each day of free time in the open will play sufficiently to get enough exercise. We are coming to realize tho that directed



play in the school is necessary and desirable, because children left to play undirected will often overtax themselves. This is especially true of under-nourished children.

The country child who trudges several miles to and from school each day needs little or no time devoted to formal gymnastics in school, especially when farm chores, done evening or morning, or both, are added to his long walk. The country child does need organized and directed play as a part of his school routine. Every country school, no matter how small, should possess some simple equipment for games:

Basketball, baseball, giant stride, swings and slides should be the minimum equipment. The country school should welcome the visiting special teacher of Physical Education with her helpful ideas about games and sports.

Directed play as a part of the school routine not only supplies the child with exercise but with *enjoyable* exercise. It further gives him another avenue of self-expression and last, but not least, it teaches him to love fair play.

Remember that while farm chores do give the child exercise, and done within a reasonable amount, are helpful to him, there is no denying that for him they constitute work. They lack the spirit of play and fun. Exercise to have the most beneficial effect should be done joyously.

It is this joyous element so essential to the best kind of exercise, that skillfully organized and directed play in the school can so well supply to the child.

5. Sleep.—This, together with food and air constitutes an absolute fundamental for good health.

A child of ten requires at least ten hours of sound sleep every night in a well-ventilated room or sleeping porch if he is to grow into the strong man of tomorrow.

The child should be trained to go to bed at a regular time, removing *all* clothing worn during the day, putting on clean loose night clothes.

A regular rising time should also be established and adhered to carefully unless some special event has kept the child up late the night before and he has sleep to make up. Naps in the daytime when possible are advisable especially with the weaker, poorly-nourished children.

Many of the more modern schools now have rest rooms with cots where the weaker children are encouraged to take short rest periods during the school day.

During the summer vacation a nap in the daytime should be encouraged for all children.

It is only in sleep that the worn-out parts of the child's body can be adequately repaired. Children who are growing rapidly and very active highly strung children need extra amounts of sleep.

Much of the nervousness seen in our American children today can be directly traced to disturbed or inadequate sleep.

It must also be remembered that children stand loss of sleep very badly—much more so than adults. The most systematic and careful effort should be made to secure abundant sleep for growing children. The adult sleep requirement is eight hours out of twenty-four for the average person. This is not sufficient for the average boy or girl much before the 20th year.

Average sleep requirements:—

6— 8 yrs. requires 11—12 hrs.
8—12 yrs. requires 10—11 hrs.
12—16 yrs. requires 9—10 hrs.
16—20 yrs. requires 8— 9 hrs.

6. Mental Hygiene and Parental Control.—Modern psychology is teaching us more the profound influence the child's mental hygiene has upon the health of his nervous system and indeed upon his whole physical make-up. What phases of the child's hygienic regime may be included under the term mental hygiene?

1. Parental control and discipline—this when exercised wisely and carefully in the early years of childhood will make for those habits of obedience, cheerfulness, gentleness, promptness, neatness and emotional control, which, if well established, add so much to the physical and mental wellbeing of the child.

The disobedient, untidy, peevish and emotionally uncontrolled child has not the chance of being so well physically as his better trained brother.

It is quite true, of course, that a child may act in an undisciplined way because he is not well physically, but it is also very true that the undisciplined child, with his fits of temper and peevish disobedience, reacts physically to his own mental state

The most important disciplining of the child along these lines must be done before the 5th year. The mental habits mentioned

here are inextricably bound up with the health and wellbeing of the child's nervous system—and this is the system which controls every part of the child's body.

The so-called "nervous child" is not always an undisciplined child, but he is all too frequently so. It must be confessed that the average American parent is not conspicuously successful in this matter of wise discipline. They usually err in one of two ways.

By constant nagging of the child. "Don't do this", "don't do that," "stop that noise," "sit down and be quiet," etc. to most of which the average child pays little or no attention. Then when a real situation arises and the child receives advice which should be heeded at once, his habit of not responding is so fixed that he "pays no attention," as usual. Many children described by parents and teachers as careless and disobedient are so simply because of persistent nagging. Not only do parents sin in this direction, but often teachers as well. The correct policy here is to leave the child as free as possible, making demands only when it is essentail and then insisting on absolute and immediate response. Children who are not fatigued by constant nagging usually respond well to this method.

So far as enforcing of discipline is concerned, without lengthy discussion, suffice it to say that it is not the severity of the punishment which makes it effective, but the absolute certainty that punishment will be given.

The second common error made here all too often by both parents and teachers is to punish severely one time the same act that would be allowed to go unnoticed another time. This bewilders and confuses the child so that his sense of values with reference to conduct is never well established.

2. Better understanding by the parent of the child's sex nature—using the term sex in the newer broader sense (to be indicated below) and some attempt at rational sex instruction.

This raises, of course, a much discussed problem. It is being recognized, however, more and more by medical experts everywhere that much of the nervous ill health of adult life is undoubtedly due to faulty sex concepts developed in childhood.

Educators are pretty generally agreed that the child's first sex instruction should come from the parent. But before this can be done very effectively most parents feel the need of a broader and clearer understanding of sex themselves. The embarassment and difficulty many parents experience in attempting to give even the most meagre instruction along this line is usually the result of their own unpleasant ideas and associations connected with the subject. The parent who feels that there is something innately wrong and vulgar about the question of sex should not attempt to give any instruction to his child until he has been able to free his mind of this point of view. He will only succeed in passing over his own disturbed viewpoint to the child. We must realize at the onset that the sex urge, next to the desire for food and drink, is the most fundamental instinct the human being possesses. Modern psychology is teaching now that all human motives for conduct may be divided into two great groups on this basis—

1. Those motives which spring from the need of self preservation—these vary all the way from the desire for food to the quest for power and self-aggrandizement. Without this so-called motive for self-protection in each individual we should soon perish.

2. Those motives which spring from the need of *race* preservation. These vary all the way from simple physical sex desire to the most altruistic actions of which man is capable. This is known as the race motive, or sex motive—it leads men to love, marriage, procreation; also to build hospitals, schools, orphanages and asylums.

Seldom in a given act is the motive unmixed—except in the seeking of food or sex satisfaction. Thus the man who raises money for a new school or hospital may not be inspired by race motive alone—his ego motive is flattered, by, say the prominence this connection will bring him. The best poised individuals are those in whom there is a fine balance of ego motive and race or sex motive. The person whose ego motive is dominant is the well recognized type of selfish, pushing, power-seeking individual all too prevalent in public and private life today—the un-

scrupulous politician, the coal baron or the petty tyrant. The individual with the sex or race motive dominant gives us in the highest types our very best philanthropists and educators, or the very finest of parents and teachers. In grosser types, where as we say, the sex motive is unsublimated, the individual may be grossly sexual or even sexually immoral. This briefly is what is meant by the broader point of view concerning sex which every parent should have.

He should further understand something of the normal sex development of the child. Many people consider that there is little or nothing of sex about the child, except the physical differentiation, before the age of puberty. This is not true. The development of the child along lines of sex may be divided roughly into 4 periods:—

1. The period of infancy—including roughly the first three years of life. Even at his early age the two main trends of energy in the human being can be recognized by the close observer. The will to power or ego motive—the child asserts his ego by crying for everything he wants. The sex motive—in his period of development the sex motive in the child is of course very vague—it consists chiefly of vaguely pleasurable sensations from his own body. Thus the habit of rubbing the thighs together as the child lies on his back is vaguely pleasant. Urination and defacation are also attended by pleasurable sensations in the young child. The establishment of the so-called primacy of the sex zones—that is the localizing of sex sensation in the sex organs alone has not yet taken place.

There are various erogenous zones at this time, including the mouth (sucking is also pleasurable to the child), the anus, and various regions of the skin, as well as the beginnings of possibilities of sensation in the sex organs themselves.

There is no need for us to be offended at the idea of associating anything of sex with such a young child, as at this age he is of course neither moral nor immoral—he is simply a healthy little growing human animal with enormous possibilities both for good and evil.

2. The second stage in sex development, roughly speaking, is the period from about the 3rd to 8th or 9th year. During this time in the normal child the primacy of the sex organs as the seat of sex sensation becomes better established tho it is not complete until after puberty. The child's love impulse or sex impulse which has been hitherto occupied entirely with his own little body goes out to those nearest to him, i. e., the father and mother; they are his first loves. By careful psychological test it is being proven that the love interest of the little boy at this time seems to center more about his mother and that of the little girl about her father. The memory of this period is effaced in the minds of most grown-ups.

It is during this period especially that friction between the father and mother, quarrels, separations and divorces may cause serious harm or injury to the developing sex consciousness of the child.

Over harshness, or over indulgence and excessive affection from one or the other parent during this period, may cause what is known as a father or mother "fixation."

That is the child's love interest becomes unduly fixed on one or the other parent and this fixation, or complex, as it is sometimes called, is carried on *unconsciously* by the child into adult life. People with parent fixations frequently find it impossible to fall in love satisfactorily or to marry at all; or sometimes marry a person much older than themselves and often unhappily. The parent on whom the person is unconsciously "fixed" may meanwhile have died or be far away and the person himself is unconscious, of course, of what is blocking his love impulse.

The great majority of children fortunately pass thru this stage of childhood in a perfectly normal way—reaching puberty with a normal amount of the right kind of affection for the parents. Children are entirely at the mercy of their parents during this period of development. Over-harshness and over-indulgence and affection on the part of one parent as opposed to the other at this time should be carefully avoided.

3. The third stage which may be roughly outlined in the development of the child's sex nature is from about the 10th year to 16th or 17th. The length of this period varies greatly in different children—may last even into adult life. It is sometimes described as the home-sexual period—meaning that time when the love interest of the child seems to center on an in-

dividual of the *same* sex outside of the family. It is the hero worship stage. After loving first himself, then his parents (particularly the one of the opposite sex), the child's love impulse reaches out a step further and fixes on a person of his own sex, not of his family. It is very often a teacher, a Scout master, a moving picture hero or heroine, a baseball star, an athletic leader, etc. This stage in the sex development of the child is frought with enormous possibilities from an educational standpoint. Careers are often determined and life goals fixed by these juvenile affections. It places a very grave responsibility on those who are the recipients of such admiration.

Teachers and leaders of all kinds who handle our boys and girls during this period should be given the most careful instruction as to the handling of this problem. Mismanaged or badly handled, the child may be injured severely along lines of his normal *mental* sex development.

The unnecessary prolonging of this stage by isolation of the sexes in school or the strict supervision at home may also be injurious. Boys and girls during the adolescent years should have reasonable opportunity for associating freely with each other, under wise supervision.

Separate schools for the sexes during this period which segregates the boys and girls rigidly from each other may, and in all too many cases do, trend to deepen and prolong to an unwholesome extent the homesexual period in development. It is during this period that physical sexual maturity is reached. Sex consciousness deepens at this time and sex questions become of vital interest to both the boy and girl.

4. The last period in development is maturity, when the love impulse goes out normally to persons of the opposite sex—reached varying from 15—22 or 23.

The next question to be considered is—while all this development is going on naturally in the growing child what information (and when) shall he be given concerning the subject of sex? Carefully collected statistics from our leading colleges show that most boys receive their first sex information at about the age of 7—the girls at about 9. The sources of the information being usually illicit and undesirable—such as older comrades, servants, rough associates, etc. So that in all too many instances the child's first concept of sex is a distorted, vulgar, coarse one which it may take years to eradicate.

The best course for parents to pursue here is somewhat as follows:—

1. Answer *honestly* and *frankly* to the limit of the child's understanding his *first* question about sex.

2. Do not force subsequent information upon him, but make him feel that you are ready at all times to talk with him as freely as he desires.

3. Encourage him to be interested and to observe carefully plants and animals.

4. At puberty (sex maturity) 13—14 years, if few questions have been asked, round out the child's concepts with the idea that he now possesses potentially the power of fatherhood. With the girl the idea that she now possesses potential motherhood. Meaning of menstruation should be explained to the little girl. Tell her it is part of Nature's method of preparing her to be a mother. With the boy, the relation of seminal emission to fatherhood should be similarly explained.

Cautioning children against masturbation before there is any evidence of its having occurred is always to be avoided.

The girl should not be frightened or depressed about the coming of her periods. She should be taught to regard the function as a perfectly natural thing—one of the milestones in growing to be a woman. Do not let her regard herself as "sick" at that time. Do not use the word sickness in reference to the period. Much of the menstrual distress seen in young women today is undoubtedly due to faulty mental attitude formed when the periods are being established. The girl should be encouraged to go about her work as usual, avoiding the more strenuous kinds of exercise, such as basketball and swimming, and giving herself a little extra protection from cold and dampness.

The old idea that bathing should be abstained from during the period is ridiculous and obsolete. A plunge bath need not be taken, but a warm sponge bath in a warm room immediately before bed can-

not possibly harm even a very delicate girl.

If the periods are late in appearing (after 15 or 16) or unusually painful a physician's advice should be sought.

In most families the father is the best teacher for the boy on sex matters—the mother for the girl. Good literature for the parents on this very important aspect of child health may be secured from the American Social Hygiene Assn., New York City.

We know today that much of the nervous illness in adults dates back to faulty sex education in youth—this is a responsibility which no intelligent parent can any longer refuse to face.

Care of Masturbation in Children.—This is relatively common in both boys and girls—in most healthy children gradually given up as they grow older.

Causes:—

1. Tight foreskin—need of circumcision (boys).
2. Neurotic make up.
3. Vicious associations.
4. Uncleanliness of parts.
5. Clothing too tight over the parts.

It is a great mistake to frighten or scold unduly about this habit.

1. Make sure if there is a removable physical cause that it receives attention (see second column).

2. Encourage the child to gradually break the habit by simple sex instruction and ideals of physical strength.

3. Avoid scolding and disciplinary measures that will increase the child's sense of shame and self-condemnation. This habit is injurious largely in direct proportion to the sense of shame and self-condemnation felt by the sufferer. It is very undesirable, of course, and means a constant waste of energy on the child's part. This is particularly true in boys after puberty, but no good is ever accomplished by harsh disciplinary measures.

If the habit grows worse in spite of gentle and sympathetic care on the part of the parent, a physician should be consulted.

The older literature on this subject often gave the idea that insanity and feeble mindedness could be caused by this habit. We know now that this is absolutely untrue. It does, however, constitute more or less of a menace to the nervous health of the child when it becomes excessive.

SECTION II.

Methods of Protecting the Child Against Disease.

Careful general hygiene such as has been described in Section 1 will help to give the child the physical endurance and nervous stability that will aid greatly in protecting him from infection.

Teaching the child himself simple health habits both at home and at school will aid greatly in building up good hygienic habits. These should be formed in early childhood. The following, published by the Federal Bureau of Education, should hang in every school room and home where there are growing children:—

Rules of the Health Game.

1. A full bath more than once a week.
2. Brushing the teeth at least once every day.
3. Sleeping long hours, with windows open.
4. Drinking as much milk as possible, but no tea or coffee.
5. Eating some vegetables or fruit every day.
6. Drinking at least four glasses of water a day.
7. Playing part of each day out of doors.
8. A bowel movement every morning.

The parent and the teacher must here work together to see that the child carries out to the very best of his ability every rule of the health game. Such health habits established in childhood will be automatic long before adult life is reached.

2. Vaccination against smallpox. There are a few highly contagious diseases against which even the vigorous health seems to be no protection. Smallpox is one of these. Practically every person, no matter how healthy, who has never had the disease and never been successfully vaccinated will succumb if freely exposed. Smallpox is a very loathsome disease, with high death rate, and causes annually the loss of thousands of lives throughout the civilized world right up to modern times.

The discovery of the principle of vaccination by Dr. Edward Jenner, an English physician, in 1794, has been a wonderful boon to humanity. Since vaccination has been perfected smallpox from being one of the worse scourges known to humanity has come to be a relatively uncommon disease. Every child should be vac-

cinated before attending school. If the vaccination is kept clean there is now no danger of infection of any kind. Badly swollen arms, marked illness and the very occasional lockjaw following vaccination mean that the sore was infected by bacteria as a result of uncleanliness. No intelligent parent is in any way justified in

opposing vaccination in this age. If he does so he is working against the best interest of his child and the whole community.

Typhoid fever is another disease for which the principle of vaccination is being used. In sanitary communities with good water and milk supply routine vaccination against typhoid is not yet advocated.

The principle of vaccination in a modified form (antitoxin) is also used in diphtheria. So far it has been employed chiefly as treatment for the child sick with diphtheria. It is probable that in the near future it may be used routinely as a preventive of diphtheria somewhat after the manner of vaccination for smallpox.

Here again the intelligent parent will readily acquiesce.

3. Care of the child's teeth. We realize today more than ever before that the condition of the teeth is of vital importance to the child's health.

The following procedure is indicated here:—

1. Teach the child the use of the tooth brush by the fourth year—the mouth and brush being cared for by the mother before that time.

2. Take the child routinely to a dentist every six months after the fifth year, sooner if pain or decay appears.

3. It is a mistake to neglect the milk teeth, and in pulling them at home great care should be taken not to pull by mistake the so-called "six year old molar"—this is the first permanent double tooth and if accidentally pulled or allowed to decay so that it is lost all the teeth in the jaw will be crooked and deformed, as it acts as the keystone of the arch. The effects of decayed teeth (either first or second) on the child are as follows:—

1. *Indigestion* from swallowing of germ laden food—every decayed tooth accumulates masses of bacteria—and from imperfect chewing.

2. Nervous irritability and poor nutrition from indigestion.

3. Child is predisposed to such infections as tuberculosis, diphtheria, sore throat and tonsilitis because the decayed teeth act as breeding places for bacteria.

4. Unattractive appearance.

4. Care of Child's Nose and Throat.—This requires especial attention because of adenoids and tonsils. As is well known, these structures in American children especially tend frequently to be enlarged and diseased.

The adenoid body is a small mass of soft tissue located just where the nose opens into the throat. When it is healthy it is not enlarged and is supposed to aid in destroying bacteria. If it becomes enlarged, the following results are soon noticed in the child:—

1. He cannot breathe through his nose—breathes through mouth *all the time.*

2. Seems to have a cold in the head *all the time.*

3. Sleeps restlessly.

4. Face looks dull and heavy.

5. School progress retarded.

6. General nutrition and appetite often badly affected.

The removal of the adenoids by a simple operation is the only cure for this condition.

Once this has been recommended by a good physician it is almost criminal neglect on the parent's part to defer having it done. Nothing will so undermine a child's health as neglect of this condition.

Children's tonsils also frequently become diseased and enlarged. The possible results to the child's health here are as follows:

1. Frequent sore throat and tonsilitis.

2. Indigestion and poor nutrition from swallowing germ laden material from the infected tonsils.

3. Child is predisposed to tuberculosis, diphtheria, scarlet fever, etc.

4. Injury to the child's heart from repeated attacks of tonsilitis. This is the most serious result of diseased tonsils. The removal of the tonsils by simple operation is the only cure possible here. Once this has been recommended by a reputable physician it should be done promptly, as in the case of adenoids.

5. Prevention and care of so called common diseases of childhood, i.e., measles, whooping cough, chicken pox, mumps.

Diphtheria and Scarlet Fever Are, of Course, More Serious.

Twenty years ago these more serious infections of childhood were looked upon as inevitable and necessary in the life of every child. Hence, let the children contract them as soon as possible and have it finished and done. They were not regarded as particularly harmful at any rate.

We know today that both of these lines of reasoning are false and pernicious. It is *not* necessary for every child to have these diseases and they may in any given child prove serious, more particularly in their after effects perhaps than during the the actual illness. Modern medicine is taking every precaution to protect children against these diseases.

Quarantine is the best all-round method of prevention. Every intelligent parent and citizen should do his utmost to uphold these quarantine regulations. By quarantine we mean, of course, measures taken to isolate the sick from the well.

Measles is the most serious of these diseases. It begins usually like a common cold in the head, the rash appearing a day or two later. The child should always be kept warm in bed in a darkened, well ventilated room, fed very lightly, and a doctor consulted. The disease itself is seldom serious but it may have the following serious after effects. especially if neglected and allowed to take cold:—

1. Bronchial pneumonia.
2. Earache with severe abcess.
3. Injury to vision.
4. Injury to the kidneys.

Chicken pox is usually milder than measles, with less likelihood of severe after effects, but pretty much the same precautions should be taken.

Whooping cough does not as a rule show very serious after effects.

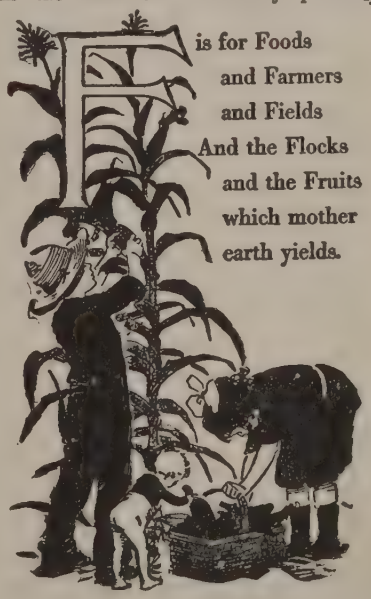
Mumps is an infection of the salivary gland in front of and below each ear. It is highly contagious and painful, usually not serious, but with about three children out of every hundred affected tending to show inflammation of the ovary, or testicle, as an after effect. If this after effect is severe, it may cause sterility in later life, especially in boys.

Scarlet fever and diphtheria are both, of course, much more serious than the infections just mentioned. They call for expert medical care. The after effects of both these diseases may be very severe, as:—

1. Injury to the heart.
2. Abcess in the middle ear, with deafness.
3. Injury to kidneys.

To summarize then, the best methods for preventions of these diseases and the minimizing of their possible injuries after effects—

1. Rigid obedience to quarantine laws.
2. Prompt attention to common colds in the head—as these very probably



predispose to the infections just mentioned. If the child wakes with a cold in the head, he had much better miss a day at school—remaining warmly in bed, with a laxative and hot foot bath, than to go out and run the risk of a more severe illness.

3. Care as to daily bowel movement—faulty elimination being a common pre-

disposing cause of sore throats, colds and more severe infections. Every child should be trained to have a set time of the day for elimination and *go* unfailingly at that time. The child's school work, home chores, etc. should be arranged so as not to interfere with this set time.

Parents can do their children no greater

service than to establish a regular daily time for elimination very early in childhood—then hold the child firmly to it. Faulty habit formation in childhood is one of the commonest causes of chronic constipation in adults.

4. Care of simple wounds, cuts and abrasions. These may constitute a serious menace to the health of the child if they become infected—in severe cases meaning perhaps permanent crippling of a part of life itself. The best home treatment for a simple cut is to cleanse with tincture of green soap in hot water, apply iodine and a sterile gauze dressing. The wound should be kept covered till healed in order to keep out bacteria, which cause infection. Healthy children do not infect readily in this way. The gravest result which can follow a wound or abrasion is lockjaw, or tetanus. This organism is found in highly cultivated soil and gains entrance to the body thru a so called punctured wound, such as would be made by a nail in the foot. Punctured wounds of any severity, especially about the feet, should always be seen by a physician.

Routine Medical Examination.—Next to careful hygienic care routine medical, or as it is often now called routine Health Examination, at least once a year is indispensable in safeguarding the health of the child.

So clearly has this been recognized by physicians and educators all over the country that systematized school medical inspection is rapidly becoming established wherever possible. School authorities are recognizing more and more that the school as well as the parent is responsible for the child's health and that his health is more fundamental even than the instruction he receives. Many of our states and larger cities are attempting to do this for their school children. Unfortunately in only a few of the larger communities is there sufficient money appropriated to insure the work is being well done.

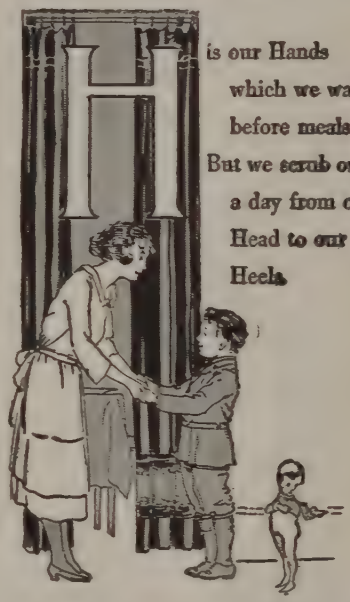
The object of routine school medical examination and inspection are as follows:—

1. To discover any diseased conditions in the child.
2. To discover the presence of infectious conditions.
3. To discover correctable physical defects, such as those of vision or hearing, tonsils, adenoids, posture, teeth, etc.
4. To indicate ways in which the child's health may be improved.

By giving each child a complete examination once in each school year; by having routine daily inspection to locate sick and ailing children and by careful follow up work on each child it is possible to bring about greatly improved health conditions among our school children.

The weakest place usually in this scheme is in the follow up work—thus:

The school doctor examines as carefully as time permits say 300 children in School



No 12. Out of that 300 he finds 12 with defective vision—badly in need of glasses; 4 needing adenoids removed, 5 with badly diseased tonsils, 13 in need of dental care, 7 badly undernourished, etc. Printed notices are sent home to the parents with instructions to take the child to the family doctor or the free school clinic, if the parent so desires. In all too many instances this advice goes unheeded, the child keeps his defect and the state has spent its money in vain.

The efficacy of school medical inspection must be measured entirely by the percentage of corrections obtained. These depend very largely on the intelligence and cooperation of the parent. You as parents are taxed to pay for school medical inspection. Why not get your money's worth by at least investigating the advice sent home about your child? The examiner does not *wish* to find defects in your child—he is much more likely to err on side of missing them when they are present than of declaring them when they are absent.

School Medical Inspection can be improved only by increased confidence and cooperation on the part of the parents, together with more intelligent understanding from our teachers.

In some localities school physicians are not permitted to remove any of the children's clothing—this of course, greatly hampers him. The examiner should always be permitted to have children stripped to the waist. The parent should be even more interested in the child's Health Examination record than in his regular school report.

Some localities are adopting the plan of grading each child as a result of Health Examination—i. e. A, very good; B, good; C, fair, etc.—explaining to the child that his grade will go up if, for instance, he can gain 5 pounds, or be fitted with glasses, or have his teeth attended to, or whatever is necessary.

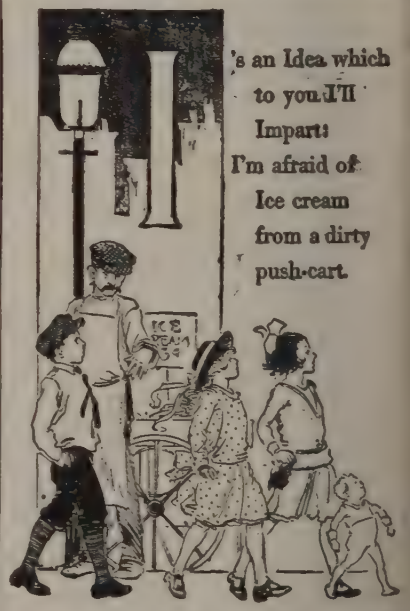
It has been abundantly demonstrated that good health for our children is purchasable—and cheap at any price.

The Six Doors of Child Health

1. A scale in every school.
2. Time allowed in every school for teaching of health habits.
3. A hot school lunch available for every child.
4. Teachers trained in Normal Schools to teach health habits.
5. Every child's weight record sent home on the monthly report card.
6. A thorough physical examination, with the clothing removed to the waist, at least twice a year for all school children.

From "Summer Health and Play School"

HUMAN PHYSIOLOGY.—Physiology in relation to the human body is the science which concerns itself with the functions



of the various parts and the manner in which they perform their duties. The work done by any part depends primarily upon the character of the minute particles of matter of which it is formed.

CELLS.—Each of these microscopic particles is called a *cell*. It consists of a thin sac enveloping a clear substance, the *proto-*

plasm, which contains a less granular portion known as the *nucleus*.

Tissues, Organs, Systems.—A combination of similar cells forms a *tissue*, and the union of two or more tissues to constitute a structure for the performance of a special function is called an *organ*. The heart is an organ for pumping blood and the stomach is an organ for helping to digest food. Several organs working in harmony for the accomplishment of a common purpose constitute a *system*.

Locomotion.—The *osseous system*, composed of over 200 bones, and the *muscular system*, formed of over 500 muscles, serve chiefly for the purpose of locomotion. One kind of muscles known as the *involuntary* are present in nearly all tubelike structures, such as the alimentary canal and blood vessels. The marked power of contraction and relaxation possessed by all muscles enables them to render important service to the bodily welfare. They have, however, no power in themselves to act, but must be stimulated by another set of organs composing what is known as the nervous system.

The Nervous System, consisting of the brain and spinal cord, with their thousands of tiny nerve fibers branching to all parts of the body, controls every movement and the activity of each organ. The numerous nerve fibers, which are bound into bundles forming the white cord-like nerves, are the processes of cells located in the brain or spinal cord or near to them.

Neurone.—A nerve cell, with its two or more processes, varying from less than a half inch to more than three feet in length, is called a *neurone*. The purpose of the processes is to transmit a stimulus or message, while the function of the body-part of the neurone is to originate a stimulus or modify one sent to it by another neurone

Brain.—The neurones in the thinking regions of the brain, *i. e.*, the frontal third and the portion adjacent to the crown, seem able to originate stimuli and direct at will the daily activities in which we engage. A band of neurones in front of the central fissure of the brain is called the *motor area* because these cells control the voluntary movements of the body. The bursting of a blood vessel in this area or along the processes of these cells extending down through the brain and cord often causes paralysis of the muscles which the neurones affected govern. The band of neurones behind the central fissure form the *sensory area* of the brain. Here the impulses aroused by touch, heat, cold and pain are received. The *hearing neurones* are located in the region of the brain adjacent to the ear and those concerned in *seeing* lie in the back part of the brain.

Communication of Neurones. — The neurones whose cell bodies form the gray matter, and their processes, the white fibrous portions of the brain and cord, are able to communicate with one another by contact of processes. The independent neurones of the brain direct the dependent neurones both in the brain and in the spinal cord.

Reflex Action.—The dependent neurones can also be made to act by an outside stimulus, such as touch or pain. A pinprick on the toe of a sound sleeper will send an impulse up the sensory nerves to the spinal cord, where it will arouse the motor neurones to send an impulse causing the muscles to contract and withdraw the limb, but the brain will know nothing of the operation. Such activities, carried on without the effort of brain neurones controlled by the will, are known as *reflex actions*.

Sympathetic System.—Many neurones concerned in reflex action are located at the base of the brain and in its stem, while others of the same character form the *sympathetic system*, whose nerves supply the digestive organs and other viscera and all the involuntary muscles of the body. The work of the lungs, heart, stomach, liver and other vital organs goes on involuntarily because the neurones governing them are stimulated to act by the needs of the body.

The taste of food stimulates the neurones, causing the stomach to form gastric juice, but we can also make the stomach do this work to some extent by thinking of the delicious flavor of foods. In this case the neurones of the brain originate a stimulus and send it down to the neurones exciting the juice-making organs to work. Even though food is in the stomach and its presence has started the flow of gastric juice, the output may in a few minutes be greatly decreased by the inhibiting influence of the neurones of the brain, aroused to action by some excitement or great grief affecting the mind.

Influence of Mind on Body. — Although the exact relation of the mind to the brain and other parts of the body is not entirely understood, observations and experiments show that the mind may influence the work of all the organs of the body. This fact forms a vital part of the Christian Science faith, which teaches that thought is more efficient than drugs and hygienic measures in curing disease. In many disorders of the nervous system mental suggestion renders worthy service.

Sense Organs.—In order that the brain may be informed of the conditions in the external world, many of the nerve fibers called sensory nerves have special terminations on or near the surface of the body called *sense organs*. The eyes are the special sense organs which are so affected by the waves of light coming from objects that they can send to the brain through their nerves a message telling how things look. The ears receive and transmit to the brain only those impulses aroused by the waves of sound. The delicate nerve endings within the nose inform the brain concerning odors, while the peculiar nerve terminations in the tongue and other parts of the mouth receive and send to the brain all knowledge as to how foods taste. Special tiny organs at the ends of nerves are scattered throughout the skin to receive the stimuli aroused by touch, heat or cold, and, inform the brain when the body is being hurt.

Foods.—While thought and action are the chief purposes of the body, the systems which effect these must be hourly repaired and nourished, the waste matter must be gotten rid of, and a means of reproducing the species must be provided. The chief part of the living tissues consists of *proteids* whose worn-out parts can be replaced only by the consumption of other *proteids* found in the albumen of lean meat, the white of egg, casein of milk, and in peas, beans, corn and wheat.

Oxidation.—Starches, sugars and fats cannot repair the worn-out parts of the cells, but by the living action of the body these foods can be made to unite with oxygen. This *oxidation* may furnish heat to keep the body warm and may also supply the energy necessary for its activities. While the fat of the body is largely made from the starches and sugars, forming what is known as the carbohydrate foods, proteids can also be transformed into fat and used to furnish energy and heat.

Diet.—The daily food requirements of a man at ordinary labor are about three ounces of proteids and one pound of starches, sugars and fats. Some inorganic salts and water are also necessary.

Digestion.—In order that the nourishing materials may reach all cells of the body they must be prepared to enter the blood stream for transportation. This preparation is accomplished by a group of organs forming the digestive system. The two chief processes of digestion are mastication, or the breaking up of the food into small particles in the mouth, and the transforming action of the juices from certain organs called *glands*. The important elements in the watery secretions of these glands are known as *enzymes*. These are ferments which cause chemical changes in the food without any change in themselves.

The *ptyalin* from the salivary glands of the face changes starch into sugar, the *pepsin* from the thousands of gastric glands in the lining of the stomach transforms part of the proteids into peptones, while the other part is acted on by the *trypsin* of the pancreas. This chief gland of digestion also yields *lipase* to split up the fats and *amylopsin* to make sugars of the remaining starches.

Absorption of Food.—After the food has been acted on by the gastric juice from one to four hours, and by the intestinal and pancreatic juices a variable period, it is in a state capable of being absorbed by the cells forming the lining of the small intestine. The absorbing surface is greatly increased by transverse folds and millions of tiny projections called *villi*. Within these are thin-walled tubes to receive the liquid food and pass it on to the larger blood tubes, whence it is transported to all parts of the body.

Liver.—The liver serves as a storehouse for part of the food, which it deals out according to the needs of the body. Much of the food passes through the liver before it is distributed to the body, thus giving this organ opportunity to remove poisons which may be present and dispose of them in the bile sent into the intestine to aid digestion.

Circulatory System.—The circulatory system, in addition to distributing the food throughout the body, conveys the oxygen from the lungs to all the tissues and transports the waste matter from all cells to the lungs, skin and kidneys for elimination. The *plasma*, or clear part of the blood, bears the food elements, while the red corpuscles, with a special affinity for oxygen on account of their hemaglobin, load up with this gas in the lungs and discharge it to the tissues throughout the body.

Heart, and Course of the Blood. — The blood stream is kept in perpetual motion by the beating of the heart, with valves so arranged as to prevent any backward flow. The blood is carried by the veins from all parts of the body to the right auricle of the heart, whence it passes to the right ventricle. This sends it through the pulmonary artery to the lungs, where the carbon dioxide is exchanged for oxygen through the tiny, thin-walled capillary branches of the artery. The oxygenated blood returns by the pulmonary veins to the left auricle, passes to the left ventricle and thence out through the aorta,

branching again and again in all regions of the body until the final subdivisions are smaller than hairs and with walls so thin that the oxygen and food can easily pass through to nourish the cells. At the same time the carbon dioxide and part of the other waste products enter the blood stream of these tiny vessels called *capillaries*, which unite to form the veins carrying the blood to the heart.

Lymphatics.—Some of the blood plasma and the white corpuscles passing out of the capillaries, together with some of the waste matter, enter a set of vessels called *lymphatics*. These unite into larger vessels which ramify through firm bunches of tissues called *lymph glands* and terminate in veins in the neck.

Exercise renders the lymph system more active because the muscular contractions press the waste matter into the vessels and move it forward, as a series of valves prevents the backward flow. *Massage* accomplishes the same effect and therefore like exercise greatly aids the body in removing its waste. The purpose of the lymph glands, so abundant in the groin, the armpit, the neck and amid the intestines, is to catch and destroy any infection such as bacteria.

Respiratory System.—The sole purpose of the respiratory system, consisting of the lungs and the air passages leading to them, is to supply the body with oxygen and cast out the carbon dioxide constantly resulting from living processes. The inspired air consists of four-fifths parts of nitrogen, one-fifth part of oxygen and only four-ten-thousandths part of carbon dioxide, while the expired air contains one-twentieth part of carbon dioxide and less than one-sixth part of oxygen.

Excretory System.—The dying tissues and a remnant of the oxidized food proteids form the nitrogenous waste which is removed from the body by the excretory system. This consists chiefly of the kidneys, with the two tubes called ureters carrying the urine drop by drop into the bladder, where it is stored and passed out at intervals through a small tube called the urethra. About one and a half quarts of urine, containing some salts and an ounce of urea, the tissue waste, are excreted daily.

Diabetes and Bright's Disease.—In persons with diabetes the urine contains sugar because too much sugar is free in the blood. This condition may be due to a disorder of the cells of the pancreas or liver. In Bright's disease the cells of the kidney fail to perform their work and allow some of the nourishing part of the blood to escape with the urine. Such a condition is sometimes due to a prolonged fever, the excessive use of alcohol, a heavy meat diet, lack of thorough mastication or too little exercise.

Skin.—The skin is also an organ of excretion, as its millions of sweat glands pour out daily from one quart to a gallon of perspiration containing some salt and a little urea. The chief use of the sweat, however, is to cool the body. The skin is filled with the terminations of the nerves of sense, whose stimulation by heat or cold excites to action the entire system.

Bathing.—On this fact depends the physiologic effects of bathing and hydrotherapy. Many internal chronic disorders, as well as acute ailments, are frequently alleviated or entirely cured by the proper application of water when all other measures fail. Since a large portion of the blood passes through the skin each minute, cold bathing relieves the body of much heat and is therefore the most efficient means of lowering the temperature in cases of fever.

Hair.—Each hair grows from a little papilla at the bottom of its sac and will be renewed every time it is pulled out so long as the papilla is uninjured. A pair of sebaceous glands in connection with each hair furnish an oily substance to soften the hair and skin. The loss of the hair on the scalp is seldom due to any microbe or germ, but to a diminishing of the nourishment from the blood-vessels in the papilla. The best remedy for falling hair is a thorough washing of the scalp fortnightly and a daily five-minute massage continued for several months.

Reproductive System.—The average length of life of each individual is about 45 years. To continue the race new individuals must arise. The only portion of the body, however, which can give origin to a new being is a special large cell called an *ovum* or *egg* developed in females from about the thirteenth to the fiftieth year within the two small organs called *ovaries* lying below the kidneys. This special cell or ovum is capable of further growth only after another special cell, the *spermatozoon*, from the testes of the male has united with it. After the union of the two cells, which process is known as *fertilization*, the egg continues down the tube leading from the ovary into a thick-walled sac, the *uterus* or *womb*. Here it becomes fixed to the soft lining, absorbs nourishment from the blood of the mother for a period of about nine months, when it is born as a complete individual.

Hygiene.—Hygiene is the science which concerns itself with the prevention of disease and the maintenance of the body in vigorous health. Personal hygiene relates to the special care of one's own body, while public hygiene includes much of sanitary science and deals with the general food supply, water supply, disposal of sewage, quarantine regulations and other questions affecting the entire community.

Death Rate. — The development of the science of hygiene began about the middle of the nineteenth century and has made such rapid progress as to greatly lessen the death rate in communities regulating their living according to its teachings. In benighted India the death rate is 42, *i. e.*, 42 people die annually among every thousand living. In the United States the death rate is 17, while in Norway, Sweden and Denmark, where hygienic living is practiced by the greatest numbers, the death rate is only 14 per thousand.

Length of Life.—The average length of life increases with our growing knowledge and practice of healthful living. The average length of life in the sixteenth century was about 18 years; to-day it is over 40 years in Germany, England and the United States. The life span in France in 1830 was only 39 years, while in 1900 it was over 47 years. In Massachusetts it increased from 39 years in 1850 to 46 years in 1900.

Cause of Sickness.—There are about 3,000,000 people sick every day in the United States and one-half this number die annually from disease. Recent investigations show that at least one-fourth of this sickness and death can be avoided by the individual and combined efforts of the people of our country. Much of the sickness and about one-half of the deaths result from diseases caused by the countless army of unseen life called *microbes*.

Contagious Diseases.—Microbes are the agents concerned in all *infectious diseases*, some of which are spoken of as *contagious* because the healthy readily contract the ailments by associating with the sick or by handling articles from the sickroom. The germs of tuberculosis slay 150,000 persons yearly in the United States, pneumonia destroys more than 100,000 lives, while typhoid fever kills about one-tenth of its 250,000 victims. Over 100,000 infants perish yearly from digestive disorders due to bacteria, largely introduced by unclean milk and other food.

How Disease Germs Are Scattered.—The germs of typhoid fever, cholera, dysentery and diarrhœa leave the body in the excreta from the bowels and kidneys. The body of a sick person is a germ garden yielding a deadly harvest of microbes, which if allowed to escape alive in the body waste are quite certain by the aid of wind, water or insects to find new victims. This fact shows the vital importance of treating the body excretions in such a manner as to destroy the agents of disease. If this were carefully done for even a decade, students of hygiene believe that tuberculosis and typhoid fever would be lessened by one-half.

How Typhoid Is Contracted.—The germs of typhoid generally reach new victims either in water or in food, though they may be transferred to the mouth by the fingers or other objects which have been in contact with the sick. Fortunately the germs will generally not live in ordinary river water more than ten days and most of them are destroyed by sedimentation, sunlight and other agencies during twenty-four hours transportation in a stream averaging two or three feet in depth and flowing at the rate of about three miles per hour. Investigations indicate that more than one-half of the cases of typhoid fever are due to contaminated water.

Food as a Source of Infection. — Such foods as shellfish, celery and cress are sometimes the source of typhoid and dysentery when they have been taken from water or earth contaminated by sewage or night soils.

Since tuberculosis is widely distributed among the cattle of this country and as many as 10 per cent are affected in many localities, market milk frequently contains tubercle bacilli. These germs enter the milk sometimes through the udder but more frequently by means of the feces which soil the cow and are then knocked as dry particles into the milk pail.

Diarrhoea in Infants.—The greater part of the diarrhœa and intestinal disorders of infants, resulting in over 10,000 deaths during each warm month of the year, is due to the large number of germs of various kinds in unclean milk. In many instances, the milk when delivered to the customers in the city contains one million germs per cubic centimeter. Milk from healthy cows and properly cared for should not contain more than 30,000 germs per cubic centimeter when twenty-four hours old.

Other Diseases Conveyed by Milk.—In addition, to typhoid fever and tuberculosis, scarlet fever and diphtheria are frequently transmitted through the agency of milk. This fact explains why every one should wash his hands thoroughly before handling milk, in which diphtheria and typhoid germs multiply rapidly.

of a thousand cubic feet by adding one pint of formaldehyde solution to a gallon jar containing twelve ounces of potassium permanganate. The room should remain tightly closed for twelve hours. Clothing, metals and furniture are in no way injured by the gas.

Vaccination.—Specific immunity against various infectious diseases may be acquired by *vaccination*. This consists in inoculating the body with weakened germs or the growth-products of the same kind of germs as those causing the disease to which one wishes to become immune. Immunity from typhoid fever, plague and cholera is often secured by injecting under the skin dead cultures of the germs of these diseases. Immunity from hydrophobia is secured by several successive inoculations with hydrophobia germs which have been weakened in the spinal cords of rabbits exposed to dry air from two to fifteen days.

The most successful vaccine produced is that which prevents smallpox, the most dreaded malady of the eighteenth century, when it killed 60,000,000 people in Europe. This vaccine is prepared by weakening the smallpox germs by growing them in the skin of calves. These weakened germs when smeared on the broken skin of the arm result in the formation of a large scab, some fever and slight indisposition due to the products of the germs, which cause the body tissues to react and form substances capable of destroying the strong smallpox germs which may later reach the body. Owing to the fact that these substances so inimical to the smallpox germs in the body become successively weaker each year after the fourth or fifth year, it is necessary for one to vaccinated every ten years, until middle life.

The words "leg," "trunk," "arm," "face," are printed over the centers that control the corresponding parts of the body. Other words show where different sensations and memories are located

Antitoxins. — Immunization against such diseases as lockjaw and diphtheria is effected by introducing into the body substances which nullify the poisons generated by the growing germs. These substances are called antitoxins. They are secured from the blood of animals which have developed them to fight off the poisons of these germs injected into them at varying intervals.

The constitutional diseases, such as rheumatism, Bright's disease, arteriosclerosis, or hardening of the arteries, and certain affections of the heart, are not well understood as to their causation, and therefore efforts to prevent them have not met with success.

The Certified Milk to be had in many cities is usually of high quality and contains less than 30,000 bacteria per cubic centimeter. Such milk is taken from cows shown to be free of disease by periodical physical examination and tuberculin tests. The stables are kept scrupulously clean and free from flies and all the milk receptacles after being rinsed in cold water are sterilized in steam or boiling water. The milk is cooled immediately after it is drawn and stored in ice water, because warmth causes a rapid growth of the bacteria which poison the children.

Pasteurized Milk.—It is unsafe to give to young children milk not known to be clean and from healthy cows. When it is necessary to use questionable milk it should always be pasteurized. A special apparatus for pasteurizing may be purchased, but with some care the process may be accomplished by placing the milk in a Mason jar or tall pail, which is then set into a kettle of boiling water, just removed from the stove. The water in the kettle should stand at least as high as the milk in the pail, which must be

stirred ten minutes and then left standing (covered) ten minutes longer. The milk should then be cooled as quickly as possible by placing it in cold water and stirring it a few minutes. Milk thus treated will usually remain sweet in an ordinary refrigerator three or four days, but it is preferable to use it within twenty-four hours.

The commercial pasteurized milk sold in many cities is often unreliable because the pasteurization has not been properly accomplished, and frequently the milk is of too dirty a quality at the beginning. Experiments prove that children thrive almost if not quite as well on properly pasteurized milk as upon clean raw milk. In pasteurization the temperature should never exceed 160 degrees and it is preferable to maintain it at about 148 degrees. Boiled or sterilized milk should not be used as the regular food for children because some of the albumin has been coagulated and salts precipitated.

Mastication.—Toxins injurious to the heart and other organs are commonly generated in large quantities in the large intestine of those consuming much meat. A vegetarian diet with milk (especially buttermilk) and eggs lessens the formation of these toxins and thorough mastication, often called Fletcherizing, in some way stimulates the bowels to cover the waste matter with a coat of mucus, preventing the absorption of any toxins present.

The careful preservation of the teeth, the thorough mastication of a largely vegetarian diet, regular daily exercise in the open air, daily evacuation of the bowels, induced by laxative foods and exercise and not by drugs, and eight hours of sleep in a room with open windows, together with a cold morning bath, are the best known means for maintaining a vigorous constitution which will have marked power in warding off both infectious and constitutional diseases and for enabling the organs to continue in the healthy performance of their functions even beyond fourscore years and ten.

ARCHERY

Archery of course long ago ceased to be of life and death importance. The last notable use of bows in war was made by the Chinese, about 1860. But in the days of early Edwards and Richard III in England, the long bow was England's chief defense against her enemies. The king commonly required the entire male population to practice with the bow every Sunday, and forbade all other sports. In Scotland, surreptitious golf gave the department of state a good deal of anxious trouble.

Queer as all this is, in dead earnest, archery as a pastime has kept much of its old fascination, as every boy knows; and the details of this modern game are sure to interest somebody.

The best bows are still made of yew, as they were six hundred years ago, and the best yew comes from Italy and Spain. But when yew was hard to get, the English armed their less skillful marksmen with witch hazel, ash and elm. If they had been able to get at the American hickory, the chances are it would have given yew a good run for its money. The American Boy Scout hand-book names mulberry, osage-orange, sassafras, Southern cedar, black locust, apple, black walnut, slippery elm, ironwood, mountain ash, hickory, California yew and hemlock.

The English long bow was usually five feet long. The practice now is to have the bow about as long as the bowman is. The stiffness of a bow is spoken of as its weight, in the number of pounds pull required to draw a full-sized arrow to the head. A woman's bow now weights 24 to 32 pounds, a man's bow 40 to 60 pounds, and a Boy Scout's bow 15.

Like fishing-rods, bows are made either solid or spliced and are glued. The one piece, "self" bow has the pleasanter action, but costs more, and is more apt to warp or spring out of shape. All very long bows are likely to be spliced in the middle. The wood is rounded on the inside, toward the string, and flattened on the other side.

The experts say that it takes more skill to make a good arrow than to make a good bow. A perfect target arrow is quite a complicated affair. The main shaft is of pine, with a piece of hard wood to carry the metallic head. A square notch is cut for the string, and just forward of the notch three feather guides are attached, either by glue or by silk winding fore and aft. If these feathers curve, it is important that they all curve the same way.

The string is best made of flax or linen, silk wound for the arrow head, and carefully waxed or glued.

Targets for the modern sport of archery are four feet in diameter, with a series of concentric rings 4 and 4/5 inches broad. The score is: inner circle, gold, 9 points; inner ring, red, 7 points; next ring, blue, 5 points; next ring, black, 3 points; outer ring, white, 1 point.

Popular distances now are 40, 50, and 60 yards—a degeneracy beneath Robin Hood's scorn. Of course the secret of this change is in the fact that the modern rifle begins where the best bowmen of Robin's day left off.

BASEBALL

Baseball is played by two opposing teams of nine men each, on a field containing a diamond. A baseball diamond is a square, ninety feet on each side, with a base at each corner.

When a player makes a complete circuit of the four bases without being put out under the rules of the game, he has scored, or made a run for his team. The side making the larger number of runs during a game wins.

A standard game of baseball consists of nine innings. For the first half of the first inning, the captain of the home team chooses whether his men shall bat or take the field. After three men of the side first at bat have been put out, the teams exchange places, and so alternate throughout the game, each half inning continuing until three men have been put out.

A man at bat becomes a base runner (a) if he makes a fair hit (not a foul); (b) if the umpire calls four balls on the pitcher; (c) if under certain conditions a third strike called by the umpire be not caught and held by the catcher; (d) if the person or clothing of the batter be hit by a ball at which he does not strike, and which he makes a reasonable effort to avoid; (e) if the catcher interferes with his attempt to bat; (f) if a fair hit ball touch the person or clothing of an umpire or base runner before touching a fielder.

A player is declared out in any one of some thirty cases, the commonest being these:

1. If he bat either a foul or a fair hit which is caught by an opponent before the ball touches the ground.
2. If while a batter three strikes be called.
3. If while a base runner he be touched by a ball in the hands of an opponent, unless some part of the runner's person be in contact with a base to which he is entitled.
4. If he interferes with a player attempting to field a batted ball.
5. If in running bases he runs more than three feet from the base line, except to avoid an opponent who is fielding a batted ball.

Batsmen are passed to first base without liability to be put out (a) when four balls are called; (b) when hit by a pitched ball; (c) when the catcher interferes with batting; (d) when a fair hit ball strikes the person or clothing of an umpire or base runner before reaching a fielder; (e) if the umpire declare a balk.

Base runners advance one base without liability to be put out:

1. Whenever by reason of any player receiving free advancement under the rules; two men would otherwise claim the same base. If, for example, all bases are full when a batsman is passed to first by four balls, the situation will bring in a score and leave the bases still full.
2. If the umpire call a balk.
3. If the catcher allow a passed ball.
4. A base runner is entitled to advance one base if he be blocked from a base by a fielder who has not the ball in his possession.
5. An illegal catch of a batted ball gives all runners three bases; of a thrown ball, two bases.
6. All runners are entitled to advance one base if the catcher move out of his position pending a throw by pitcher.

Base Ball Terms and Specifications

(1) **Materials.**—*Official Ball.* Reach or Spalding, cork center, yarn wound, horsehide cover, 9 to 9¼ in. circumference, 5 to 5½ oz.

Bat. Hardwood, round, diameter not over 2¾ in., length not over 42 in.

Catcher's or First Baseman's Mit. Any size, shape, or weight.

All Other Gloves. Weight not over 10 oz., size not over 10 in. around palm.

Protector. A padded or air-filled shield for the body of umpire and catcher.

Mask. A wire head gear for men working behind the bat, especially to protect against foul tips.

Leg Guard. A lower defensive armor for umpire and catcher.

Base. Stuffed canvas bag, 15 in. square, attached by its center at intersection of base lines, for first, second and third bases.

Home Plate. Five sided white rubber plate. Front 17 in., sides 8½ in., running along base lines 12 inches each.

Pitcher's Plate. White rubber, 24x6 in., located 60 ft. 6 in. from home plate.

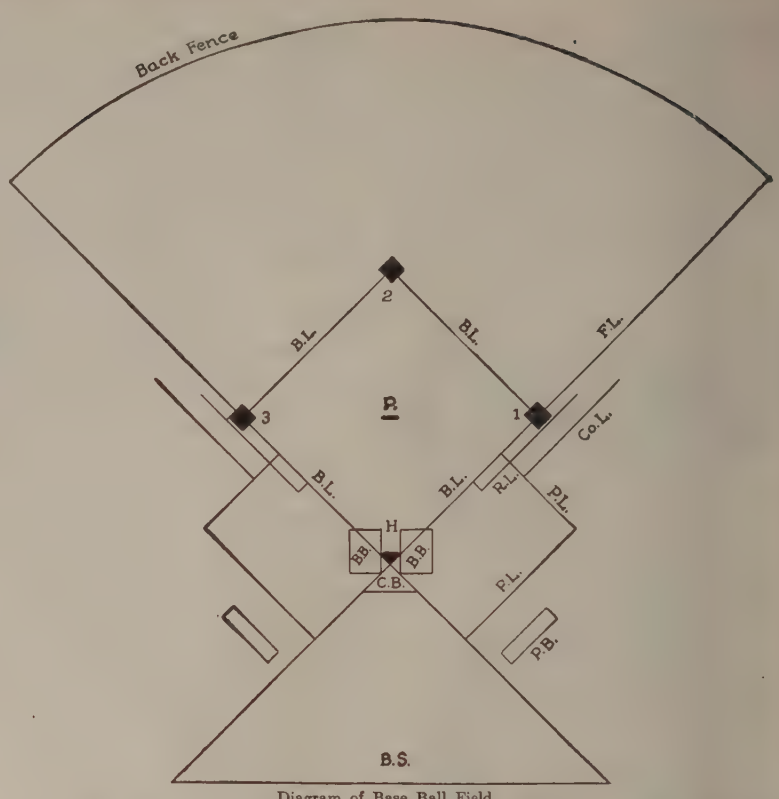

Diagram of Base Ball Field.

Toe Plate, Heel Plate. Spiked to prevent slipping.

(2) **Grounds.**—*Diamond or Infield.* A square, 90 ft. on a side, within or near which the pitcher, catcher, basemen, and shortstop play their defensive game against the batsmen and base runners of the opposing team.

Outfield. The clear space beyond first, second and third bases, in which the three fielders work. The outfield should extend at least 235 feet from the home plate.

Pitcher's Box. A position of the pitcher, in which one or both the pitcher's feet are touching the pitcher's plate.

Catcher's Box. A triangular space 10 ft. deep, behind the home plate. (See diagram.)

Batter's Box. A rectangle 4x6 ft., at right and left of home plate, six in. from the plate.

Players' Lines. Enclosed rectangles 50x74 ft. along base lines each side of home plate, to be kept clear of all players not actually engaged in the game.

Coachers' Lines. Outside the diamond, 15 ft. from the foul line and parallel to it, near first and third, beyond the players' lines. One coacher may work along this line at first and one at third, but never within the line.

Runner's Line. Begins 45 ft. from home plate, runs parallel to base line, 3 ft. outside the diamond, to first base.

Backstop. A large upright frame covered with wire netting, at least 90 ft. behind home plate.

Grand Stand, Bleachers. No seats for spectators within 90 ft. of home plate or of foul lines. In outfield, no spectators or obstructions within 235 ft. of home.

Foul Lines. The base lines from home plate to 1st and 3rd, and their continuation into the outfield.

Players' Bench. A bench at least 25 ft. outside players' lines, on which must be seated all players of the team at bat, unless actually batting, coaching, or running bases.

(3) **Terms of Play.**—*Assist.* Any handling of the ball which directly aids in putting an opponent out, is called an "assist" and is so recorded by the scorer.

Balk. One of numerous forbidden motions, chiefly by the pitcher. For example, the pitcher may not begin to throw to the batter or to first base without completing the throw; he may not throw to put out a base runner without stepping directly toward the base he aims at, etc. See Reach or Spalding guides.

Base on Balls. When a pitcher has made four throws to a given batsman, at which the batsman does not strike, and which do not pass over any part of the home plate, the batsman is entitled to become a base runner at 1st base. Certain other throws by the pitcher are also called balls. See guides.

Base Runner. A player who has ceased to be a batsman, and is on his way around the diamond, in an attempt to score.

Batting Order. A regular arrangement of players' names, for succession in batting. Batting order cannot be changed during a game, except by the use of substitutes.

Block Ball. A ball which, while in play, touches any person not in the game. In case of block ball, the players running bases may advance until the ball is again in pitcher's hands.

Bunt, Bunt Hit. A form of batting in which the ball strikes the bat, instead of the bat striking the ball. A bunted ball is commonly a sacrifice, though a swift runner with a quick get-away may sometimes beat out a well placed bunt, especially if there be indecision among the fielders

as to who shall field the bunted ball. A bunted foul counts as a strike, even a third strike.

Called Game. A game terminated by the umpire because of rain, panic, fire, darkness, or any other cause endangering players or spectators. Games called before the fifth inning is completed are commonly called no game.

Caught Stealing. The putting out of a base runner who is trying to make a base on the sly.

Chance. The opportunity of a fielder to so field a ball as to assist in retiring a base runner.

Double Play, Triple Play. A play in which two runners, or three, are put out in quick succession, by clever fielding.

Drawn Game. A game with a tie score, called by the umpire after five or more innings.

Earned Run. Scored when a player reaches home base by reason of safe hits, sacrifice hits, stolen bases, bases on balls, hit batsmen, wild pitches, and balks, but not by reason of fielding errors, or other penalties than those implied in this list.

Error. In general, any misplay in fielding which prolongs the life of an opposing batter or base runner.

Extra Innings. Play which runs beyond the regular nine innings, by reason of a tied score.

Fair Hit. A hit which settles on the foul line or inside the diamond, short of first or third base; a hit which, passing first or third base, bounds on fair territory or first strikes on fair territory.

Fly. A ball batted high in fair territory.

Forfeited Game. A game awarded by the umpire against an offending team, by reason of broken rules of play.

Foul, Foul Hit. (1) Short of 1st or 3d base, a batted ball which settles outside the diamond, or would so settle if not interfered with. (2) A batted ball which bounds past first or third in foul territory. (3) A batted ball which first lands on foul territory beyond first or third base.

Foul Strike. Fouls count toward the first two of a batter's three possible strikes. Foul bunts may count for all three strikes.

Foul Tip. A foul hit in which the bat merely glazes the ball.

Hit Batsman. A batsman whose person or clothing has been hit by a pitched ball which he made reasonable effort to avoid.

Homer, Home Run. A fair hit which goes so far that the batter is able to make a circuit of the bases before the ball can be fielded.

Infield Fly. Before two men are out, with runners on first and second bases, the umpire will declare out any man who bats a fair fly which can be handled by the infield, bunts excepted.

Passed Ball. A pitched ball which goes to the backstop 90 ft. behind home plate. In such case all runners advance one base.

Run. A complete circuit of the bases resulting in a score.

Runs Batted In. Runs scored by reason of hits made by other players.

Sacrifice. A hit made for the purpose of advancing a base runner, though the batter expects to be put out.

Safe Hit. A hit which cannot be fielded in time to prevent the batter reaching first base.

Shut Out. To prevent a team from scoring during an entire game.

Strike. In general, one of three batting opportunities the loss of which will put a batsman out, or the act of losing one of these three opportunities. See opening discussion.

Time. Temporary suspension of play by the umpire.

Time at Bat. A lawful occupation of the batters' box which does not terminate in four balls, a hit batsman, a sacrifice hit, or interference by the catcher.

Wild Pitch. A pitched ball so high or wide that it cannot be effectively fielded by the catcher.

Abbreviations in Base Ball

BASKETBALL

Basketball is one of the best of games for both player and spectator. There is opportunity for personal prowess and for team work; quick thinking and quick action are at a premium; accuracy of motion and of judgment are necessary. The individual star has frequent opportunities to shine, but he will be often eclipsed if he does not use good passwork by his team, in support of personal brilliance. Attack and defense are so varied, so quickly shifting from one team to the other, that a moment's inattention may be very costly.

The side which has the ball attempts to advance it for a try at goal; the defending team meanwhile uses every legal effort to break the attack by getting possession of the ball.

Like all good games, basketball is what it is largely because of its rules. These rules vary slightly from year to year, and vary with the quality of the players, there being separate sets of rules for women, for professionals, and for male amateurs. Rules for women eliminate roughness, reduce the danger of falling, shorten the distances covered in running, and in general adapt the game to the feminine physique. Amateur rules for men are in a number of respects intermediate between the vigorously combative game of the professionals and the non-interfering game played under women's rules. The following summary of play is founded on the amateur rules for men.

A basketball court is a rectangle sixty to ninety feet long and thirty-five to fifty feet wide, with clearly marked sides and end lines. At the middle of each end, a "basket" is suspended ten feet above the floor, from a wire ring eighteen inches in diameter, carried by a back board four feet by six.

Free throw lines are twenty-four inches long, directly in front of the baskets, fifteen feet from the end lines. Free-throw lanes are so marked that no player of either side may come within three feet of the ball during its progress from the free-throw line to the basket.

At the centre of the court is a circle four feet in diameter, within which the ball is put in play by the referee at the beginning of the game and at various other times as provided by rule.

The object of the game is to score baskets or goals—each team attempts to throw or toss the ball through its own basket. A goal scored from the field in the ordinary course of the game counts two points; a goal secured from the free-throw line as the penalty for a foul committed by opponents counts one point.

Two classes of fouls are distinguished: Personal fouls are declared for forbidden roughness in personal contact, for holding a player, or blocking his progress. For personal fouls, the penalties range from one free throw to the disqualification of the player for the remainder of the game. Four personal fouls of any sort during a game disqualify the player for the remainder of that game.

Technical fouls are called for other violations of the rules. For example, it is forbidden to carry the ball more than one step in any direction, to make a second dribble without first passing the ball to another player, to delay the game, to talk to officials during the game, and so on.

To dribble is to keep the ball moving, in one player's possession, by throwing, batting, rolling, or bounding it with one hand. A dribble ceases if the ball comes to rest in one or both hands, if it touches both hands at once, or if it touches a second player. The ball may be batted

in the air only once during a dribble. A player may throw for goal after dribbling.

The ball is dead, and is put in play at center by the referee after a goal is made, after the two free throws following a double foul, or when the ball lodges in the supports of the basket.

A ball becomes dead when it goes out of bounds. The last player who touches it before it leaves the court is held to be the cause of its going out of bounds. The referee commonly designates the nearest opposing player to put the ball in play, by throwing, rolling, or bounding it to another player in the court.

A ball is "held" when two opposing players have one or both hands on it, or when a closely guarded player is held by the referee to be withholding the ball from play. A held ball is dead until put in play by the referee at the spot where held, in the same manner as at the beginning of the game, except that a ball held in either end zone must be thrown out by a member of the defending team.

If the referee is unable to decide who is responsible for a ball going out of bounds, he declares a "jump ball" near the boundary line, between two players of his own choosing.

Team work, accuracy in handling the ball, speed, quickness and accuracy of judgment, cleverness in deceiving opponents all go to make the good player and the good team in basketball. A good coach will invent a variety of snappy exercises to test and develop all these general qualities. He will also train for the actual situations of play. For example, several players must be able to throw baskets from the foul line, scoring at least three shots in four; several players should specialize in the dribble; everybody should practice receiving a hotly-thrown ball while running toward the basket, instantly checking himself for the try-at-goal; baskets should be thrown from the field at long and short range, from all angles; a number of systems should be perfected for getting the ball down the field by passing; and so on.

BOXING

A Few General Suggestions.—*Position.* Left arm, left foot advanced, right foot angled for a brace in starting, right heel slightly off ground, for quick action. Body quartering, left side forward, generally slightly crouched. Thumbs in the only safe position—the middle one.

Distance. Don't waste strength making or guarding blows which could not reach their mark. Work in, quickly, before you really attempt to land. Give as little warning as possible, make your blows snappy, with a quick get-away. In gauging distance by extending the arm, work around toward your left, away from the opponent's dangerous right arm, until you get your opportunity for leading in.

Muscles. Active, but not strongly contracted, except in the very act of striking, or receiving a heavy blow.

Bend the body freely, forward and back from the hips; bend the head, neck, shoulders, and back quickly, freely, in all directions. These movements deceive the enemy as to distance, are useful in guarding and in covering and launching an attack.

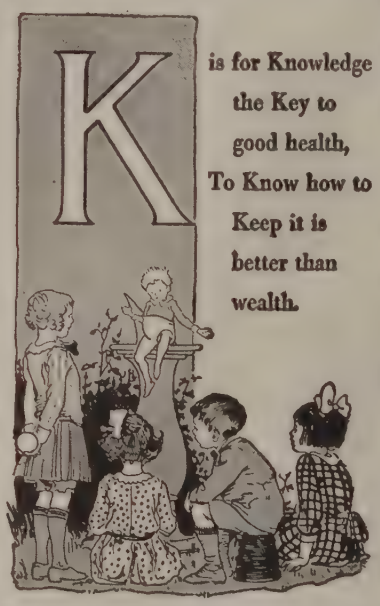
It is exceedingly important to answer every blow you see coming, by a *counter blow*, at the same time guarding against the one you have seen under way.

Follow up your successful blows with a *rush* and shower if you're sure it's *safe*—look out for opening yourself to a big blow of the knockout sort.

Seldom make big windmill *swings*. They are too obvious, and dangerous to the man who makes them. Save your big attacks for real openings. Don't put all your force in a blow that could be easily blocked, and probably will be.

Give first and most careful attention to *defense*. The chief means of guarding against attack are blocking, shoving aside a blow, stopping an opponent's blow by a quick counter blow, slipping, ducking, and side stepping. Study the signs of a coming blow. The eye is the great tell-tale. *Watch it!*

To *block* is to receive on the fist or arm a blow meant for the body or head. In the instant of using one hand for blocking, watch for an opening for the other. Put only enough effort in the blocking motion to keep off the force of the blow. The



right arm is the main guard. Don't send it too far out in blocking, or you will leave an opening.

Coming blows may be *shoved aside* either to right or left. It is occasionally possible to shove an opponent's right across to your right, or his left to your left, thus turning him partially around, making an opening, and perhaps disturbing his balance. The open palm does well in blocking and shoving off blows.

Stops are quick counter blows with the left hand, shot out for the head or body in the instant you feel the enemy is going to strike. Stops are good when they beat the other fellow to it, and so surprise the force out of his blow, or head it off altogether. While making stops with the left, change the guard of the right, to protect both body and face.

A *slip* is a sudden jerk of the head or body to right or left, letting a blow glance by. If the blow is from the opponent's right, slip to your right, and vice versa.

In boxing, a *duck* is a big slip, usually to avoid a big swing for the head. Guard the chin while ducking, and make a counter blow with the other hand.

A *side step* has three swift movements; retreat one step, spring to right one step, and turn to left, facing opponent.

A *feint* is a useful preparation for a lead. A short step forward with the left, a snappy blow which you know will not quite land, instant recovery, and instantly a longer step, with a real blow. Feinting is commonly done with the left hand. If with the right, feint for the head and lead for the body, or feint low and strike high. Feinting of course succeeds only when it causes the enemy to raise or lower his guard, leaving an opening. Feints are used also to draw leads from the enemy, which, being expected, can be blocked and countered, often to marked advantage. The feint and the real blow following are of course almost always by the same hand. A good feinter who is quick on his feet, keeps his opponent guessing.

In general, hit with the *palm down*—a position which leaves the forearm ready to block or shove away a blow, as well as to attack. *Practice all sorts* of blows—straight out, hooks to right and left, uppercuts, jabs by the body twist, and even the slugging windmill swings. To strike with weights in the hand is a practice that puts power in the blow of the empty hand later on.

John L. Sullivan changed the long-drawn brutality of old-time fist fights into a swift decisiveness, by the use of *knockout blows*. Corbett and others perfected these blows and added variations. There are four main types of knockout, and it is well to know all about them, possibly for offense, surely for defense. These four blows land (1) on the point of the chin or near it; (2) on the solar plexus, or pit of the stomach; (3) over the heart; and (4) on the neck close under the ear. The most painful of these is the stomach blow, the most temporary effect is from the blow under the ear.

Skill in boxing can come only through *constant practice* of a good many sorts. A punching bag is indispensable, as are chest weights, used in all possible positions. Breathing exercises and long runs in the open are good for the "wind" and some quick-shifting game like squash for speed on the feet. But most necessary of all are a wrestling mate for generally "mixing it up", and a sparring partner, preferably more skillful than you are.

CAMPING OUT

One doesn't camp out in a cabin or bungalow, with hired chefs and a community dining room. He brings his house with him on the running board or under the wagon seat; he cooks his own food; if he wants furniture, he makes it with an ax. Real camping is a throw-back to the primitive—the butcher, the baker, the candle-stick maker are barred. At its best, there isn't even a guide. The instinct for returning to simplicity is pretty strong in most of us, but we have come so far in our way of civilization that few of us know how to get back. This article is for the folks who would like to join the big procession returning to their father's house in the woods.

Where to go doesn't so much matter. Little journeys will often do as well as long ones. The main thing is to cut loose from routine, get an utterly new angle on the game of living. This may sometimes be as well managed by a creek bank over the next hill, as in the Canadian wilderness. But if one has a few weeks off and a little gas car, he may almost choose his own

camping ground; let him try the mountains this year, the lakes and rivers next, and after that the Old Salt itself. Which he will like best will depend on his temperament, but he will be the richer for all three.

Three Sorts of Camp. The motor car has popularized the traveling camp, for one night stands *en route* to some far country. At the journey's end a headquarters camp may be set up, from which side trips lead out to hiking camps, over a night or two. In any case, the first and biggest question is of outfit.

Outfit in General. Long before your starting date, begin a check list. You can have fun with that all winter, until you get to be such a seasoned old camper that you throw together a two weeks' outfit off-hand. Even the old stager has a mental check list, he says to himself, shelter and bed; fire, cooking and eating tools; grub and grub getters; personal kit; sundries for safety, comfort, and pleasure. Every item admitted to the check list must prove its right to be there; for one wagon, quite likely a Ford car, carries each party of four and all its duffel. There may be a folding cot or two for the cripples, but feathers, mats, and spring beds are left at home, along with easy chairs and porcelain dishes. These are the tests of camp duffel: Can I get along without it? Is it as light and compact as possible? Is it durable? Is its design right for camping?

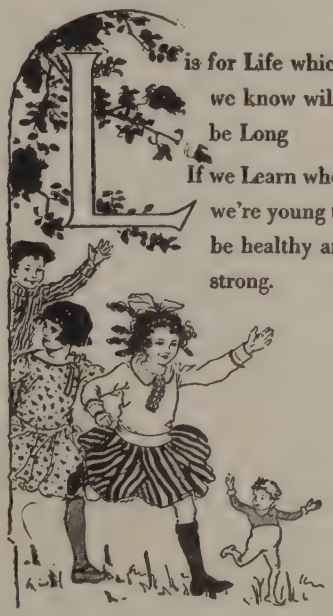
Duffel Bags. The entire camp luggage for a party of four, to stay several weeks, should be packed in six or at most seven waterproofed bags: Four bundles bedding, clothing, and personal effects; one bundle tents, flies, jointed poles, stakes, and extra canvas; one bundle grub, table ware, and camp sundries; one bundle stove and stove furniture. Clothing is kept in light muslin sacks which serve for pillows in camp; odds and ends of personal property are put in the pockets of the sleeping bags, or enclosed in smaller sacks within the clothing bags. Theoretically, there should be no loose odds and ends whatever, on the journey; they are sure to be very much in the way.

Loading the Car. A folding baby gate makes the best carrier for the running board. It is light in weight, high, long as you want it, strong enough for the purpose, and inexpensive. Fasten it with angle irons at the bottom, ropes or wire braces at the top. The tent bundle is long and flat, on the right running-board under the doors. A few harness clips on the running-board are useful and inconspicuous. If the front fenders are strongly braced, there will be a bundle on each, tied to the headlight irons. Four bundles in the baby gate, one on the right running-board, two in front. Of course if you have tonneau room, you can either bring in two bundles from the outside, or take along a few extra comforts.

Camps by the Way are one night stands, very simple, commonly set up at twilight. It is best to turn off the main highways a mile or so along a side road, where you can either set up your house by the side of the road, or get a farmer's permission to stay over night in his orchard or meadow. A courteous statement of who you are, where you are from, where you are going, and what you want will almost always be met half-way. To make sure that this condition lasts, we should take care to give as many favors as we get.

On long trips, the storage battery may well be used for lighting your evening camp.

Of course the simplest roadside camp is a lean-to of some sort, fastened to the top of the car. Automobile tents may be had for this purpose, though any sheet of waterproof duck or twill will do. An excellent scheme is to use the fly from the wall tent combination, fastening one end to the car-top, the other end to the two wheels, and staking the middle out on the ground with a board or pole running through, so that the one canvas serves for both roof and ground cloth. This is a capital arrangement when the grass is wet. A rehearsal or two at home before you start will make it practical to sew a few tapes along the ground-line of this fly tent, for staking out. By this device, night camp may be set up in five or ten minutes, with dry beds and an excellent shelter. With this arrangement, you will study the direction of the wind before you stop your car in bad weather. A few extra pairs of tapes along the sides of the fly may help in shutting out a driving storm. It certainly pays to make up your beds in the



water-proof rolls described later in this article. With such rolls, four beds can be made in four minutes—there's nothing to do but unbuckle and unroll—and a little rain more or less doesn't matter.

If the weather is fair, it's a waste of time to put up any shelter at all. No other sleeping room can compare with the unroofed open air.

The Headquarters Camp.—*Shelter and Bed.* East of the Rocky Mountain states, there should certainly be a tent or two for each party. The 9x9's or one 10x12 will make very comfortable quarters for four. The requirements of weight and bulk forbids the use of heavy duck. We recommend the use of shelter tent duck or the best grade of twill for all sizes up to and including 10x12. Tents of these materials may now be bought ready made from any of the better dealers in outing goods, or may be made up to order.

There are half a dozen or more standard shapes of tents, but of these, two are pretty clearly the all-round styles for general use. Women are quite sure to prefer wall tents, with 8 ft. poles and 3½ or 4 ft. walls. Men who know are about as unanimous in choosing the lumberman's style, lean-to roof, 8 or 9 ft. poles, low rear walls, and an upright front. This front may be staked out awning fashion, thrown back on the roof, or tied down to close the tent. The lumberman's tent is thus convertible into three. It is a lean-to with warming fire in front; it is a living room with a front porch; it is a snugly closed house.

Whatever the style of tent, there should be an 8 or 9 in. sod cloth around the bottom, and some good drop screen in front, to keep out varmints, flies and mosquitos. A front of double mosquito net or single bobbinet is effective. It is well to have a broad band of cheesecloth at the top, bottom, and sides of the curtain for wear and tear, and for surplus tucking in. A few minutes attention to sod cloth and drop curtain will positively shut out the whole horde of flying and crawling night pests. We make no guarantees about quadrupeds. They are part of the game. Of course it will be necessary to kill off any mosquitos you have shut in. They will suggest how it can be done.

If carrying space permits, the headquarters camp will be greatly improved in hot or rainy weather by the use of a fly over each wall tent, extending well out in front for a porch.

In a country of wooded undergrowth, it is commonly unnecessary to carry poles or stakes; but if the journey is a long one and a tent is to be set up every night, it may be well to carry half a dozen stakes, and to put ferrule joints in light end poles cut to the length of your tent bundle. If your tents are made with a ridge of rope or tape, as they should be, you will not need a ridge pole on the way. Ridge poles should always be used in permanent camps, to gain head room and preserve the shape of the tent.

It is well to floor the ladies' tent with a water-proofed ground cloth, of material like the tent. A ground cloth of some sort is particularly desirable for camps set up by the road in the evening. It makes a neat cover for the bundles in the baby gate.

Waterproof your tents, flies, ground-clothes, and duffel-bags in a paraffin solution. Melt a pound of "Parawax" for each six quarts of gasoline, pour the hot paraffin into the gas, and go ahead. Dipping does the more thorough job, but brushing will do. Articles waterproofed in this way should be aired for several days before using, in order to evaporate all the gasoline.

Beds and Bedding. Sleeping bags are bulky, heavy, and expensive, but a home-made blanket roll will pay for itself in comfort, especially if the nights are cool, or if one likes to sleep in the open. The roll we recommend is made up in a simple cross-shaped cover of water-proofed twill, with tapes for tying or rings and a strong cord for lacing up. If the sleeper uses a cot, he must have as many thicknesses of blanket under him as over; if he sleeps on the ground, there may be a blanket or two less under than over. In any case, the proper way to make up blankets for a single bed out-of-doors begins like this:

Lay the twill cover out flat. Spread one blanket in position BC, another in position AB; Fold blanket C over B; A over B; cover flap E over B; C over B; A over B. Lace and tie, leaving a little freedom, for comfort. If more than two blankets are needed, fold all but the top one alternately, as above; the top one may well be tucked in at both sides. Flap D is a head cover, with convenient pockets for

odds and ends. This head flap for out-of-door sleeping is held up from the face by a cross-bar resting in forked sticks. The lower ends of D are of course tied down. It is impossible to kick out of a bed made up like that; wind and weather cannot get through it.

A few newspapers under the bottom blanket of any bed will do wonders for warmth.

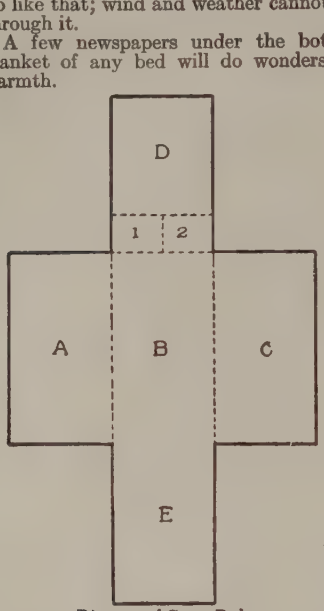


Diagram of Camp Bed

Lacking a natural mattress for your ground bed, one may be improvised of almost any leafy material—ferns, juniper, branches from any of the evergreen trees, small brush, sweet clover—whatever comes handy. For downright comfort, juniper is perhaps the best of the lot, though unpleasant to handle. If branches are used, they should not be thrown down haphazard, but should be laid in courses like shingles, covering the butts. Ground beds in the permanent camp should be made in two layers, a lower one of coarse stuff, and a finishing coat of tips, ferns, or leaves.

Occasionally, one may find it necessary to sleep on bare ground. This will not be bad, if hollows are dug for the hips. A form-fitting bed of sand is more comfortable than prodding branches badly covered.

The Camp Kitchen. It may be well enough to know how to make a fire without matches, but it is vastly more important never to forget the matches. Flint and steel, burning glass and fire fiddle will not be needed if there is a good reserve stock of matches in camp and in your pocket, both in waterproof containers.

Headquarters camp should have some means of baking. Kettle ovens and steel camp stoves are heavy; the writer always straps on the wagon somewhere a light four griddle, sheet iron stove, with an oven. This is admittedly a bulky package—its actual dimensions are 11x16x22 in., and its weight 14 pounds. Such a stove should be carried if at all practicable. It takes most of the hardship from your permanent camp; reduces the bulk of firewood required, raises the fire off the ground so that the cook can stand erect, and makes possible a comfortable tent on cold, rainy days, and in the evening.

If the stove cannot be carried, a folding reflector is the next best thing, though it is possible to improvise ovens of many sorts. The writer once served a meal of potatoes, muffins, and corn pudding baked at the same time in one galvanized bucket. An overlapping cover makes an oven of a frying pan. The regulation meat baker used at home will itself serve very well as oven in camp. Potatoes, corn, and fish may be baked in hot embers under the fire. The corn is protected by its husks, potatoes are delicious in their charred shells, but the fish will need a protection of wet paper. Boy Scouts learn to bake a twist of dough on a stick held near the fire. Suit yourself. Half the fun of camping is in inventing new ways to do old things.

No breakable utensil should go to camp. Aluminum ware is preferable except for dishes which must be held in the hand. It gets hot quickly and stays hot long. On this account aluminum cups are quite out of the question, except for cold drinks. Aluminum fry pans are excellent, if they have the right sort of handles. A light 12-inch fry pan with a smooth flat bottom gets our vote as the all-round best camp kitchen tool. It should have a socket for a long wooden handle, in case you need to fry over a big warming fire. Next to the fry pan in importance come three or four nested aluminum stew pans or pails. Of course all handles should be riveted, not soldered on. Don't forget the long handled spoon or the pan-cake turner. You *can* do without them. Guides enjoy the flourish of turning cakes by flipping the pan in the air, but what's the use, if the results are inferior?

Grub and Grub Getters. It all depends on who you are, where you are going, how long you are going to stay, and what time of year it is. Camp is a bad place for finicky folks. But most people will eat in camp things they refuse entirely at home. The general tests for a grub list are: *What items can we surely depend on from the country we camp in.*. It is well to discount this expectation pretty heavily. The fish do not always bite; a late frost may have killed the berries; we are hungrier than we planned to be. *Are our staples of the lightest possible weight for their food value?* Rice will do more for us than potatoes, at a fraction of the weight and bulk. Bacon is easily the best camp meat brought from home. Sugar, oatmeal, cornmeal, flour are high in value for their bulk. Dried fruits must always be included, for their medicinal qualities. Condensed milk is less bulky than the evaporated sort, and keeps better after opening. Butter is a luxury worth carrying. Pack it in the lightest tins you have. If one's camping is to be really strenuous and in far places, he must cut out the canned goods altogether. In a good country and in the good old summer time, the loss will not be serious. Dehydrated vegetables, eggs, and even powdered milk are practical, and growing in favor.

Always carry a few hooks and lines. The rods do not so much matter. There is a peculiar exasperation in the sight of game fish, or any other pan fish, when one has no tackle. By the same token, carry an accurate .22 rifle, or a .22 pistol with six-inch barrel, the lighter the better. Don't insist on head shots, if the camp is hungry. Red squirrels and woodchucks are always in season, and you are not wise in the camping game if you scorn them.

In many states, one may fairly count on wild berries — strawberries, raspberries, blueberries, blackberries, in succession, from May until August. On the New England shore, wild cranberries are ready late in summer. There are spots along the great lakes, in the mountains—best of all on the coast—where the combination of wild riches, free for the taking, is true beyond dreaming, from snow to snow. To get the best of it, you will of course steer wide and clear of all beach resorts, hotels, and popular summer camping grounds. We are still a young enough and big enough land for this happy appropriation of a common treasure, off the beaten track.

Personal Kits. By this time it will be understood that conventional travelling bags and cases are out of order in camp. One change of clothing, in a light muslin sack, is useful for a pillow at night. Give particular attention to the comfort of your feet. Conventional notions about the dangers of getting wet will require a larger wardrobe than folks need who have exploded this fallacy. But a poncho is comfortable in a pouring rain, and wet clothes are a bit clammy to sleep in or put on in the morning. There is of course no family wash in camp. Such tyrannies are in the discard. Put into your kit all the things you must have for health and for a reasonable degree of comfort, but go light on decorations for a while. It will make a noticeable difference in the load. Odds and ends of toilet articles are best kept in the pockets of the bed roll. Positively no personal property goes that cannot be packed in your one duffel bag, along with your blankets and clothing. Be sure to put in a pocket compass, a jackknife and a waterproof match-box of some sort.

Camp Sundries. Candles or candle lanterns are better for camp than oil lamps of any sort. Camp axes are sheathed, and carried in the duffel bags. A buck-saw is worth carrying, if you use a stove, or if you tinker much about camp. Remember soap, towels, and an old rag or two. Nails are very useful—a pound of 10's, a pound of 20's, and a half a pound of 6's. Take 50 ft. of small cotton rope, braided if you can get it, and some stove-pipe wire. A pair of white cotton gloves will be convenient in case there are fish to skin. There's a knack, for instance, of drawing the edible part of a bull-head away from the rest, with half a dozen simple motions, if you have a sharp jack-knife and a pair of cotton gloves. Be sure of a whetstone, carborundum preferred.

Carry maps of the regions you are to visit. If the U. S. topographical survey has covered the regions, get the map of every quadrangle which may interest you.

Except in a hunting party, one or two light guns are enough, and more are a nuisance. Always one or two small cameras—the smaller the better—if the lenses and shutters are good. Small pictures are good mementos, and the occasional lucky composition can be enlarged. Mosquito dope, in spring and summer. Any aromatic oils are useful—cedar, pennyroyal, peppermint, camphor; oil of pine is effective, but not good to look at. Citronella is the stand-by. Use a little olive oil or melted vaseline for a base. Put up as many one-ounce bottles or boxes as there are members in your party, and keep one larger bottle in reserve.

Working Hints About Camp. In locating your camp, water, wood, shelter, bed, drainage, and permission are the main things to look out for. Sometimes it is necessary to beware of the dog, but that speaks ill for the location. I once found it necessary to make a funeral for twenty-five

porcupines before camp duffel could be safe. Granted the six necessities named above, one begins to thank his wood gods for such bathing pools, bird songs, water falls, vistas, fruits, fish, game and sunshine as are available.

Fires. Big open fires are unpleasant for general cooking purposes, even in winter. If you must have a big fire for warmth, study the wind, and locate a small cooking fire so that you can work between the two. A fire built for cooking only should be small, directly under the cooking utensil, and close to it. Makeshift fireplaces do very well for short stays. Narrow trenches, parallel lines of rocks, tripods of stones, sharpened green sticks driven down in threes, two logs a few inches apart at one end, and separating slowly for the larger utensils—these are a few of the simple devices. Forked sticks will support a pole above the fire, and from this horizontal pole, smaller forked sticks in various lengths will carry the cooking pots. Six foot saplings make good swinging cranes. Fire irons and patent grids are of course very convenient.

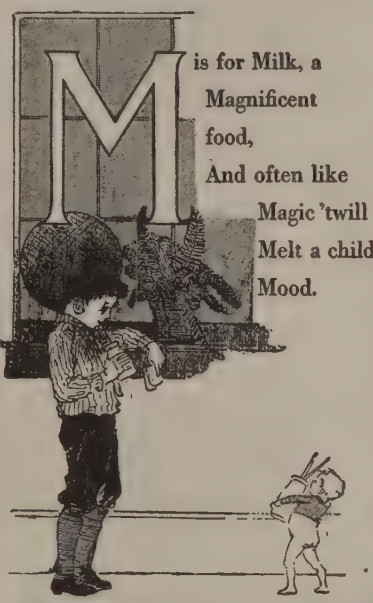
Lighting the Fire. Anybody can start a fire in a dry time. It's another story when the ground is wet, and all the fallen sticks are soaked through with rain. A hot *little* fire is what you must plan for first. Get the materials for your fire before you strike a match. It is almost always best to lay your fire before you light it. It is well to recognize several kinds of fire materials: tinder, anything which readily takes fire from the flame of one match; small dry twigs or split-up sticks which kindle from the tinder; middle-sized sticks, broken up; larger sticks, left unbroken, and thrust in as they burn. If coals are wanted for broiling, hardwood sticks several inches through are best. Always, the hot little fire first. Birch bark, white or yellow, will burn in any weather. But woodman, spare that tree! Cut it down if you must and the law allows, but don't disfigure it with a knife. Pull off loose fringes with your hands, or find a dead tree and work your works on it. Standing dead stuff is of course drier than ground wood in wet weather. The lower branches of evergreens die first, and may always be counted on, if they're there. Break them off, split them, and whittle, if you have no birch bark. Gauge and grade the size, the dryness, and the kindling heat required for all the materials at hand. Any sound deadwood is likely to be dry at the heart, so the ax and pocket knife, with common sense, will solve the fire problem.

Safe fires are not built on dry peat or leaf mold. Rocks, bare soil, creek banks, or raised fire-places are safest. Fire is of course particularly dangerous in a dry time of high winds. Let your fire run, if it will, several yards out in all directions from the starting point. The one rule for safe fires is, *watch them* while you're in camp, and *put them out* when you go away. Night fires should be used only under conditions of known safety. Tent stoves are best for that purpose.

The convenient and comfortable camp is near water and wood, is water-proof and shaded by a fly, requires little stooping, has a place for every utensil, good beds, a table or two, and portable seats. Camp without these is no place for old folks, for women, or families, beyond the first day or two. But with these things, and a fair division of labor, there is little hardship in camping. It is understood that *all camp furniture is made in camp.* Buck-saw, nails, and nail-pulling hand-ax make quick work of it. Tables, benches, and chairs can be sturdy and portable only when they stand on four good legs, each leg braced two directions at right angles. Wire sixes are best for fastening these braces. It is a simple matter to put backs on the benches and chairs. If you take along some extra canvas, hammocks, cots, and reclining chairs are in your repertoire.

Hints on Camp Cooking. Fry fish slowly, in fat as deep as you can spare it. This means a small, steady fire and frequent turning. Roll your fish in a mixture of corn-meal and flour before frying. If you turn a trout or flat fish a few times before leaving him in the pan, he will lie without curling.

Stews are easily possible. Red squirrels, wood-chucks, and cotton-tails are available when other things fail. Dehydrated vegetables in a stew will probably require longer cooking than your meats. If you



have fresh vegetables study their boiling periods and add each at the right time to bring all together at the finish. For instance, do not put in the potatoes until the meats begin to be tender, with twenty-five minutes to go. A slow simmering fire is the thing for stews. Add butter, salt, and a thin, smooth batter of flour—not much of it—a few minutes before serving.

In *Baking* remember one rounded or heaping teaspoon of baking powder to the cup of flour. Gems and muffins need a cup of milk (solution of powder or dilution from tin can); an egg or its equivalent in egg powder; tablespoon melted butter; sugar and salt to taste, the whole stirred with flour of any sort to the consistency of well-cooked mush. The stuff should run, but slowly.

Pancakes are more tender made with water than with milk. Better take along some prepared flour—"Aunt Jemima" if you can get it.

Too much baking powder is better than too little.

Johnny Cakes are better of half wheat, half corn.

For *Puddings*, boil rice or corn mush; stir in milk to a thin batter; add beaten egg or egg powder, raisins, sugar, nutmeg; bake until brown.

Steaks, chops, fish can be *broiled* in camp as well as at home, or better, if you bring along a camp grid or a folding bread toaster. Use a bed of live coals. Wire the broiler handle to a stick, if you find the heat unpleasant.

Planked meats are more readily prepared in camp than at home.

There is no better way with *small game* than to boil it until tender, and brown it with butter in the frying pan.

Fish Chowder. A kettle or big stew pan, with layers, in turn, of pork, fish, sliced potatoes, and crackers. Long, slow simmering. Keep covered with water.

Baked Beans. Layers, from the bottom upward, of onion, beans, onion, pork, beans, molasses, covered with water. Beans previously boiled until nearly tender. Both the chowder and the beans will be much better if they can be baked in a fire-hole. This requires a covered kettle, a rock-lined pit, and enough live coals to bury the pot completely. Layer of ashes on top. Get this pit in action at noon, and a delicious hot supper will be waiting for you at night. The pit itself is of course first heated by a fire built for that purpose.

Coffee, the good rule: tablespoon to the cup, and one for the pot. Better say pint cup, unless you like it strong. Don't boil your coffee; let it come slowly to a boil, and then merely keep it hot till you are ready for it.

One of the very best things about camping is that there may be so complete a change of work that we call it play. We have a new set of cooks, for out-of-doors it is the men's turn to cook, at least until the kitchen is made easy to work in. Even at that, the folks who cook at home need a change much more than the men are likely to need it. In general, men's camp cooking is likely to be greasy. Better make an art of it. Digestion will approve, and there's fun in the gem.

The Hiking Camp. Outfit, only what each man can carry comfortably on his back, say around thirty pounds, complete, packed either in a duffel bag with harness, or in a pack basket. The basket holds its shape, does not jam the contents, is cooler to carry, but is not water-proof. The basket wins by a big margin, if you can protect it from rain.

Small waterproof bags, stamped or tagged, are very useful for dry foods and sundries.

In midsummer, a shelter tent (pup tent), with a blanket or two and a liberal square of mosquito net will be advisable; but in cooler weather, a well made bed-roll is rain-proof, damp-proof, wind-proof, cold-proof—all the house you need.

For a hiking trip in the woods, one should plan each meal in advance, making them all very simple, of condensed nourishment, and carrying only such dishes as are positively necessary. There should be a change of gear for the feet, but a poncho will probably make further change unnecessary.

Real outers find the improvised hiking camp most interesting of all. But it is possible to overdo the impromptu feature of the game. When you set out for a long walk in the woods, it is always well to have along the half of a dog tent, a tin of meat or cheese, a compass, and a loaded water-proof matchbox. If you lose your sense of direction in the woods, and haven't a compass, *stop travelling!* Sit down, cool off, think it over, wait. Recall where your

camp is placed; review the land-marks on your way; reflect that water runs down hill, that moss is heaviest on the shaded side of trees, and the worst possible thing to do is to lose your head and rush around.

Perhaps the last word about wandering alone in the big woods is *not to do it*, until you have a sure and tested sense of direction, and a habit of really seeing and remembering the land-marks you pass, looking back at them as well as forward.

CANOEING

Paddling one's own canoe is an immensely popular sport, over thousands of miles on inland waterways. Here and there is a group of canoe sailing enthusiasts, with their arguments, their races, their elaborate contrivances for carrying more and more sail, preserving balance, and resisting side thrust. Folding centerboard outriggers, seats sliding far over the side, and a big sail together make a craft which only an expert can handle without coming to grief. Obviously, all canoeists should be good swimmers, whether they get their thrills by shooting rapids or by coming about in squally winds under full sail.

Beginners in paddling might be glad of a suggestion or two. Let your canoe be light, but strong. Some of us prefer spruce, and like to shape our own, thin and broad. In any case, before a long journey is done, you are sure to appreciate lightness of outfit, canoes, paddles and all.

All popular canoe models are now made of canvas covered cedar.

Two paddlers make more than twice as good headway as one. They neutralize each other's side thrust. Every moment's use of rudder or paddle to change the course is a moment of lost energy. The through traveller makes no unnecessary zigzags.

Learn to steer with your stroke. No matter on which side you are paddling, turn the inner edge of your paddle back a bit, and strike parallel to the course, as usual. The angle at which you hold your paddle as it goes through the water will determine whether you turn to right, to left or go straight ahead.

Canoeists are likely to be interested in the article on camping, in this volume.

CRICKET

Cricket, a national favorite in England, has taken little more hold in America than baseball has with the Britons. Cricket is much like the Two Old Cat of our country school days. In place of the two bases for the Old Cat game, stand two "wickets"; each wicket is a set of three posts 27 inches high, carrying a loose block of wood called a "bail". The posts must be too close together to let a ball through between them, and must be sensitive enough to make the bail fall off if a pitched ball hits the wicket.

Four feet from each wicket, toward the other wicket, is a line marking the batter's position. Two batters are up at once, one by each wicket.

The game is played by two opposing teams of eleven men each. In each inning, all the players come to bat. While one team is at bat the other is in the field. A pitcher stands beside each wicket and each pitcher throws in turn at the opposite wicket. If he can hit his mark, the bail will fall, and the batter at that wicket will be out. It was the batter's business to hit the ball before it struck the wicket.

All batted balls are fair hits, and each hit requires the two runners to exchange places. Meantime, if the batted ball is caught on the fly, or if a bail can be knocked off by a ball in the hands of a wicket keeper before the runner due at that base arrives, that runner is out. There are thus three methods of putting a batter out.

The batsman may make several runs for each hit if they have time, and since the bats have a flat surface and the game is a long one, the score often runs into hundreds.

FIELD HOCKEY

Field, 100 yd. by 50 or 60 yd.

Five yard strips along each side.

Goal Posts, 12 ft. apart at middle of each end.

Cross Bar, 7 ft. up.

Net back of goal to catch ball.

Striking Circle. Front of this circle is a 12 ft. line parallel to goal line 15 yd. forward from goal posts. Ends of this forward line are connected with goal line by arcs from goal posts as centers.

Boundary Lines are called Side Lines and Goal Lines, respectively.

One Mid Line and two Quarter Lines.

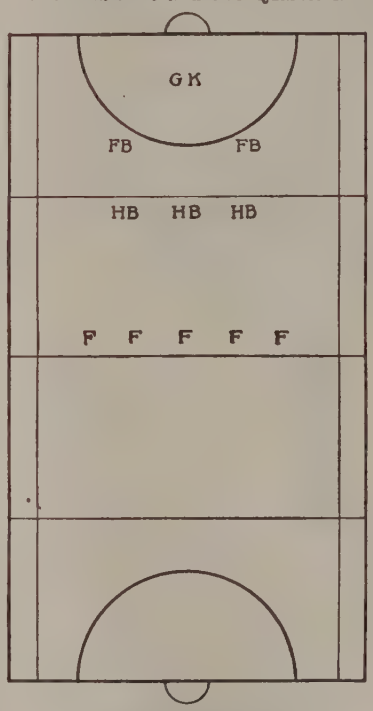


Diagram of Hockey Field.

Team, 11 men—5 forwards, 3 half backs, two full backs, 1 goal keeper, with general positions as shown in the diagram.

Object of the game, to drive a ball through the opponents' goal, by striking it with hockey sticks. All shots at goal must be made from within the striking circle.

The forwards are the chief attackers; the half backs assist the forwards; full backs break up attacks by the enemy; goal keepers block shots at goal. Every attacking man is guarded by a corresponding opponent.

Only players "on-side" may strike a ball toward the opponents' goal. A player is off-side when the ball has last been hit by a member of his own team behind him, unless at the time three or more opponents are between the player and the goal he is attacking. An off-side player becomes on-side when his team-mate who last touched the ball passes him toward the opponents' goal, or when an opponent touches the ball.

It is permitted to stop the ball by using any part of the body, but only the goal keeper may kick the ball. A ball caught in the hands must be dropped at once.

Back strokes are not permitted. A player may hook an opponents' stick to stop a blow, but may not hook an opponents' clothing or person.

The beginning of a hockey game is an operation known as the "bully". For this two opposing players stand on the center line, each with the opponents' goal at his left hand and with the ball between them. Each must strike the ground and the opponents' stick three times in succession, after which both are free to strike the ball. During this operation all players of each side must be behind the ball.

A bully on the mid-line is also used at the beginning of the second half and after each scoring of a goal. If an attacker drives the ball across the opponents' goal line outside the posts a bully must be played on the 25 yd. line nearer this goal. A foul by the defenders within the striking circle calls for a bully at the spot where the foul was committed.

When any player causes the ball to go out of bounds at the side one of his opponents must put the ball back in play by rolling it into the field in any direction other than forward. For this purpose only one man may be outside the five yard line.

It is a foul to hold, strike, push, trip or kick an opponent.

To raise the stick above the shoulders.

To strike with the back of the stick.

To strike the ball while off-side.

To cross between a player and the ball, in order to prevent his striking.

Penalty for each of these fouls, one free hit by the opponents, the defenders standing at least five yards from the man who makes the free hit.

Game, two halves of thirty-five minutes each, or shorter halves by agreement.

Score, one point for each goal.

The referee is head official, and has charge of the ball.

An umpire in each half of the field watches the conduct of players, and reports certain classes of fouls assigned to him.

FISHING

There is a good edge on the old saw
When the wind's in the west
Fish bite the best;
Wind in the south
Drives the bait in the fish's mouth;
When the wind's in the east
Fish bite the least;
When the wind's in the north
The fisherman goes not forth.

But all such maxims are only general. The writer's guiltiest memory of an overcatch goes to a day of northeast wind; and he has found many a spot where the "wise natives" could tell, if they would, when the signs were right in the lakes and streams near by. If you come across somebody who has the reputation of always catching fish, get next to him if you can. He has studied or stumbled his way to a revised version of proverbs. Perhaps he just knows where they are and what they are doing to-day.

This should make it plain that any statements about the sure way to make big-heap-catch fish will be six or eight parts bunkum in an average ten. So even this discussion is condemned to begin with. But try it.

Hard up for bait? Crickets and grasshoppers are sleepy and stiff early in a cool morning. Bass like hoppers as trout like flies.

The unexpected wakes up the big slow fellows at the bottom of the pool. Give them a swimming frog, a mouse a devil bug of some unearthly design.

Can't catch frogs. Cut a bit of fresh or salt pork rind to act like a frog when you draw it along in little jerks. Put a triple hook or two on the meat side of the rind.

Night crawlers do crawl at night, if there's dew or rain on the ground. Take a lantern, look sharply, step gently, and end with a forearm snap, a grip, and a steady pull. They are game animals. Even small trout seem to prefer one bite of crawler to three whole garden worms.

There is nothing offensive about the larva of a fly, unless you happen to think so. In a very dry time you might do worse than to hang up some defunct creature in the sun, with a pan of corn meal directly below it. Bird-catching tomcats are suggested. Plan your plans and work your works several days before you need the bait.

Flat fish in the lakes—perch, sunfish, blue-gills—always leave an inch of worm to squirm around the point of the hook. The reluctant fellows can't quite resist that. Trout? Hook the worm two or three times through, across. Trout do not nibble.

Corks and bobbers—yes, if the water is shallow or if you are out for occasional biters. At the first sign of steady motion, *strike*! That is, make a short, sharp pull on your rod to sink the barb of your hook. After that, take your time—the bigger the fish, the more the time.

But if you can keep your bait where you want it, don't use a float. Answer every touch on your hook by a little flip of your rod. In that way you can catch three fish to the one of the fellow who waits "for him to swallow it" or for the bobber to go under.

Live minnows—big ones, for big pike; two inch or three inch, for perch; middle size for bass. Tie or tack four feet of mosquito netting to two four-foot sticks. Get into the small stream below the big pool and have your partner drive them down to you. Slow troll with a long line for big fish.

Perch live near the bottom. Find the bottom with a sinker heavy enough to show by slack line the moment bottom is reached. Then lift a foot or so. Take the depth in this way whenever your boat has been moved. That is one of the advantages of having a reel on your rod.

The natural feeding grounds of fish are over or just over the edge of weed beds. But in summer mid-day they are out in the lake—not always deep in the water. Some kind of fish, blue gills for instance, keep during the middle of the day a fairly constant depth of six or fifteen feet, however deep the lake may be; but there are hours when they fairly lie on top. At such times even blue gills may be taken with the fly.

Bait casting is accomplished in three ways—hand line, long reed pole and short rod with a reel. Each is good sport and has its advantages. The bait rod and reel get the vote for all-round efficiency. Rod and reel together cost from seven to seventy dollars, as you will. Get your outfit some weeks before the season opens and practice over all distances, landing weights on a newspaper. An automatic winding reel makes back-lash infrequent, though we old-stagers hardly approve of such fool-proof devices. They are emptying the ponds. In using any artificial bait, plug, rubber, or fly, it is important to strike the instant the fly touches the bait. He will promptly discover the fraud, and rid himself of it if he can. The use of live bait for large lake fish counsels a longer wait before striking.

Make your own flies, if you want all the fun there is in it. There's nothing mysterious about it. Dissect a few store flies, beginning at the head. In this dissecting, do not cut where you can untie. You will find that most knots are only half hitches. Your dissection should show the use of a

binding thread, the reverse folding of wings, the winding of hackles, herl, silk, and tinsel. If you shoot, keep a growing collection of feathers, with plenty of oil of cedar or moth balls in the box. Stand in well with some folks who raise chickens. Keep your eye especially on all game roosters. Feathers from the necks of those birds are the most useful ones in your box. One can do very well without any other hackles, if necessary. Note that binding thread goes round the hook in a direction opposite to all other materials.

Tools and Materials for fly tying.

A small vise, from the ten cent store (lacking this, use a pair of pliers, with a string wound tightly round the handles; at a pinch, you can hold these pliers between your knees), hooks, silkworm gut or substitute, wing feathers, hackles, silk floss, silk thread, peacock herl, ostrich herl, shoemaker's wax, shellac, a mounted needle with square bent end.

Begin with the wing in reverse position; then go to the tail; fasten in each feather with a half hitch of the binding thread; carry the thread a few turns forward out of the way; wind on, and fasten in turn, the tail, body of floss or herl, ribs of tinsel or silk twist, hackles, and finally the wings, bent back to position. The fastening of the wings and a touch of shellac or a tuft of ostrich herl make the head.

Dry fly fishing is the top notch of play in this line. Make them small. Balance your wings. Use dry fly oil. (All your flies would be the better for it.) Use a fine or a finely tapered leader.

Fly casting is not mysterious, not excessively difficult, and not very expensive, if you do most of the work on your outfit. Much of the cost of a good fly rod is in the winding. You can do that yourself, if you will study out the trick of burying both ends of your thread.

The back cast is the key to good fly casting. In general, keep it high and put a curve at the far, back end, rather than a whip-cracking snap. Make your wrist do the work. The job is daintier and easier so. Lift the tip a bit just before the flies are to light on the water. That makes them come down more gently. Side casts are useful acquisitions, later on. Be sure to varnish all used bamboo rods every fall. That holds the winding and keeps out water. Save the surface and you save the fish that gets away when your rod is soft. Use highest grade elastic rod varnish; not shellac.

Test every line before you leave home, especially the first ten feet of it. Don't go out with a line that breaks under eight or ten pounds. Dry your lines every day—storage of wet lines rots them.

Keep the law. That is only fair to the other fellow, and in the end, it is best for you.

FOOTBALL

To an outsider, football seems at first an unintelligible series of fallings-down and gettings-up again. But it is really a highly technical game, full of opportunities for both physical and mental prowess, and governed by very exacting rules.

Football is played on a field 160 ft. by 360 ft. A midline divides the field across, and on each side are ten cross lines, five yards apart. Counting from the center, the tenth cross line at each end of the field is a goal line. The area enclosed by the side lines and the goal lines is the field of play. The spaces back of the goal lines, measuring 30 ft. by 160 ft., are the end zones. At the middle of each goal line stand two goal posts 18 ft. 6 in. apart, with a cross bar ten feet above the ground.

Two teams of eleven men each play the game. The general object of each team is to advance the ball toward and across the opponents' goal line. This advance is made by throwing the ball, carrying it, or kicking it, subject to rules. The team not in possession of the ball attempts to block the advance, either by checking the progress of the player who carries the ball or by getting possession of the ball itself.

A football game is divided into two halves, and each half into two quarters. The quarters are commonly of fifteen minutes each. A fifteen minute intermission separates the halves; a one minute intermission occurs between the first and second quarters, and between the third and fourth.

At the beginning of the game the opposing captains toss up for choice of goal or kickoff. If the winner of the toss chooses goal, the other side must kick off. At the beginning of the third quarter, the team which lost the initial toss-up has its choice of goal or kickoff. For the second

and fourth quarters, the team exchange goals.

The team which has possession of the ball makes the attack, or offensive. For this attack the opening play of the first and third quarters is a kickoff. At kickoff, the ball is sent into the opponents' territory by a place kick from the holders' 40 yd. line—the line ten yards from the middle of the field on the attackers' side. Of course if the opponents secure possession of the ball after a kick they become the attacking party. At kickoff, the team possessing the ball may not advance beyond the cross-line on which the ball lies, nor may the opponents come within ten yards of that line, until the kick is made.

There are four general methods of putting the ball in play: punt, drop-kick, place-kick, and scrimmage. As just explained, a place-kick is used to open each half game. After a free catch, any one of the four methods may be used.

Until 1922, a touch-down was always followed by a place-kick for a try-at-goal. In that year, the place-kick after touch-down was abolished in American Intercollegiate foot ball. Instead of place-kick after touch-down, the ball is now brought out 5 yards for one play of any practical sort from scrimmage line.

Definitions and Chief Rules of Play.—A *down* occurs when the referee blows his whistle or declares the ball dead. When a player carrying the ball is so held that he cannot advance the ball is "down" and either the player or the referee may call it so. If the man carrying the ball is so held by an opponent that any part of his body other than his hands or feet touches the ground while he is so held, the ball is down. Other chief instances of downs or dead balls are: after a touch-down, touch-back, safety, or goal has been made; in general when the ball goes out of bounds at the side; after an incompleted forward pass; while the penalty for a foul is being enforced; after a air catch.

If a team having continuous possession of the ball fails to make ten yards' advance during four consecutive downs, the ball goes to the opponents on the fifth down.

No play may be made while the ball is dead, except as provided by rules for reopening play in the case.

To make a *drop-kick*, a player lets the ball fall from his hands and kicks it just as it rebounds from the earth.

When a player has an opportunity to catch a ball which is in the air from an opponent's kick, he may signal for a *fair catch*, by throwing up an arm; in which case he must not be interfered with in his attempt at a catch. If he succeeds in catching the ball and takes no more than two steps after catching it his team is entitled to put the ball back into play by any one of four methods already mentioned—scrimmage, drop kick, punt or place kick.

Forward Pass. Once during each scrimmage, from a point at least five yards back of the scrimmage line, the ball may be thrown forward any distance toward the opponents' goal. Suppose Team A makes the pass. Any member of team B may attempt to catch the ball, and if he succeeds, may advance with it or call it down, in his possession. If team A makes the pass only the end men of the scrimmage line or players at least one yard back of the line in team A may attempt to catch the ball before it is touched by an opponent. After a member of team B has touched the ball any player of either side may seek to gain possession of it. If a ball passed forward be not caught, but strikes the ground, either before or after being touched by a player of either side, the pass is incomplete. An incomplete forward pass counts as a down, at the spot of the preceding down.

Foul. Any violation of rules. See *penalties.*

Free Kick. A punt, drop kick, or place kick following a fair catch. During this play the side in possession of the ball must not advance beyond the line of the fair catch, and the opponents must not come within ten yards of that line until the ball has been kicked or has touched the ground for a kick.

Goal from Field. A goal kicked from the field during the regular progress of play. Ball must go over the cross-bar, or over one of the goal posts. Score, 3 points.

Hurdling with the ball is not permitted. A player carrying the ball may not hurdle

in the scrimmage line by jumping over a player within five yards of the point from which the ball was snapped back. A man carrying the ball in the open more than five yards from the point of beginning the play may not attempt to jump over a player who is still on his feet. Stepping over a prostrate player is not hurdling. In the open, a player on his knee may be hurdled without penalty.

Kickoff. The play by which first and third halves are opened. A place kick from the forty yard line of the team possessing the ball.

Offside. A player is offside when the ball has last been touched by a member of his own team behind him. No offside man may touch the ball, except to recover a muff or a fumble or to recover a forward pass under the rules. All players of team A are on side when the ball has last been touched by a member of team B.

Out of Bounds. The ball is out of bounds when either the ball or the player carrying it touches the ground on or outside the side line or side line extended. If a ball kicked by a member of team A goes out of bounds without touching a member of team B, the ball goes to team B; but if such a ball touches a member of team B before going out it belongs to the team which first secures possession of it. A ball out of bounds must be brought back into the field five or fifteen yards, for scrimmage. No player may be out of bounds when the ball is put in play except the kicker and the holder of the ball in a place kick.

Penalties, Summary of.

Loss of two yards. For taking out time more than three times during either half.

Loss of five yards. For failure of a substitute to report to referee before entering play; for illegal position or offside play; for violating neutral zone at scrimmage; for playing out of bounds; for putting ball in play illegally; for guard or center carrying ball; for feint to snap the ball; for fake attempts to draw opponents off side; for player taking more than two steps after fair catch; for delaying the game; for interfering with opponents before ball is in play; for holding by defense; for wilful collision with the full-back; for crawling after the ball is down; for flying tackle or tackle below the knees; for unfair play not specifically mentioned in the rules.

Loss of ten yards. For intentional throwing of forward pass to the ground; for running into opponents after the ball is dead.

Loss of fifteen yards. For substitute communicating with a player before the ball is put in play; for any player leaving the field during the one minute intermissions; for interfering with a signalled fair catch; for tackling a player who has made a fair catch; for unlawful assistance to a man carrying the ball, including interlocked interference; for holding by side possessing the ball; for forward pass by the team which did not put the ball in play; for roughing a man who has kicked the ball; for hurdling; for piling up after the referee declares the ball dead; for any unnecessary roughness or unsportsmanlike action; for coaching from the side lines; for illegal presence on the field of play.

Loss of twenty-five yards. For being unready to play at the beginning of the second half.

Loss of half the distance to the goal. For a player illegally returning to the game; for striking, kneeing or kicking an opponent; for a foul by the defense within one yard of its goal line.

Loss of a down. For incomplete forward pass; for more than one forward pass in a scrimmage; for two players of the passing side touching a forward pass; for forward pass going out of bounds on the fly; for ball snapped out of bounds by team A and recovered by team A.

Loss of ball to opponents. For the five cases last mentioned, if on fourth down; for an offside player touching the ball; for a kicker recovering the ball before it has been touched by a man entitled to get it; for kicking or kicking at a loose ball.

Suspension from game. For illegal return to the game; for illegal equipment.

Disqualification. For striking, kneeing, kicking; for roughing the kicker; for any flagrantly unsportsmanlike conduct.

Forfeiture of the game. For refusal to allow the game to proceed, or refusal to play within two minutes, when ordered by the referee.

Definitions continued: *Place kick.* A ball kicked while it is resting on the ground, either free, as at kickoff, or supported by an assisting player.

Punt. A kick in which the ball is struck as it drops from the player's hands, and before it touches the ground.

Safety. A safety is made when the ball is declared down, behind or on the goal

line, in the hands of a player defending his own goal, provided that the impetus which sent the ball over the goal line was given by a member of the defending team. Certain other technical cases of fouls, incomplete passes, or kicks across the side lines also constitute safeties. A safety made by a player of team A counts 2 points for team B.

Scrimmage. The action of putting the ball in play between closely opposing lines of players. At least seven men of each team must be in position on the scrimmage when the ball is put in play. There are really two scrimmage lines, separated by the length of the ball as it lies lengthwise of the field. To be in position on the scrimmage line a player must have two hands or two feet, or one hand and the opposite foot, within twelve inches of his team's line.

The seven men in the line up for scrimmage are, each way from the middle, center, right and left guards, right and left tackles, right and left ends. Back of the line, one yard or more, are the quarterback, the right and left half-backs, and the full-back. The ball is put in play by being snapped back on signal from center to quarterback.

Touch-back. Resembles safety. Occurs, for example, when team A has sent the ball over B's goal line, but a member of B touches it down behind the line. After a touch-back or a safety, the defenders who made the touch-back or the safety put the ball in play on their own 20 yard line.

Touch Down. Made when a ball lawfully held by a member of either team is declared "down," *on, over* or *behind* the opponents' goal line.

BOY SCOUTS

Things Scouts Must Know.—(From the Official Handbook, by Permission of Boy Scouts of America, New York City.)—To be a good scout one should know something about the woods and the animals that inhabit them and how to care for one's self when camping.

The habits of animals can be studied by stalking them and watching them in their native haunts.

BOY SCOUTS

The Scout should never kill an animal or other living creature needlessly. There is more sport in stalking animals to photograph them and in coming to know their habits than in hunting to kill.

Woodcraft is one of the activities of the Boy Scouts of America and means becoming acquainted with things that are out of doors. It includes the tracking of animals by the marks left by their hoofs, and by stealing out upon these animals, not to do them harm, but for the sake of studying their habits and getting acquainted with them.

It also means to be able to distinguish the different birds—to know a song sparrow from an ordinary sparrow; to know a thrush from a lark; and to be able to distinguish the birds by their plumage and by their song. It means to understand the reptile and snake life, which sometimes is abundant in our forests, and to actually know that there are only three kinds of snakes that are dangerous—the rattlesnake, the moccasin, and the copperhead. All the other kinds are harmless, and part of woodcraft is to know the habits of these reptiles and to look upon them as friends.

It also means to know the fishes, to tell pools where the muscalonge can be caught, know the ripples where the trout sport, know where the pickerel and the perch have their haunts, and not only to enjoy the sport of pursuing them, but the delight

of eating them baked or cooked in the woodman's style.

It means to be able to know the trees, and to be able to tell by the foliage and bark the difference between the oak and the maple, and the birch and the chestnut, as well as the other trees which grow so abundantly in our woods. It means to be in close touch with nature. To understand plant life in the different ferns and grasses; to know which flowers bloom in the spring, which in the summer and which the fall—in short, to get so intimately in touch with nature as to know her at her best and to love her in many moods—to truly enjoy this great world which God has made.

It means to know the secrets of the streams and the trails in the forest. To know the stars by name and to be able to find one's way by them. It means to understand and appreciate the whispers of the sea as well as the hoarse dash of the ocean waves against the rocky coast. It means to appreciate the song of the surf as it dashes over the pebbles; and, in fact, to live and understand the great outdoor life which is all about us.

Camp life means to live under canvas, away from the piles of brick and stone that we generally call our cities. It means to be in the open air, to breathe pure oxygen, to sleep upon "a bed of boughs beside the trail", to hear the whisper of the trees from amidst the fragrance of the "couch of boughs", to look at the campfire and the stars when the sun has set, to ply the oar or wield the paddle in the moonlight; to dive in the cool waters of the lake or river at the dawn; to eat the plain substantial food of the forests and the wilds, with the delicacy of the fish and

BOY SCOUTS CARRYING THE INJURED

fruit which they afford; and to come heart to heart with nature in constant communion with the woods, the mountains, and the streams—all of this is camping, and all of this is good.

But the camp affords a better opportunity than this. It offers the finest method for a boy's education. Between the ages of twelve and eighteen years the interests of a boy are general, and reach all the way from the catching of minnows and tadpoles to finding God in the stars. Each day brings him new discoveries, and each night sends him back to his camp bed, to sleep among the branches of the balsam or fir, with an unspeakable joy tugging at his heart. A summer spent

BOY SCOUTS FOLLOWING A TRAIL, WOODSMAN FASHION

like this puts red blood in the boy's veins, a glow of health to his cheek, the hardness of steel to his muscles and sinews, and fits him for the struggle of the school or the shop that is going to test his endurance during the long winter months.

The life of camp is profitable because of its varied activities. A boy learns to build his own bed out of fallen timber, to make his own mattress out of fir branches or by weaving it out of grass; to cook his own meals; to make his own fishing equipment; to catch his own fish; to build his

own fire; to keep his camp clean, and in short, to rely upon himself and to take care of himself.

He learns self-resourcefulness in this outdoor life faster than he would anywhere else; and somehow or other, every lake, and tree, and star, and pool of water come to be his personal friends, so that no matter where he is, he is never alone; and whether in solitude or with companions, he is cheerful and sunny, and always ready to help others.

BOY SCOUTS

Some boys cannot go to a camp for a summer, while others cannot even go to camp for one week or two weeks, but there isn't a boy, no matter in what city he lives or how big it may be, who cannot go out into God's out of doors for a week-end hiking party or camp.

The Boy Scouts of America also teach the Boy Scouts to make themselves valuable to the community by saving life. Accidents occur every day. Some one falls and breaks a bone. Or there is an accident by rail or by water. Never a day passes in the history of the world but many are seriously injured by some unsuspected and unforseen happening, and it is the part of the Boy Scout to live up to his motto, which is "BE PREPARED," so as to be able to relieve the unfortunate one who is hurt or wounded in any of these happenings.

For this reason the Boy Scout needs to know what we call "First Aid to the Injured." For this purpose he has to know something about the structure of the human body. He has to know the main bones, the joints, the muscles. He has to know how the blood circulates and whether the veins or the arteries carry the blood to or from the heart. He has to know about the method of breathing, and also the method for digesting food. He has to know something about the nervous system, and the five senses of touch, sight, smell, taste and hearing. He also has to know something about the skin.

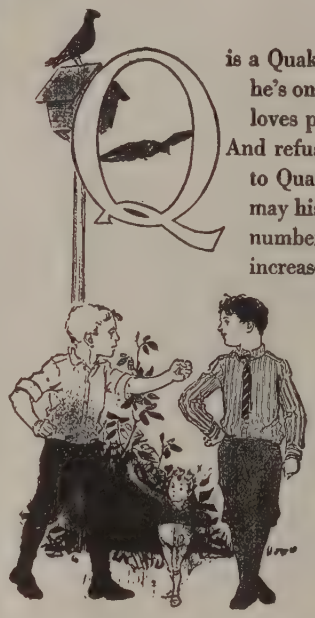
Knowing the construction of the body, he should know how to bandage a broken limb. He should know how to use a tourniquet for the stopping of the flow of blood. He ought to know what to do in case some one faints. He ought to know what a compress is, and how stimulants are used.

There are various kinds of accidents of which a Boy Scout ought to have sufficient knowledge to handle rightly. There are those injuries in which the skin is not pierced or broken, such as bruises, strains, sprains, discolations and fractures. There are those injuries in which the skin is pierced or broken, such as wounds and hemorrhage, nose-bleed, abdominal wounds, wounds in which foreign bodies remain.

There are injuries from local effects of heat and cold and electricity, such as burns and scalds and frost-bite. Then there are injuries which produce unconsciousness, such as shock, fainting, injury to the brain, sun-stroke, heat-stroke, freezing, suffocation, besides the accident of poisoning by drugs or in some other manner.

Then there are injuries which result from indoor and outdoor sport, as in the gymnasium, in the baseball or football game, in Fourth of July celebrations, in boating, skating, swimming, shooting and fishing, automobiling, and in camping and outings.

Not only this, but there are hundreds of cases of drowning every year, and the Boy Scout ought to know how to rescue those who are in peril of their lives by water, how to produce artificial respiration and how to act in every case of accident and emergency. To know what to do, and to be prepared to do it, is one of the privileges and duties and the glories of every Boy Scout.



The great aim of the Boy Scout of America is to make every Boy Scout a better citizen. It aims to touch him physically—in the campcraft and woodcraft of the outdoor life in order that he may have strength in after days to give the best he has to the city and community in which he lives, as well as to the nation of which he is a part. It seeks to develop him by observation, and the knowing of things far and near, so that later on, when he enters business life, he may be alert and keen, and so be able to add to the wealth of the nation. It teaches him chivalry, and unselfishness, duty, charity, thrift and loyalty; so that no matter what should happen in the business, or social, or national life, he may always be a true gentleman, seeking to give sympathy, help, encouragement and good cheer to those about him. It teaches him life saving in order that he may be able in dire accidents and peril by land and sea to know just what to do to relieve others of suffering. It teaches him endurance, in order that he may guard his health by being temperate, eating pure food, keeping himself clean; so that being possessed of good health, he may always be ready to serve his country in the hour of her need. It teaches him patriotism by telling him about the country he lives in, her history, her army and navy, in order that he may become a good citizen and do those things which every citizen ought to do to make the community and land that he lives in the best community and land in the world.

Good citizenship means to the Boy Scout not merely the doing of things which he ought to do when he becomes a man, such as voting, obeying the law and paying his taxes, but the looking for opportunities to do good turns by safeguarding the interests of the community and by giving himself in unselfish service to the town or city, and even the nation, of which he is a part. It means that he will seek public office when the public office needs him. It means that he will stand for the equal opportunity and justice which the Declaration of Independence and the Constitution guarantees. It means that in every duty of life he may be on the right side and loyal to the best interests of the state and nation. By the "good turn" that he does daily as a Boy Scout, he is training himself for the unselfish service that our cities and land need so much.

The foregoing statement from the Scout Manual deals with the general purposes of the Boy Scout organization, and is sufficient to deserve attention and respect. One of the best features of scout work is its appeal to a wide range of healthy interests at a time when the boy doesn't yet know what he will do for a life work. He gets an insight into the quality of many different occupations and industries, while he is still pliant enough to be interested in many things, and he goes far enough in a number of the lines he takes up to learn whether these may furnish the chief aim for his future. But whether scout work helps him find his own life niche or not. it makes him at home, interested, and useful in a world of real things and real folks.

After a boy has passed through the three stages or preliminary degrees, and has become a first class Scout, he may begin to qualify for merit badges in special fields. No merit badge is given except after a real

BOY SCOUTS

test, given by somebody who knows well the field in question. The list of subjects is long and interesting:

Agriculture	Bird Study
Angling	Blacksmithing
Architecture	Bugling
Art	Business
Astronomy	Camping
Athletics	Carpentry
Automobiling	Chemistry
Aviation	Civics
Bee Keeping	Conservation

Cooking	Music
Craftsmanship	Painting
Cycling	Pathfinding
Dairying	Personal Health
Electricity	Photography
Firemanship	Physical Development
First Aid	Pioneering
First Aid to Animals	Plumbing
Forestry	Poultry Keeping
Gardening	Printing
Handicraft	Public Health
Horsemanship	Scholarship
Interpreting	Sculpture
Leather Working	Seamanship
Life Saving	Signalling
Machinery	Stalking
Marksmanship	Surveying
Masonry	Swimming
Mining	Taxidermy

A general statement of what is to be mastered for a merit badge in each of these subjects is found in the handbook.

Beyond these badges of honor in special subjects are a few important special honors:

The Life Scout badge is given to all first class Scouts who qualify for merit badges in first aid, physical development, personal health, public health, and life saving or pioneering.

The Star Scout badge is awarded to a first class Scout who has qualified for ten merit badges—the five of the Life Scout and five others.

The Eagle Scout badge goes to a first class Scout who holds twenty-one merit badges, including first aid, physical development, life saving, personal health public health, cooking, camping, bird study, pathfinding, pioneering, athletics, and any ten others.

National headquarters for both Boy and Girl Scouts are maintained in New York City.

GIRL SCOUTS.

The Girl Scouts of America use the same motto as the Boy Scouts: "Be prepared;" and the same slogan: "Do a good turn daily."

CAMPFIRE GIRLS

Much of the training of Girl Scouts is identical with that of the boys, the chief difference being in the substitution of careful work in domestic training for the general trade and handicraft work of the boys, Before a girl can be a first class Scout, she must prove her familiarity with various out-of-door activities: signalling, tracking, stalking, and nature study in general; she must have skill in every branch of housekeeping, in first aid, in nursing; she must show a patriotic acquaintance with American institutions.

First class Girl Scouts may try for merit badges through a long list of admirably chosen activities. In this list, the numbers starred are reserved for the older girls:

Artist	Health Winner
Athlete*	Home Maker
Bee Keeper	Home Nurse
Bird Hunter	Horse Woman
Bugler	Hostess
Business Woman*	Interpreter
Canner	Journalist*
Child Nurse	Laundress
Citizen*	Milliner
Cook	Motorist*
Craftsman	Musician
Cyclist	Needlewoman
Dairy Maid	Pathfinder
Dancer	Photographer
Dressmaker	Pioneer*
Brummer	Rock Tapper
Economist	Sailor*
Electrician	Scribe
Farmer	Signaller
First Aide*	Star Gazer
Flower Finder	Swimmer
Gardener	Telegrapher
Handy Woman	Zoologist
Health Guardian*	

GOLF

Golf is a very old game. Its earliest records are found in pictures of the sport as played in Holland, but its introduction to Scotland more than five hundred years ago proved so popular that golf is generally understood to be of Scotch origin. The rise of golf in America has been very rapid. 350,000 players spend a total of over $50,000,000 a year for this recreation; some 300,000 men and boys earn money as professional instructors, caddies, and keepers of grounds; the investment in golf courses and buildings is more than $100,000,000 in the United States alone.

The cost of playing varies greatly with the conditions. If one is willing to wait his turn on public courses, content himself with a half dozen clubs and half-dollar balls, he may have his golf for fifteen or twenty dollars a season, assuming no special costume for the game. The average annual cost to those who do the thing in standard fashion, club-house, caddies, and the rest, is about $120 a year. Of course when it is figured that membership in a golf course commonly implies among other things the ownership of a good motor car and the ability to feed one's friends, when golf is thought of as a social function,—it becomes anything but a poor man's game. This is unfortunate, but there seems no help for it, except in the continued extension of public courses supported by tax, or by the gifts of those whose public service takes that turn.

Most people who make a beginning at golf become enthusiasts, whether they master the game or not. There are a good many reasons for this. Always there is a long walk in the open, in attractive country, on velvety turf. Always one matches his wits and skill against a combination hard to beat, so that every good stroke is a personal triumph and every bad shot is a challenge to do better next time. The conditions are so varied that two perfect shots can seldom be exactly alike. Distances vary, surfaces vary, there are traps and obstacles, slopes up, down, right, left. At one time it may be desirable to make all possible distance—a hundred-fifty, two hundred yards in the clear, with a long run of the ball after it strikes; again only a medium distance is to be covered, but the ball must perhaps rise high in the air to get over an obstacle, and stop almost without run, to avoid a trap, or stay on the green. Even these shots are not the most difficult ones, for more games are lost on the putting green than anywhere else. It is the dainty little shots of a few inches or a few feet that make the severest test of judgment and control. Here a fraction of an inch to the right or left, a shade too much or too little force, leaves the ball high and dry, with a stroke as surely lost as though a long drive had failed. To accomplish just the result desired, the right club must be chosen and the stroke must be timed and directed, the power controlled for the effects wanted.

Usually one has a live opponent and a very real contest, but it is possible to have a very good round of golf with only Colonel Bogie in sight. Colonel Bogie is that imaginary player on every course who never makes a hopelessly bad mistake; always manages to get from one hole to the next in a proper number of strokes, and leaves a record of his performance at each hole for other folks to measure themselves against.

A standard golf course consists of eighteen holes, at distances varying from a hundred yards to half a mile apart. In match play two players go over the course together, each claiming for his own score the holes which he has made in a smaller number of strokes than his opponent has used. In medal play only the total number of strokes used by each player in the entire round is counted in the final decision. A full contest of either sort plays seventy-two holes.

In championship play the winner commonly makes an average of about four and one-sixth shots for each of the seventy-two holes.

The clubs used in golf may well enough be classed in four general groups: drivers, for long shots; driving irons, for intermediate shots; putters, for sinking the ball in the cup; and clubs of special design or material, used in meeting emergencies. To the last group named belong the niblick, for example, and the lofting mashie. Since a ball may not be touched by the hands from the time it is teed for the first shot till it drops into the four-inch can, there are bound to be times when clubs useful in smooth, level going are of no service whatever in crises. If a ball has dropped into a rut or a heel-print, a niblick will get it out; if it is necessary to make a short lifting shot in order to clear an obstacle or reach a higher level a lofting mashie will turn the trick.

Probably no game has ever been invented which takes a stronger hold on its devotees than golf.

For a clear statement of rules and etiquette in golf, see Bancroft and Pulvermacher: *Handbook of Athletic Games*—Macmillan.

GYMNASIUM AND PLAYGROUND GAMES

Bar Pull.—Two players sit on the floor facing each other, legs extended, soles of feet touching and hands grasping a wand held cross-wise between them. On signal, each attempts to pull the other to his feet.

Bombardment.—A line is drawn across the middle of the field and two teams line up on opposite sides, a dozen feet or more from

the line. Each party has several basket balls or medicine balls for ammunition, and each player has an Indian club standing beside him, which it is his business to guard. If a pin is knocked down either by an opponent or by the guard it counts for the opposition and must be set up before the guard can make another shot.

Bowling.—A bowling alley must be 60 ft. long from foul line to head pin; the rolling surface must be 41 to 42 inches wide—smooth, and perfectly level. Balls may not weigh more than 16½ pounds nor be more than 27 inches in circumference, though any smaller size may be used. The ten "pins" are each 15 inches high, turned from hard maple, with carefully standardized dimensions. Back of the foul line, which a bowler may not cross, is a run-way at least 15 feet long. At the far end of the alley is the pit, for receiving balls and pins. Three inches from the pit a row of four circles mark the base of the pin pyramid. The next row contains three, the next two, making the total ten, with the head-pin. Pins are exactly 12 inches apart from center to center.

Any number of players may compete, each rolling one frame of two balls, in turn, until ten frames have been rolled. If the first ball rolled by any player knocks down all the pins, a "strike" is recorded, by marking an X in the upper right hand corner of the player's score for that frame. The final score for a frame in which a strike occurs cannot be recorded until two more balls have been rolled by this player, for the score in such a case consists of the sum of all pins knocked down in three shots by him. If all three shots should be strikes, the score for the first frame would be 30, and a game entirely made up of strikes would bring a score of 300. If all the pins are knocked down in two shots, a "spare" is noted by making a diagonal line in the upper right hand corner of the frame. The point score for that frame will count ten pins from these two shots, and whatever pins may fall from the first shot in the next frame. If this third shot is a strike, the score will be 20 for the frame in which the spare was made.

Bull in the Pen.—Players join hands in a ring, facing in. One of the number is chosen "bull," and attempts to break out by charging through between two players. If he succeeds, he may take the place of either of the two who let him through, and the player so displaced becomes "bull."

Captain Ball.—Eight small circles three feet across, two large circles five feet across, placed as in the diagram. Captains stand in the large circles, supported by team-

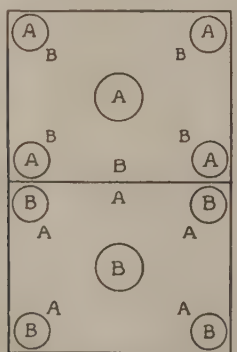


Diagram of Captain Ball Floor.

mates in small circles. Guards may not step across any circle line and men in circles must not step out. Ten men in each team are placed, as shown by letters A and B. Balls which come into the captain's hands count a point for his team, but only his circle men may throw to him. The business of the guards is to block opponents' throws and secure possession of the ball for their own circle man and captain. The game starts like basketball, with a jump between the captains' guards at center.

Cat and Mouse.—Circle of players facing in, hands joined. A player chosen to be "cat" attempts to catch a player mouse, beginning with the mouse inside the circle, the cat outside. The players in the circle let the mouse through by raising their arms, but lock the cat. Two slow cats and one quick mouse make a good variation.

Chicken Fight.—Two players stand in an eight foot circle, each on one foot, with arms folded, or with one arm folded and the other clasping the unused foot. The players hop about the circle and try to bump each other into losing the fight. If either touches his second foot to the ground, or steps across the circle, or falls, or unfolds his arms, he is defeated.

Circle Ball.—A circle of players several feet apart, with one player inside the ring. Players in the circle throw to each other a medicine ball or basketball, and the player within tries to intercept it. If a catcher drops the ball he is "it," and if the player in the center blocks the ball or catches it, the thrower becomes "it."

Crowd Ball.—A large ball 20 inches in diameter is tossed up between two lines of players near the center of the field, whereupon each party attempts to rush the ball down field to the opponents' goal line. Batting and throwing the ball are permitted. Goals count one point.

Curtain Ball.—A curtain ten feet high is stretched across the middle of the playing space, with half the company on each side. Each party throws the ball over the curtain, and balls which touch the floor count for the throwers.

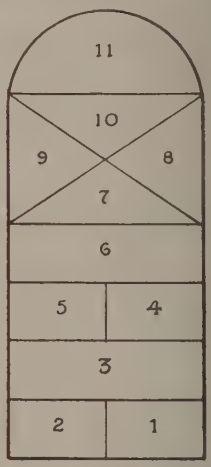
Dodge Ball.—Half the players stand in a large circle, the other half inside the circle. Those in the circle try to hit players inside the circle with a basketball. Players so hit drop out. When the last one is hit the sides exchange places.

Duck on the Rock.—A straight line is drawn on the ground, about twenty-five feet from a substantial rock. The player who is "it" stands near this rock, guarding his "duck," which sits on the rock. Other players begin the game by throwing their rocks, one by one, at the duck. If the duck is knocked off the rock players who have thrown may recover their missiles and go safely back to the throwing line, so long as the duck is off. The tender hurries to put his duck back on the rock, for while the duck is on, the guard may tag anybody who so much as touches a missile in the attempt to recover it, and a person so caught becomes "it," placing his own missile as duck.

Fox and Geese. Fox Trail.—Played on the spokes and rim of a large wheel tramped in the snow. The fox or the hunter—his name depends on the title of the game—stands near the hub of the wheel and attempts to catch any players who try to cross from side to side. Neither fox nor geese may leave the beaten paths. Geese are safe in the "dens," where spokes meet the rims of the wheel. The game is livelier when two circles are drawn, with dens on the outer rim and runways along the spokes and the inner rim. Any player caught becomes "it."

Hand Wrestling.—Two standing players face each other and grasp right hands. Using this contact only, each player tries to make the other move one foot.

Hop Scotch.—Hop Scotch is played in several forms, all alike in that an object is thrown into and brought back from successive areas in a diagram. The best place for the game is on bare ground or on good-sized squares of cement.



This is one of the oldest diagrams. 1, 2, 4, 5 are "bed-rooms"; 3, 6 are "pick-ups"; 7, 8, 9, 10 are "pie"; 11 is the "moon."

A player standing on the base-line tosses the hop Scotch block into number 1, lifts one foot, hops in, works the block around until he can kick it out at the base line, and hops out after it. Then he does the second bedroom in the same way, but must hop through number 1 on the way in and out. Numbers 3, 6, the pick-ups, are like 1 and 2 except that the block is picked up and carried in the hand as the player hops back through the preceding spaces. 4, 5 are like 1, 2, and so are the pies, 7, 8, 9, 10. The moon is the high climax in this game. The block is thrown in as before, worked toward the curved end of the moon and kicked out backward. Then the player hops out after it, picks it up, places it under his knee, and holds it in the angle of the raised leg while he hops back through all the spaces in reverse order. The player who first achieves all this wins. An error of any sort ends the player's turn, and he must begin at his next turn in the square for which he last threw the block.

A player must hop through each square in 1, 2, 3 order to the one where he is due, and must come back in reverse order. He must not step on a line. The block must not stop on a line nor be dropped except into the square where due. There must be no handling of the block in coming back from the moon.

Human Target.—One player is chosen for target. All others, moving about and

passing the ball, attempt to hit the target. Throwers cannot run with the ball in their possession. When the player is hit, a new target is chosen.

Indian Club Race.—Forty or fifty feet from the starting line is a second line, along which are standing four Indian clubs for each contestant. The runner who brings one at a time and sets up all his clubs wins the race. The clubs may be arranged in various ways or the race may be a relay.

Indian Wrestle.—Two players lie on the mat with feet in opposite directions, the right arms locked together. On count "one" they raise the right legs and touch toes. Same for count "two." On count "three" they raise and lock legs at knees and in that position attempt to roll each other over backward. Vary with *left* arms and legs.

"I Spy."—Any number of players from 3 to 30. The player who is "it" stands at goal blindfolded, counting 100 while all other players hide. At the last count he calls out "one hundred!" or some other warning and starts out to find the hidden players. A familiar warning call is:

"One, two, three! Look out for me!
For I am coming, and I can see!"

As soon as a player knows he has been seen he should race to the goal, for the first to count three there wins. If the spy comes first, he says "One, two, three for (e. g.) Billy Jones," and Billy, as first man caught, must stand for next game. Any players who reach the goal and count three there before the spy can do so for them are free. Their formula is "One, two, three for me!"

Keep the Ball.—Three or more players. If more than three, divide them into teams. Each team attempts to pass the ball by throwing to a teammate, while the other side attempts to block passes and capture the ball. A game may be won by counting passes to any agreed number.

Kicking Baseball.—Home plate four feet wide, two feet deep. The batsman stands on the home plate and kicks at a pitched basketball. Strikes are called for pitched balls which pass over the plate below the knee, for attempts to kick, and for the first two fouls. Bases are thirty or forty feet apart. Players are put out as in baseball, and also by the catching of the third strike on first bound or by being hit by a ball while running bases.

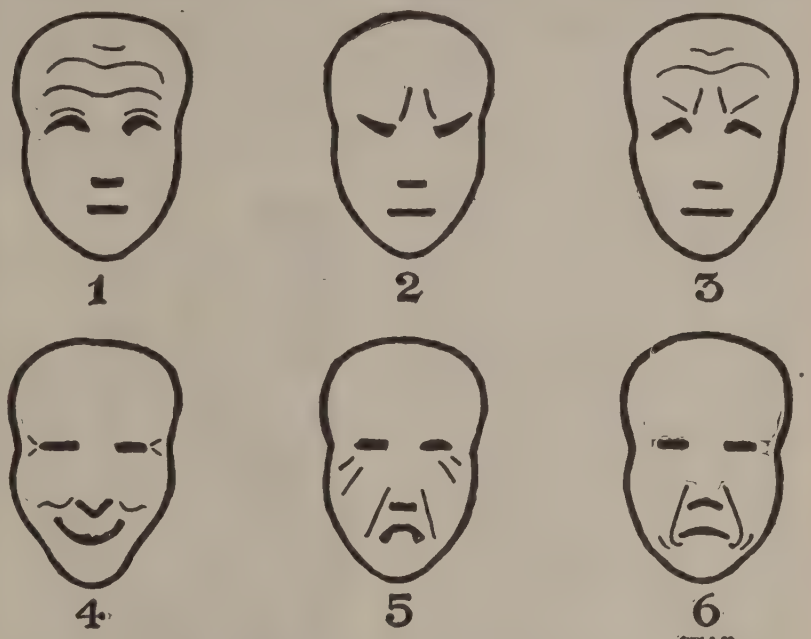
Line Football.—Opposing teams line up behind goal lines at ends of gymnasium or playground. A basketball lies in the center. At signal, the right end man of each line runs for the ball, attempting to kick a goal. Kickers must not use the hands, but guards may bat or kick the ball, provided they have only one foot across the line. Kickers take their places at the left end of the line. Goals count one point.

Old Sow.—If there are five players, four shallow holes are dug at the four corners of a square about fifteen feet on a side, and a similar hole is dug in the middle. Each player has a hockey stick or other crooked club, with which he strikes the block. The player who is "it" tries to bring the block into the center hole, and the others try to prevent by batting it away. A hole may be stolen whenever a player is not holding it with his stick, and the player who is "it" may capture a hole by putting his stick in it while the owner's stick is out, in which case the dispossessed must either find another hole or become "it". If the middle man succeeds in dropping the block into the center hole he may choose his successor.

One Hole Cat, One Old Cat, One 'Ol Cat.—Three or four players, who rotate through positions of fielder, pitcher, catcher, batter. One base is so located that the batter can run to it and back after a good hit. The batter continues to bat until he is put out. Then the catcher takes his place, everybody moves up one notch, and the ousted batter begins again as pitcher or fielder.

unhindered to continue the game. The game ends either by the exhaustion of the enemy's forces or by a count of heads when time is up.

Pull-Away.—Two parallel lines at any convenient distance apart. The player who is "it" attempts to tag on the back the players who run across from side to side. If they do not cross, he warns—"Pom-pom—pull-away! Come away or I'll fetch you away!" Whereupon he counts ten, and on the tenth stroke, all must run across, on penalty of being tagged where they stand. Players caught join in catching others, until none



MUSCLES MAKING REVELATIONS

1, astonishment; 2, reflection; 3, pain; 4, laughter; 5, weeping; 6, contempt. — After Schmidt

Plug Ball.—Two lines about 20 feet apart, with same number of players, preferably a big group behind each line. Basketballs and medicine balls are thrown back and forth. A ball touching the floor before it reaches the team line counts against the thrower; balls touching the floor behind the line count against the receivers. A referee keeps score for each goal line. There should be one ball for six or eight players.

Prisoner's Base.—A very old game. Two parallel base lines are drawn 50 or 60 feet apart, with a 3 foot circle—the prison—just behind the middle of each line. The object of each party is to take and keep prisoners from the enemy and to set free its own members who have been captured. A player who left his home base after an opponent set out may capture that opponent and take him to prison in the 3 foot circle, provided that a still later opponent does not appear and take captive the captor. Any player who returns to home base may immediately set out as the all-conquering hero, until a still fresher arrival send him scurrying back for a new right of way. If a player successfully penetrates to his enemy's prison, he may release the prisoners and bring them home remain. The first one caught is "it" for next time.

Quoits.—The formal game of quoits is seldom met in this country, but "pitching horse-shoes" is common enough. Two pegs are driven down about twenty-five feet apart, inclining slightly toward each other, with three or four inches projecting above ground. Each player has three or four old horseshoes, matched in sets as nearly as may be. The players take turns in pitching, standing behind one peg and aiming at the other. Shoes which encircle the peg when the count is taken are "ringers," and count five; shoes leaning against the peg at the finish are hubbers, counting three; one count goes to each shoe which lies nearer to the peg than any shoe of an opponent.

Rope Tug of War.—A long rope is provided, on which two opposing teams pull, endeavoring to draw the marked middle of the rope beyond a certain distance marker. In the more exciting forms of this sport, a ditch or stream lies between the contending parties and the losers pay the penalty of a ducking.

Scrimmage Ball.—Two goal lines are

drawn near opposite ends of the playing space. Each team lines up behind its own goal, with the ball lying on the floor at center. One half of each team are forwards, the other half guards. The forwards and guards exchange places after each goal. On the referee's signal, the forwards rush out and try to put the ball across the opponents' goal line, by pushing or batting it with one hand. Guards defending their goal may step across the line with one foot, but not with both. Fouls are declared for rough play, for blocking or propelling the ball except with one hand, for throwing the ball, or for the propelling of the ball by a player who is down. Penalty for fouls, a try at goal from the foul line, with defenders behind their goal line, and attackers on the foul line. The ball is tossed up by one of the forwards, and batted by another forward. If the defenders block the ball, it is still in play. Goal from the field, two points; goal from foul line, one point.

Scrub.—Scrub grows out of one old cat by the addition of another base or two, a few fielders, and perhaps a waiting list of batters, everybody moving up in turn as a batter is put out.

Sparrow Fight.—Two players sit on the floor near each other, each with a wand held in the bend of the elbows and passing under the knees, the hands clasped over the shins. Each player attempts to upset the other by getting a toe under the opponent's foot, and lifting.

Swat Ball.—Two equal teams divide between them all available air-filled balls, and attempt to hit opponents with them. A player who is hit must drop out of the game. Balls may be recovered by anybody who can get them and used over and over. There are no space restrictions. The game ends by a count of teams after a given time or by the annihilation of either party.

Three Deep.—Players in a circle, two deep—that is, in pairs, one player behind another. A runner and a chaser are chosen. To avoid being caught, the runner may stop in front of any pair, making it "three deep." The outside or rear player is thus crowded off, and becomes the runner, in danger of being caught, until he saves himself. If the player who is "it" catches the runner, the runner becomes chaser, and the former chaser must save himself by stopping somewhere three deep.

Tug of War, Catch and Pull.—A line is drawn on the floor or the ground. Players divide into two teams on opposite sides of this line. The game is to pull opponents across the line, catch as catch can. Several players may grapple one man if they can manage it, but any player who wholly crosses the scratch line, becomes a member of the opponents' team and must work there.

Two Old Cat.—Four or more players. Two bases, with a batter at each, and a catcher behind the bat. Each catcher becomes a pitcher for the return throw, so that the batters strike alternately. When either makes a hit both batters must run, exchanging bases, and either or both may be put out by getting the ball to the base before the runner reaches it. When a putout occurs at either base, the catcher at that base takes the bat, and his fielder, if any, becomes catcher.

War.—The most violent of team contests. Two well-separated lines mark the two home grounds. Each player attempts by brute strength to capture and drag home enemy players.

HandBall.—Handball is a national game of Ireland, where it appears to have originated. It is played in England, under the name of "fives," with rules rather more elaborate than the Irish rules. Handball in the United States is of the simpler form.

Handball strongly resembles squash, the chief differences being that in squash the ball is struck by a racket, the court is smaller, and five playing surfaces are necessary, rather than optional.

A handball floor is 60 ft. by 24½ ft. The front wall is 35 ft. high. Other walls may slope down toward the back, which is considerably lower than the front. A line, called the ace line, is drawn on the floor parallel to the front wall and thirty feet from it. Two feet nearer the front

wall is a second line, marking the limit beyond which the server must not take more than one step in the act of serving.

The game is played by two or four persons. The object is to secure points, by causing the opponent to fail in returning a ball to the front wall. In this country 21 points make game.

The ball may be hit by either hand. The hand is best held as a shallow cup, deepest at the second joint, where the ball strikes. Gloves may be worn.

Each effort to win a point begins by a service. For this play a ball is dropped to the floor and hit as it rebounds. A ball served must go to the front wall without striking any other object, must hit the wall above the six inch base board, and in rebounding must first touch the floor beyond the ace line—though it may cleverly be made to strike side and back walls on its way to the floor. A served ball which strikes between the front wall and the ace line in its rebound from the front is a short ball. Three shorts in succession cause loss of service—the hand-in becomes hand-out. Each fair service cancels whatever shorts the server may have against him.

If a served ball strikes properly behind the ace line the receiver must return it on first bound, to the front wall above the base board. After this first service and return the players alternate in striking the ball until one fails to get it back to the front. Only the served ball must strike behind the ace line in rebounding from the front wall; all returned balls may fall on either side of the ace line. Again, it is only the served ball which must be returned on first bound; in all other cases balls coming from the front may be either volleyed before they strike the floor or may be hit on first bound.

In general, intentional interference, blocking the ball is a foul, and unintentional interference is only a hinder. Fouls are punished, but a hinder is merely followed by reservice from the same player. It is always a foul, however, to stop a ball on its way to the front wall.

It is a foul to strike a ball with both hands; to touch the ball twice in one attempt at batting.

Since only the server can score, fouls by the hand-in forfeit the ball, while fouls by the hand-out score for the server.

The officials of handball are a referee and a scorer.

Ice Hockey.—Ice Hockey resembles Field Hockey—see that title—except that a team consists of seven players instead of eleven; caroms from side banks are important; a rubber disk called puck is used instead of a ball; and the goal is smaller. The posts for ice hockey are six feet apart, and the crossbar is four feet up. The playing rules are about the same in the two games.

Indoor Baseball.—The floor space for indoor baseball should be at least 40 ft. by 50 ft. The standard size for a diamond in a gymnasium is 27 ft. square. Where more space is available, the square is often 35 ft. The front of the pitcher's box is 23 ft. from home plate—less than half the distance required for out-of-door baseball. The home plate is 12 by 12 and all others are 18 inches square.

Teams may consist of either seven or nine players.

The object of the game is to make runs—passages round the diamond, touching all four bases. Runners are liable to be put out in various ways, much as in out-door baseball.

Nine innings make a game.

The smallness of the field makes certain changes of baseball rules necessary:

The ball is larger than an out-of-door ball and much softer.

The bat is shorter and smaller around than for the regular game out-of-doors.

Pitchers may throw to the batter *only underhand.*

A batted ball is fair or foul according as it first strikes, not as it rolls or bounds after striking.

Stealing is minimized by the rule that base runners may not leave their bases while the pitcher holds the ball.

Base runners may overrun at 2d and 3d as well as at 1st, provided that they take the sack with them as they go by and bring it back.

The positions of all players but the pitcher are considerably varied, as need

arises and the captain directs. Since hits are necessarily short, several fielders are likely to be found in positions which would belong to a shortstop out-of-doors.

In other respects, indoor baseball is about like the out-of-door game.

Lacrosse.—Lacrosse, the national game of Canada, is of Indian origin. The British are mildly interested in lacrosse, the Americans hardly more than curious about it. But the game admits of wonderful skill. In general, it resembles hockey; the field is about the same size; the object of the game is to pass a ball through a goal at the end of the field; goal posts are six feet high, with a crossbar six feet from the ground; nets are commonly placed behind the goals to stop the ball. But the differences are also notable:

The boundaries of the lacrosse field are agreed upon by the captains. The striking circle of hockey is replaced by a 12 foot square, with the goal in its center. Twelve men constitute a team. The hockey stick is displaced by the crosse, a sort of shallow, racket-pouch with a handle of any convenient length, loosely strung in such a way that the ball can be retained in the pouch only by a skilful rocking of the crosse. Offside play is not recognized, and so of course not penalized. Rubber soles are permitted, but spikes are forbidden. The ball is of spongy rubber, weight 4¼ oz.

The score is one point for each goal.

The play begins with "Facing"—a manoeuver corresponding to the "Bully" of hockey and the center-jump of basketball. Two players face each other, left hands toward the goal they are to attack. On signal each draws his crosse sharply toward him and is then free to try for the ball. He may bat the ball if he chooses, or scoop it up and run with it, but the best tactics is to begin as promptly as possible a series of short quick passes toward the goal. The Canadians have developed amazing team-play, with passwork more remarkable than that of the best basketball, in view of the tools by which the passing must be done. It is possible to throw the ball 200 yards or more with the crosse, but short throws retaining control of the ball pay better in the long run.

Charging is not permitted, but a man may block the progress of a player who is advancing with the ball, by standing in his way.

When the ball goes out of bounds the two nearest players must "face," not less than four yards from the boundary line.

It is a foul to strike, push, hold or trip an opponent; to throw the crosse; to interfere with a player who has not the ball; to interfere with the goal-keeper before the ball passes into the crease; to touch the ball with the hand. (A goal-keeper may stop the ball with his hands, as in hockey. The crease is the 12 foot square surrounding the goal.)

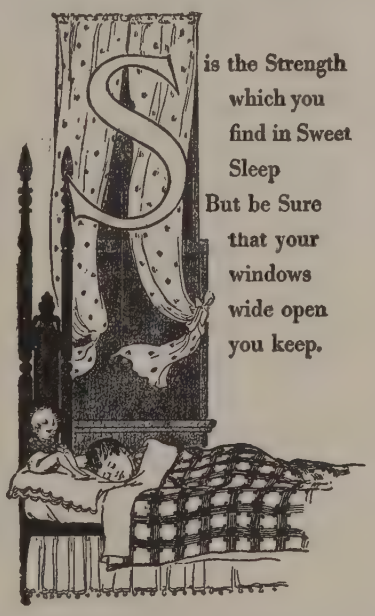
The penalty for a foul is either disqualification, or a "free position". If the latter, the referee designates a player of the side against whom the foul was committed to make such play with the ball as he may choose, no opponent being permitted within 5 yards when his play is made. A free position cannot be declared within ten yards of the goal which would be endangered by it.

PHOTOGRAPHY FOR BEGINNERS

Hand cameras cost what the buyer and the maker please, from two dollars to three hundred and fifty, beginning with the smallest "Brownie" and ending with the luxurious "Home Portrait Graflex". In all this range of styles and prices, each instrument will do good work in its own field. The more complex and perfect the camera, the greater the variety of things it can do—but every added adjustment is one more opportunity to go wrong. The beginner may take satisfaction in his high percentages on the photographic target.

Pleasure in pictures is of course always a matter of personal taste. Most people use cameras to make records—souvenirs of persons and things, so that the photographic album has come to be the modern diary.

What folks generally want in a picture is clearness of detail. They enjoy identifying John Henry and Whoppingers'



Falls—names are very important in the scheme. This big company will always be beginners in photography. They are happier so.

Now and then somebody wonders why it is that two pictures of the same object are not equally pleasing; perhaps he sets out to find what it is about a picture that makes us call it beautiful. That is another beginning. If this enquirer sticks to his problem, he may learn to make pictures which are more than mere souvenirs; his work may interest others; it will be attractive fifty years from now; names will be incidental. The picture is even more like John Henry because it suggests everybody else who thinks and acts like John Henry; Whoppingers' Falls gets to be a *mood* of things—partly human and commonplace, partly mysterious, beyond us, like sunsets and tides. Workers in this group, the pictorialists, understand that sharp detail is not often desirable. They try to make the camera see what their own eyes see—a world never twice alike, always in some mood—gay, dreamy, sombre, threatening, but always a bit baffling, even when most matter-of-fact. So it appears that our beginner has a great many things to think about.

Record Photography.—It will be necessary first to talk in plain terms about the use of box cameras, and the first stages of dark room procedure.

Time. Just as we are taught that fungi must be either mushrooms or toadstools, so we are told that pictures are either snapshots or time exposures. One of these statements is about as stupid as the other. There are several hundreds of mushroom species, most of them harmless, scores of them delicious, but only students are able to prove them so. So *all* pictures are made by time exposures. The question is: *how much* time? That requires study.

Brownie "snapshots" and Kodak "I" exposures are of about 1–25 second. With care, a camera may be held in the hand for this exposure. Longer time requires a tripod, or other firm support. These facts mark the only distinction between "Time" and "Instantaneous" speeds.

With a watch in hand one may learn to count seconds. Then by putting in a word between seconds he may count *half* seconds pretty accurately. Say 1 and 2 and 3 and 4. If you practice with an empty Brownie camera, open so that you can see the light flash, you can acquire control of one-fifth second, one-half second, and any number of seconds. One-fifth of a second is about the time that it takes to move a Brownie lever quickly up and down *once*, or to open and close a shutter set for "B" or Bulb exposure.

Why bother? Because you can make pictures from morning till night, summer or winter, indoors or out, if you will *study your instruments.*

The writer once made an excellent portrait indoors, with window lighting, at 4.30 P. M. on a rainy day in March, using a 2A Brownie. Of course the poser had to be a good one, for the time was 18 seconds. The entire range of daylight is yours, with flashlights in reserve, if you are a student of lighting.

Aperture — Every camera has some means of controlling the amount of light that goes through the lens. Evidently the larger stops, or light openings, let in more light than the small stops, and the more light the more quickly the work is done. Brownies have three stops, called F16 (the largest), F32, and F64 (the smallest).

From 9 A. M. to 3 P. M. of a bright summer's daystop 16 will make a good exposure of an average out-of-door subject in 1/25 of a second; stop 32 in 1/10 of a second; stop 64 in 1/5 of a second. The smaller the opening the greater the detail, so it might occasionally be worth while to try stop 64 at 1/5 second on average views, particularly of buildings which you want to represent exactly.

Time of exposure depends also upon the hour of day, the strength of light and the season. Winter scenes without snow, require about twice as much time as summer views. Spring, fall and snow scenes are intermediate. Exposures in mid-forenoon or mid-afternoon will need nearly twice as much light as at noon with the same stop, and pictures made near sunrise or sunset will need several times over more time than pictures at noon.

The *direction* of light also matters.

Working against the light requires about four times the exposure needed for working with the light. The reason is, of course, that in working against the light we are picturing objects in shadow.

In general, one should expose for the deepest shadows in his field of view, rather than for the brightly lighted spots. Few pictures are hopelessly over-exposed, but under-exposure is an everyday affair. To help the Brownie people and the "T B I's", we have worked out a chart of exposures, including most of the foregoing suggestions.

Indoor portraits, window lighted, with reflector and portrait attachment, stop 16, distance 3½ feet, time 2 seconds to 8 seconds according to light.

Interior views in subdued light, 9 A. M. to 3 P. M., stop 64, time 15 minutes to 45 minutes, according to walls and lighting. (Pull down shades facing camera.)

Developing and Printing.—The fun of picture making is only begun when the film has been exposed. Developing and printing are really simpler than beginners imagine, and quite inexpensive. You need:

1. A dark room, with a safe light—safe means *photographically* safe. Such a light comes through red and orange glass. For example, darken the windows, put a red bulb in your light (electric), and pin an orange cloth or paper around it. The writer has used a light like that for ten years. A candle lantern or enclosed kerosene lamp may be made safe with orange or ruby glass. Kodak safe lights cost less than a dollar complete.

2. *Developing solution.* Buy MQ tubes or Kodak developing powders. Pyro powders are excellent for films, but not for papers. The simplest way is to use MQ tubes for both films and papers. One tube of MQ to 8 oz. of water for a strong, quick working solution. It is commonly better to use one tube to 12 oz. of water. An ordinary drinking tumbler holds about 8 oz. MQ solution will keep for several days and may be used until it no longer works well. Pyro discolors rapidly and is made up fresh for each film or two.

3. *Fixing solution.* Buy acid Hypo in half pound boxes. Dissolve the half pound of Hypo and the small package of hardener (also found in each box) in 32 oz. of water—four tumblers. Acid Hypo solution keeps indefinitely and should be used until it loses its effectiveness in clearing a film. One of the indications of exhausted Hypo is its tendency to become frothy when stirred.

4. *Photographic paper.* AZO, to begin with. It is cheap, slow enough so you can control it and sufficiently varied to suit all your negatives. For pictures taken directly with the light or directly against it use extreme contrast No. 4. Good average negatives take AZO 2 or 3. If you wish to make softened prints from very contrasting negatives, use AZO 1.

5. Three trays and a printing frame.

Developing Roll Film.—If you buy a film tank, follow the directions which come with it. But in order to *see* the pictures come in your negatives use three trays,

in a darkroom with safe light—Tray 1, developer solution, one MQ tube to 12 oz. of water; Tray 2, rinsing water; Tray 3, acid Hypo. Take the film out of its wrapper and off its spool. Holding it by each end, wet it in Tray 2, water only, to avoid staining. Then draw back and forth, film side up—the film is on the inner side of the roll—through developer in Tray 1 until the highlights (that is, the dark spots of the negative) are heavy on the film side and show through pretty clearly on the back. *Rinse* by drawing similarly a few times through Tray 2. *Fix* with same motion in Tray 3 until the negative is perfectly clear, with no trace of white on the back. A roll of film should clear in four or five minutes. If it takes much longer mix fresh Hypo.

Wash for an hour in running water, or through a dozen changes of water. The film must not be washed as a *roll*, or the work will not be thorough, and the negatives will not keep well. It may be pinned out on a board which slants down from the water tap, or may be weighted at each end in the bath-tub. Washing by hand is a laborious process. It isn't a bad plan to cut up the developed film and pin or clip each section so that it hangs in a washing box under the water faucet. Guard against rolling.

Rolling.—Hang up the film to dry. If it shows a tendency to roll and twist clip a straight edge of some sort, perhaps a piece of stiff cardboard, on each end. Drying will require from one to four hours, according to conditions.

Printing.—When the films are dry, cut them into single negatives. Lay your printing frame glass side down, take out the cover, put in your first negative, picture side up. Place a sheet of AZO, emulsion down, and clamp the cover on. Expose under the lamp. You will remember that the two sensitized surfaces come together, making a print by actual contact. The dull side of the film carries the negative. Printing paper is not so easily judged. A sheet of dry photographic paper almost always shows some tendency to roll with emulsion inside. The two sides of the dry paper feel unlike to the touch. If these tests do not satisfy, nip the corner of the paper between your teeth. The emulsion, or sensitive side, will stick to your teeth. This is an unfailing test.

In printing hold your frame at a distance from the lamp equal to the diagonal of your negative. A postcard negative, for example, may be held six and one-half inches from the light. With a 60 watt Mazda lamp, ordinary negatives print on AZO, ARTURA, or PROFESSIONAL CYKO in ten to fifteen seconds. If the negative lacks contrast, it is better to underprint a bit and prolong the development. Economy suggests the use of trial strips to determine the printing time, until you become expert in judging negatives. If you find one side of the negative stronger than the other hold the printing frame obliquely under the light, to favor the unexposed area. If the dense areas, or weak spots, are local in the middle of the negative, for instance, a "dodger" may be kept in motion over the thin area, to protect it during part of the exposure time. By the use of a "dodger" and double printing clouds may be introduced from special cloud negatives into landscapes otherwise bare at the top.

Developing Prints.—Developing prints requires about the same process as develop-

BROWNIE EXPOSURES—APRIL to SEPTEMBER

SUBJECT	LIGHT	9 a. m. 3 p. m. Stop	9 a. m. 3 p. m. Time	8-9 a. m. 3-4 p. m. Stop	8-9 a. m. 3-4 p. m. Time	7-8 a. m. 4-5 p. m. Stop	7-8 a. m. 4-5 p. m. Time	6-7 a. m. 5-6 p. m. Stop	6-7 a. m. 5-6 p. m. Time
Light clouds only. Distant views; sea and sky; heavy clouds snow.	Bright	64	1/25	64	1/25	32	1/25	32	1/25

	Dull	16	½ sec.	16	4/12 sec.	16	6/16 sec.		

ing negatives. MQ solution for both, but preferably stronger for paper than for films. If the prints develop too fast you have probably over-printed. Cut your time on the next print. If the result is still unsatisfactory, try adding a few drops of Potassium Bromide solution to your developer—never more than a total of two drops saturated solution to an oz. of developer.

Rinse the print and place it in the same Hypo bath which you used for your film.

Wash thoroughly, even more thoroughly than you wash your films, for unless all the Hypo is taken out of the print it will slowly fade and discolor. Prints do not wash in contact with each other. They must either be kept moving by running water or must be individually handled through about thirteen changes of water, requiring altogether about an hour of time.

Dry prints by spreading out, picture side down, on any clean cloth surface. Cheese cloth frames make quickest driers, but it is less bother to spread the prints on bed covers wherever it becomes handiest.

Trimming.—The best way to trim your prints is to study the composition of each picture before you press the camera button. The next best thing is to make a set of printing masks, one by one as you need them, so that each print has a margin and includes only what is essential to the picture. But if a print has come through badly proportioned, with bald sky, barren foreground and unnecessary detail at the sides, *trim it* . . . savagely.

Mounting.—Photographic albums are of course neatly convenient, but if you want each picture to show on its own merits you will mount it separately. The writer prefers to use double weight photographic paper, a size or two larger than the print. Margins may then be left blank, double printed or embossed, as the worker prefers. If you decide to mount your prints, either on cards or in albums, dry mounting tissue is the most satisfactory adhesive.

Hints to pictorialists. One can find out by himself pretty nearly all he needs to know about composition if he is willing to make experimental blunders for a few years. There is a good deal of satisfaction in the feeling of progress, which is sure to come to anybody of fair taste, through the winnowing process of repeated selection. The best workers in the country hardly average more than one masterpiece to a hundred exposures. But every moment of this study pays. It opens one's eyes to both nature and art. For a time we begin to see that there are a few big ideas in all sorts of art. The long road of experiment may be shortened if one chooses to apply these few big notions to field work with the camera.

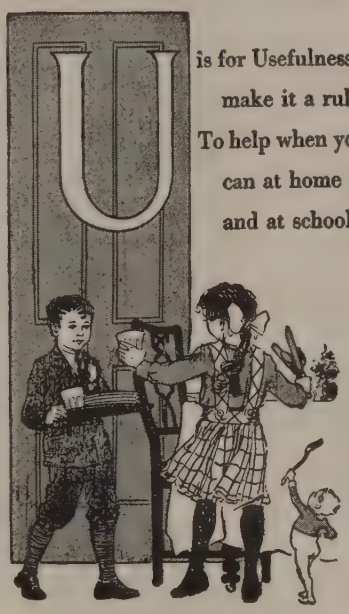
UNITY. Let the picture mean one thing, one mood, not several i. e. . . A high bare rock and a meadow-willow-brook pastoral are not likely to combine well in one negative.

SIMPLICITY. Too many things in one picture are pretty sure to kill the unity. A thousand horses may go into one real picture, if they are all in a cavalry charge. In such a complex there is real simplicity.

DOMINANT OBJECT. Great pictures are rather sure to have a focus of attention, to which the eye returns over and over, a real key to the composition. Study will prove that there are a certain few best locations for this dominant object. It will almost surely not be in the exact center, nor exactly above, below, right or left of the center. It will probably be found somewhere near the center, however, and near a diagonal line.

RESPONSE. There are a good many sorts of response in pictures. A big, dark object may be echoed by a smaller dark object. Heavy shadows are offset by high lights. A rythm of lines at pleasing intervals is a thing worth knowing about. For instance, upright trunks of trees answer each other, but perfectly even spacing of such objects is mechanical rather than pictorial, by the same token that an elm is more graceful than a maple. Horizontal lines find interesting answers in vertical ones, and so on.

BALANCE, PROPORTION, HARMONY are suggested by the foregoing. Downright symmetry of equal halves is very seldom approved, but some kind of balance is needed. This feeling for proportioned masses very often results in



perceptible thirds . . . sky ⅔, water ⅓, land ⅓, and the like. Vertical and horizontal halving is to be avoided, but diagonal halves and many other fractions than ½ are available.

GENERAL DESIGN. Geometric figures will often be found in pictures, frequently with radiation toward a common point. The large plan may suggest ovals, triangles, angles toward a vanishing point at right or left, top or bottom. Sometimes there is more than one vanishing point . . . i. e. one for the setting and another for the figures in the picture. Several geometric systems may be found harmoniously developed in one pattern, making a sort of symphony.

The student of pictorial design can hardly do better than to get a big collection of penny prints from great paintings, where he will find the clearest emphasis on each of the foregoing keys to composition.

(Composition is, of course, only the first stage of camera craft. Each of the photographic processes is worthy of similar analysis, but this article has already reached its limit. There are great numbers of photographic books and magazines for those who are interested.)

POLO

Polo is the oldest and most wide-spread member of the hockey family, for judging by the records and literary references, foot hockey has always been derived from the mounted sort. Authentic polo is more than 2,000 years old.

Polo has naturally used a great variety of rules, implements, team numbers, and styles of play. The English system of closely planned team-work and short passes down the field was defeated by an American team in 1909. British comment reported that when the Americans came across, they were inferior in both mounts and passwork, but that they bought the ponies and learned the combinations, without sacrificing individual dash and long-range marksmanship.

Polo grounds are commonly about 175 by 300 yards in size, with board margins. Two to eight players—usually four—make a team. The object of the game is to drive a wooden ball, from horseback, by strokes of a long-handled mallet, between goal-posts eight yards apart.

Ponies for this game are especially bred and trained. They must be exactly fourteen hands and two inches high, "with the strength of a hunter, the courage of a racer, and the docility of a pony". The tendency to extravagant expense in the game has to be met by rules and close supervision.

The requirements of this game are severe. There must be perfect horsemanship, good, quick, clear and cool headwork, and the ability to make controlled shots, forward or backhand, meeting a flying ball with a mallet head a few sizes bigger than the business end of a good-sized golf ball.

The conditions of this game make it less democratic than golf, but its magnificent challenge to daring and skill, and its value in training for open warfare have kept its hold on vigorous young men of means, and its place in regular armies.

Play is in periods of 7½ minutes each, the number of periods depending on the number of players. When four men play, there are eight periods, with short intermissions between.

The game begins by a throw-in. On signal, the referee throws the ball between two opposing lines of three players each, facing opposite goals, with one man on guard behind each line. Instantly after the throw-in, the dash and struggle are on. The ball may be struck only with the mallet, must not be caught or held, though it may be blocked by the players person or by his pony. Dribbling with the mallet is permitted.

If a ball goes over the side lines, it is thrown in as in the beginning, but opposite the point where it went out. If the attackers drive a ball across their opponents' end line outside the goal posts, a defender shall knock the ball into the field, from a point along the end-line at least ten feet outside the post. At the instant he strikes the ball no opponent may be within 50 feet of him. If the player delays in making his stroke the referee may put the ball in play by throwing it in.

Safety of players and ponies is furthered by certain rules. The player who last hit the ball has the right of way in following it for another shot. No opponent may block his right of way by stopping crosswise of his course between him and the ball, nor may there be any crossing of his path except at safe distances. But a man may cut into or across the right of way if

the conditions make it safe to do so. The referee is, of course, the judge of safe play.

Hooking an opponent's mallet is forbidden, except to block an actual stroke, and then there must be no reaching across the opponent's pony. Two players approaching a ball from opposite directions must have the ball between them, at each man's right hand. Charging, striking a player or a pony with the mallet are forbidden. Fouls are declared for any of these offenses, and in general for all cases of careless, reckless, dangerous riding, for roughness in personal contact with an opponent, or for cruel treatment of ponies. It is a foul for a dismounted player to strike the ball or for any assistance to be given in the progress of the game by a person who comes on the field for that purpose.

Each foul subtracts ¼ or ½ point from the score of the offending team. A goal made, directly or indirectly, by means of foul play does not count.

RIFLES

Hints for Beginners.—Clean and oil your gun every day you use it, every day in camp, and once a month on general principles. You can inspect the inside of a rifle barrel by putting a piece of paper in the breech for a reflector. Don't stop cleaning until the rags come through without any discoloring, and the barrel shines in every spot. Nitro-solvent oil is best for taking out the residue of powder. Be especially careful to clean the cartridge chamber in the barrel. That is where rifles are likely to first go wrong. The powder residue eats away the steel, the shells expand on firing and then the extractor will not work.

Be careful not to jam your sights. A slight blow may spoil your marksmanship and bring famine in camp.

If you give peep sights a three days' trial, you will probably not use other types afterward. For snap shooting get the largest aperture you can buy.

Practical rifle fire is both quick and accurate. In all contests, and in your daily practice, work against both time and the bull's eye. Invent a scoring system in which time counts perhaps two points, to three for accuracy. To gain speed, learn to shoot on the lift and on the swing from right and left. It is bad policy to try to freeze the sights in a long, hesitating refinement. Make your gun barrel draw a line which brings the tip of the front bead just below the spot you want to hit. Slow down the motion as the bead comes to place and squeeze of the trigger. Never consciously pull on a trigger with the finger. Squeeze with the whole hand as though the gun stock were a lemon.

If your shots tend to group at one side, study the situation. If you are a new man and the shots are at the right, you are probably flinching a bit, *pulling* your trigger and drawing the muzzle around with it. Try lying prone, shooting over a padded rest of some sort—a lump of sod, a folded coat, anything to support the barrel without solid reaction from below. Very slowly squeeze off the trigger.

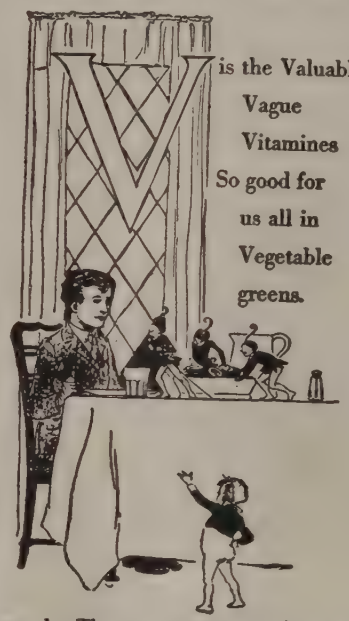
Learn to "call your shots". That is, notice exactly where the bead lies on the target when the bullet starts. That point is by no means sure to be where it was when you told yourself to let it go.

If your gun comes with a heavy trigger pull, and is not automatic, better have the trigger pull reduced to four pounds.

After several hours of careful practice on different days, if your shots continue to go wrong in consistent groups better have an expert try your sights. Sight your own rifles as soon as you know you can trust your aim and your trigger pull from the prone position. Remember that the forward sight works by contraries—if you move it to the left, you have thrown your shots to the right, and so on. The final horizontal corrections of a peep sight are made with bits of paper under one edge of the sight base.

Some sort of rivalry gives the best impulse to speed, but the higher premium must always be on accuracy. When you can score ten bulls in ten seconds, at a two inch ring fifty yards away, you are becoming a fair shot at a standing mark. Refinement of the stationary game comes with the use of smaller targets, farther away, with allowance for sunlight, windage and distance.

The use of rifles at moving targets will at once show the value of these hints on



speed. There are two general styles of shooting at running game. One may follow its movements with the gun, and so come up in a kind of pursuit, or he may anticipate the motions and have his sights lined up in waiting. Of the two, the snappy follower will get more shots, but the shrewd anticipater will often make a bigger percentage of kills for the number of shots fired. Of course, the ideal rifleman combines both systems and takes all the chances that offer.

ROWING

Rowing has been an officially recognized sport for only a little over a century. The adoption of outriggers—steel frames for placing the row-locks well out at the side of the boat—started in 1845 the rapid movement toward the long, narrow, and light racing shells of our day. The sliding seat was first used in a race in 1870.

At present, an eight oared shell is about 60 ft. long, 2 ft. wide, and weighs around 270 lbs.; and a single shell is about 26 ft. long, 11 in. wide, with a weight of 28 lbs.

To row with an oar in each hand is called sculling. Sculls are a little less than 10 ft. long. When each man pulls one oar in a team or crew, the oars are called sweeps, and are about 12 ft. 3 in. long. Races in a full rowing regatta are likely to include single and double sculls, and sweeps in pairs, fours, and eights.

A full crew of eight men is accompanied by a coxswain, who sits in the stern facing forward, steers the boat, keeps the captain posted and advises him about the pace. In spurts a racing crew is likely to finish a short race at about 41 strokes to the minute. Longer courses of three miles or more take a steady pace of about 33, and quicken at the finish to 38 or better.

The first oarsman facing the coxswain is the captain or stroke oar, who receives the advice of the coxswain and himself sets the rowing pace. Other oarsmen must of course follow his lead accurately or there can be no hope of winning. Good generalship is required in placing the men, both to balance the boat and to match men in pairs according to strength. In general, of course, the less the rudder has to be used, the more energy can go toward the goal flag.

Much depends on form. The sliding seat makes it possible to use muscles from neck to toes, but it is no easy matter to bring these into smooth agreement. Practice commonly begins with rowing machines in a gymnasium long before the spring opens. Each new man on a crew adds to the problems of training.

Certain types of stroke have proved advantageous. Best results require that the oar blades should not be deeply plunged during the stroke, but should be only well covered by water. Feathering is universal, in order to cut the resistance of the air in the backward thrust of the oar. To feather is to give such a downward flip to the wrist and forearm as to make the oar-blade skim along nearly parallel to the surface of the water in the recovery after each stroke. If the oar is spoon-shaped, it is sometimes allowed to touch the water lightly as it swings back, thus sustaining a part of the weight of the oar on the water; but more than a very little of this saves the rower at the expense of the pace.

Rowing is a favorite inter-collegiate contest wherever practicable, but is by no means limited to that range. Boat clubs practice it the world over, and annual regattas are of national and international interest.

SHOTGUNS

Shooting with the rifle at running or flying game is so difficult a sport that there is no disgrace in using a scatter gun for the purpose, and it does less harm to the landscape. The drift of practice with both rifles and shotguns has been toward smaller and smaller bore. In 1875, a ten gauge shotgun was the ordinary thing; in 1900, twelves were in order; now the sportsmanlike bird hunter uses sixteens and twenties. He has all the advantage of the argument. Whether the gun shall be a repeater or double-barreled, is entirely a matter of taste. There is a good deal of force in the notion that all guns a man takes to the woods should have the same type of action.

Trap Shooting is in itself a sport with many thousands of adherents. Even unredeemed pot-hunters find that it pays to practice the leads at unknown angles on clay birds. One doesn't like to miss the few chances he gets in the fall. A Dupont hand trap costs only a few dollars, and

does first class work. It is as hard to learn to shoot by the book as it is to learn to swim in that way. Practice is the big thing, but theory helps. For instance, a flock of teal in full flight go about ninety miles an hour. If we assume that shot travel 1,000 feet per second, it is easy to figure that the lead for a cross-flight of these birds at ten rods distance will be about 21 feet. But the angle of flight makes a very great difference in the amount of the lead, and something is also to be allowed for the drop of the shot. So it appears that a man who can make a high score at flying marks in all directions, with speeds up to ninety miles an hour, is an artist worthy of respectful approval in his field.

STALKING

Whether your purpose in following game in the woods is carnivorous, photographic, or only curious, there's good fun in it. The hints given here are obvious to all old stagers.

Travel up the wind, or across it, never with it, while you mean business.

Stop! Look! Listen! Don't talk! Don't be near enough together to talk.

Make either much noise or none. Much often arouses curiosity and disarms suspicion. In order of preference, no noise, much noise, middle-sized noise. But at that, it depends on the kind of noise.

Bring your toes down first, and look out for dry twigs under your feet. They are as bad as Fennimore Cooper made them out to be!

Don't wear either corduroy or canvas in the woods, if you hope to do real stalking. These things can be heard a long way.

Come up to the brow of the hill with great caution. Peep over; travel along just below the ridge for a while.

In the right spot, sit down, use your eyes and ears, and don't move around.

Small creatures are as interesting as big ones, often more so.

Crafty game animals are pretty sure to double back to get the wind of the disturber. Size up the country and allow for this turn, if you can. A big buck will drop his head and slip through the brush without a sound when he chooses, and sometimes he plays this trick unbelievably near you.

Some creatures have so much curiosity that your patience can be made to outlast theirs. The young and foolish of many tribes are like that, and some of the old ones. It is not always useless to wait by a woodchuck hole. But expect an eye and an ear to come up first! If you sit in plain sight, don't look for much more until you have become a part of the landscape, very still and unoffending. There are times when even the wild animals seem to detect hostility and to reward friendliness.

One has to acquire a new sort of vision in the woods, where there is so much protective coloration. A gray squirrel against a beech trunk is pretty well hidden, if his tail doesn't blow in the wind. The upstretched neck of a partridge looks like any other broken off stick in the woods. Deer freeze so still in thickets that it takes eyes like an Indian's to find them there. Perhaps the best way to learn to see things in the woods is to study slowly the field of view one little square at a time, watching for the faintest suspicion of movement.

SKATING

There are two general types of skating —one emphasizes speed, the other values grace and ingenuity. Each has its devotees, with national and international contests annually.

Speed records in skating do not differ greatly from sprinting records on foot, as may be inferred from the fact that the 100 yd. dash on skates is made in 8 to 12 seconds.

By official agreement, the title of champion in international speed contests goes to the winner of three out of four races, the distances being 500, 1,500, 5,000, and 10,000 metres. (A metre is 1 yd. 3 and 39–100 in.)

Figure skating contests are conducted annually, but arouse less interest in America than speed racing. As a sporting proposition, Americans are chiefly interested in skating as a means of playing hockey. But the recreational popularity of skating is very great, and is pretty sure to remain so—witness the temporary craze and the permanent eclipse of the roller rinks in this country.

The modern ice skate differs radically from its antecedents of a generation back. In 1890, "club" skates were fastened by adjustable clamps; the skate was likely to come off at embarassing moments, often bringing a sole of shoe with it. No special shoe was required, except as to strength at the sides of the soles. The skates were all steel, with blades about $\frac{3}{16}$ of an inch thick, resting on the ice at only one point of an arc, thus earning the name of rockers. Newer types came in with the popularity of hockey, and were designed for quick stops, speed, lightness and safety. A skating shoe is now a permanent part of the outfit, riveted fast to the plates of the skate. The blades are long, thin, straight and borne on three aluminum tubes, one horizontal, two vertical.

Much old-time grace has been sacrificed to speed in the change of blade design. Rockers tended to curves, and to pleasing variations of balance; hockey skates tend to straight lines and a general firmness of movement, rather than grace.

SKIING

Skis are the descendants of the long, narrow, leather-covered snowshoes used in northern Europe since very ancient times, but popularized in our generation by the sports of Norway. Skis are now thin, flat strips of oak, ash, or spruce, five or six inches wide, about eighteen inches longer than the user is tall, smooth or ribbed lengthwise on the bottom, thickest under the feet, fastened with straps across the toes, like snowshoes.

There are two types of official contests with skis: the jump and the long distance across country trip. Of late years, the distance record in jumping has been held in America, clearing a distance of 214 feet, or better. When one remembers the terrific velocity necessary to gain this distance, and the fact that a fall in landing cancels the jump, the feat seems to require incredible daring and skill. In the United States—Michigan, Wisconsin, Minnesota, and the Rocky Mountain country are chiefly interested in ski jumping. The sport is gaining in popularity wherever deep snows prevail in winter.

Skis have practical uses in the Scandinavian sections of Europe. They had a considerable place in the Alpine campaigns of the world war. Soldiers of continental Europe are giving increasing attention to them. Military ski runners have covered 15 miles in an hour and a half, under favorable conditions. Skis require a depth of at least six inches of snow for best service; they do not work well in melting snow nor in thick underbrush. In such unfavorable conditions they yield to the snowshoes perfected by American Indians.

SNOWSHOEING

Unlike skiing, snowshoeing has little of the spectacular about it. One can get the knack of it in a few minutes; the rest is an affair of training the leg and foot muscles to an unaccustomed straddle, heels up, toes down. Assuming that there are bound to be occasional falls, one does well to practice for them at first, so that the general tangle of pack, snowshoes, and snowshoer may be less hopeless when the time comes. After the novelty wears off, snowshoeing becomes a workaday affair of getting where one wants to go, but could not go without this Indian legacy.

SOCCER

The rules of Association Football, known in the United States as Soccer, were first formulated at Cambridge University, England, about 1860. The game is steadily growing in popularity in this country, especially in grammar schools.

The field is rectangular, commonly about 75 yards by 115 yards, with well marked boundaries. At the middle of each end are goal posts 8 yards apart, with a crossbar 8 feet up. A mid-line divides the field across, and from the middle of this line a circle is drawn, with a 10 yard radius. Flags mark each corner of the field. In front of each goal is a goal area, 20 yards by 6 yards, running 20 yards along the end line. Enclosing the goal area is a penalty area, 18 yards by 44 yards, running 44 yards along the end line. A penalty kick mark is 12 yards in front of the mid-point of each goal line. A corner kick area is a quadrant drawn from each corner with a radius of one yard.

The ball used in soccer is perfectly round, unlike the Rugby ball.

Soccer rules resemble those for field hockey. The ball may be advanced only by kicking. A goal is made when the ball is kicked under the crossbar, not over it. Two teams of eleven men each are placed

as in field hockey—a goal keeper, two full backs, three half backs, and five forwards.

A player is offside when the ball was last touched by a member of his own team behind him; provided that the presence of three or more opponents ahead of player A, at the instant his teammate B kicks the ball, makes player A on side, and provided further that a player cannot be offside who was in his own half of the field when the ball was last played.

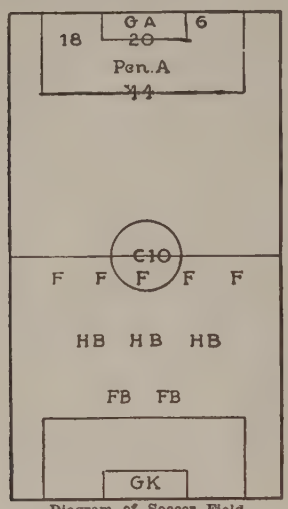


Diagram of Soccer Field.

A player offside cannot put himself onside. This must be done for him in one of three ways: (1) An opponent may play the ball. (2) The offside man may be behind the ball when a teammate plays it. (3) Three opponents may be ahead of the offside man when a teammate behind him plays the ball. "Take care that when the ball is played by one of your own side you have three opponents between you and their goal line or that you are in a line with or behind the ball."

No one but the goal-keeper may catch the ball, or bat it with his hands, arms or shoulders, and he only in actually guarding the goal.

The game is played in two halves of twenty to forty-five minutes each, according to the age of the players.

Toss-up awards choice of goal or kickoff at the beginning of the game; goals are exchanged at the beginning of the second half.

Play is started by a kickoff at the center of the field. At kickoff no member of either team may cross the mid-line until the ball is kicked, nor may any opponent enter the ten-yard circle until that time. After the scoring of a goal by either team, their opponents kick off at center.

If the attackers send the ball over the end-line outside the goal posts, a member of the defending team has a free kick from within the goal area, no opponent being permitted within ten yards. The ball is in play as soon as kicked.

If the defenders send the ball over their own goal line the attackers have a free kick from the nearest corner circle, no opponent within ten yards.

If the ball crosses a side line a member of the team which did not drive it out shall throw it in by an overhead throw in any direction, using both hands.

When play is resumed after time out, the referee tosses the ball up at the point where it was when play was suspended. At toss-up, the ball is not in play until it strikes the ground.

Fouls: For offside play; for touching the ball with the hands (except goal keeper); for tripping, kicking, kneeing, holding, or roughly charging an opponent.

Penalties vary according to location. If the defenders commit personal foul within the penalty area, the attackers have a free kick from the penalty kick mark, 12 yards in front of the goal. For fouls committed by either party outside the penalty area, and by the attackers within that area, the offended party are awarded a free kick at the spot where the foul occurred.

The officials of soccer are one referee and two linesmen. Linesmen are the referee's assistants, particularly charged with watching the ball, noting the cause of its crossing bounds or goal line and furnishing necessary measurements for free kicks.

SQUASH

The game of squash resembles handball and tennis in certain respects, but is still more like the English game of rackets.

A squash court is a rectangular room with five playing surfaces—front wall, back wall, side walls, and floor. Light and ventilation are provided at the top. Squash courts in clubhouses and dwellings are best located on upper floors. Entrance to the court is through a door in the rear wall, made flush with the playing surface. Floor and walls are planked, with a smooth dull surface. All boundary and playing lines are painted black, one inch wide.

The rectangle of the floor is 17 ft. by 32½ ft. The front, back, and side walls must be at least 14, 9, and 12 ft. high, respectively.

The front wall is divided into three horizontal rectangles. A service line 6½ feet from the floor sets off the top area, within which balls must strike in service. Nearest the floor is a forbidden area, within which no ball may strike without loss to the man who drives it there. The upper part of this forbidden area is commonly covered by the tell-tale—a noisy strip of sheet metal 15 inches wide, painted black. Balls which strike here tell their own story. The planking is left bare for 9 inches next the floor to aid in the recovery of balls.

The back wall is divided across by a line 4½ feet from the floor, below which line lies the playing surface for all balls which are to rebound to the front wall.

The floor is divided lengthwise into equal parts, and cross-wise by a service line, ten feet from the back wall. Behind this line are the right and left boxes, between which service alternates, and forward are the right and left service courts.

Four persons can play squash, but they are likely to get in one another's way. Official contests are between two players

Play is begun by a service, as in tennis. The choice of serve is determined by spinning rackets. The server stands first in the right box, tosses up the ball and strikes it as it comes down. A ball so served must hit in the upper rectangle of the front wall, above the service line, and must rebound into the left service court. After one bound on the floor the ball must be returned to the front wall by the opponent, striking the wall above the tell-tale. The players alternate in returning the ball to the front, until one fails in his return, and so loses the point. Except in service, balls may strike the front wall anywhere above the tell-tale. In returning a ball to the front, either player may use caroms from the floor, rear wall, or side walls. After service, a ball coming from the front may similarly carom from any or all of the playing surfaces, including the floor, but it must be played before it strikes the floor a second time, or the point is lost. As explained, a served ball may be returned only on first bound from the floor, but after this first return, the ball may be volleyed directly from the wall, or may be struck in any part of its course before it reaches the floor a second time. No player is permitted to strike a ball twice during one effort at return.

A failure to serve correctly is called a fault. Two faults, or one failure to return a ball in due turn cause the server (hand-in) to become receiver (hand-out). Successful service from the right box is followed by service from the left, in which case the ball must come back to the right service court on the floor.

Only the server can score in squash, by the failure of the hand-out to keep the ball properly coming back to the front.

A fly ball, directly from the racket, is dead if it strikes above a boundary line on any of the four walls, but a bounding ball is not dead in such case.

A "let" is a failure for which the player failing is not responsible under the rules. For example, if a player be interfered with by his opponent, or if a player be hit by an opponent's ball on its way to the front wall, no score can follow as a result of the failure to return. But if a ball coming from the front wall strikes a player, there is no let.

The first person to reach a score of fifteen points wins the game, provided that whenever the score is tied at 13 or 14, the out-hand sets the game, by announcing whether the winner of the next three or the next five points shall have the game.

Squash is perhaps the speediest game now in use. There is little hope for a squash player of slow judgment or slow physical reaction. But this means that the game has its own hot enthusiasts.

SWIMMING

Many folks who have never been taught to swim have found themselves able to keep afloat and to make some progress toward shore when they have accidentally fallen into deep water. But progress of that sort is likely to be slow and panicky, and if the panic gets too severe, another drowning occurs. For drowning is almost always a mental trouble before it is a physical one. There is fear of sinking; a frantic desire to keep the head and shoulders above water; fear to breathe, because a bit of water, gone wrong, has been unpleasant. If the shore or other safety is in sight the struggle to reach it is needlessly hurried and exhausting. The motions necessary to keep afloat are so utterly simple and easy that accidental drowning becomes the tragedy of ignorance.

For most people, floating on the back in salt water requires no motion whatever, and floating in fresh water is a very easy matter. Captain Dalton once swam on his back across the English Channel, a distance of 60 miles. Floating and swimming on the back should be mastered by everybody. Treading water is a process pretty fairly explained by its name. The motion is practically that of climbing a steep flight of stairs.

In all swimming the taking of breath is, of course, a very important thing to learn. Beginners are pretty sure to want to keep

their chins dry. Only violent exertion can manage that, and hence the early fatigue, so often fatal. In all the racing strokes the face is entirely under water for more time than it is out. A good general rule for breathing is to breathe through the mouth and out through the nose. The mouth need not be closed under water. One should exhale slowly while the face is submerged, and so be ready for a quick intake when the moment comes.

Next to swimming on the back, the old-fashioned breast stroke is most important. A swimming frog illustrates the leg motion of this stroke pretty clearly. Draw the knees well up under the body and well apart, kick the legs out straight and then snap them together. The hands shoot forward from the chest, palms together, and then the arms sweep around at each side to right angles with the body, draw in, and start again.

The trudgeon and the crawl are the two race winning strokes, though each expert is likely to make his own combinations and variations of the two. The trudgeon is somewhat less fatiguing than the crawl, and the crawl is correspondingly faster. The trudgeon stroke uses a sort of big over-arm movement, the two arms alternating, and a *scissors kick*. For the scissors kick, the legs are separated, as in walking, rather than drawn up sidewise as in the breast stroke, and are then snapped together. The Australian crawl uses a short alternating over-arm stroke, a sort of downward flip from the elbow, like the motion of good base-throwing on a ball diamond, with a similarly alternating thresh of the lower leg. In the true Australian crawl, the right arm and left leg strike together, then the left arm and the right leg. The American crawl uses the arms independently of the leg motion, and narrows the angle of the leg stroke. In both the trudgeon and the crawl, the swimmer lies in the water face downward, rolling a bit from side to side, and twisting the head to bring the mouth up for air.

For the best brief manual of the theory of swimming, see the Spalding Red Book *Speed Swimming*; and for a humorous discussion of "swimming by the book," read Irwin Cobb's *Fibble D. D.*

TENNIS

Lawn tennis is played on either an outdoor or indoor court, with any smooth, firm surface. A closely trimmed, firmly rolled grass court is excellent; the liveliest court is of clay; but cement courts have the advantage of being quickly available after rain; while in-door tennis courts naturally have wooden floors.

Tennis Players in Action.

The total space available should be about 40 by 90 feet, laid out as in the diagram. When three or four persons play, the rectangle ABCD is used, size 36 by 78 feet. In singles, as the tennis game for two persons is called, only the area EFGH is used, size 27 by 78 feet. A tennis net is stretched between posts IJ, with a height of three feet at the mid-point S.

The opposing parties at tennis contend for points by batting a ball back and forth across the net. The side that fails to return the ball over the net loses the point. One person "serves", that is, puts the ball in play, throughout each game, and announces the total score as each point in turn is won or lost. (In match games the score is announced by the referee.)

If south side puts the ball in play, for example, he stands just back of line GH, nearer G than H, tosses the ball well above his head and strikes it with his racket as it comes down, aiming to make it clear the net and fall within the area KS. If, at either the first or second trial the ball clears the net and falls on or within the lines RKOS, north side must return the ball *on the first bound*. In singles, this returned ball may strike the court anywhere in area RG; in doubles area IC is used. All returned balls may be batted either on first bound or they strike the ground—the latter stroke being known as a "volley".

When this first point has been won or lost the server delivers a ball into court OQ, from a position nearer H than G, on line GH. So the service for each point alternates from right court to left. If neither of the two served balls strikes within the required area the point is lost. Balls which strike the net and roll over into the required court do not count either for or against the server.

The first and second points of a game count fifteen each, the third point counts ten. The winner of the fourth point wins the game, provided the score has not been divided. To make the scoring clear, suppose south wins first point; he announces the score 15 *love*; north wins second point, score 15 *all*; south gets third and fourth points, score 40-15; north wins fifth and sixth points, score 40 *all*, or *deuce*. In this game, had south won the fifth point, the game would have been his. But in a game which reaches the score of *deuce*, the winner must be two points ahead. The first of these two points is "advantage in"; the second is game. When two players are evenly matched, the score often passes back and forth through deuce to *'vantage in*, *'vantage out* several times before "game" can be declared.

If south serves the first game, north serves the second, and so on. The first winner of six games wins a "set", provided that the games do not count *"five all"*, making a *deuce set*; in which case the set must go through "vantage in", "vantage out," until the server win or lose two games more than his opponent.

When a set has been finished, north and south exchange sides, if they wish to continue.

In doubles, north and south sides alternate in serving, but all four players serve, each a game, in rotation. The player not serving or receiving commonly stands near the net, for a better chance to "kill" any balls which come within his reach. Tennis doubles offer a very fine combination of strategic team-work and personal skill. It is possible for superior strategy to overcome a considerable superiority of personal skill. For instance, if player A of south side is known to have a weak backhand, which he is reluctant to use, both players of north party will aim at this weakness on every possible occasion, which rather brutal procedure is bound to make trouble for south.

Much practice is necessary to develop speed and control in striking the ball, not only in service, but in return. A good player has at command not only swift, straight balls, but a variety of curves and "cuts." A beginner will do well to study both the flight and the rebound of a curved ball, and he should master one curve at a

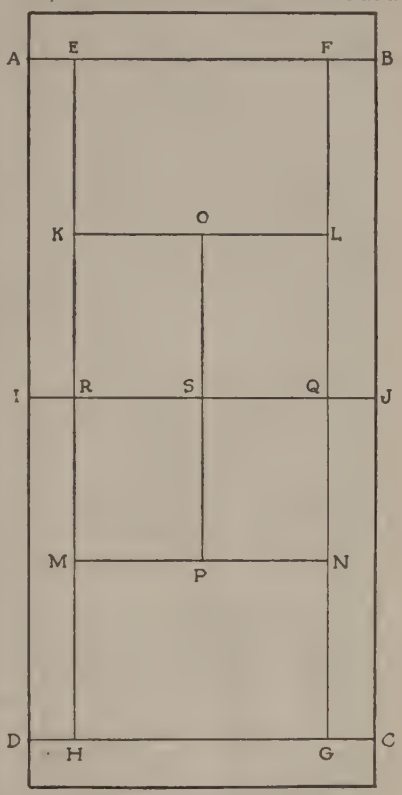

Diagram of Tennis Court.

time, after gaining fair control of a swift straight ball. Since most players are more skilled with the right hand than with the left, a service which twists the ball toward the receiver's left is likely to be troublesome. Extreme curves are likely to be so slow in flight that much of their baffling quality is offset by the added time given for solving them. If an opponent is playing too far back, an under cut dropping the ball near the net will be pretty sure to win or lose the point. If the opponent is too close to the net, a bit of upper cut in the high lob sent over his head will help to bring the ball down within bounds. Batting the ball against the smooth side of a building is a very useful exercise in gaining control of the racket.

TRACK AND FIELD EVENTS

Track and field events show little team work, except of a mild sort in relay races. These contests are rather individual struggles against rivals all doing the same thing, in an attempt to win honors or trophies for themselves or for their organizations. When rival athletic organizations meet points are scored for the winning of each event under rules which vary with the age and sex of the contestants or the custom of the groups concerned.

The control of athletic events in this country is largely in the hands of a few associations: Elementary and high school unions are local, intercollegiate associations

are broader in range, the Y. M. C. A. and Amateur Athletic Union are national.

The commonly recognized distinction between amateur and professional athletes is that a professional has received money for his services as a player or a coach. This definition is often unjust in various ways. Payment may be in other forms than cash, and the occasional acceptance of money for taking part in games does not in any way indicate a really professional attitude toward the game in question. The definition is likely to be revised in the near future.

The terms Track and Field are commonly used together to cover all sorts of contests in running, jumping, and weight throwing. The names of these contests and a short statement of the rules and customs holding in each will be given in turn.

Officials.—Each athletic meet is in general charge of a referee, whose word is final in the matters he pronounces on, subject only to a later protest, in certain cases, before a governing committee of the association he represents.

The referee's assistants are:

Clerk of the Course, who records all entries, investigates records with a view to handicapping contestants, assigns numbers and otherwise busies himself.

Starter, the man behind the gun.

Inspectors, for relays and running races above 300 yards, to make sure that the rules are fairly observed in the distant parts of the course.

Judges at the finish, who pick the winners.

Timekeepers, with stop watches registering fifths of seconds.

Scorer, the secretary of official results.

Field Judges of jumping, weight throwing, and vaulting.

Marshall, to keep the peace and clear the track.

All contestants report to the clerk of the course on arrival, register, enter for certain events, receive handicaps according to previous records and receive a number for the meet. They must learn in advance the exact time for each event in which they are to appear and be on hand unless officially excused.

Sprints, or dashes, cover any distance up to three hundred yards. The course is divided into lanes, one for each contestant. These lanes are assigned by lot. Runners who are not handicapped start from scratch K, a line drawn across the track. A runner's body may overhang this line at the start, but he may not in any way touch ground beyond the line before the starting signal is given. This starting signal is always in three stages, for which the words are: (1) On your mark! (2) Get set! (3) Go! For sprints and dashes, a pistol shot is used instead of the word Go. A crouching start aids a quick getaway in all sprints and dashes.

Fouls in all Running Races.—Running without a number, unless permitted by the referee.

False start—that is, touching the ground beyond the starting mark before the signal is given. Penalty, a distance forfeit in yards for the first two offenses, disqualification for the third.

Receiving coaching or other aid during a race.

Hindering a competitor in any way during a race.

Grasping the tape at the finish. Hands should be held high or thrown back.

Unsportsmanlike conduct, or disputing the judgments of officials.

Crossing in front of competitors after rounding the last turn toward the finish, or at any other time unless six feet or more in advance of the man whose trail is crossed.

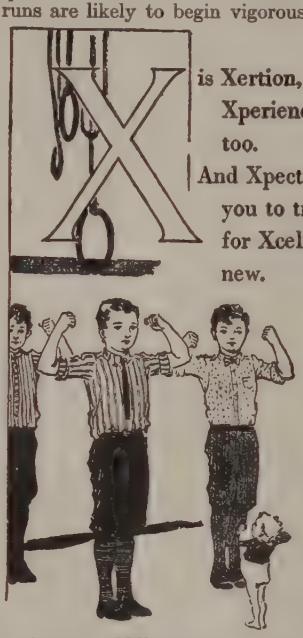
When there are too many runners for a decision in one trial, the race is run in heats, the winners of each heat entering the finals.

In championship races up to 300 yards, under official rules, each runner must have a separate course, marked off with ropes or permanent lines.

Men are making good time in the dashes at the rate of 9 3/5 seconds to 10 3/5 seconds per 100 yards, or about ten yards each second. Women's colleges report the 100 yards in about 12 seconds.

Middle Distance Runs.—300 yds. to one mile.

Long distance runs, the cross-country and Marathon, depend more on endurance than on speed. Dashes require speed and quick nervous reactions. Middle distance runs are likely to begin vigorously, use a



moderate middle pace and end with a dash. On this account, all distance runs should end in a straightaway course.

440 yd. races commonly use the crouching start; longer races get away from the standing position.

Rules are as in dashes.

Good time for adults, including high schools and Y. M. C. A.'S, runs for various distances about as follows:

440 yd.—47 to 54 sec.

880 yd.—1 min. 50 sec. to 2 min. 5 sec.

1 mile—4 min. 15 sec. to 4 min. 47 sec.

Relay Races.—As used in adult athletic contest, a relay race is an affair between two or more teams, usually of four men each. When the teams are of four men, each man does one-fourth of the total distance. The first runners are started as in dashes; no other runner may start until he has been touched by the teammate next before him in the race. Commonly, each team passes through from man to man a token which is delivered at the goal, automatically proving the fairness of all the contacts. The touch-off, or delivery, of tokens must occur within a twenty-foot space marked off for the purpose. An inspector is stationed at each of these starting points to see that the rules are complied with.

Relay races are commonly run on regular tracks, with distances from 300 yds. upward, usually such that each runner can go through his part of the distance at top speed. The speeds obtained in relay races are likely to be faster than the runners would make in single competition.

Hurdle Races combine running and jumping. A hurdle is a gate-like obstacle which the runner must leap over as he comes to it. There are two standard hurdle races—one of 120 yds. with 10 high hurdles, (3 ft. 6 in.); the other of 220 yds. with 10 low hurdles, (2 ft. 6 in.). In championship races, the location of each hurdle is exactly prescribed. A runner is permitted to knock down two hurdles, but not more, under penalty of disqualification.

Adult men do the short hurdle races in 15 to 17 sec., the long one in 25 to 27 sec.

Cross-Country Runs are usually between teams of any equal number, over open country, to a total distance of six miles. Scoring may be individual, or may be based on time made either by the entire teams, or by the first five members to arrive at the finish.

Cross-country speed for six miles is about 32½ minutes.

Walking Races are commonly for ½ mile, 1 mile or 2 miles. No walker may have both feet off the ground at once. A judge accompanies the walkers to enforce this rule.

Championship time will be about one mile in seven minutes.

Jumping.—The *Running Broad Jump* requires a 40 yd. running path of cinders or firm earth, leading to a take-off plank, beyond which the soil is dug up for safety in landing. The take-off plank varies in width, the standard being 5 in., but is always sunk broad side up, flush with the ground level. At the edge of the plank next the landing pit, the soil is dug out several inches for leverage in springing from the plank.

Each contestant takes as much run as he pleases—the ordinary run is about six paces—so timing his steps as to bring his jumping foot on the take-off plank for the spring. If the running path is soft or the wind unfavorable, more is lost than gained by long runs. The runner approaches the board at full speed, lands solidly on his jumping leg, and without pause makes a crouching spring; flings his arms forward for the bit of boost that gives, and while still in the air thrusts his legs forward, in order to make his mark as far from the plank as possible.

Jumps are measured from the forward or unburied edge of the take-off board to the nearest mark made by the jumper in landing. On this account he must be careful not to fall backward or even throw a hand to support himself in landing, for the marks so made will lower his record.

Field judges are the officials for jumping.

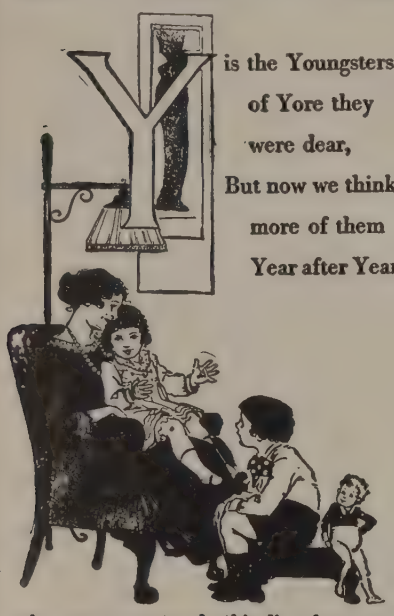
When a large number of competitors are entered, each has three trial jumps, and a convenient number of winners from these trials enter the final competition. In the final competition each man again has three jumps and the best of the three jumps made by each man is his record for the event.

It is a foul for the toes to touch the ground beyond the plank in making the spring, or for the jumper to over-run the board without jumping. Either of these offenses counts as one of the three trial jumps.

Any distance above 20 ft. is good for the

running broad jump; the best collegiate record is 24 ft. 11¾ in.

The *Standing Broad Jump* uses a regular take-off board, with both feet on the board when the spring is made. Toes may overhang the edge of the board, for starting thrust. If, as sometimes happens, the jump is from a scratch line on the ground



the toes may touch this line but must not over-reach it.

Three trials are used, as in the running jumps.

Field judges are in charge.

Records for standing broad jumps go 11 ft. 4⅛ ins.

Three Standing Broad Jumps.—Managed as broad jump, above. The jumper must not stop, even for one extra set of motions, between jumps, but must spring to his second and third immediately on landing from first and second.

Adult records run above 45 feet for three jumps.

Running Hop, Step and Jump.—The start is as for running broad jump. The foot that makes the take-off must make the first landing; the opposite foot at once takes the step; then without a pause both feet register the final jump. The distance is measured from the scratch line or bare edge of the take-off board to the nearest trace of feet, body or hands in the final landing.

Running High Jump.—General management as all other jumps. Required, a landing pit of soft earth, dug up six feet square; a pair of uprights six feet apart, bored for pegs to support a light crossbar; a V-shaped running ground, such that contestants may get a 20 yd. approach from either side. Good form does not approach the bar from the front. In intercollegiate practice, a balk line is drawn on the ground three feet from the uprights; the runner must not step beyond this line before he springs.

Any method of getting over the bar is permitted, if the jumper does not touch it; but best results have been gained by working in standard form. Since height, not broad distance, is required, the approach should not be too fast. The take-off is from right or left foot according to the direction of approach. The leg nearest the bar is first thrown over, then a twist to clear the hips, a flip of the second foot, and a landing on the foot that made the take-off.

Three trials are permitted at each height. A contestant may decline to try any particular height, and may come in at a greater height later on, but there may be no return to lower levels, except to break a tie.

Handicaps are added to the score of the opponents.

Good records for high schools are above 5 ft. 6 in., and for colleges, above 6 ft.

The *Standing High Jump* is made from any position, with one or both feet, but without preliminary hops or jumps.

Good scores for adults must be close to 5 ft. The record is a few inches above it.

The requirements for a *Pole Vault* are: A run-way 8 to 10 ft. wide and 20 yd. or so long; uprights notched or pinned for half-inch lifts of the crossbar; a landingpit of soft earth or sawdust. Between the uprights a wide plank is sunk, edge up, crosswise, with two inches projecting, to stop the bottom end of the pole. In front of this plank a hole is dug for the same purpose—if the jumper doesn't like that 'ole, 'e may find a better one. Fifteen feet in front of the bar is a balk-line, not to be crossed before the take-off. Poles are about 16 ft. long, of spruce or bamboo, wound for grip, and plugged or spiked at the lower end.

Good form is very important. The pace must be managed to bring the jumping foot to the balk-line; one hand grasps the pole slightly below the height of the crossbar, the other hand two feet higher up. The run is finished at top speed. As he comes to the balk-line, the runner places his pole, lifts one foot, springs from the other, slides the lower hand up on the pole, lifts the body by the pull and thrust of both arms, turns to a horizontal position above the pole, feet forward, drops the pole back, and lands on his feet in the pit. Most jumpers land facing the bar. A good landing is important for safety.

The jump is fair and the height is recorded if the cross-bar is not displaced by either the pole or the person of the jumper.

Field judges officiate.

Records for men run from 12 to 13 ft.

Throwing the Weights.—The *Shotput* is made from within a 7-ft. circle, which the contestant must not cross in making the throw, or leave from the front before the throw is measured. A toe-board is fastened near the forward edge of the circle, for the thrower's convenience. The weight of the shot varies with the age of the contestants. The standard is 16 pounds.

The shot must be "put", not thrown—that is, it must not be drawn back of the ear or behind the shoulder; at the beginning of the action, it preferably rests *on* the shoulder, in the cup of the hand. Form is important: (1) A half crouch at rear of the circle, the weighted shoulder drawn far back and low; (2) a sliding hop forward; (3) a twisting shift of the feet and an upward lunge of the whole body, while the putting arm straightens, and even the fingers add their flip at the end, like the kick of the toes in swimming.

Each contestant has three trials. The best of the three is his record for the event.

Field judges.

Good adult distance for the 16 lb. shot put is 45 to 50 ft.

There are two styles of throwing the discus—one, the old Greek form, with prescribed motions from a fixed position; the other, a modern free style, managed much like the shot-put, except that the discus is really thrown, with a full arm swing.

The discus is a double convex wooden contrivance, iron-bound and metal-faced, diameter about 9 inches, weight about 4½ lbs.

Scores of 97 ft. have been made in Greek style, and 135 to 150 ft. free style.

The *Hammer Throw* is from within a 7 ft. circle which must not be crossed in throwing, and which may be left only from the rear.

The standard hammer is of metal, with a wire handle; total weight 16 lb., total length not over 4 ft.

Good form requires one, two, or three complete turns of the thrower before he releases his hammer. If he can control himself, two turns are better than one, and three are better than two, since speed can be built up throughout. Intercollegiate and adult records with the hammer run from 160 to 190 ft.

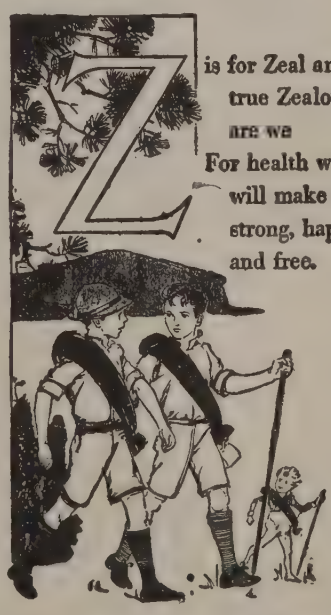
Throwing the 56 *lb. Weight.* Same general conditions as for shot put and hammer throw. Throwing this weight is like throwing a very heavy hammer with a very short handle. The over-all length of this weight must not be over 16 in.

The record is close to 50 ft., 6 in.

Throwing the Javelin.—This is a Swedish event, imported like the discus throw from the modern Olympic games.

The official javelin is 8.5 ft. long, weighs 1.6 lb. or more.

The thrower runs about 18 yds. to a restraining line, and without touching or over-stepping that line launches his javelin. The score may be taken for either hand, or for both added together. The best score for one hand runs over 200 ft.,



and for both added together, about 359 ft.

Base Ball Distance Throw.—From within a 6 ft. circle. The thrower steps from the rear half into the forward half of this circle, but must not cross the line.

Women's records go well above 200 ft.

Basketball Distance Throw. — Managed like the baseball throw. The basketball

and baseball throws are not now commonly included in intercollegiate events.

VOLLEY BALL

Volley ball is a lively and interesting game between two teams of any convenient number of players.

Across the middle of a rectangular field, not larger than 30 by 60 ft., a net is stretched, the upper edge 7½ ft. from the floor. The object of each team is to keep the ball beyond the net in the enemy's country, and to prevent its striking the ground in home territory.

No matter how many play, each player must take his turn at serving the ball and must continue to serve until his side is out, by reason of faulty service, foul, or failure in returning the ball. To serve a ball, a player stands back of the end line in his own court—he may have one or both feet on the line—tosses up the ball, and bats it with his hand toward the opponents' court, as it comes down. He may use either or both open hands, but must not use doubled fists. The ball need not go over the net on the server's stroke, if other members of his team can keep it from touching the ground, and eventually get it over. But in any one such attempt, no one player may touch the ball a second time.

When a team makes a foul or fails in service or return the referee calls *side out;* service passes to the opposing team, and each of the losers moves on one stage in his rotation toward service.

Catching or holding the ball is illegal; dribbling is prohibited—dribbling is touching the ball twice in succession. Players must not delay the game by batting the ball about unnecessarily—they must seek legitimately to advance their score.

Served balls are dead if they touch the net, but returned balls may be recovered from the net.

The ball is dead when it touches the floor, when it touches any object outside the court or when the referee blows his whistle. No player may touch the net, or reach over the net to strike a ball. No player may be helped or supported while striking the ball. Players must remain in their own court. If the serving side makes a foul the ball goes to the opponents, and there may be an additional penalty of a point added to the opponents' score if the foul is for unsportsmanlike conduct or for addressing officials. A foul by the receivers adds a point to the servers' score. Only the servers may score, except for fouls.

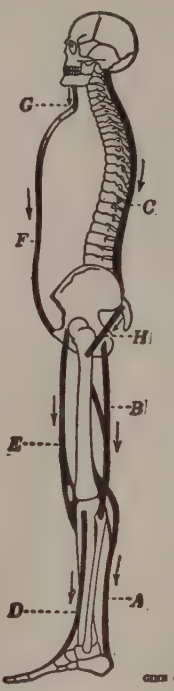


Diagram showing the action of antagonistic muscles which keep the body erect. After Huxley.

Arrows indicate the direction of the pull, the feet serving as a fixed basis of support. The muscles A, B, H, and C keep the body from falling forward; D, E, F, and G keep it from falling backward.

The officials are a referee and two linesmen. The referee is chief official, and works near the middle of the field, with a linesman at each end.

A standard volley ball is somewhat smaller than a basketball, though a basketball will do when the game is played for recreation only. For the net, any tennis net will serve.

WRESTLING

Wrestling is a sport no doubt much older than man, but the rules of the game have changed from age to age. In the old Greek wrestling matches, for instance, no hold below the waist-line was permitted. In the Irish collar and elbow contests neither man may for an instant let go his hold on his opponent's collar.

In this country wrestling means catch-as-catch-can, and a fall is secured whenever both shoulders squarly touch the floor at once. Only strangle-holds, shutting off an opponent's wind, are barred. At least twenty-five different holds are named and distinguished by professional wrestlers.

The arm and neck, foot hold, toe hold, quarter Nelson, and further Nelson are generally preliminary to other holds. A number of holds, for example the toe hold, are not directly productive of falls, but are so painful that the victim concedes a fall in order to escape.

There is not much value in a mere list of wrestling positions. The movements involved, the changes from one hold to another, the escapes and counters are often so fast and complicated that only a moving picture or a living instructor could tell the whole story. Wrestling is an art worth any young man's time. Champion wrestlers must have not only tremendous all-round muscular development, but mental alertness to match.

A fairly complete list of wrestling holds follows:

Arm and Leg
Arm and Neck
Arm Drag
Arm Grapevine
Arm Roll
Chancery
Chancery and Bar
Cross Buttock
Crotch Hold
Double Body Hold
Double Nelson
Double Thigh and Crotch
Double Wrist
Elbow and Back Heel
Flying Mare
Foot Hold
Further Nelson
Half Nelson
Hip Lock
Knee Hold
Quarter Nelson
Scissors
Single Wrist
Sit Back
Strangle Holds (Barred)
Three Quarter Nelson
Toe Hold

BOOK XV

FINE ARTS

ARTHUR HOEBNER, A. N. A.
VIRGINIA ROBIE
RUPERT HUGHES, M. A.

FINE ARTS.—This term is generally applied to those arts in which the artist seeks chiefly to give pleasure by the immediate impression produced on the mind by his work. These arts are thus distinguished from arts which are designed to answer some practical purpose, and so have been termed *useful*. By some, the term fine arts, which is generally taken to include those which appeal to the eye and ear alike, has been limited to the arts of *painting, sculpture, architecture,* and *music*.

The minor fine arts may be defined as those dexterities and industries which add to the quality of usefulness certain elements of pleasure and beauty, such as embroidery, ceramics, glassmaking, goldsmiths' work, jewelry, and cabinet-makers' work. Poetry, dancing, acting, and studied eloquence, inasmuch as they are related, are classed as fine arts.

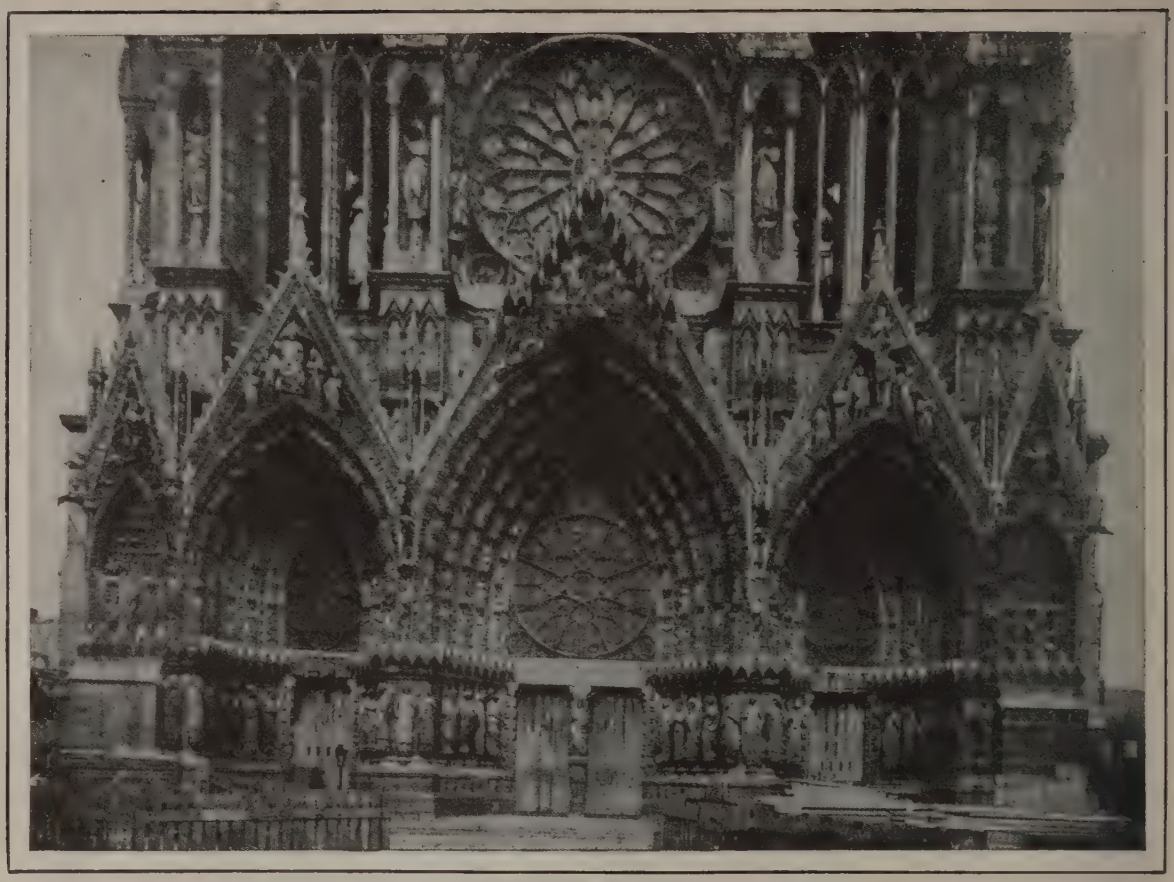
Antique Arts.—In its general acceptation the term *antique art* is understood to be that of a period antecedent to the revival of the classical studies in western Europe, or before *renaissance* of the arts from their assumed period of lethargy. There was, in fact, a distinct character about the productions of the artists of the more ancient and the more modern times, which was sufficiently marked to produce in the best of them a separate style of art, and which has led to the establishment of the schools of the so-called antique and modern styles; the mediæval arts form, as it were, an intermediate class, which was as distinctly marked as any of the other styles. The antique school was distinguished by an anthropomorphism and a divination of the human form.

Mediaeval Art was formed upon, and characterized by, a species of contempt for the human figure, and an inspiration after an ideal perfection, and therefore there is something vague and undefined in its efforts to represent the objects it copied.

Modern Art has united the indefiniteness of its aim with that clearness of the perception of its objects which is so marked a characteristic of its productions.

The antique schools date from the dawn of civilization to the end of the tenth century; the mediæval schools date from the tenth to the fifteenth century; and the modern schools have continued the traditions of the masters of art to the present time.

THE HAWA MAHAL, OR HALL OF THE WINDS, JEYPORE, INDIA.
Part of the Palace of the Maharajahs of Jeypore. It was composed entirely of pink and white stucco and is a unique piece of Indian architecture. It was built by the founder of the city, Jey Sing, in 1728.



REIMS CATHEDRAL, FRANCE

One of the grandest Gothic structures in Europe, built 1212-1430. Contained splendid rose windows, and a mass of beautiful statues and monuments. Charles VII. was crowned here, with Joan of Arc standing by his side.

ARCHITECTURE.—The art of building or constructing is coeval with the earliest dawn of civilization, and may be said to present largely the history of the human family written in stone, brick, or other durable material.

Architecture is divided into three classes —civil, military and naval:

Civil architecture has for its object the construction of any public or particular buildings intended to meet the requirements of an organized society. It is sometimes divided into *domestic, rural* and *monumental.*

Military architecture relates to the erection of works necessary to the defence or attack of cities, harbors, or countries.

Naval architecture relates to the construction of marine vessels, whether intended for purposes of war or commerce.

Of these classes most general importance attaches to civil architecture, which usually finds a place as one of the branches of the so-called Fine Arts.

Greek and Roman Orders.—To Greece we are indebted for the three orders of architecture, the *Doric*, the *Ionic*, and the *Corinthian;* Rome added two others, both formed out of the former, the *Tuscan* and the *Composite.* Each of these has a particular expression; so that a building, or any parts of one, may be rude, solid, neat, delicate, or gay, accordingly as the Tuscan, the Doric, the Ionic, the Corinthian, or the Composite are employed. The columns of these several orders are easily distinguishable to common observers, by reason of the ornaments that are peculiar to their capitals; but the scientific difference consists in their proportions.

The Doric Order is the oldest, strongest, and simplest of the three Grecian orders, and the one that is best represented among the remains of ancient Greek architecture. The Doric column, is distinguished by its want of a base (in the more ancient examples, at least), by the small number of its flutings, and by its massive proportions, the true Grecian Doric having the height of its pillars six times that of the diameter. The capital was small and simple, and the architrave, frieze, and cornice were rather plain and massive.

The Ionic Order is distinguished by the volutes of its capital. In the *Grecian Ionic* (1) the stylobate consists of three receding equal steps, the combined height of which is from four-fifths to a whole diameter; (2) the column, which includes band, shaft, and capital, is rather more than nine diameters in height, the shaft being fluted with twenty-four flutes and alternating fillets; while (3) the entablature is rather more than two diameters in height. The volutes are connected on the flanks by a peculiar roll-moulding, called the baluster or *bolster.*

In the *Roman Ionic*, a modification of the latter style, the stylobate is lofty and not graduated; the shaft diminishes one-tenth of a diameter and has twenty fillets and flutes; the capital, which is two-fifths of a diameter, has its volutes a little lower than the other, and a square abacus with moulded edges covers the whole. The chief examples of the Grecian Ionic are those of the Athenian Acropolis; while those of the Roman Ionic are found on the Temple of Fortuna Virilis and the Colosseum at Rome.

The Corinthian Order has the capital of the column adorned with beautifully carved acanthus leaves, but varies considerably in minor details. The column is generally fluted, with a fillet between the flutings, and stands upon a base. The entablature is variously decorated, especially the cornice; the frieze may be quite plain, or sculptured with foliage and animals. The Corinthian order was not very common in Greece before the time of Alexander the Great; among the Romans it was much employed.

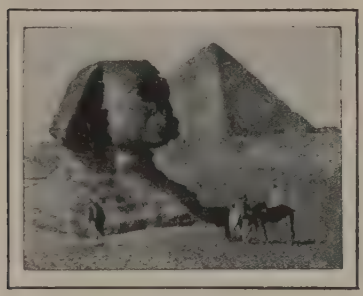
The Tuscan Order admits of no ornaments, and the columns are never fluted. Otherwise it differs so little, however, from the Doric, that it is generally regarded as being only a variety of the latter.

The Composite Order is so called because the capital belonging to it is composed out of those of the other orders, borrowing a quarter-round from the Tuscan and Doric a row of leaves from the Corinthian, and volutes from the Ionic. Its cornice has simple modillions or dentils. It is called also the *Roman* of the *Italic* order.

There are, besides these, various *styles* of architecture, such as the Gothic, the Moorish, etc., but these are not classed as orders, being styles merely.

Early Period.—The Egyptians are the most ancient nation known to us among whom architecture had attained the character of a fine art. Other ancient peoples among whom it had made great progress were the Babylonians, whose most celebrated buildings were temples, palaces, and hanging-gardens; the Assyrians, whose capital, Nineveh, was rich in splendid buildings; the Phenicians, whose cities, Sidon and Tyre were adorned with equal magnificence; and the Israelites, whose temple was a wonder of architecture. But comparatively few architectural monuments of these latter nations have remained till our day.

Egyptian.—This is not the case with the architecture of Egypt, however, of which we possess ample remains in the shape of pyramids, temples, sepulchres, obelisks, etc. Egyptian chronology is far from certain but the greatest of the architectural monuments of the country, the pyramids of Ghizeh, are at least as old as 2800 or 2700 B. C.



THE SPHINX AND GREAT PYRAMID, AT GIZEH, EGYPT

The Sphinx is considered older than any of the pyramids, and is hewn from the natural rock. It was a local personification of the sun-god.

The Egyptian temples had walls of great thickness and sloping on the outside from bottom to top; the roofs were flat, and composed of blocks of stone reaching from one wall or column to another. The columns were numerous, close, and very stout, generally without bases, and exhibiting great variety in the designs of their capitals. The principle of the arch though known was not employed for architectural purposes. Statues of enormous size, sphinxes carved in stone, and on the walls sculptures in outline of dieties and animals, with innumerable hieroglyphics, are the decorative objects which belong to this style.

Greek Architecture.—The earliest architectural remains of Greece are of unknown antiquity, and consist of massive walls built of huge blocks of stone. In historic times the Greeks developed an architecture of noble simplicity and dignity. This style is of modern origin compared with that of Egypt, and the earliest remains give indications that it was in part derived from the Egyptian. It is considered to have attained its greatest perfection in the age of Pericles, or about 460-430 B. C. The great masters of this period were Phidias, Ictinus and Callicrates. All the extant buildings are more or less in ruins. The style is characterized by beauty, harmony and simplicity in the highest degree.

Distinctive of it are what are called the *orders* of architecture, by which term are understood certain modes of proportioning and decorating the column and its superimposed entablature. The Greeks had three orders, called respectively the *Doric, Ionic,* and *Corinthian.* Greek buildings were abundantly adorned with sculptures,

TEMPLE OF THESEUS AT ATHENS

Erected about 460 B. C. It is a Doric structure, built of Pentelic marble, whose columns are 19 feet high. The sculptures are lost.

and painting was extensively used, the details of the structures being enriched by different colors or tints. Lowness of roofs and the absence of arches were distinctive features of Greek architecture, in which, as in that of Egypt, horizontality of line is another characteristic mark. The most remarkable public edifices of the Greeks were temples, of which the most famous is the Parthenon at Athens, though the best preserved is the Temple of Theseus. Others exist in various parts of Greece as well as in Sicily, Southern Italy, and Asia Minor, where important Greek communities were early settled. Their theatres were semi-circular on one side and square on the other, the semi-circular part being usually excavated in the side of some convenient hill. This part, the auditorium, was filled with concentric seats, and might be capable of containing 20,000 spectators. A number exist in Greece, Sicily, and Asia Minor, and elsewhere. No remains of private houses are known to exist. By the end of the Peloponnesian war, or about 400 B. C., the best period of Greek architecture was over; a noble simplicity had given place to excess or ornament. After the death of Alexander the Great, 323 B. C., the decline was still more marked.

ARCH OF TITUS, ROME

Commemorated the destruction of Jerusalem, 70 A. D., and is considered first of the Roman arches in beauty of execution. It was constructed of marble and adorned with beautiful reliefs of scenes connected with the captivity of the Jews by Titus.

Roman.—Among the Romans there was no original development of architecture as among the Greeks, though they early took the foremost place in the construction of such works as aqueducts and sewers, the arch being in early and extensive use among this people. As a fine art, however, Roman architecture had its origin in copies of the Greek models, all the Grecian orders being introduced into Rome, and variously modified. Their number, moreover, was augmented by the addition of two new orders—the *Tuscan* and the *Composite.*

The Romans became acquainted with the architecture of the Greeks soon after 200 B. C., but it was not till about two centuries later that the architecture of Rome attained (under Augustus) its greatest perfection. Among the great works now erected were temples, aqueducts, amphitheatres, magnificent villas, triumphal arches, monumental pillars, etc.

The *amphitheatre* differed from the theatre in being a completely circular or rather elliptical building, filled on all sides with ascending seats for spectators and leaving only the central space, called the *arena,* for the combatants and public shows. The Colosseum is a stupendous structure of this kind. The *thermæ,* or baths, were vast structures in which multitudes of people could bathe at once. Magnificent tombs were often built by the wealthy.

COLOSSEUM, ROME

This famous arena was Rome's chief marvel. It was founded by Vespasian and finished by Titus 80 A. D., and became the scene of countless fights of gladiators and wild beasts, as well as of the magnificent celebration of the 1000th anniversary of Rome's foundation—248 A. D. It would accommodate 87,000 spectators.

Remains of private residences are numerous and the excavations at Pompeii in particular have thrown great light on the internal arrangements of the Roman dwelling-house.

Almost all the successors of Augustus embellished Rome more or less, erected splendid palaces and temples, and adorned, like Hadrian, even the conquered countries with them. But after the period of Hadrian (117-138 A. D.) Roman architecture is considered to have been on the decline. The refined and noble style of the Greeks was neglected, and there was an attempt to embellish the beautiful more and more. This decline was all the more rapid latterly from the disturbed state of the empire and the incursions of the barbarians.

Byzantine.—In Constantinople, after its virtual separation from the Western empire, arose a style of art and architecture which was practiced by the Greek church during the whole of the middle ages. This is called the Byzantine style. The church of St. Sophia at Constantinople, built by Justinian (reigned 527-565), offers the most typical specimen of the style, of which the fundamental principle was an application of the Roman arch, the dome being the most strking feature of the building. In the most typical examples the dome or cupola rests on four pendentives.

After the dismemberment of the Roman empire the beautiful works of ancient architecture were almost entirely destroyed by the Goths, Vandals, and other barbarians in Italy, Greece, Asia, Spain, and Africa; or what was spared by them was ruined by the fanaticism of the Christians.

ST. SOPHIA, CONSTANTINOPLE

Rebuilt by Justinian in the 6th century, is probably the finest example of Byzantine architecture. The principal dome was supplemented by minor domes, and when converted into a mosque after the conquest of Constantinople by the Turks, minarets were added. Henceforth it became the model for all Turkish mosques.

Mediaeval Period.—A couple of centuries after the fall of Rome, a new style of architecture arose, two forms of which the Lombard and the Norman Romanesque, form important phases of art. The Lombard prevailed in North Italy and South Germany from the eighth or ninth to the thirteenth century; the Norman Romanesque flourished, especially in Normandy and England, from the eleventh to the middle of the thirteenth century. The semicircular arch is the most characteristic feature of this style. With the Lombard Romanesque were combined Byzantine features, and buildings in the pure Byzantine style were also erected in Italy, as the Church of St. Mark at Venice. The best example of the

ST. MARK'S CATHEDRAL, VENICE

Begun in the 10th century to receive the relics of the Apostles brought from Alexandria, it was transformed in the 12th and 13th centuries into the finest type of a richly colored Byzantine basilica. Rich in carved details, gleaming pinnacles, colored marbles and mosaics, bronze reliefs and sculptures, the whole structure is dominated by the grand figure of St. Mark above the chief archway.

Tuscan Romanesque is the Cathedral of Pisa (1063-1118) with its Baptistry and celebrated Leaning Tower. A peculiar variety of Romanesque originated in Southern Italy and Sicily, the finest example of which is the Cathedral of Monreal in Sicily.

CATHEDRAL OF PISA

with the Baptistry in the foreground and the Leaning Tower in the background. The Baptistry is the finest of the group. The edifice was begun in 1152 and the main structure completed in 1278. It is built almost entirely of white marble, and one arcaded story succeeds another, surmounted with a conical dome. It contains Nicolo Pisano's world-famous marble pulpit.

Moorish Type.—The conquest of the Moors introduced a fresh style of architecture into Europe after the eighth century—the Moorish or Saracenic. This style accompanied the spread of Mohammedanism after its rise in Arabia in the seventh century. The edifices erected by the Moors and Saracens in Spain, Egypt, and Turkey are distinguished, among other things, by a peculiar form of the arch, which forms a curve constituting more than half

COURT OF LIONS

in the Alhambra, perhaps the most celebrated portion of the Moorish palace at Granada. It contained 128 white marble columns supporting galleries. In the center was an alabaster basin flanked with twelve lions, from which the court takes its name. It has been extravagantly lauded in both romance and poetry.

of a circle or ellipse. A peculiar flowery decoration, called *arabesque*, is a common ornament of this style, of which the building called the Alhambra is perhaps the chief glory. The Giralda cathedral at Seville is also a fine example.

The Germans were unacquainted with architecture until the time of Charlemagne (or Charles the Great, 742-814). He introduced into Germany the Byzantine and Romanesque styles. Afterwards the Moorish or Arabian style had some influence upon that of the western nations, and thus originated the mixed style which maintained itself till the middle of the thirteenth century.

Gothic.—The modern Gothic style grew up in France, England, and Germany. Its striking characteristics are its pointed arches, its pinnacles and spires, its large buttresses, clustered pillars, vaulted roofs, profusion of ornaments, and, on the whole, its lofty, bold character. Its most distinctive feature, as compared with the Greek or the Egyptian style, is the predominance in it of perpendicular or rising lines, producing forms that convey the idea of soaring or mounting upwards. Its greatest capabilities have been best displayed in ecclesiastical edifices.

The Gothic style is divided into four principal epochs: the *Early Pointed*, or general style of the thirteenth century; the *Decorated*, or style of the fourteenth century; the *Perpendicular*, in vogue during the fifteenth and early part of the sixteenth centuries; and the *Tudor*, or general style of the sixteenth century. This style lasted in England up to the seventeenth century, being gradually displaced by that branch of the Renaissance or modified revival of ancient Roman architecture which is known as the *Elizabethan style*, and which is perhaps more purely an English style than any other that can be named.

Notable examples of Gothic architecture during the thirteenth and fourteenth centuries are as follows:

In Germany. Cathedrals at Strasburg, Cologne and Freiburg; the churches at Nuremberg and the minster at Ulm.

In Italy a modified form of Gothic is represented by the cathedrals at Milan, Siena and Florence; while in France, Germany, the Netherlands, and Italy are to be found many examples of secular Gothic in the ducal palaces, castles and private mansions.

MILAN CATHEDRAL, MILAN

Built 1386-1500; second to St. Peter's and Seville cathedrals in size. It contains 6,000 statues, superb stained windows, many tombs (including that of St. Carlo Borromeo), and vast granite monoliths. Its roof is marble, with 98 Gothic turrets and hundreds of pinnacles. The whole edifice is white marble.

In France, Cathedral of Notre Dame, Paris; the cathedrals at Rheims, Amiens, Chartres, Beauvais and Rouen; and the churches of St. Ouen and St. Malcom at Rouen, St. Jacques at Dieppe, and St. Wulfraud at Abbeville.

CATHEDRAL OF NOTRE DAME, PARIS

A famous example of the Pointed Gothic style. It was begun in 1163 but was built chiefly in the 13th century, and restored by Viollet-le-Duc, 1866, and following. The façade, with its rich Gothic sculptures, is very imposing; while the long range of windows and flying buttresses is highly effective. The fine pulpit and rood-spire were built by Viollet-le-Duc. Cathedral contains 37 chapels.

In England. Westminster Abbey, London; cathedrals at Lincoln, Salisbury, Wells, Litchfield, Exeter, Winchester, York and Carlisle; the series of abbeys with Melrose as chief; St. George's chapel, Windsor, and King's College chapel, Cambridge.

The Renaissance.—The rise of the Renaissance style in Italy is the greatest event in the history of architecture after the introduction of the Gothic style. The Gothic style had been introduced into the country and extensively employed, but had never been thoroughly naturalized. The Renaissance is a revival of the classic style based on the study of the ancient models; and having practically begun in Florence about the beginning of the fifteenth century, it soon spread with great rapidity over Italy and the greater part of Europe. The most illustrious architects of this early period of the style were Brunelleschi, who built at Florence the dome of the cathedral, the Pitti Palace, etc., besides many edifices at Milan, Pisa, Pesaro and Mantua; Alberti, who wrote an important work on architecture, and erected many admired churches; Bramante, who began the building of St. Peter's, Rome, and Michelangelo, who erected its magnificent dome. On St. Peter's were also employed Raphael, Peruzzi, and San Gallo. The noblest building in this style of architecture in Great Britain is St. Paul's, London, the work of Sir Christopher Wren; and seconded by the Banqueting Hall of Whitehall, executed by Inigo Jones.

In France the Renaissance style is shown in Lescot's court of the Louvre, Paris; the palace of Versailles; the Invalides; and the colonnade of the Louvre.

In Germany the most important monuments are the castle of Heidelberg, and the town halls of Augsburg, Rothenburg and Bremen.

In Spain the Renaissance period produced the Cathedral of Valladolid, and the Escorial.

ST. PAUL'S CATHEDRAL, LONDON

Was built 1675-1710 by Sir Christopher Wren, in the form of a Latin cross, and is next in size to Milan Cathedral. The interior is vast and contains numerous monuments and crypts. Wellington and Nelson are buried here and several famous artists. The dome of the cathedral is probably the most imposing in existence.

Modern Period.—Since the Renaissance, architecture has been marked by two sets of influences—the *Classic Revival* and the *Gothic Revival.* The former received its first impulse in France and the latter in England. The former was a reaction against the extravagances practiced during the Renaissance, and the latter was a reaction against the imitations of classic forms.

In France, Roman models were followed, and the type is represented in the Church of the Madeleine and the Arc de Triomphe, Paris. In Great Britain we have the British Museum, London, and St. George's Hall, Liverpool; in Germany, the Old Museum at Berlin, the Walhalla near Ratisbon, and the Glyptothek at Munich; and in Austria by the Parliament House at Vienna

CHURCH OF THE MADELEINE

Built by Vignon and finished 1842, is the most beautiful edifice in Paris. It is a vast Corinthian temple lighted from above, and richly adorned with painting and sculpture. The south façade contains a colossal group of sculpture representing the LAST JUDGMENT. There are many exquisite side chapels with sculptures by Bouchet, Pradier, Rude, and others.

The Gothic Revival has its best examples in the British Houses of Parliament and in the Natural History Museum at South Kensington, London. In Germany and Austria the building of a number of important churches resulted, especially the Votive Church, at Vienna.

VOTIVE CHURCH, VIENNA

A superb modern Gothic structure, built by Ferstel, commemorating the Emperor's escape from assassination in 1853. It abounds in statues, and wonderful stained windows and possesses finely decorated twin spires.

ST. PETER'S, ROME

Built 1450-1626, is the largest church edifice in the world. The interior has 30 altars, many vast and beautiful chapels, tombs of popes, and statues by Michelangelo, Canova, and Thorwaldsen. 138 popes were buried in St. Peter's. It took 176 years to build, and cost $60,000,000. The Doric colonnades surrounding St. Peter's square were built by Bernini in 1667.

Recent European Architecture.—There has been no dominating style of architecture apparent for more than a half century, though there has been an undoubted tendency toward a refined Renaissance. This was especially signalized in France by the completed Louvre, the new Opera House, the new Hotel de Ville, the Sorbonne and the church of Sacré Coeur, all in Paris. In Germany and Austria the same tendency is to be observed in the theatre at Dresden; the opera house and new Burgtheater at Vienna; and the new Parliament house, Protestant cathedral, and Bauschule at Berlin. Both Renaissance and Gothic styles have been followed in Great Britain, the former being represented by the Albert Memorial Hall, and

the Victoria and Albert museums, London; and the latter by the imposing Westminster Catholic cathedral, and the Liverpool cathedral.

OPERA HOUSE, PARIS

Largest theatre in the world, built 1861-74 by Garnier. The façade is exceedingly rich in statuary. The grand staircase of white marble, with balustrades of red antique marble, is the finest in Europe. The interior is adorned with sculptures, frescoes and mosaics by the first of French artists.

The great industrial and commercial activity of the people have stimulated the construction of the most palatial commercial and financial buildings in the world. Among multitudes of these the most striking are the Auditorium and Peoples' Gas buildings in Chicago; the Majestic building in Detroit; the *Times*, Trinity, Stock Exchange, Flatiron, and World buildings in New York; and many large and luxurious hotels, particularly in New York, Philadelphia, Chicago, Boston and Washington. Notable, too, are many railway terminals—the Grand Central and Pennsylvania in New York, the Pennsylvania in Washington, the new Northwestern in Chicago, and the South Station in Boston. Domestic architecture is original and characteristic, ranging from the colonial manor house of the South through many eclectic styles, to the classic mansion of upper Fifth avenue or Lake Shore boulevard. As compared with the older European countries, the United States possesses little purely historical architecture of merit. More history than art attaches to Old South church and Fanueil hall, Boston, St. Paul's in New York, Christ's church and Independence hall in Philadelphia.

TRINITY CHURCH, BOSTON

Built by H. H. Richardson, and completed 1877. The style is Romanesque and was suggested by the Cathedral at Salamanca, Spain. The harmony of both exterior and interior proclaims this edifice one of the few of first rank in America.

CAPITOL AT WASHINGTON

Built from designs of several architects (including Bulfinch, Walter, and Crawford), 1818-65, of white marble and stone. Its greatest length from north to south is 751 feet; its greatest width, 350 feet. Its imposing dome is one of the finest in the world, and the interior is replete with statues and historical paintings. It contains the Senate chamber, the Representatives Hall, Supreme Court rooms, Law Library, a Hall of Statuary, and numerous offices and committee rooms. The architecture is classic Renaissance.

United States.—Architecture in the United States has received its strongest influences from the classic revivals of Europe. To such influences belong the Capitol at Washington; the University of Virginia; Girard College, Philadelphia; the White House, and much of the federal architecture. The Gothic revival is notable in St. Patrick's cathedral and the Cathedral of St. John the Divine, New York, and Romanesque influences in the works of Richardson, such as Trinity church, Boston, and the County Buildings at Pittsburgh. The new and splendid buildings of the University of Chicago are close imitations of academic Gothic, while the newer Medical and Law buildings of Harvard University follow classical lines. Many imposing buildings have been erected by educational institutions and municipalities, notably the Boston public library, the Congressional library at Washington, the New York library, the National academies at West Point and Annapolis, Columbia University, N. Y., the University of California, Princeton University and the Museum of Fine Arts, Boston.

India and China require brief notice. Although many widely differing styles are to be found in India, the oldest and only true native style of Indian ecclesiastical architecture is the Buddhist, the earliest specimens dating to 250 B. C. Among the chief objects of Buddhist art are *stupas* or *topes*, built in the form of large towers, and employed as *dagobas* to contain relics of Buddha or of some noted saint. Other works of Buddhist art are temples or monasteries excavated from the solid rock, and supported by pillars of the natural rock left in their places. Buddhist architecture is found in Ceylon, Tibet, and Java, as well as in India. The most remarkable Hindu or Brahmanical temples are in Southern India. They are pyramidal in form, rising in a series of stories. The Saracenic architecture latterly introduced into India is of foreign origin.

The Chinese have made the *tent* the elementary feature of their architecture;

HARPER MEMORIAL LIBRARY, UNIVERSITY OF CHICAGO

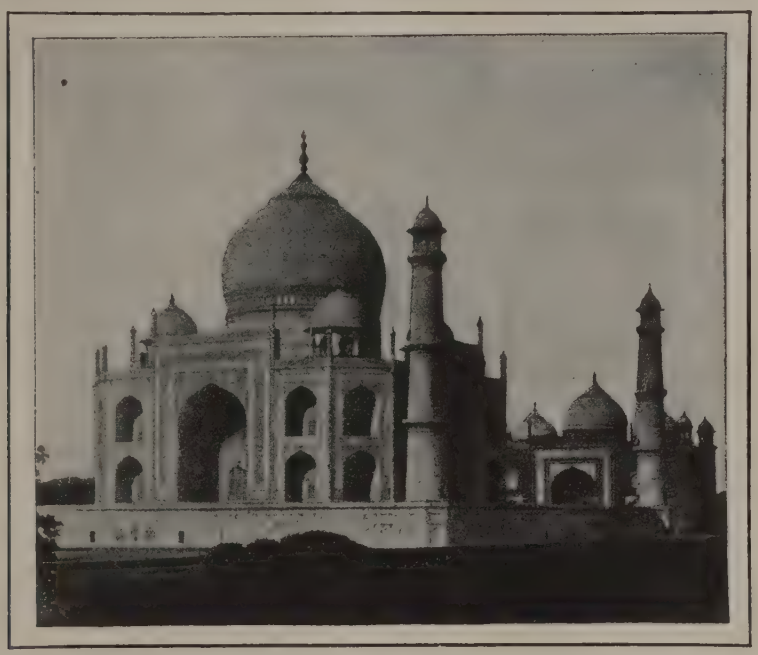
Fine example of English Gothic architecture, suggested by King's College Chapel, Cambridge, and Magdalen College and Christ Church, of Oxford, England. Designed by Shepley, Rutan and Coolidge, and built at a cost exceeding $1,000,000.

and of their style any one may form an idea by inspecting the figures which are depicted upon common chinaware. Chinese roofs are concave on the upper side, as if made of canvas instead of wood.

The imperial palaces are of great extent; consisting of a series of courts with galleries and halls of audience, beautifully painted. The temples differ greatly in form and size, but, in many points of architectural construction and decoration, they resemble the dwelling-houses of a higher class. The ordinary temples, or *joss-houses*, consist each of one chamber containing an idol. The Buddhist temples are larger and more elaborate, consisting of a vestibule, which leads to courts containing temples, sometimes two stories in height, in which are seated colossal images of Buddha.

The pagodas, which form a conspicuous feature in Chinese scenery, are either monumental records, or are intended for the reception of some relic of Buddha. They are generally octagonal in form, and nine stories in height, and surmounted by a conical roof, from which an ornamental pole arises. Each story is less in size than the one below it, and is surrounded by a balcony, from which a sort of penthouse projects, ornamented with bells at the corners. These pagodas are built of brick, and the exterior of some of them is coated with porcelain tiles.

The most famous architectural structure in India is the Taj Mahal at Agra, a splendid mausoleum of the seventeenth century built by the Emperor Shah Jehan to his favorite queen.



TAJ MAHAL, AGRA, INDIA

Famous marble mausoleum erected by Shah Jehan to his wife, Mumtaz Mahal. 20,000 men were employed on the work for 22 years at a cost of $15,000,000. It was built by Hindustan artists about the middle of the 17th century, and is inlaid with jasper, agate, cornelian, and other precious stones.

SCULPTURE.—While the term "Sculpture" would strictly, refer only to works carved or cut by hand in some solid substance, it is extended to include all plastic forms, cast, moulded, hammered, carved or engraved; everything, in fact, where a surface is changed by man's intervention directly or indirectly.

Materials. — Almost every imaginable material has been used, the most popular being gold, silver, bronze, ivory, all kinds of marble, stone, wood, precious and semi-precious stones, clay, enamel, wax, plaster. Sometimes several materials are combined. In the so-called chryselephantine sculpture of the Greeks, some parts of a statue were of gold, others of ivory. In Limoges enamel there are portions where the precious metals are not enameled. In many mediæval and Renaissance wood-carvings the wood surface is entirely concealed by a thin coating of plaster which in its turn, is colored; silver was often gilded; stone and terracotta coated with stucco.

Polychromy.—We are so accustomed to a colorless sculpture in marble and stone, that we forget how large a part was played in the past by polychromy or the custom of giving a colored surface to sculpture. This was particularly the case among the Babylonians, Egyptians, Assyrians, Persians and early Greeks. It even survived through the best Greek periods, and was continued by Etruscan, Roman, mediæval and Renaissance art. Of course, most of this coloring was evanescent, when exposed to the weather; and this makes it difficult for us to understand exactly how a great deal of sculpture looked when it came from the artist's hand. One method was permanent, the glazed and colored terracottas. The lions and other animals and figures built up of enameled tiles in relief, which have been found at Babylon, Susa and Khorsabad show how familiar this method was to the ancient Orient. The most famous later examples are the terracottas of the Italian Renaissance called "Robbia" ware. Many mediæval and Renaissance ivories, woodcarvings and stuccoes also preserve a rich coloring. The polychromatic remains of Greek sculpture are, naturally, much less well preserved, but there is enough to show that brilliant and heavy coloring was used at an early date especially in architectural sculptures. As soon as marble replaced stone it was not necessary to stucco and paint the entire surface and the polychromy was gradually restricted to patterns and borders, to shading the eyes, the hair and other details. The interesting statues of priestesses found on the Athenian Acropolis, after being buried there since about 490 B. C., show the most exquisite of the early coloring; while the so-called *Sarcophagus of Alexander* in Constantinople is the best preserved example of the latest and most delicate work. Even so great a painter as Nikias was accustomed to complete the surfaces of the masterpieces of Praxiteles.

Surface Treatment.—There is great variety in the treatment of surfaces, from sculpture in the round, at one end, to intaglio at the other. In the process of intaglio or incavo, used particularly in precious or semi-precious stones, the design is excavated and often reversed. Sometimes the design is merely scratched or outlined in the surface, as in Greek and Etruscan bronze mirrors or jewel cases. Next comes work in which the back-ground is only slightly lowered (stiacciato), the figures being kept flat, with cameo-like unreality, mainly in connection with figures in higher relief in the same composition.

Low relief follow, used singly or together. In early work, whether Oriental or Greek, it was the custom to carve all figures on the same plane. The Romans added the idea of combining figures on different planes in a single composition in which the figures in the foreground are so nearly detached as to be held only by one or two members to the figures behind them, giving practically the effect of statuary.

Statuary and sculpture in the round is where the surface is free standing on all sides. Its most perfect embodiments are of course the equestrian or other statues that stand out on pedestals, to be viewed from any point. But the majority of such works in the past have been made to stand against some background, in a niche, in the gable of a temple, the portal of a Gothic cathedral, and the like, and were often left unfinished in the parts that could not be seen. It is curious that statuary should be both the most clumsy and primitive and again the ultimate and most perfect form of sculpture. The stiff Babylonian seated figures, the miraculous wooden images of the prehistoric Greeks, the puppet-like Virgins with the Child of the Romanesque middle ages, are the least skillful products of their respective ages. And yet, at the other extreme, the majority of masterpieces of Greece and Rome, Gothic and Renaissance, are statues either single like the *Phidian Zeus* and *Athena*, the *Hera of Polyclitus*, the *Aphrodite*, or a group like the *Laocoon*, or *Praxiteles*. Nothing in relief can equal such works as the *Venus of Milo* or Verrocchio's equestrian statue of *Colleoni*.

Mission of Sculpture.—Sculpture as embodying human form, has a triple mission: to express plastic beauty of form; to embody thought and feeling; to act as a chronicler of facts. It was not always able to carry out this triple mission; in fact it did so only during three periods, the Greco-Roman, the Gothic and the early Renaissance. The particular genius of sculpture assigned to it certain limitations. It could not, of course, tell a story with

the same detail as painting. On the other hand it could embody better than painting the deeper, broader moods of typical humanity. Consequently sculptors are often tempted to resort to figures embodying general ideas or types, such as allegorical and symbolic figures of Peace, of War, Labor, Commerce, Charity, the embodiments of Virtues and Vices, Occupations and Trades, Inventions and Beliefs. In our day this tendency has produced many insipid works.

At the other extreme is sculpture turned into pictorial channels: this was mainly in relief work, especially when the Romans had, as we have already seen, opened up the way by using a multiplicity of figures in several planes. *The Farnese Bull* group is an example of it in statuary. The so-called Alexandrine reliefs of Greco-Roman art, with their backgrounds of landscape and architecture and the spiral narrative of Trajan's column lead up to such elaborate compositions as the early Renaissance scenes in Ghiberti's *Gates*.

Periods.—Considering its broad historic lines we find that sculpture has had a history of nearly six thousand years. For the first three thousand five hundred years, from about 4000 to 500 B. C., it remained a form of narrative, an embodiment of certain facts or persons. It was instructive but not intended to convey any pleasure. It had little or no æsthetic value. Such was the sculpture of Egypt, Babylonia, Assyria, Persia and other Eastern nations.

In about 500 B. C., the Greeks began to make of it not only a vehicle of thought and feeling but an end in itself, a thing of beauty and interest. Sculpture then became in every way an art. The Romans continued this idea, with variations and a gradual loss of beauty until the final downfall in about 300 A. D. Sculpture had therefore been of æsthetic value for about eight centuries. It then lapsed into being once more an embodiment of fact, but more than in the earliest stage of its history, it was used to express thoughts and beliefs, though with infirmity of technical ability. This æsthetic eclipse, this dark age, lasted for nine centuries from about 300 to 1200 A. D.

Then, with the Gothic revival came a new birth similar to that of Greece, combining in the same way love of nature and artistic imagination, perfection of technique and a wealth of ideas to be expressed. Sculpture once more was complete and practiced for its own sake. During the Renaissance there was a decay in imagination and an emphasis on naturalism. Types were displaced by individuals. Post-Renaissance work becomes somewhat artificial and spectacular, leading to the simplicity of the neo-classic revival as a reaction. But, dissatisfied with its cold artificiality, the leading sculptors of the nineteenth century have in various different ways sought the secret of plastic expression mainly through naturalism, simplicity and occasionally by a forceful realism that is inspired as if by the primitive passions of earth.

Egypt.—Aside from the crude figures of prehistoric animals outlined on rocks by cave-men, the earliest sculptures are those of Egypt. To the uninitiated there is a monotonous uniformity in Egyptian sculpture during the four thousand years of its history; but a real vitality appears at two periods,—at its beginning and during its closing stages under the Ptolemies. This shows itself especially in portraiture. The heads may be rigid but they are certainly realistic; this realism was less a matter of art than of religion. It was believed that the soul of the deceased would return to inhabit at intervals the body, and in case anything should have happened to the body, portrait statues were provided with heads so realistic that the soul would be sure to recognize it. Hence the fanatic pains to reproduce every smallest peculiarity. Hence the filling of the chamber tombs of Egypt with such statues. With the waning of religious belief came also a waning of this realism. The famous squatting Scribe in the Louvre, the kneeling washwoman, and the Mayor of the Village at Cairo, are perhaps the most extraordinary works thus far found in this style.

But Egyptian sculpture may also be credited with the ability to express an idealistic impressiveness of an impassive type in royal and divine figures. The statue of King Khufu, of the Great Pyramid, at Cairo, and the colossal rock-cut statues at Ipsambul are plastic embodiments of the genius of Egypt and rise to the dignity of works of art. They are the exceptions. But, while in these seated figures we do not notice the ability to express the human form, this is clear as soon as the sculptor attempts to put figures in movement or carve them in relief. Of course there is decorative value and delicacy of detail in Egypt relief work, especially in the Middle empire, but the ignorance of perspective and action are lamentable.

Babylonia, Assyria and Persia.—Although sculpture commenced in Babylonia almost as soon as in Egypt,—not long after 4000 B. C.,—it never equalled it either in amount or value. The sculptors suffered from lack of adequate material, and the hard diorite that was imported gave an even more disagreeable stiffness to statuary than was the case in Egypt. The statues from Telloh in the Louvre are typical of this fault.

In Assyria, Babylonia's successor in the artistic leadership of Western Asia, numerous quarries of soft limestone gave an opportunity to develop relief sculpture, and to spread the exploits of the Assyrian Kings on the inner palace walls, in the same way as the walls of tombs and temples had been covered in Egypt. While sculpture is still in the main narrative and still ignorant of perspective and free movement, we must confess to receiving a distinct impression of force from the muscular and energetic Assyrian warriors and of animal vitality from the hybrid monsters who guard the palace-portals, winged bulls and lions. The Assyrians were great sportsmen and hillmen. They therefore knew and studied animal life and could reproduce animals far more faithfully than men. The lions, wild asses, deer and hounds that we see in the royal hunts, wounded, slain or led, are full of character and realism. In fact, in the opinion of some critics, one must jump twenty-five hundred years to the modern work of Barye to find superior understanding of animals in action. One wounded lioness, with paralyzed spine, dragging herself along, is famous.

All the other oriental peoples practiced sculpture to a certain extent, but among the numerous works of Persian, Hittite or Phenician artists, nothing emerges as of especial interest. Nearly everything is a more or less lifeless imitation of Babylonia and Assyria, or, occasionally, of Egypt.

Greece.—In Greek sculpture there are four periods: (a) the archaic style, before c. 480 B. C.; (b) the grand style of the fifth century; (c) the beautiful style of the fourth century; (d) the dramatic and picturesque style of the Hellenistic age.

First Period—The Greeks long carved symbols, far inferior to Oriental art; formless statues in wood or stone to be worshipped, or lifeless reliefs. But during the sixth century their plastic sense was stirred. Two distinct racial schools were formed, the Ionic, originating in Asia Minor, and the Doric, with its centre in Greece, in the Peloponnesus. We are accustomed to these styles in architecture, they were quite as real in sculpture. The Ionian school developed relief work and the draped female figure, and showed poetry and imagination in types of gods, heroes, legends and myths. The Dorian school studied particularly the nude male figure and statuary, were greater realists, and perfected the athletic type. Both schools made an attempt at portraiture and realism in details, which proves considerable power of observation, though as yet there was no sense of life. It was an age of incubation. The most interesting exceptions are those fascinating priestesses from the Athenian Acropolis, each a different character study. The curious smile on some of them, with the up-curved lips, gives an almost Leonardesque aspect to their faces, which make up in quaintness what they lack in mystery. Their polychromy is the most artistic and best preserved of the archaic age.

The famous statues of the gables of the Temple of Ægina, now at Munich, are the best works of the pure Doric school. At the west end was the Fight over the body of Patroclus, and in the east the earlier expedition against Troy. Here the attempt is made to bring the athletic single figures into a composition in the awkward triangular space formed by the gables. The fallen helmeted warrior is full of repressed anguish, the stooping figure reaching out with both arms, like a football quarterback, is full of eagerness. All the figures are those of athletes trained to the minute, and the effect is of bronze statues.

The recent discoveries at Delphi have given superb works of both schools to this age; the unique great bronze charioteer, purely Doric, and a series illustrating the development of relief sculpture during the century preceding the Parthenon (550–450). There are friezes and metopes of the treasury-buildings of various Greek cities built within the sacred precincts; especially interesting as a prototype of the Parthenon is the frieze of the treasury of Siphnos. These are mainly Ionian.

The reaction against the stiffness of the early athletic figures, with arms glued to their sides, already evident at Aegina, is emphasized in the group of the tyrannicides, Harmodius and Aristogiton, carved by Critius and Nesiotes, of which a copy is in Naples. They are rushing forward vehemently to strike the tyrant Hipparchus. This vehemence is itself eliminated in the works of the greatest predecessor of Phidias, Myron (c. 470-460 B. C.), in which mastery of physical form in action is complete and yet repressed.

His two masterpieces, of which copies remain, are the *Discobolus* or disk-thrower bending low for the throw, and the *Marquas* (Rome, Lateran), starting back as he sees the flutes of Athena. All archaicisms have disappeared except in such minor details as the hair. Yet the grand style does not yet exist, because Myron was a materialist, and great art required the creative imagination of a Phidias. Perhaps the charming *Girl Runner* in the Vatican shows a similar mastery of the trained female form at this time.

Another preparatory work was the gable sculpture at the temple of Zeus in Olympia, excavated by the Germans; and representing at one end a fight between Lapiths and Centaurs, and at the other a famous chariot race. The grouping and posing are freer than at Aegina, but the workmanship is disappointing. Apparently the artists, said to be Peconius and Alcamenes, relied upon polychromy and distance. The stately Apollo in the center has traces of archaicism; while the aged reclining seer is a realistic portrait. It is archaic art made supply and human before the advent of the Phidian types. This is even clearer in the metopes, of which *Heracles and Atlas* is the most beautiful, and *Hercales and the Bull* the most dramatic.

Second Period.—The decorations of the Parthenon are the greatest works of sculpture of any age; they are nearly all collected in the British museum. It is impossible to say whether Phidias himself actually handled any part of them, or did more than plan them; but as all his famous masterpieces, such as the colossal statues of *Athena, Parthenos* and the *Olympian Zeus* have disappeared, they are our only clue to his style. The small scenes in the metopes are mainly the earliest part, and have archaicisms and irregularities of execution. The two pediments stand closest to Phidias. One had the Birth of Athena, the other the Contest between Athena and Posedion for Athens. The most wonderful of the remaining male nude figures are the *Theseus* and the *Cephisus*, both reclining; while of the females the group of the *Three Fates* is perhaps the grandest in existence, in its majestic beauty, in the drapery, minute yet broad, free yet clinging, in the heavy yet supple forms, showing so translucently, in Ionic softness.

The frieze representing the Panatheniac procession in honor of Athena had an average relief of only one inch and a half, but the extraordinary modeling makes the figures appear to project much further and this effect is increased by the skilful overlaping managed through inclining the planes. The most beautiful of the figures in repose is the group of three gods from the east frieze, still in Athens; while it is difficult to select one slab as more perfect than another among the graceful groups of Athenian horsemen and maidens. They are the embodiment of idealized humanity expressed by an art as subtle in the rendering of personality as of form and texture.

The sculptures of the Theseum at Athens are of about the same age but far inferior. There are two other almost contemporary works at Athens worthy of the Parthenon. They are the grandoise Caryatid figures supporting the porch of the Erechtheum, and the Victories of the balustrade of the temple of Nike, a graceful and voluptuous development of the *Three Fates*, with even transparent drapery. The *Victory binding on her Sandal* is a masterpiece.

Outside Athens the most important remaining work is the frieze of the temple of Apollo near Phigalia (c. 430 B. C.), now in the British museum. The subjects are the popular fights between Greeks and Amazons, Centaurs and Lapiths. Though the sturdy figures are full of action and variety the execution of the drapery is superior to that of the nudes.

There was another great master in the Fifth century, Polyclitus. Being Dorian rather than Attic he naturally excelled in statuary. His masterpieces are the *Diadumenus*, a victorious athlete binding the fillet around his head and the *Doryphorus*, an athletic holding a spear, who embodies in his square, massive build the canon of proportions for the human body which Polyclitus established as a rule to be followed by all sculptors. The bronze originals are lost, but several Roman copies in marble, more or less accurate, remain in Naples, the British museum, Rome, etc. Another notable work was a wounded Amazon, of which the best copy is in Rome (Vatican). His colossal statue of *Hera* (Juno) was as much admired as the *Olympian Zeus* of Phidias, and the bust of the Ludovisi Juno in Rome and another in Naples, have been supposed to reproduce its noble head.

Third Period.—Praxiteles, about 350 B. C., introduced a new ideal of grace and beauty, a different feeling for textures and postures, a more humanized and less lofty aesthetic ideal. This humanism was heralded by Cephisadotus, in his *Irene and Plutus* (Peace nursing Wealth) preserved at Munich in the marble copy of the bronze original. The most beautiful of Praxiteles' statues was considered by antiquity to be the *Aphrodite of Cnidus*. Of the lost original the best copy is in the Vatican. It was the most famous of Greek nude Aphrodites; soft and voluptuous yet broadly developed, shrinking yet conscious of her beauty. She has the melting, dreamy gaze characteristic of Praxiteles. Almost as famous was the *Satyr*, of which an admirable torso is in the Louvre, but the best copy as a whole in the Capitoline (Rome), where he rests against a tree-trunk with left hand on hip, careless and playful. There are many less artistic replicas. But there remains one original by the hand of Praxiteles himself, which though less famous in antiquity, is far more precious to us as it gives his own handling, which was so great a part of his art. It is the statue of Hermes holding the infant Dionysus, found at Olympia, a masterly combination of strength and softness, of sketchiness and finish. The feeling for texture is equally exquisite in flesh, hair and drapery.

Another sculptor, quite as great as Praxiteles and as dramatic as Praxiteles was self-poised, was Scopas. He incarnates the spirit that heralds the coming age. He took part in the most ambitious sculptural work of the times, the Mausoleum of Halicarnassus, built after 351 B. C. Many superb pieces are in the British museum, especially the notable and spirited colossal statue of Mausolus himself and the supposed Arthemisia. The two friezes, that of the chariot race and that of the Amazons are interesting to compare with such fifth century work as the Phigalian frieze. They are less crowded, more delicate and lithe. The museums are full of statues of the schools of Scopas and Praxiteles; various types of Eros, of Satyrs and Fauns, of Aphrodite, various portrait statues of poets and philosophers; various types of gods and goddesses, must be referred to this age, which was the golden period for well poised, beautiful, calm humanistic types. There was also, however, the dramatic and pathetic side to this art, represented especially by Scopas, and there are copies of one group of statues in particular that render this spirit splendidly; the statues of Niobe and her children being slain by Apollo and Arthemis. The best are in Florence. Among the numerous figures the son of Niobe with up-stretched arm and sweeping drapery and Niobe herself protecting her youngest child, are especially full of pathos. Among single figures the Meleager of the Vatican is typical of Scopas.

Latest of the fourth century masters is Lysippus, a prolific and popular artist who headed the late Dorian of Sicyonian school, reviving the polyclitan idea of a canon of the human figure, which he made slenderer and with smaller head. He was also an impressionist. The best copy of his masterpiece, the *Apoxyomenos*, or the Athlete cleaning himself with a strigil, probably embodies his canon, with its light pose and agile strength.

The most beautiful work of the end of this age, and the best preserved work of Greek sculpture, is the *Sarcophagus of Alexander* from Sidon, in Constantinople. Its hunting and battle scenes between Greeks and Persians are even more picturesque than the Amazon frieze of Halicarnassus, and the effect is enhanced by the perfect condition of the surface, on which every detail of delicate polychromy remained, to show us how the hard whiteness of the marble can be eliminated with perfect art.

Fourth Period.—The conquest of Alexander assisted in spreading Hellenic sculpture throughout the East and changed its character, by creating new centers of artistic production. Athens and, in fact, Greece itself ceased to lead. The principal schools were at Alexandria, Rhodes, Pergamon, and other cities of Asia Minor. Sculpture became more pictorial, dramatic, realistic. Landscape, portraiture, genre child life, colossal figures and groups, historic scenes and theatrical episodes, all became the fashion. The placidity, ideality and grace of the previous age were lost. Many among the best known Greek originals and copies belong to this age. Conspicuous is the *Apollo Belvedere* (See p. 1066), a Roman copy in marble of a bronze Greek original of Apollo as an archer, a graceful figure which became famous at a time when few Greek originals were known. The statue of Apollo's sister, *Artemis* (Louvre), as huntress is a companion to it. To continue examples of types of the Olympian gods, the famous Otricole head of *Zeus* (Vatican), popularly thought to represent the Phidian Jupiter, is a splendid conception of this time in a Roman copy. There are two spectacular figures of Hercules, the originals of which are of the school of Lysippus: one is the *Farnese Hercules* (Naples), an exaggerated muscular figure in repose, the other the much admired *Torso Belvedere* (Vatican). Of the figures of Venus or Aphrodite, the foremost and the only Greek original is the wonderful *Venus de Milo* (Louvre).

APOLLO BELVEDERE

In the Vatican, Rome. This famous statue is generally ascribed to the school of Scopas. It is thought to have been brought from Greece by Nero. Lubke calls it the most brilliant piece of sculpture of ancient times. "Too fair to worship; too divine to love."

which rises above the peculiarities of our age, and is a thing of such serene beauty as to stand on a level with even the Parthenon gables. The exquisite handling of flesh and drapery and the grace of the pose are subordinated to the artist's conception of the goddess as super-woman. There could be no greater contrast than the self-conscious and meretricious Venus de Medici of the Ufizzi (Florence), perfect as it is as a study from nature.

STATUE OF THE VENUS OF MELOS

Now in the Louvre, Paris. One of the most perfect masterpieces of Greek sculpture; by an unknown genius about 200 B. C.; was discovered on the island of Melos, 1820.

A Greek original dating from the very beginning of this age is the statue of *Victory* found at Samothrace (Louvre), a most impressive and theatrical study of drapery in violent motion. This and similar works, and the two famous groups, the *Laocoon* (Vatican) and the *Farnese Bull* (Naples), are all derived from the school of sculpture at Pergamon.

Pergamon in Asia Minor, was the seat of the Attalid Kings. Its greatness was due to Attalus (241 B. C.), whose victories over the hordes of Gauls were commemorated in a group of bronze statues. The intensely dramatic figure of the *Dying Gaul* (Capitol, Rome) is an early marble copy of one of these masterpieces, and a realistic study of a barbarian hero. Another copy from this series is the Gaul slaying himself and his wife, rather than fall a captive (Ludoviso, Rome). Some small single figures of dead warriors in Naples, so beautiful in their realism and repressed vigor, are copies of other works dedicated by Attalus at Athens. A fighting Persian in Rome (Vatican), resting on one knee, is worthy of Michelangelo in his pose.

THE DYING GAUL

In the Capitol, Rome. By an unknown Greek sculptor. Found in the gardens of Sallust. The right arm was restored by Michelangelo. Hawthorne says: "I do not believe that so much pathos is wrought into any other block of stone." This statue was long called the "Dying Gladiator."

The direct successor of Attalus, Eumenes, built at Pergamon the great *Altar of Zeus*, one of the seven wonders of the world. It was surrounded by two carved friezes, large parts of which have been excavated and are in the Berlin museum. The larger frieze represents the Battle of the Gods and Giants. It is for the Hellenistic age what the Parthenon sculptures are for the fifth century. The two finest sections are those where Zeus in one case and Athena in the other, are engaged in combat. There is an exuberant and massive vigor about the figures, a restlessness and intricacy, a contrast of light and shade, a clashing of lines in the composition that, combined with the size of the figures make it quite overpowering. The relief is so high that the figures are almost detached and have the effect of gable rather than of frieze sculptures. For nearly three centuries this great Pergamine altar influenced sculpture.

This is shown in the spectacular group of the *Laocoon*, by Agesander and two other sculptors of the Rhodian school in about 100 B. C. We see in this struggling, writhing mass, an artificial form of the dramatic art of the earlier Pergamenes, in which everything is sacrificed to technical virtuosity. It corresponds to the late Barocco style of Bernini after Michelangelo. To the same school and date belongs the group of the *Farnese Bull* in Naples representing the punishment of Dirce, fastened to a bull by her step-sons. It was carved by Apollonius and Tauriscus. It is wonderful in overcoming the difficulties of a colossal group carved so as to appear equally well on all sides.

Portraiture was also developed. There are a number of characteristic heads of Alexander, conspicuous for his leonine locks, his deep-set eyes and his neck drawn down to one side. In the Naples museum are many bronze heads from Herculaneum of this age, some suppose to be portraits of the Ptolemies; others are of the famous Greek philosophers and poets. The boy with a goose in the Louvre, after Boethus, and similar pieces in the Vatican, show the genre work that was so popular in Alexandria. The picturesque element which the same school introduced appears in many reliefs, such as that in the British museum of Dionysus and his tipsy followers, on his way through the streets to visit a dramatic poet.

Rome.—Added to the patrimony of sculpture certain invaluable new elements. These were principally in portraiture, in historic relief sculpture in equestrian statuary and in decorative sculpture. This is certainly a wide enough field.

Portraiture. In almost any of the large museums one is struck by some characteristic Roman bust or portrait statue. Ancestor worship, the use of realistic wax figures and painted terracotta portraits so common in Republican Rome, explain why under the empire portraiture in marble and bronze attained to a perfection never equalled before or since. It is a realistic art in which there is enough of idealism to save it from being a mere photograph of nature. This art kept its excellence for nearly three centuries. To compare the seamed and gnarled old man, with near-sighted eyes in the marvellous head of the time of Cicero, in figure with the serene head of Augustus from his statue in the Vatican, is to see the two sides of this art in its earliest stage. The technique is perfect but unobtrusive. One can gain a clearer idea of Roman character from these heads than from reading Latin literature.

During the century after Augustus there was a gain in realistic power and smoothness of execution, which is well shown in heads of these equally rotund and unintellectual Emperors Vitellius and Vespasian, where the treatment of flesh textures is more perfect and brilliant. In the Vatican the head of a colossal seated statue of the Emperor Nerva, nearly a half-century later, is less perfect, perhaps, in workmanship, but is extraordinarily vivid in its portrayal of a man full of plans but without the strength of character to execute them under difficulties. The weak mouth, dreamy eyes and seamed forehead are those of a disappointed optimist. Then come numerous excellent portraits of Trajan and Hadrian before the art begins to stiffen. Even then there are remarkable exceptions, such as the heads of Caracalla, a masterly transcript of unbalanced impetuosity and vicious atavism. How different all this is to the Greek conception of concealing the emotions under a serene and perfectly balanced exterior, and of giving to plastic effects the form of types instead of individuals!

Many of the portraits belong not to busts but to life-size or colossal statues,

in which one may say that Hellenic and Roman peculiarities were combined. The emperors were represented often as gods, and as nude or slightly draped figures of Hellenic type. They were also given as orators and benefactors, in statues of a kind similar to those of Sophocles, or Demosthenes produced by later Greek art. But they also appear as generals, in full military panoply, like the Vatican Augustus, and this form is typically Roman. It is a general fact that there never was a time in the history of sculpture when so many honorary portrait statues of persons of every sort, men and women, were erected. The squares of every town, the basilicas and porticos, the villas, the baths, the theatres and hippodromes, were all peopled with hundreds of these works, so that we may say that the Romans throughout the world were surfeited with sculpture to an extent unknown even to the Greeks.

AUGUSTUS, AS GENERAL,
in Vatican, Rome. A superb portrait statue somewhat idealized. It was found, in 1863, at the Villa Livia, near Rome. The finest imperial statue that has come down to us.

Historic Relief Sculpture was the second peculiarly Roman field. This was made possible by the new form given to work in relief. Roman artists revolutionized the art. Their realism seized on sculpture as a medium for expressing national and political life as well as mythological scenes. They attempted at first to do this without radically breaking away from Greek methods. We see this in the reliefs covering the marble parapet that encircled the famous Altar of Peace erected in the Field of Mars at Rome in 12 A. D. to celebrate the pacification of the world by Augustus. This was the greatest work in its class, covering a length of about one hundred and fifty feet. The procession on its two unbroken sides—the other two have doorways—has been called the Roman version of the Parthenon frieze and is a fair type of the Roman individual, realistic way of treating a theme. Compared to the Hellenic symbolism, that left out the personality of Pericles and the other Greeks whose position corresponds to that of the Romans, we see here the imperial family headed by Augustus on their way to the great commemorative sacrifice.

Out of this graceful semi-Hellenic Augustan style it took a century to develop what was characteristically Roman, forceful, dramatic, picturesque and story-telling. A half-way stage was marked in 81 A. D. by the well-known reliefs on the Arch of Titus, with its triumphal procession and the carrying of the seven-branched candlestick. It was in 114, in the reliefs of the Arch of Trajan at Beneventum, that the final stage was reached and perfectly expressed. In them nearly all the principal events in Trajan's reign were represented: his triumph over the Dacians, his Eastern wars, his army reforms, his efforts to restore prosperity by the encouragement of agriculture and commerce. In order to tell these stories effectively the sculptor has adopted the method of placing his figures in three planes, in perspective, one behind the other. The figures in the front plane are sometimes almost detached, being held by an arm so that they have almost the effect of statues; while the figures in the background are almost flat and sink back. This gave the sculptor an opportunity for the greatest variety of pose and direction, of groupings and composing. There is great play of light and shade and this helps to give dramatic effect. To us this may seem almost a commonplace, but until then these had all been unknown factors in sculpture. So carried away were the Romans of this time by the storytelling possibilities of relief-sculpture that the same men who decorated this arch, carved a continuous spiral band that unwinds itself on the column of Trajan in Rome, the entire history of his two Dacian wars. It is in very low relief and local touches are given by details of architecture and landscape; while originally its effectiveness was increased by brilliant coloring.

Equestrian Statues were used by Greek sculptors before the time of Alexander, whose figure on a prancing steed, engaged in battle, was a famous work often copied by Roman artists. In the Naples museum there are two bronze Equestrian statues of men of the Augustan age named Balbus, found at Herculaneum: they sit well and the horses are more graceful and Hellenic than the heavier animals that were modelled by later Roman artists. The colossal bronze Marcus Aurelius in the square of the Capitol is the most famous Equestrian statue in the world, and served as model for many artists during the Renaissance and later. It is a powerful work, and dramatic in a somewhat heavy style.

Decorative Sculpture.—Quite as interesting as innovation was the creation of a varied system of decorative sculpture lavishly used and fantastically varied. Greek carved decoration had been so simple and serene that we did not need to consider it in connection with the history of sculpture especially as the line of demarcation between figures and ornament had been strictly maintained. But with Roman art, encouraged by late Hellenistic suggestions, there came a rank exuberance, a richness of decorative work, a charming mingling of figures and ornament. What could be more exquisite than some of the carved marble vases and altars in the Vatican museum or than many of the pilasters that served as models for the fanciful designs of the Italian Renaissance.

Even figures alone were made to serve a decorative purpose, as in the charming stuccoes in the walls of certain tombs on the Via Latina and in the Terme museum at Rome. The artist would sketch in the wet stucco on the walls with a hand admirably sure, little genre scenes that have never been surpassed in delicacy and effectiveness.

The history of Roman sculpture has not yet been written but its outlines are clear. Semi-Hellenic and Eclectic in the age of Augustus, it assumed increasingly Roman characteristics until the time of Trajan, though Attic grace and Hellenic idealism often prevades it. Hadrian, for a time gave it an increase of Greek characteristics, but under Marcus Aurelius there was a distinctly Roman reaction, with an infusion of the dramatic traits of the Hellenistic school of Pergamon and Rhodes. The free use of the drill helped to cheapen dramatic effects and there was a gradual decline during and after the reign of Septimius Severus. At the close of the third century, under Diocletian, figure sculpture has become lifeless and almost puppet-like.

Early Christian and Mediaeval.—It was the natural result of the decay of Roman society rather than enmity to sculpture that eliminated it from the field of art at about the time when Christianity became the religion of the State under Constantine. The friezes of the arch of Constantine,—about the only parts of its sculpture that was not robbed from the earlier monuments—and the figures of Consuls of this time found in the Roman Forum, show that the growing incapacity of sculptors is a sufficient explanation, without bringing in the idea that the Christian church proscribed the art because it so frequently represented the "idols" of paganism. The decay was general throughout the Roman world, both East and West.

For a short time the Christian sarcophagi were able in their reliefs to tell in a mechanical way the story of Christian belief in the Bible and immortality, but even this phase, which left sculpture without æsthetic value and on the same storytelling plane as in the pre-Hellenic days of Egypt and Assyria, came to an end in the fifth century. Painting was then used alone to teach the people the facts of faith and history.

After this, sculpture remained in eclipse for nearly seven hundred years, while the world went through many changes: the crumbling of the old world, the invasion of the northern races, the rise of Mohammedanism, and the gradual growth of the nationalities and the culture of European peoples under the guidance of the Church. Architecture and painting fluctuated yet survived; but sculpture did not rise above the level of industrial carving until, in the twelfth century, the later Middle Ages awoke once more to the joys of æsthetic beauty, in a manifold and glorious effort to rejuvenate the world. It was merely one phase of the combination of hard practical work and self-denial under the guidance of idealism which ruled the twelfth and thirteenth centuries and led to the crusades, the great Monastic movement, the age of chivalry, and the formation of States and communes.

Gothic Style.—It was at the close of this age we call "Romanesque" that sculpture, after having been reduced to decorating book-covers and reliquaries, once more assumed a really monumental role, and began an evolution that has no parallel except that of Greece. Even the Greeks and Romans has succeeded less completely in making of the plastic art an integral element a logical

coadjutor of architecture. This happened when the new art reached its efflorescence in the Gothic style of the thirteenth century. This new union was fundamental because the Gothic architects were usually sculptors as well, and not only furnished the drawings for a cathedral but carved its portals or its capitals with their own hands. By doing this they went further than either the Greek or Renaissance artists in a practical amalgamation of the two arts.

France was not only the birthplace of the Gothic style but established its purest and best forms. The new sculpture was used to express the knowledge and the ideas then current throughout Europe. The age was one of extraordinary culture. Universities were making education quite general; encyclopaedias were being written; a multitude of teachers were trying to give ideals and facts to the masses. Artists and men of letters were aiding each other in the work. The propaganda among the masses had to be carried on largely through the eyes, and as the cathedrals usually were the one place where all the people congregated not only for worship but for plays, for fairs, for public and political meetings, the cathedrals were used as the means for instructing the masses. Their walls and portals were carved with figures and relief which systematically summed up the encyclopedic teaching—all the knowledge of the time. We see in thousands of figures a system of doctrine and morality explained and illustrated; the history of the world set forth; the law and the various phases of labor, both manual and intellectual. **"Man, know thyself and thy God."**

It took more than a half century to achieve this result. The figures set in the old porches of the cathedrals of Chartres and Le Mans have a similar architectural stiffness to an archaic Apollo or Artemis. They are intentionally elongated and straightened in order to give them almost the function of a column or a caryatid. In some faces we even see a reflex of the archaic smile. The artist is at the same pains to reproduce exactly the details of the face and costume of his models. He aims at a portrait rather than a type and like the Greek sculptor before Phidias, he misses the sentiment of life. The statue of a queen from Corbeil now at St. Denis, illustrates this stage. This realistic phase was just as necessary with the French as it had been with the Greeks in order to enable the artist by careful study and observation to attain to that perfection of technical execution and knowledge of nature that will let him use his art freely. The sculptor is once more a man with a mission as he was in Greece in the fifth century B. C. Each cathedral is a museum of masterpieces, beginning at Notre Dame in Paris and continuing at the cathedrals of Chartres, Rheims, Amiens, Auxerre, Troyes and many more.

The perfection of the early French style is shown in the exterior of Rheims cathedral. We have here a breadth of style, a grand treatment of drapery and a majesty of pose that reminds of the Parthenon gables. At the same time there is the greatest versatility. A sense of humor is shown in many heads, as in the St. Joseph, and a capacity for grotesque effects that is quite Leonardesque, appears in many of the corbel masks. One of the apostles recalls an antique philosopher or poet—a Sophocles or Aeschines; a St. Elisabeth is like a Juno. The figures are superbly posed and we must believe that they were often studied from the nude and draped afterward,—a thing which critics have thought was not done until the middle Renaissance. Another Greek analogy is that the leading Gothic masters sought to establish canons for figured sculpture, in the same way as had been done by Polyclitus and Lysippas. These canons were geometric and based on triangles or rectangles, and were more elaborate than the Greek because they took account of all the main poses of the body.

While it is true that most of the heads are rather types than portraits, there is an evident study of nature. For instance in the charming youthful head of the Virgin, and in the piquant angel at Rheims. This is even true in such works as the Saint Theodore at Chartres, a figure which may be considered the typical knight of the Crusades. Though the costume hardly lends itself to artistic effect, it is made charming by ease and grace of pose, by skilful play of light and shade and by perfect naturalness. It does not suffer at all by comparison with the famous statue of St. George by Donatello, which typifies the more self-conscious champion of the Renaissance. Some of the finest statues are those dividing the main portal. The "Beautiful Christ" at Amiens, and the severer one at Chartres, the dignified Virgin at Notre Dame, the smiling and coquettish Virgin at Amiens and the rather self-conscious Grande Dame at Rheims are all masterpieces. As a composition, one of the most symmetrical and artistic is the tympanum of the left doorway at Notre Dame, with the Resurrection and Coronation of the Virgin. Mannerisms and studied richness in drapery appear later in the century, as in the apostles at the Sainte Chapelle, and the sculptors became more and more artificial as the fourteenth century advances, until from the north, especially Flanders, comes a wave of realism and character study, which can be studied in the school of Burgundy, in the monuments of Dijon, ending in nearly 1500, with two masterpieces—the monuments of the Duke of Burgundy and the Pulpit called the Well of Moses.

Spain.—French artists carried to Spain their decorative system and subjects. There are fine portals at Burgos, Leon and Toro, in the thirteenth century and sculpture was more abundant here than in Italy or Germany: but though the designs were good, we seldom find the beauty of French work.

Germany. — The Gothic movement reached Germany from France quite as soon if not sooner than the corresponding architectural wave. Germany had begun an interesting use of monumental sculpture in the Romanesque age, especially in Saxony and neighboring provinces, and it was here that, in the middle of the thirteenth century, one finds the first works of real genius, with a mastery of technique and expression to rival the French works. These are the Golden Gate of the cathedral of Freiberg, the portals of Magdeburg cathedral and especially the statuary and portals of Bamberg, where the crudity of Germanic realism is modified. The most famous single figure is the Equestrian statue of the Emperor Conrad III at Bamberg. There is little of the French idealism or love of pure beauty, or creation of types; but rather a strong personality, sometimes artificial and clumsy. This art reaches great force in certain large figures in the choir of the cathedral at Maumburg, especially the twelve statues of the great nobles; bold, free, strong and full of life, they have all the qualities and none of the defects of German naturalism and are the most perfect embodiments of the feudal pride of the Saxons. Perhaps the finest are the Margrave Eckardt and his wife Uta. Their date is about 1270.

STATUE OF THE "SYNAGOGUE"
From the façade of Strassburg Cathedral. This façade was designed by Erwin of Steinbach, and is rich in sculptures after the French Gothic school. These sculptures are in stone.

A few years later we find at Strassburg Cathedral other great German masterpieces though in this Rhenish School, French influence is much more domi-

nant. Perhaps the earliest part is the extraordinary angels' pillar inside the transept, which is still archaic; and the most perfect are the two famous statues of the church and the Synagogue, outside the south transept. The Synagogue especially, with its gauze-like simple drapery, bent head and curving lines, is one of the most gracefully poetic figures conceived by the sculpture of any age. On the main facade the statues of the Wise and Foolish Virgins and of the Prophets are less perfect but very striking and dramatic. They show the approach of the rather exaggerated art of the fourteenth century. The grand style now disappears, the center of production shifts to Nürnberg, to Cologne, and Ulm.

Beside architectural sculpture the Germans were active in sepulchral monuments and shrines, which are better preserved there than in France, where the Revolution destroyed so much. Terra cotta and wood, also, were more generally used than in France, and here we can see more traces remaining of the polychromy which originally covered almost all Gothic sculpture.

Pre-Renaissance.—We usually speak of the "revival" of art, in the sense of an early Renaissance, as beginning in Italy during the thirteenth century, with Giotto in painting and Nicola Pisans in sculpture. Yet Italy was far inferior to France during the Gothic age in the amount and quality of her sculpture. Nicola Pisano, was her first great sculptor, and the famous pulpit in the Baptistery at Pisa, carved in 1260, his earliest masterpiece. In its fine bas-reliefs we see an interesting adaptation of Roman, Byzantine and French Gothic models. In the Adoration of the Magi, the Virgin is a Juno, the angel seems taken from some work of the Emperor Justinian. The figures have none of the Gothic vivacity and slenderness, but are majestic and heavy, and an occasional nude figure shows plainly the study of the antique. Another pulpit at Siena is the work of the master with the help of his son Giovanni and several scholars. Here enters a dramatic element which was developed by Giovanni, who is far more of a typical Gothic artist than his father: his pulpit at Pistoia, in S. Andrea, is his best. The great fountain of the square at Perugia is a joint work. Giovanni entered into the spirit of Gothic symbolism, as is evident in the caryatid figure of his pulpit for the cathedral at Pisa. He became overdramatic in his later works, but several of his statues of the Virgin with the Child are full of dignity.

This school of the Pisani spread over the entire peninsula. A spectacular work in the north, at Milan, is the shrined S. Peter Martys; another at Bologna, is the shrine of S. Domenico; while the royal tombs in Naples prove how quickly it conquered the south. In Florence and Orvieto, however, are the schools' two most extensive undertakings. The facade of the cathedral of Orvieto is unique in Italy. Four broad piers separate the portals and are covered with a series of low reliefs representing a vast Christian poem in four scenes: Genesis, the Tree of Jesse, with a choir of the Prophets of the Redemption; the Life of Christ; the Last Judgment. This epitome of the world from Creation is given in a charming poetic and at times dramatic style. The scene of the Last Judgment is particularly grand, and the Creation scenes the most exquisitely beautiful. There is nothing like it even in France. It is the incarnation of a poet's dream.

Giotto's tower in Florence has many five sided reliefs (fifty-four in all), which were planned by Giotto himself, mainly in the spirit of allegory. The Virtues and Vices, the Arts and Sciences, the glorification of labor, of commerce and industry, of organized society. They are interesting to compare with the different representations of similar subjects on the French cathedrals. Of greater beauty and grace are the reliefs in the bronze doors of the Baptistery by Andrea Pisano, mainly devoted to the life of John the Baptist. These charming framed and grouped scenes are of a classic simplicity, and are quite perfect in their drapery and grace. They remind one of the best French work, which they certainly equal. The last notable master of this school was Andrea Orcagna whose tabernacle at Or San Michile in Florence is an extraordinarily successful combination of architectural design and color with sculpture. This brings us to the eve of the Renaissance.

Of English Gothic sculpture there is little to be said. It is very abundant at Wells cathedral and fairly so at Lichfield and Salisbury, but not well arranged and too much addicted to isolated statuary. There are no individual statues and scenes of great artistic beauty as in France or Italy.

Renaissance.—Italy now wrests the leadership from France. The Renaissance was born in Tuscany at the beginning of the fifteenth century, and the revolutionary movement invaded all the arts almost simultaneously. Three men took the lead in the field of sculpture: Ghiberti, Donatello and Jacopo della Quercia.

Donatello was by far the greatest and exercised the widest influence. His St. George, is one of the famous statues of the world, standing solidly and earnestly though with a touch of self-consciousness. In his charming bust of the youthful Christ and in St. John, Donatello really recreated the child in art, at least in Italy, where children had always seemed like little men in mediæval art. Nothing more rollicking and joyous can be imagined than his dance of plump but active children on the pulpit at Prato. His wonderful versatility appears in his equestrian statue of Gattamelata at Padua, his Brancacci tomb at Naples, with its wealth of decorative design, and his bronze statue of David in Florence.

Ghiberti, his contemporary; is chiefly famous for the bronze gates of the Florentine Baptistry. He is a connecting link with the Gothic past. In the first gate he imitates so closely the neighboring gate of 1330 by Andrea Pisano, with its small simple compositions, that he seems thoroughly mediæval. A few years later he adopted an absolutely opposite scheme for his second gate, which Michelangelo thought worthy of Paradise. Here the scenes were few and large, the figures numerous and small. These reliefs with their vanishing planes, their vivid picturesqueness and elaborate scenario struck an entirely new note in sculpture.

Jacopo della Quercia, the third in this early trio, was the precursor of Michelangelo in his love of anatomy and his dramatic bravura. This is especially evident in his work at S. Petronio, in Bologna, in the reliefs of the portals in the facade and the group of the Virgin holding the Child. He was at the same time master of a delicate and penetrating charm, which he shows in the exquisite reclining figure of Ilaria del Carreto, on her tomb at Lucca, on a cenotaph decorated with children holding a long wreath, the most beautiful instance of a favorite motif copied from some Roman original.

TOMB OF ILARIA DEL CARRETO

In Lucca Cathedral, by Jacopo della Quercia. Perhaps the most beautiful composition of sepulchral art.

Later Italians.—The latter part of the fifteenth century is so crowded with talent, not only Florentines (and other Tuscans), but Lombards, that it is difficult to single out special men and works. Fiesole's bust of Bishop Salutati, with its keen and rather pleasantly ascetic face, is a highly finished example of Tuscan verve. Among the numerous sepulchral monuments in which decoration and figures were more happily combined than in any other class of works, perhaps the Marsuppine tomb by Desideris da Settignano, stands supreme. He was Donatello's greatest pupil. Among the pulpits the most harmonious is that in Santa Croce in Florence by Benedetto da Majano. It has a relief in each face and here the pictorial style inaugurated by Ghiberti is adopted with its use of perspective and scenario—in exactly the same way that it was adopted at the same time by painters like Mantegna. Among altarpieces, the most spectacular are perhaps two: that at Padua by Donatello in bronze and that at Pistoia (S. Jacopo) by several artists. This last is of silver and not only covers the face of the triple altar but surmounts it with a high structure. The whole is made up of lines of compositions in relief and statues in niches. It is the largest work of its kind and the most varied and interesting.

Robbia School.—Next came Luca della Robbia, a serene religious artist, most noted as the creator of that form of relief sculpture in polychromatic glazed terra cotta known from him as "Robbie ware." It was extremely popular throughout Tuscany and further south. His nephew Andrea almost equalled him in talent and productiveness. The Resurrection of Christ at S. Marco in Florence is an early and simple study in white and blue. The coloring became more and more elaborate until under Luca's grandson Giovanni, it was at times crude. The Robbia school was the great representative of religion in the Italian sculpture of the Renaissance, as Fra Angelico and the Sienese artists were in painting.

MADONNA AND CHILD WITH ANGELS

In Via dell' Agnola, Florence, by Luca della Robbia. A beautiful lunette, in glazed terra cotta with figures of singular simplicity, directness and purity, mainly white and blue.

As the culminating work of the early Florentine school came the very greatest equestrian statue the world has seen, the Bartolommeo Colleone in Venice by Andrea del Verrocchio, the *beau ideal* of a fearless Renaissance adventurer or *condottiere*. It is in every way superior to the Marcus Aurelius, its only antique rival. Horse and man are one and full of force and life.

EQUESTRIAN STATUE OF COLLEONI

At Venice, by Andrea del Verrocchio. It was finished by Leopardi, and is the greatest equestrian statue in the world. It is vibrant with energy and personality.

However, the days of masterpieces passed away for a short time, even the men who led the Florentine school just before Michelangelo, such as Sansavino and Rovezzano were second-rate men.

Michelangelo was essentially a plastic genius. It is evident even in his works of architecture and painting. He was more original and varied than Donatello, in his conceptions if not in his style. We might call him the Browning of Sculpture so difficult is it sometimes to explain him, so subtle and wise is his thought. He cut himself lose from traditions and schools. At first he steeped himself in classic sculpture and imitated it so well in his Faun as to deceive the best critics. Then he passed through a phase of normal religious themes, as we see in his *Pieta* at St. Peter's, where the highly-finished surface is also a passing phase in his technique, which affected afterward greater sketchiness. Michelangelo reached the full realization of his colossal talent in two works: the tomb of Pope Julius II, which was never completed, and of which the famous powerful statue of Moses belongs; and the monuments of the Medici at S. Lorenzo in Florence, of which the tombs of Guiliano and Lorenzo were almost finished. We have in these works primitive, elemental sculpture used to convey generic ideas of life and death. The mystery that has enveloped the reclining figures that we call *Dawn* and *Twilight, Day and Night*, has been continuous since the day of their execution. The Lorenzo, popularly called *"Il Penseroso,"* is far more than a portrait, it is brooding introspection. No artist before Michelangelo had so openly played with the human form, and yet none had been so completely an idealist. His heads, especially the David, the Brutus, the Lorenzo make an undying and vital appeal.

After him, the Decadence. Benvenuto Cellini, to be sure, was an extraordinary technician. His *Perseus* with the head of Medusa shows that he could produce other things than the works of delicate and decorative beauty for which he was famous. Baccio Bandinelli was an inflated and debased follower of Michelangelo's Baroccio mood. Giovanni da Bologni had better taste and was the last classicist of any merit.

France.—Though Italy certainly overshadowed the rest of Europe during the Renaissance, a great deal of interesting sculpture was produced in France, and its national character is now being more clearly seen. Its greatest representative was Jean Goujon (1520-1566), whose influence transformed the French school, combining with it characteristics both Italian and Flemish. His most famous figures are the water nymphs for the Fountain of the Innocents, in Paris, and the Diana of the Fountain for the Chateau at Anet. There is a touch of artificiality in pose and drapery, a self-conscious grace that is not at all disagreeable. His predecessor, Michel Colombe, was more classic and truly graceful, and his work, while quite different from the Italian style, is more closely related to it. There is a great deal of picturesqueness and atmosphere to his relief of St. George fighting the Dragon made for the Chateau of Gaillon. Another and somewhat later master, Germain Pilon, left masterpieces in the tombs of Francis I. and Henry II. at St. Denis. So also did Jean Juste in his tomb of Louis XII.

TOMB OF LOUIS XII.

At St. Denis, by Jean Juste, of Tours. One of the finest royal tombs at St. Denis whose sculptures have escaped destruction.

Germany. — The German Renaissance hardly ever reached a high level. Something seemed to prevent its sculptors from passing beyond a rather commonplace naturalism. The one great exception was

MOSES

By Michelangelo, now in S. Pietro in Vincoli, Rome. Designed to adorn the tomb of Pope Julius II., intended to be erected in St. Peter's. It is an extraordinary expression of the sublime and terrible.

Peter Vischer (1460-1529) whose beautiful shrine of St. Sebald at Nuremberg, with its beautiful apostles shows Italian influence, while his colossal bronze statues of Kings Arthur and Theodore at Innsbruck are quite original and deserve to take their place beside the Gothic *St. Theodore* and Donatello's *St. George.*

KING ARTHUR

By Peter Vischer, in the **Hofkirche**, Innsbruck. One of a series of bronze statues surrounding the tomb of the Emperor Maximilian. A splendid example of the armored knight.

It is curious that in all Germany, Austria and the Netherlands there is so little during the fifteenth and sixteenth centuries that is at all notable, considering that so much was produced in mere quantity: carved portals, statues of the Cross, altarpieces, sepulchral monuments. It is a national trait that wood should then be preferred to stone or marble by most sculptors.

Modern—The seventeenth and eighteenth centuries were a rather futile period for sculpture. The spirit of the Renaissance was dead; the modern spirit not yet born. There was nothing real or simple in art; all was artificial and exaggerated and designed to display technical virtuosity. Bernini (1598-1680) led this Baroccio style in Italy; Girardon (1628-1715) and Puget (1622-1694) in France. Draperies were inflated, attitudes pronounced, compositions over-dramatic. The vision of St. Theresa by Bernini is more characteristic of him and of the mawkish religious sentimentality of the age than his classic pieces, and the same is true of Girardon's monument to Richelieu. Puget's Milo of Crotona introduced the Baroccio manner even into classic themes. Finally, the finicky preciosity so characteristic of the age of Louis XV. is embodied in such works as the statue of the Marechal de Saxe by Pigalle (1714-1785) at Louvre.

One may perhaps date the real beginning of modern sculpture at the French Revolution, and preface it with Houdon's vivacious figure of *Voltaire*, its prophet. It was at first largely characterized by a neo-classic revival, necessarily artificial because it had no connection with the age. Its leaders were the Venetian Canova and the Dane Thorwaldsen. Canova's influence became universal. Rome inspired them all.

Canova was an unusually prolific artist. Of his many works the early *Cupid and Psyche* and the *Pauline Borghese* as Venus are especially famous and illustrate his charm of line and softness of texture. The essential coldness of his style, however, kept his art from becoming great.

PAULINE BORGHESE

By Canova, in Borghese Palace, Rome. Here Napoleon's sister is represented as Venus, reclining on a couch, slightly draped. This famous statue caused a great sensation as a combination of portraiture and mythology.

VOLTAIRE

By Houdon, in the Theatre Français, Paris. A superb character study, superior to anything since the Italian Renaissance.

Thorwaldsen showed dependence on the antique even more literal and more Hellenic. His frieze at the Quirinal in Rome shows that he was as accomplished in relief work as in statuary. Dannecker spread the new style in Germany; witness his *Ariadne* at Frankfort. Flaxman did the same in England, though his famous *Michael and Satan* shows independence in the selection of non-classic themes. Sculpture as the real reflection of the age had, however, its representatives, and grew stronger every decade. On the Arc de Triomphe in Paris, the stupendous group embodying the French Revolution, known as the *Chant du Depart* and the *Marseillaise*, is a work of vital drama by Rude, himself a part of the Revolution. A similar quality appears in his pupil Carpeaux (1827-1875), whose vital force is best expressed in the group of the *Spirit of the Dance* (1869) at the Opera in Paris. Barye (1795-1875) also came with his wonderful interpretations of animal life, so familiar to Americans. One had to go to Assyria to find anything approaching his varied sympathy with the brute creation. There was nothing corresponding to this movement in Italy.

CENTAUR AND LAPITHA

In bronze, by Barye, in the Louvre, Paris. A fine mythological composition exhibiting his genius as a sculpture of animals. Barye has been called the "Michelangelo of Wild Beasts."

Germany soon threw off neo-classicism and produced a Schadow (1764-1850), who almost established a national type in his statue of Leopold. Another fine example of Schadow is his *Queen Louise and her Sister*. Then came Rauch (1777-1857) whose statues are perhaps the finest in Germany; especially his *Maximilian I*, at Munich and his *Frederick the Great* at Berlin. His pupil Reitchel (1804-1861) was an excellent artist but did not reach his master's level, though his statues of *Lessing* (Brunswick) and *Luther* (Worms) and his *Pieta* at Potsdam show more sentiment.

QUEEN LOUISE AND HER SISTER

By Schadow, in the National Gallery, Berlin. A fine example of the neo-classical of which Schadow was a brilliant representative in Germany.

Recent Sculpture—France has been the leader in the last two generations. National schools of sculpture have long since died, so far as style is concerned; the art is becoming rapidly international, and France has struck the key-notes. There has been the greatest variety in her styles. Dubois with his *Florentine Singer* and his *St. John*; Mercie, with his *David* and his *Thiers* are governed by the spirit of the Tuscan Renaissance, except that Mercie goes deeper into modern feeling. Fermiet seems a reincarnation of the playful spirit of the late Greek genre masters of

EQUESTRIAN STATUE OF VELASQUEZ

In bronze, by Fremiet, in the Louvre, Paris. A famous example by the nephew of Rude, the sculptor of the Arc de Triomphe. A very vivacious composition.

the Alexandrian age. His equestrian statue of Velasquez is one of his most representative works. Another sculptor of high rank is Chapu (1833-1891,) whose *Joan of Arc* has been placed in the Louvre.

JOAN OF ARC AT DOMREMY

By Chapu, in the Louvre, Paris. A notable study by this distinguished representative of modern French eclecticism.

Dalou sometimes suggests a combination of Rubens and the classic side of Greek art, as in his *Triumph of Silenus*, sometimes embodies present day realities as in his *Mirabeau*. He is the greatest of the modern men except Rodin.

With Rodin we reach the ultimate break with the academic school, with all traditions and all recurrences to past types. He is as naturalistic as Donatello in his ugly beginnings; as primeval as Michelangelo without the Italian's idealism. His *Kiss* as an embodiment of passion, his *Thinker* as the ruminant spirit of brute force about to spring, are extraordinarily original and full of power. His ill-balanced and extreme individualism make his works very uneven. His is in sculpture what Zolo aimed to be in literature. One may say that Bartholomé strikes a similar note in his extraordinary composition for the Pere-Lachaise cemetery (Paris) with a nude human maid entering a sort of Egyptian tomb, while a writhing mass of grief-stricken figures, that seem transferred from Dante's *Inferno* are grouped outside, flung together with complete lack of restraint.

One hesitates to compare with these giants the modern English sculptors such as Thornycroft (The Mower), Onslow Ford (statue of Henry Irving, Dancing) and Gilbert, so academic in their productions.

America has at last entered the arena with distinction. The neo-classic revival was responsible for the earlier men who flourished in or before the middle of the nineteenth century. Powers' (1805-1873) Greek slave, so reminiscent of Canova is its best known single work. But Crawford (1813-1857) succeeded in infusing something of America in his *Indian mourning the decay of his race.* These men lived and studied in Rome. So did W. W. Story (1819-1896) whose statues did not rise above cold mediocrity.

Rhinehart's (1825-1874) seated statue of Justice Tancy, at Annapolis and Baltimore, is something which we can safely praise for its naturalness and dignity. Another expatriate to Rome, Moses J. Ezekiel, has gone over to the neo-classicists. The former dean of American sculptors, J. Q. A. Ward (1830-1910), who recently died never joined the new movement, which is embodied in various forms: in Herbert Adams whose charming busts are a Franco-American variation on the Lombard Renaissance; in F. W. MacMonnies, whose style is full of prose, vivacity and expansiveness and quite Neo-Alexandrian; in D. C. French whose style is more personal and self-conscious; and especially in Augustus St. Gaudens, whose death removed the greatest sculptor we have yet developed, a man of originality and force. His Shaw monument in Boston is full of intensity and real motion, his *Puritan* in Springfield is a real representative of New England; his equestrian statue of General Sherman is interesting to compare with Fremiet's *Joan of Arc*, in Paris, and Rauch's *Frederick the Great*, in Berlin.

Among the younger sculptors the most ambitious is George G. Barnard, whose work has been done in France. His colossal groups of the *Life of Humanity* for the state capital at Harrisburg were exhibited in Paris before being sent to this country.

PAINTING.—While it is probable that men made use of color and design in some rude way since the earliest times, the first authentic records of painting are met with in Egypt, as far back as the third or fourth Memphitic dynasty of kings, the date, which is quite uncertain, being somewhere near 3,500 B. C. and it is at Memphis, in Lower Egypt, then the seat of empire, that are found the earliest and best examples consisting chiefly of decorations on tombs and mummy cases. This was before the later conventional types were represented, and consisted of domestic scenes rendered by flat, shadowless methods yet still with better drawing and more variety than appeared later.

In the Theban period of the nineteenth dynasty, a time of temple and palace building, the painting of tombs and sepulchres continued, along with the decoration of walls. It was graceful, somewhat monotonous, and rather the work of the skilled craftsman, than that of an artist expressing his emotions, or finer feelings. As the country lost in military and political power, the art declined and, coming in contact with Greek methods, grew imitative, finally being quite lost in the art of the Greco-Roman world. Early Egyptian paintings still exist, curiously enough, in an almost perfect state of preservation in many of the tombs, and there are examples in the Ghizeh museum, as well as in many of the great European and American art museums and the New York historical society.

Chaldaeo - Assyrian Painting was the original work of an original nation. Chaldæa, of unknown antiquity, had Babylon for his capital. There are records of its work dating approximately from 1,400 to 625 B. C. Religion had little part in the art. Painting then was largely a history and glorification of the reigning family. There were only two types of faces, one with and the other without a beard, and the painters rendered animals far more sympathetically than they did mankind. Their color was arbitrary not natural, with prevailing tones of blue and yellow. Painting, as the art is known today, was not practiced in Chaldæa-Assyria. There are valuable collections of the work in the Louvre, Paris, and the British museum, London.

Early Persian Painting was but an echo of the Assyrian. For the work of the Greeks, we have to rely mainly on the writings of early authors which are confusing. Their painting was upon pottery and they did mural decorations in distemper. Light and shade were used on the figure though not in a modern way. They had notions of perspective, both in the landscape and the figure; the first was rendered in a symbolic manner and though color was used in abundance, it was limited to leading hues.

The earliest period of Greek painting is known as the Older Attic school, of whom Polygnotus, flourishing between 475-455 B. C., is said to have been the founder. His most important works were wall paintings for the assembly room of the Knidians at Delphi, relating to the story of the Trojan war. A scene painter named Agatharchon was working toward the end of the fifth century, B. C. He made investigations in the laws of optics which was an advance toward nature, and another man, Apollodorus, of the same period, according to such writers as Plutarch and Pliny, was the first to discover variations in shades of color, as well as to paint objects as they appeared. After the Peloponnesian wars and Athen-

ian loss of supremacy, other schools sprang up, Ionian, Sikyonian, and Theban-Attic. There are few remains extant. Four slabs in the Naples museum have on them red outline drawings from which the color has scaled, but there are many Greek vases with paintings on them of various sorts, generally monochromatic work that still remains as complete as when first painted.

Roman Painting followed rather slavishly Greek methods, originating little if any, though it assumed perhaps, a more decorative quality and what has been preserved is more the work of mechanical decorators than men with large creative faculties. The name of Fabius Pictor (300 B. C.) is celebrated in historical painting, and in portraiture there were in the last century of the republic, Sopolis, Dionysius and Antiochus, the latter the most famous. Rome and Naples contain many specimens of mural work of this time and the great museums have examples, while there are some in America. Ancient painting practically ends with the destruction of Pompeii, A. D. 79.

Italian Painting—200-1250 A. D. Christianity came out of the decadent civilization of the Roman empire, was to change its art as it did all other things and, during its time of persecution, art struggled on feebly, starting Roman in form, but ending Christian, and its two principal motives were religion and decoration, the first being of the greater importance. The walls of the Catacombs in Rome contain the earliest Christian painting, in chronology very much mixed, and with degeneracy from the beginning; but with Constantine, Christianity being recognized as the national religion, it came out of the Catacombs and gave itself over to illuminations, church decoration and mosaics, declining during the sixth and seventh centuries, due to the influence of Byzantium. In 1250 came an awakening. From then to 1400, known as the Gothic period, though Italy was torn by political wars, art became the servant of the church and the chief theme was the Bible story. Work during this period was executed in fresco on the walls of churches.

The Florentine School.—Cimabue is a notable example of a man trained in the Byzantine methods, who improved upon the traditions. He gave more life to his figures than had his predecessors and his most eminent pupil was Giotto (1266?-1337) whose art was the best of its time. A half a century later, Fra Angelico was born (1387-1455) the last inheritor of the Giottesque traditions, whose religious sentiment was the strong feature of his art. He was the last of the great religionists in painting. The early Renaissance in Italy was from 1400 to 1500 and then painting became the color thought and form-language of the people. A revival of antique learning took place and after the fall of Constantinople, there came an influx of Greek scholars into Italy. Masaccio (1401?-1428?) was the first great nature-student of the early Renaissance and, in the front rank, a monk, Fra Filippo Lippi (1406-1469) who was possibly his pupil was at least his legitimate successor. He was the first to use the faces of the people about him as subjects for his religious characters, clothing them in the garb of the day, and his tendency was to materialize his sacred characters.

In Botticelli and Ghirlandajo (1449-1494) we find traits of imagination and originality not surpassed by others of the early Florentines. The first was a pupil of Lippi and a man of deep religious feeling. His figures, always tall and willowy are delicate and refined in drawing and full of tenderness and grace. Ghirlandajo was the greatest technician of his time, drawing wonderfully and composing well, though occasionally his results were somewhat prosaic, even if he was an undisputed master of his trade. Perugino, Leonardo da Vinci and Lorenzo da Credi were the distinguished pupils of Verrocchio (1435-1488), the greatest being di Vinci (1452-1519), whose *Last Supper* in Milan, and *Mona Lisa* at the Louvre, in Paris, are among the most famous paintings in the world. He was as well a distinguished mathematician, a scientist and a man of many attainments. Piero di Cosimo was of this period (1462-1521), a painter of classical and mythological themes.

LAST SUPPER

Painted by Leonardo da Vinci, 1496-98, in the Refectory adjacent to the Church of Santa Maria delle Grazie, Milan. In force of conception, harmony of detail, and delicacy of touch, this is among the finest work ever painted. Through the ravages of time little now remains of the original.

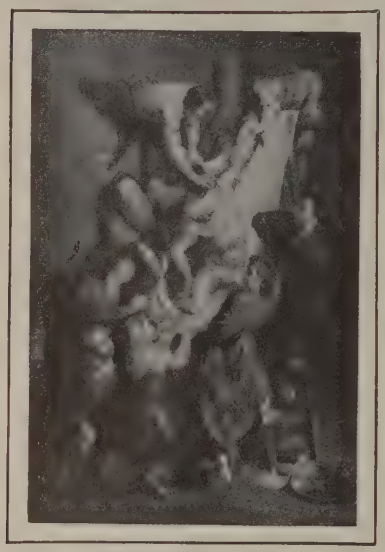
The Umbrian and Perugian Schools included Foligno (1430-1502), Piero della Francesca (1420-1492), and Signorelli (1441 1523). Finally, there was Giovanni Santi, (1434-1494), the father of Raphael. Perugino (1446-1524) showed more of the old religious feeling, his sentiment was very human, his compositions were graceful and his color was rich. He was among the first to employ the medium of oil in his painting. He had as pupils Raphael and Lo Spagna (1530?). Pinturricchio (1454-1513) did not use oils, but his frescoes were unusual in their artistry and charm, in their effectiveness and masterly qualities. He was a varied and interesting painter. In the schools of Ferrara and Bologna, were Cosimo Tura (1425-1498?), Francesco Cossa (1450-1536), and Lorenzo Cossa (1460-1536?), Francis (1450-1518) and Ercole di Giulio Grandi (1531?). Of the Lombard schools may be mentioned Vincenzo Foppa (1455-1492) and Borgongnone (1523?).

The Paduan School, the greatest representative of which was Andrea Mantegna (1431-1506), a pupil of Francesco Squarcione (1394-1474), a good teacher, but an indifferent painter. Mantegna however was a deep student of nature, one of the greatest of the early Renaissance and was scientific in his perspective. Other men were Pizzolo (about 1470) and Marco Zoppo (1445-1498). In the schools of Verona and Vicenza were Vittore Pisano, called Pisanello (1380-1456), the earliest of note; Liberale da Verona (1451-1536), Francesco Bonsignori (1455-1519), Francesco Caroto (1470-1546) and perhaps best of all, Bartolomneo Montagna (1450?-1523). The Venetians, being of a worldly spirit demanded a similar art. Their painting was largely decorative and colorful and its early manifestation, in the fifteenth century, was in the making of mosaics and altar pieces after the Greek or Byzantine manner. Of this date was Jacobello del Fiore, and Semitecolo Gentile de Fabriano, painting with Pisano as assistant in the Ducal Palace about 1420, was possibly responsible for a change in Venetian art. He taught there and was possibly the master of two Vivarinis, Antonia and Bartolommeo (1450-1499?). The latest of the family was Luigi Vivarini (1461-1503). A pupil as Carlo Crivelli (1430?-1493).

Venetian Painting dates from the Bellinis, two families working about the same time. Jacopo Bellini (1400-1464?), his two sons Gentile (1426-1507?), and the greatest of the family, Giovanni Bellini (1428-1516?) made a strong trio. The last named was the epoch making man of early Venice, being superior to all his contemporaries in technical strength. He had many followers. Other men were Carpaccio (-1522?), Cima da Conegliano (1460-1517?), Catena (-1531?), Basaiti (1490-1521?), Previtali (1470-1525), Bissolo (1464-1528), Rondinelli (1440-1500?), Diana (-1500?), Mansueti (about 1500) and finally Antonello da Messina (1444-1493?). Messina it was who introduced the use of oil medium in Venice, having learned it from the Van Eycks, the Flemish painters who discovered it. He was an excellent portrait painter. A Florentine painter was a monk of San Marco, Fra Bartholommeo (1475-1517), follower of Savonarola, the last of the pietists in art, who worked in collaboration with Albertinelli (1474-1515), in the workshop of Cosimo Rosselli. Other men; Fra Paolino (1490-1547), Bugiardini (1475-1554), Granacci (1447-1543), and Ridolfo Ghirlandajo (1483-1561). Andrea del Sarto (1486-1531) called 'the faultless painter" was the best draughtsman and colorist of the Florentine school, painting many madonnas and altar pieces. He had many pupils, most of whom deserted him later to follow Michelangelo. The best of these were Pontormo (1493-1558) and Franciabigio (1482-1525).

Michelangelo (1475-1564) was the great artist of the Renaissance. His long life was a succession of triumphs and he is universally acknowledged as the greatest man in art in the world's history. More sculptor than painter, a magnificent

draughtsman, a master of composition, Michelangelo Buonarroti, to give him his full name, was born at Castle Caprese, a small town near Florence, on March 6, 1475. At thirteen he was apprenticed to the painters Domenico and Ghirlandaio. Pope Julius II. commissioned him to paint in fresco the Vault of the Sistine Chapel in the Vatican, and it was for Pope Paul II. that he did his *Last Judgment* which was almost the last work in painting he was called to undertake, though later he did do two frescoes in the Pauline chapel of the Vatican. In addition to being sculptor and painter, he was an architect, engineer and poet, and the great dome of St. Peter's was raised from his plans. His *Last Judgment* contains no less than 314 figures and was the labor of over six years. He was the supreme master of Italian art. Among his immediate followers;—Daniele da Volterra (1509-1566), Marcello Venusti (1515-1585?) and Sebastiano del Piombo (1485-1547), the last a remarkable portrait painter.



DESCENT FROM THE CROSS

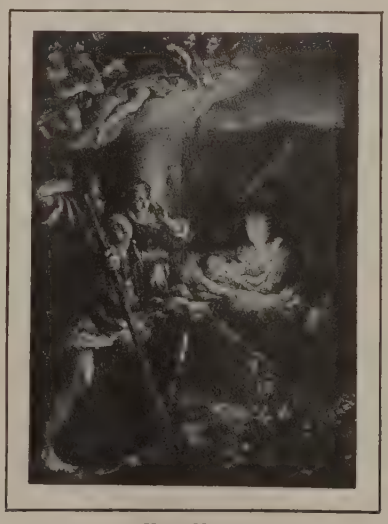
The masterpiece of Volterra, now in the Church of Triniti de Monti, Rome. Considered by Poussin one of the three great pictures of the world, and by Lanzi as among the finest pictures of Rome. Volterra was the most successful follower of Michelangelo.

Raphael Sanzio (1483-1520) often has been called "the Harmonist of the Renaissance", the very opposite of Michelangelo, a very personal painter, of grace, purity, serenity and loftiness, whose themes were religious and mythological, rendered in a calm, intellectual manner. The European galleries are full of his works among the most prominent of which are *The Sistine Madonna,* at Dresden; *Marriage of Virgin Brera,* at the National gallery, London, *Madonnas St. Michael and St. George,* at the Louvre, Paris, and many more. His influence was largely felt and he had many followers and imitators, among them;—Francesco Penni (1488-1528?), Giulio Romano (1492-1546), Primaticcio (1504-1570), Giovanni da Udine (1487-1564), Perino del Vaga (1500-1547), Andrea Sabbatini (1480-1545), Innocenza da Imoli (1494-1550?) and Timoteo di Viti (1469-1523). Bernardino Luini (1475-1533?), was a follower of da Vinci, and other men of that school were Salaino (1495-1518), Beltraffio (1467-1516), Marco da Oggiono

SISTINE MADONNA

Painted by Raphael for the monastery of San Sisto, Piacenza, Italy; hence its name. It is now in the Dresden Gallery, and is regarded by many critics as the FIRST painting in the world. No work compares with the beauty, dignity and grandeur of the Virgin, and the two enchanting angel boys, leaning on the lower division of the picture, give the last touch of beauty to this magnificent work. On the left is Pope St. Sixtus, on the right St. Barbara.

(1470-1530?), Solario (1458-1515?), Giampietrino (1520-1540), Cesare da Sesto (1485-1523) and Gaudenzio Ferrara (1481-1547?). One of his best pupils settled in Sienna. He was Sodoma (1477-1549?) and he built there a new school though its influence was slight. Among Sodoma's followers;—Pacchiarotta (1474-1540?), Girolamo della Pacchia (1477-1535), Peruzzi (1481-1536) and Beccafumi (1488-1551). Men of the Ferrara and Bolognese schools feeling the influence of Raphael were;—Dosso Dossi (1479-1542), Garofolo (1481-1559), Mazzolino (1480-1528?) and Bagnacavallo (1484-1542).

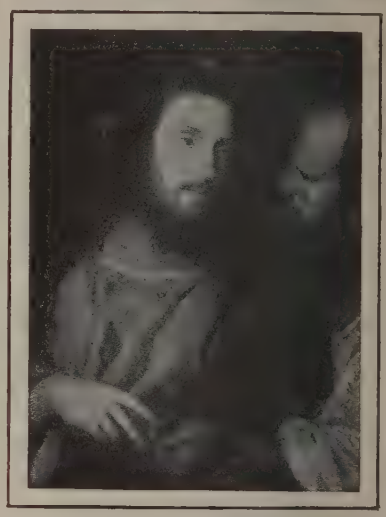


HOLY NIGHT

A famous example of the poetry of light and shadows by Correggio, now in the Dresden Gallery. The picture is a portrayal of the scene of the Saviour's birth: "But on a sudden the cloud became a great light in the cave, so that their eyes could not bear it. But the light gradually decreased, until the Infant appeared."

Antonio Allegri, more commonly called Correggio, was born near Mantua in 1494. A writer has called him "the Faun of the Renaissance." His appeal was sensuous and artistic rather than religious, historical or intellectual. He is said to have formed his style on that of Mantegna. He painted many religious and mythological subjects as well as some famous pictures of "Leda and the Swan," and he was more allied to the schools of Venice than with the severer intellectual schools of Florence. He had the most delicate perception of light and shade and his figures are endowed with every human charm, æsthetic perfection obviously having been his sole aim. He died March 5, 1534. Among his pupils who however did him small credit, were;—his son, Pomponio Allegri (1521-1593?), Michaelangelo Anselmi (1491-1554?) and Parmigianio (1540-1540).

The Venetians.—Beauty of color was the note of the school of Venice adopted by the artists of the sixteenth century there. The light and shade on the nude figure, the pre-



THE TRIBUTE MONEY

Painted by Titian, and in Dresden Gallery. One of the highly prized pictures of that gallery, perfect in finish and detail, bringing out the illimitable contrast of soul between Christ and the crafty Pharisee. It has for ages given a new meaning to Christ's answer: "Render therefore unto Cæsar the things that are Cæsar's; and unto God the things that are God's."

sentation of rich brocades, the richness of robe of adornment, the fullness of material life, the portrayal of the glories of a nation given to display held these men. The work of Giorgione had a great influence on his contemporaries. He was born in 1477 and died at the age of thirty-four. He adopted the oil medium, then little known and he introduced scrumbling and glazing to produce depth of color. Easily the first painter in the whole range of Italian art was Tiziano Vecelli, known as Titian (1477-1576), a pupil of Bellini. He lived ninety-nine years and worked to within a few months of his death, having been famous and practically independent since his thirty-fifth year. His theme was humanity whether in classical or religious compositions and his art dignified all who sat to him for in himself he was an epitome of all the excellences of painting.

Tintoretto (1518-1592), was a fecund worker, a great draughtsman, a fine colorist and a master of light. Paolo Veronese (1528-1588), the fourth of this quartette of

the great Venetians was a brilliant colorist and a decorative painter of the highest order. He turned scenes from scripture and legend into pageants of Venetian glory and his art was the most gorgeous of all his contemporaries. Other men of the school;—Palma il Vecchio (1480-1528?), Lorenzo Lotto (1480-1556?), Rocco Marconi (1505-?), Pordenone (1483-1540), Bonafazio Veronese (-1540?), Paris Bordone (1495-1570), Jacopo Bassano (1510-1592) and his son Francesco (1550-1591). From Venetian territories were;—Savoldo (1480-1548?), Romanino (1485-1566), Moretto (1498-1555?) and his pupil Giovanni Moroni (1520-1578), who was a masterful painter of portraits and a prolific workman. It is said Titian used to send clients to him. At Verona were Girolamo dai Libri (1474-1555), Torbido (1486-1546?) and Cavazzola (1486-1522).

Decadence of Italian Art.—From the first of the seventeenth century, Italian art began its decadence. Men became imitators and art may be said to have been under the rule of the Jesuits. The decoration of the churches was continued, but in a more or less perfunctory manner and without the serious piety of previous times and though there were earnest men among the artists, the spirit had fled. Agnolo Bronzino (1502-1572?) was an imitator of Michelangelo, as were Vasari the art writer (1511-1574), Salviati (1510-1563) and Federigo Zucchero (1543-1609). Baroccio (1528-1612) was an imitator of Raphael. The family of Caracci, in about 1585, sought to revive art. There were five of the Caracci, three of whom led the school: Ludovico (1555-1619), Agostino (1557-1602), and Annibale (1560-1609), the last being the most famous. Among their pupils was Domenichino (1581-1641). Guido Reni (1575-1642) ran to excessive sentiment and pathos. Other men were:—Albani (1578-1660), Guercino (1591-1666), Sassoferrato (1605-1685), Carlo Dolci (1616-1686), Cristofano Allori (1577-1621), Berrettini (1596-1669) and Maratta (1625-1713).

Neapolitan School of Naturalists.—The Neapolitan school of Naturalists was led by Caravaggio (1569-1609), who represented sacred themes by employing models from the street life about them and their use of dark shadows caused them to be referred to as the "Darklings." Other men;—Giordana (1632-1705) and Salvator Rosa (1615-1673). Among the late Venetians were Palma il Giovine (1544-1628), and Padovanino (1590-1628), while the last great Italian painter was Tiepolo (1696-1770), who with an art founded on that of Paolo Veronese, produced decorative ceilings and panels of rare beauty of color and charm. He left a son, Domenico Tiepolo (1726-1795). Two painters of Venetian canals and architecture were Canaletto (1697-1768) and Guardi (1712-1793).

Modern Italian Art has been notably without any of the grand elements that characterized the earlier workers. It has been mainly perfunctory and clever, the names of Michetti, DeNittis, Favretto, Tito, Nono and Simonetti standing rather for brush facility than any deep thought. Exception may be made in favor of Giovanni Segantini (1858-1899), an astonishingly original and personal painter who made many pictures of the high Alps and the peasantry, in a manner entirely his own, with long brush strokes of interesting pigments in effective juxtaposition. An admirable draughtsman and a master of composition, his pictures are full of allegory and human interest.

French Painting has always been strongly decorative. As early as the fifth century the artists produced mural paintings. Byzantine influences were at work in the eighth century, while in the eleventh, twelfth and thirteenth centuries, stained glass work appeared, and many missal paintings and furniture decorations. René, of Anjou, King of Naples (1409-1480), was a painter of considerable merit who gave an impetus to art, his work showing Italian influence. A contemporary was Jean Fouquet (1415-1480?) who did illuminations and painted portraits. His pupils were Jean Pèreal (-1528?) and Jean Bourdichon (1457-1521?) who formed a school at Tours. Four members of the Clouet family were painters, the most noteworthy being Jean (1485-1541?) and Francois (1500-1572?). They painted portraits, and the latter was said to have been a pupil of Holbein whose work his own resembled. Francois I. having during his travels invited many Italian painters to his court, their influence was felt on the French work. Jean Cousin (1500-1589?) and Toussaint du Breuil (1561-1602) were thus impressed.

THE BROKEN PITCHER

Painted by Greuze, and now in the Louvre, Paris. The most celebrated picture by this artist; nor has any been so often copied. This young girl, so naive and charming, has captivated the public taste from the time she was first painted down to the present day.

The Seventeenth Century discloses great development as well as production. It was the time of the founding of the French Academy of Painting and the formation of many collections. Among the earliest men of that century was Fréminet (1567-1619), as well as Vouet (1590-1649), both having studied in Italy. Nicolas Poussin (1593-1665), a Frenchman who spent most of his life in Italy, was the founder of the classic and the academic in French art, and he was strong in heroic landscapes. A more famous landscape man however was Claude Lorrain (1600-1682). He was perhaps the first one to get something of the truth and light of out-of-doors. With Louis XIV. French art took on a national character. Lebrun (1619-1690) was court painter and flattered his patron. LeSeur (1616-1655) was better and more sincere. Sebastian Bourdon (1616-1671) was a painter of history, and the leaders of portraiture were; Philip de Champaigne (1602-1674), Pierre Mignard (1610-1695?), Largilliere (1656-1746) and Rigaud (1659-1743). The frivolities of the times were responsible for the themes given out by Antoine Watteau (1684-1721), who may be said to have been the first great French painter. His work was original, decorative, of great brilliancy and charm. His best pupils were; Lancret (1690-1743), and Pater (1695-1736). Later came Van Loo (1705-1765), Boucher (1703-1770) much after the manner of Watteau, and Fragonard (1732-1806). Claude Joseph Vernet (1712-1789) was a painter of landscape and marines, Chardin (1699-1779), painted genre themes of humble life and the name of Greuze (1725-1805) is associated with sentimental heads of young girls, executed with dexterity and cleverness, works as a rule, of much charm.

French Classicism was a strong protest against the flippant and licentious art of such men as Boucher and Van Loo and which, in a way, was a revival of Greek form in art, came in first with Vien (1716-1809), and was carried on by his pupil David (1748-1825), who became the leader of the school. David painted military pictures after having studied the marbles at Rome, and he reproduced scenes from Roman and Greek life in an elevated and sculpturesque style. His portraiture was admirable. A friend of the Emperor Napoleon I. he reigned a long time as the supreme authority on art. His drawing was faultless though his color was hard and unsympathetic. His best pupils were; Jean Baptiste Regnault (1754-1729), Vincent (1746-1816), and Prudhon (1758-1823), whose themes were mythological and allegorical. Others were; Girodet (1766-1824), Léthiere (1760-1832), Guérin (1774-1833), and Gerard (1770-1837).

The most distinguished of the pupils of David, were Jean Ingres (1780-1867) and Jean Gros (1771-1835). In single figures and portraiture Ingres was at his best for he was a remarkable draughtsman who gave his greatest attention to form and line to the subordination of color and emotion. Gros too, was a superlative draughtsman with a strong sense of realism at the beginning and a deep love of color, light and air. In his art we may find the beginnings of the school of romanticism, a movement in French art that began in the early part of the nineteenth century. Landscape art of the time of Ingres continued along the traditions of Claude and Poussin. Its exponents were; Watelet (1780-1866), Bertin (1775-1842). Michallon (1796-1822), and Aligny (1798-1871). Madame Vigée-Lebrun (1755-1842) stood apart from contemporary influences and was a successful portrait painter, royalty and nobility sitting to her. Similarly Horace Vernet (1789-1863) painted battle scenes successfully, irrespective of any classic influence.

The Realists. With a famous picture, *The Raft of the Madusa*, Géricault (1791-1824) broke completely away from the traditions of the classic. It was realism so uncompromising that France was divided into two parties as far as the artists were concerned. Géricault dying young, his fellow pupil Delacroix (1799-1863) continued the new movement and his picture *Dante and Virgil*, created scarcely less of a sensation than *The Raft of the Medusa*. Other men of this period were; Deveria (1805-1865), Champmartin (1797-1883), Sigalon (1788-1837), Cogniet (1794-1880), Robert-Fleury (1797-?), Boulanger (1806-

SUNSET

Painted by Theodore Rousseau, and now one of the glories of the Louvre, Paris. This masterpiece, writes Sensier, "gives all the forceful harmonies, the forms, the accents of the autumn day upon the border line of a wood; the sun of gold and rubies throws its last flames in a sheaf of brilliant light." It was painted on the outskirts of the Forest of Fontainebleau.

1867) and Delaroche (1797-1856). Acy Scheffer (1797-1858), Dutch born, became identified with French art, but he was not among the great, his merit being rather poetic charm than individuality. Decamps (1803-1860), was among the first of the French painters to visit the Orient. Others going there were Marilhat (1811-1847), Fromentin (1820-1876), who wrote as well as he painted, and later, Gérome (1824-1904) and Cabanel (1823-1889). Other men of the time: Flandrin (1809-1864), Gleyre (1806-1874), Hamon (1821-1874), Aubert (1824-) and Couture (1815-1879), the last a mingling of several influences. His large picture, *The Romans of the Decadence*, made him famous in a day and was a departure in semi-classic realism.

The Barbizon School.—The year 1830 saw a new school of landscape art in France, the result of the study of the old Dutch landscapists and the Englishmen Constable and Bonnington, culminating in the Fontainebleau-Barbizon school of which the leader was Theodore Rousseau (1812-1867), undoubtedly the greatest landscapist of the century. Corot was earlier (1796-1875), a painter of great poetic charm and delicacy, his work being in a light, silvery key. Others of this group were: Jules Dupré (1812-1878), Diaz (1808-1876), Daubigny (1817-1878), Francais (1814-), Cazin (died 1901), Pelouse (died 1890) and Harpignies, the last still living at the age of ninety-one. Animal painters of this epoch were Troyon —the greatest—(1810-1865), Van Marcke (1827-1890), his pupil, Jacque (1813-1890), Rosa Bonheur (1822-1899) the famous woman painter, and her more talented brother, Auguste (1824-1875). Jean Francois Millet (1814-1875) was the figure painter of the Barbizon group, rendering the peasant life about him with

OXEN PLOWING

Painted by Rosa Bonheur, and now in the Luxembourg, Paris. As an animal painting, this picture stands second to none. The character given to these patient oxen, and the natural beauty of the plowed field have never been surpassed.

DANCE OF THE NYMPHS

Painted by Corot in his most characteristic style—and of idyllic grace and poetic softness. Light and air were the two great essentials of his art. It is here in all its perfection, with the added troop of Nymphs with which he was often wont to people his landscapes. This picture is hung in the Louvre, Paris.

rare fidelity and force. Another, though not a follower, was Jules Breton (1827-1906). Billet, Legros and Lerolle are other figure men still living. Decorative painters of this epoch were Paul Baudry (1828-1886) and Puvis de Chavannes (1824-1898) the last one of the greatest of modern men whose mural work in the Sorbonne, and at the Boston Museum of Art is world-famous. Other men: Hebert (1817-), Henner (1829-1905), Lefebvre (1834-), Bonnat (1833-), the portraitist Carolus-Duran (1837-), Laurens (1838-), Cormon (1845-), Benjamin-Constant (1845-1902) and Henri Regnault (1843-1871) who died in battle at the age of twenty-seven, but who left several notable canvases, his portrait of *Marshal Prim* in the Louvre, being most distinguished. Gustave Courbet (1819-1878) the realist, had to do with modifying the romantic and classical tendencies, and Bastien-Lepage (1848-1884) established a school of out-of-door painting, having a large following. Meissonier (1815-1891) was a distinguished painter of military scenes rendered in great detail after the manner of the Little

Dutchmen of the seventeenth century. He had one remarkable pupil, Charles Bargue (d. 1883), who even excelled his master in dexterity. Military painters include DeNeuville (1836-1885), Détaille (1848-1913), Berne-Bellecour (1838-) and Aime-Morot (1850-). Other men Ribot (1823-1913), Roybet (1840-), Bonvin (1817-1887) and Vollon (1833-1900) the last two having been admirable painters of still life. Fantin-Latour (1836-1904) an allegorical-romantic painter, brings us to the impressionists of which Manet (1833-1883) was the leader, his followers and adherents including Degas, Pissarro, Renoir, Sisley, Boudin, and most famous of all, Claude Monet, who in his exploitation of nature's lights quite revolutionized the palette of the century and raised the key of all contemporaneous painting.

Spanish Painting.—Spanish art before the fourteenth century is entirely conjectural, practically no facts being obtainable. That of the fifteenth century was a reflex of Italy and the Netherlands. The bulk of it was always done under church domination. The earliest school was at Toledo, of artists who embellished the cathedral. This was merged into the Castilian school with headquarters at Madrid, its founder unknown, but the first painter of importance was Antonio Rincon (1446-1500) referred to as the "father of Spanish painting," a pupil of Ghirlandajo, in Italy. He painted chiefly at Toledo and left portraits of Ferdinand and Isabella. A pupil of Michelangelo, Berruguete (1480-1561?) was the first to introduce pure Italian methods in Spain. Others; Becerra (1520-1570?), Morales (1509-1586), Sanchez-Coello (1513-1590) and a dumb painter, Navarette (1526-1579), a pupil of Titian. Theotocopuli (1548-1625) was called "El Greco" (the Greek) and had much of the Venetian influence, his work being unusual in color and drawing. A pupil was Tristan (1586-1640).

Velasquez (1599-1660) was the great man in Spanish painting. Though he studied in Italy, he was thoroughly original and Spanish to the core. He was a realist, a great master in all the technical variations of his art and one of the greatest portrait painters of all times. He made himself independent of the church and with him Spanish painting reached its climax. Although there are many examples by him in the world's galleries, his best work is in Madrid where are his famous portraits of royalty and his great compositions. Mazo (1610-1667) was his son-in-law and imitator. An assistant was Carreño de Miranda (1614-1685). Other men; Claudio Coello (1635-1693), a wonderfully facile workman, DeCastro (about 1454), Vargas (1502-1568), Cespedes (1538-1608?), Roelas (1558-1625?), Pacheco (1571-1654), Herrera the Elder (1576-1656?) and Zubaran (1598-1662) a painter of dismal themes, with monks in tortured rapture. From his dark shadows he was referred to as the Spanish Caravaggio. Cano (1601-1667), was another.

The Andalusian School was headed by Murillo (1618-1682), a painter of great religious fervor and often sentimentality, with Madonnas that had a great appeal. Other men; Juan de Joanes (1523-1579), Francisco de Ribalta (1550-1628) and Ribera (1588-1656) known as Lo Spagnoletta. A pronounced mannerist, Ribera was a painter of great strength in a dark key and with subjects of almost repulsive character; his influence spread in Italy as well as in Spain. It was Goya (1746-1828) who stood out prominently among the decaying Spanish art which languished after the passing of Valasquez and Murillo. Essentially Spanish, his themes were rather brutal and bloody, of the Inquisition, the bull ring and battle pieces, but his portraits form a historical record of his countrymen and women.

IMMACULATE CONCEPTION

Painted by Murillo, and now in the Louvre, Paris, is a copy of his finest work at Seville, Spain. A fascinating picture of tender, caressing beauty, and eloquent of sensual piety. This was a favorite subject of Murillo. Another replica of note is hung in the Hermitage, St. Petersburg.

Modern Spanish Art.—Mariano Fortuny (1838-1874) attracted the greatest attention with genre subjects treated airily and with enormous charm, for the man was a superb technician and a consummate lover of the beautiful. Nor were his landscapes less alluring. One of his famous works, now owned in America, was *The Choice of a Model*. His brother-in-law is Madrazo (1841) a painter of portraits and genre works. Zamacois (1842-1871) painted genre works in great detail, one of his famous pictures being *The Education of a Young Prince*, and men of unusual cleverness include Villegas, Pradilla, Alvarez, Luis Jiminez Aranda, Domingo and Martin Rico, the last identified with Venetian scenes. Two modern men have had not only a strong influence on the art of Spain, but on the art of Europe as well. They are Sorollo and Zuloaga, the first a painter of both figure and landscape, who portrays the brilliancy of Spanish sunlight, the activity of the city streets, the fisherman on the seashore and the happenings of refined social life. He is a portrait painter as well, having for his patrons the King and his court, and all these themes he renders in attractive color, with wonderful facility. Zuloaga, on the contrary, while painting portraits as well, has in his figure work devoted himself largely to the portrayal of the more sombre side of the Spanish character, in the most modern manner and technique. Both are able craftsmen and represent the best in modern art.

Flemish Painting.—If the earliest history of Flemish painting is lost, that country at least was not indebted to other lands for means and methods which were always quite original. Hubert van Eyck (died 1426) and his brother Jan van Eyck (died 1440) were celebrated painters, the elder being the more famous, though both did altar pieces in great detail, with rare skill. They are said to have been the first to introduce the medium of oil painting, though this is more or less apochraphal since the method was known before, but certainly they were the first to have introduced it into panel pictures. While little is known of the personality of either man, it is certain that they left a serious influence on the artists who succeeded them, among whom were Peter Cristus (1400-1472?) and Roger van der Weyden (1400-1464?), both of whom followed their style. The last founded what is known as the school of Brabant. Other men: Van der Goes (1430-1482?), Justus van Ghent (1450?) and Dierick Bouts, who though Dutch, founded a school in Louvain and his art was essentially Flemish.

Memling (1425-1495?) one of the greatest of this school, was strong, not alone in portraiture, but in the landscape as well. He had for followers Van der Meire (1427-1474?) and Gheeraert David (1450-1523). A prominent figure in Flemish art was Quentin Massys (1460-1530) who though a Dutchman, was Flemish by influence and the most important man in his profession in Antwerp. He, with Mostert (1474-1556?) was the last of the Gothic school in Flanders. Men disclosing the Italian influences now appeared, among them Mabuse (1470-1541), Franz Floris (1518-1570), Barent van Orley (1491-1542?), Cocxie (1499-1592), Lambert Lombard (1505-1584), and the portrait painters, Peeter Pourbus (1510-1584?) and Antonio Moro (1512-1578). Two brothers Brueghel, flourishing toward the end of this century were known, the one painting merrymakings, as "Droll," or "Boeren-Brueghel," and the other painting fearsome things, as "Hollen or (Hell) Brueghel."

The School of Rubens.—Flemish painting was greatest in the seventeenth century. Rubens founded a new art, on Italian methods, yet distinctly northern in character. Rubens (1577-1640) and his pupil Van Dyke were destined to leave their stamp on the art of all time. The first was eclectic in his choice of theme and to all he did he gave renaissance splendor. No one excelled him in technique and many of his subjects were religious, seen through eyes of his day, with an unction in the painting, a masterly drawing and modeling and an artistic grasp of his personages. He was well born and his life was a succession of triumphs for he was ennobled by his king, having not only the patronage of the highest, but the unstinted praise of his fellows. His masters Van Noort (1562-1641) and Vaenius (1558-1629) were far inferior to him. But in Van Dyke (1599-1641), Rubens had a worthy successor whose best work was in portraiture and who was one of the most materially successful of any of the painters. Style and great charm he had to a marked degree. He painted the famous men and women of his time, having a large studio with a great number of pupils. Other men; Diepenbeeck (1596-1675), Jordaens (1593-1678), Crayer (1582-1669), Janssens (1575-1632), Zegers (1591-1651), Rombouts (1597-1637) and Cornelius de Vos (1585-1651) the last a highly gifted painter, whose portraiture was a high order. Snyders (1579-1657), and Fyt (1609-1661).

were painters of still life and landscape, of great detail and fidelity. Snyders sometimes painted the landscape in the figure-pieces of Rubens.

Genre Painters.—About this time a group of men were drawn to pictures of the commonplace life about them, of peasants at their household tasks and pleasures, among them being Teniers the Younger (1610-1690), whose wit was inclined to be coarse, though allowance must be made for the times. Another was Brouwer (1606-1683?) and, though in a slightly different vein, Gonzales Cocques (1618-1684). A later man was Verhagen (1728-1811), a talented portrait painter. Still later men: Francois Navez (1787-1869), Wappers. (1803-1865), Louis Gallait 1810-?) and the Baron Leys (1815-1869), who developed a quaint Gothic style founded on the German, Cranach. His distinguished pupil, Sir Alma-Tadema, (1836-) now a naturalized Englishman and member of the English Royal academy, caught much of his manner and even exceeded his master in technical dexterity. Tadema has become identified with the rehabilitation of the life, customs and manners of ancient Rome, compositions of which he has made after great research and investigation. Alfred Stevens (1828-1906) one of the most charming of the moderns, a painter of genre, long a resident of Paris, was identified with French art for many years. Verboeckhoven (1799-1881) a sheep painter, but not of the first rank; Clays (1819), an admirable painter of marines; Robie, flower painter, and Van Beers, genre painter, make up another group. The name of Wiertz (1806-1865) stands for that of an eccentric but talented artist whose work is seen in a museum by itself in Brussels and discloses a strong, artistic mind, somewhat unbalanced and full of vagaries.

CLEOPATRA MEETING ANTONY

Painted by Alma-Tadema, and representing the historic scene at the moment when Antony yielded to the fatal fascination of this captivating and artful Egyptian Queen. The picture is minutely finished, and is a fine example of sensuous, Egyptian portraiture by a noted contemporary artist.

Dutch Painting.—Dutch art, like the Dutch people, has ever been sober, sturdy, honest, at times perhaps a little coarse, mostly depicting home life and its joys or sorrows, a little matter of fact, realistic occasionally to grotesqueness, but invariably true to itself and of sterling quality. Even where the theme was of sacred character, the artists used the people about them as personages in their compositions. Mainly these compositions were of a few figures engaged in card playing, carousing, seated by the hearthstone, at meals, or in the mild amusements of a social nature that made up the entertainment of these staid people. Albert van Ouwater is the first known painter, the founder of the Dutch school, and yet no picture has been definitely settled as being by him though some are ascribed to his hands, one, bearing date 1480 which might be later than he flourished. Tradition however credits him with strong landscape work. A pupil was evidently Geertjen van St. Jan (about 1475) who painted some altar pieces, and Bosch (1460-1516), painted some fantastic purgatory pictures that are known through engravings. The leading artist of the early period was Lucas van Leyden (1494-1533), pupil of Engelbrechsten (1468-1533). He was a friend of Albrecht Dürer whose manner he copied. First influenced by the art of Flanders and in late life by the Italians, van Leyden's middle period was distinctly Dutch and he was quite the strongest painter of his times.

The Sixteenth Century imitated the Italian during which time the artists included such men as: Scorel (1495-1562), Heemskerck (1498-1574), Cornelis van Haarlem (1562-1638) and Steenwyck (1550-1604?) the last two being much the stronger of the group. In the seventeenth century the profession of the painter in Holland was crowded and the work was essentially Dutch in character. There was a noble group of portrait painters of which Mierevelt (1567-1641) was one of the earliest. All of the men were thoroughly trained craftsmen, having learned their trade under excellent masters at an early age. Mierevelt was prolific, elegant, smooth, polished, agreeable in color, and had for patrons the aristocratic people of his time. Ravesteyn (1572-1657) and De Keyser (1596-1679) were accomplished workers, but the names of Hals and Rembrandt stand out with such prominence as to overshadow their contemporaries among the portrait men. Of this pair, the elder was Franz Hals (1584-1666), one of the greatest painters for the manipulation of pigment the world has ever seen, ranking with Velasquez and, with the last known as a painter's painter. He swept on his surfaces with great freedom, with certain hand, and generally in admirable color.

Rembrandt (1607-1669) is the greatest name in all Dutch art. He painted in Amsterdam and had a large following. His earliest work dates from 1627, and he painted till the end of a life full of vicissitudes, changes and at the last bitterness for, as Rembrandt grew old, his fellow townsmen turned to younger men. Yet there was nothing he touched in painting that he did not glorify for he was a supreme master of his trade, with exquisite artistic taste and judgment, with invention and absorbing interest. And he etched as well as he painted, producing marvelous drawing in line. He was most fecund and his pictures are scattered all over Europe and this country. He also had a far-reaching influence not alone on Dutch art, but on the art of all Europe. Yet though many followed him, sometimes blindly, none equalled his magic touch. Some however came reasonably close. An admirable portrait painter was Bol (1611-1680), as were Flinck (1615-1660), Eeckhout (1621-1674) and Maes (1632-1693). Other men were Poorter (painting from about 1635 to 1643), Victoors (1620-1672), Koninck (1619-1688), and Frabitius (1624-1654). A fine portrait painter was Van der Helst (1612-1670), a craftsman of much elegance and style and very capable in his arrangements of the figure. And too, he was different from the rest of the school in his precise manner.

The Little Dutch Masters, a coterie of painters, included genre painters who did their pictures on a small scale, with great attention to detail and careful finish. One of these men was Gerard Dou (1613-1675). He was a pupil of Rembrandt with whose manner he disclosed no affiliation though he rendered his panels with great charm and grace, in a masterly manner. Metsu (1630-1667), was another of the little Dutch masters; perhaps the best of them was Terburg (1617-1681), whose little panels of interiors, portraits and genre pictures are in their way, marvels of consummate skill and extraordinary artistic finish. This group has never since been equalled though it has been the inspiration of many a painter. Other men of the time: Van Mieris (1635-1681), Netscher (1639-1684), Schalcken (1643-1706), Van Ostade (1610-1685), Steen (1626-1679), Pieter de Hooghe (1632-1681), and Jan van der Meer (1632-1675), one of the best of these genre men.

Landscape Painting made considerable progress among the Dutch painters of this time, one of the earliest seventeenth century men being Van Goyen (1596-1656), whose pictures of the canals, streams, windmills and houses were most successful. He had a characteristically low sky line and obtained agreeable color. Two of the important men in this direction were Salomon van Ruisdael (1600-1670), and his nephew Jacob van Ruisdael (1625-1682) who was better than his uncle. He found themes that were rather Norwegian than Dutch, consisting of glens, waterfalls and the like, and but little is known of him, save that he lacked patrons

and died in an almshouse. Other men: Molyn (1600-1661), Wynants (1615-1679), Van der Neer (1603-1677), and Everdingen (1621-1682). The great man of the period in landscape however was Hobbema (1638-1709), probably a pupil of Jacob van Ruisdael, painting with greater freedom than his master. His favorite theme was a road leading through a woodland and he was a master in his interpretation of nature. He too, was little appreciated during his life, but he has influenced the art of landscape ever since. Of the men painting animals, the most famous was Paul Potter (1625-1654),

THE YOUNG BULL

Painted by Paul Potter, and now in the Hague Gallery. One of the great masterpieces of animal painting. This picture was carried by the French to Paris and regarded as the fourth in value in their collections. Admired for its truth, taste, and general arrangement of the masses and forms. Potter has been called the "Raphael of animals."

with a reputation not entirely merited, though his *Young Bull* at The Hague gallery is one of the best known pictures in the world. Other men: Adrien van der Velde (1635-1672), Albert Cuyp (1620-1691), Both (1610-1650), Berchem (1620-1683), Du Jardin (1622-1678) and Van der Heyden (1637-1712). Among the marine painters were, Willem van der Velde (1633-1707), perhaps the best of them all, and Backhuisen (1631-1708) and Simon de Vlieger (1601-1660). The best of the Dutch flower painters was Van Huysum (1682-1749). Jan van Heem (1600-1684) and Hondecoeter (1636-1695) rendered poultry, while Weenix (1640-1719) and Van Aelst (1620-1679) painted dead game. Adrian van der Werff (1659-1722) and Philip van Dyck (1683-1753) were of a later epoch, their work being of but modest importance.

The Modern Dutch Painters are excelled by none of their contemporaries in Europe. The *doyen* of the group is Joseph Israels, painting his own country people with rare sympathy and charm, in a masterly manner. His canvases are eagerly sought and bring enormous prices in the auction rooms. Something in his work is akin to that of the Frenchman, Millet, but he is a more able craftsman and he is still living at the age of ninety-two. Anton Mauve (1838-1888) famous for his sheep and cattle, though his landscapes were no less important, was an entirely personal painter, also of great charm and refinement, a prolific worker both in the medium of oils and water-colors. Only fairly appreciated before his death, when he passed away his work was eagerly sought after, at fabulous prices. Three brothers Maris are James, (1835-), Matthew (1835-) and Willem (1839-1910) the last named being the best of the group though all are eminent men in their profession. Willem was a portrayer of cattle in landscapes, of seashore with great skies, or of rich meadowland and he gave distinction to his canvases which are in great vogue with the collector. Weissenbruch (1822-1880), another of the group, was highly esteemed and a most capable, personal renderer of nature. Other men in the figure: Artz, (1837-1890), Blommers (1845-), Neuhuys (1844-) and Bosboom (1817-1891), with Keever, Poggenbeek and Bastert. Mesdag (1831) is a marine painter of some popularity.

German Painting.—Early art in Germany, as in the rest of Europe, received its impulse of Christianity through Italy. Always however from the beginning it has remained distinctly Teutonic, somewhat material, to an extent awkward, and without the refinement of the Italian. Yet in its robustness it is very characteristic of the country and it thus acquired a force that has ever been one of its merits. And from the earliest times the Germans painted the peoples and the material about them. Missal illumination and the decoration of walls were the first forms their art took. Some of the latter are yet extant and date back to the tenth century. They are at Oberzell. Work of the twelfth century may be still seen in the Lower church of Schwarsrheindorf, while work of the next century is in the Brunswick cathedral. About the thirteenth century, panel painting came into vogue and was used almost entirely for altar decorations. Some of these are in the Berlin museum. The earliest of the painters of the panel was known as "Meister Wilhelm," at Cologne. Stephen Lochner, flourishing about the middle of the fifteenth century, was known as "Meister Stephen." A painting by him, *Madonna of the Rose Garden*, is at the Cologne museum. In the same museum are works by the "Master of the Lyversberg Passion," of date about 1463-1480.

The Bohemian School flourished in the last half of the fourteenth century, under the patronage of Charles IV., near Prague. Among the men were Theodorich, of Prague (about 1348-1378), Wurmser and Kunz. Their art while original, was heavy, awkward, and their attempt at realism was not successful. Little is known of the early school of Nuremberg painters though some of their work remains, the chief of which is the Imhof altar piece. At Nuremberg lived Plydenwurff, who flourished about the same time as Wolgemut (1434-1519) and is said to have collaborated with this master in certain altar pieces. Wolgemut's principal fame unfortunately, for he was in himself a great artist, is that he was the master of the famous Albrecht Dürer (1471-1528), one of the world's greatest artists both in painting and engraving. Portraits, religious pieces and altar panels Dürer did with skill, sincerity, originality and distinction. His influence on German art was powerful and he had many pupils and followers. Travelling much over Europe he broadened his knowledge without losing any of his personal methods and never lacked for thorough recognition while he lived. His pupils and followers: Schäufelin (1490-1540?), Hans Baldung (1476-1552?), Hans von Kulmbach (-1522?), Altdorfer (1480-1538?), Barthel Beham (1502-1540), Sebald Beham (1500-1550), Penez (1500-1550), Aldegrever (1502-1558) and Bink (1490-1569?). Martin Schongauer (1446-1488), painter and engraver is better known by the latter work which he did in a masterly manner, beginning at a very early age. He was known among his contemporaries as "Martin, the Beautiful," by reason of his exquisite work. Other men: Zeitblom (1484-1517), Schaffner (1500-1535) and the portraitest, Bernard Strigel (1461-1528).

The Holbeins.—Hans Burkmair (1473-1531) founded at Augsburg, the Swabian school, and he was contemporaneous with Holbein, the Elder (1460-1524), the two men being the best of their time; but the son of the latter, Hans Holbein, the Younger (1497-1543), surpassed all the men of his nation and holds the highest place in German art, remaining one of the greatest art products of all times. He was an engraver, too, of the first rank and traveled much, becoming court painter to Henry VIII. of England. Though his life was comparatively short, he accomplished an enormous amount of work. Yet he always remained thoroughly German, absolutely original and there was no direction in an art way in which he was not superlatively good. Louis Cranach (1472-1553) and his son, Louis Cranach the Younger (1515-1586), were also of this time, but after Holbein there was a decline in German painting, the Italian school finding many imitators. Among these were: Rottenhammer (1564-1623), Elzheimer (1574-1620), Denner (1685-1749), Mengs (1728-1779) and Carstens (1754-1798). Angelica Kauffman (1741-1807), famous during the Georgian period in England whither she came at the age of twenty-three, was a friend among others there of Sir Joshua Reynolds and she painted with great material success being made a member of the Royal academy, but her art was of a very modest quality.

VESTAL VIRGIN

Painted by Angelica Kauffman, and now in the Dresden Gallery. The purity of conception and pleasing beauty raised this picture to a high standard. Goethe said: "No living painter excels her in dignity or in delicacy of taste."

Modern German Art.—The nineteenth century saw a revival of art in Germany, the leaders seeking to introduce something of the spirit of the Italians therein, but they failed to accomplish good results. The men: Overbeck (1789-1869), Cornelius (1783-1867), Veit (1793-1877) and Schadow (1789-1862), had studied in Rome and elsewhere. Kaulbach (1805-

1874) and Piloty (1826-1886) were more important, the last being one of the best of the Munich men. He was unusually clever technically, made enormous compositions, and had a great influence on the young men about him. Easily the two great painters of this epoch were Menzel (1815-1905) and Leibl (1844-), both distinguished draughtsmen, entirely original and excellent colorists, their work possessing great qualities of composition, craftsmanship and charm. Lenbach (1836-1904, was one of the great

PRINCE BISMARCK

Painted by Franz von Lenbach. An admirable portrait by one of the most notable of German portraitists.

portrait painters of the men of his time in Germany. Other men were Liebermann, Gabriel Max, Thoma, von Uhde and Stuck, and Heinrich Hoffmann, whose Biblical pictures bear high repute.

Among men of foreign birth painting in Germany were Makart (1840-1884) an Austrian, using brilliant color on large canvases; Munkacsy (1846-1900) a Hungarian, who subsequently left Germany for Paris and whose *Christ before Pilate* create a great sensation; and Bocklin (1827-1901) a Swiss, of enormous talent and charm, much originality and intellectual force.

The English School.—The early art in England was brought to it largely by the foreign element of painters who came from Italy, Germany, Holland and elsewhere, many of these men being attached to the court and having a strong influence on the lesser artists of British birth. The first distinctly English painter of note was Hogarth (1697-1764), an able technician, an illustrator, above all a moralist and a satirist, who attacked the vices of his day with scathing brush. In the National gallery of London is his famous series of cartoons, *Marriage a la Mode* and *The Rake's Progress*, and though these are famous rather for their satire than for their æsthetic qualities, Hogarth was nevertheless a most distinguished painter along purely artistic lines.

Georgian Portrait Painters.—This great school is headed by Sir Joshua Reynolds (1723-1792), a pupil of Hudson (1701-1799) whom he greatly surpassed. Reynolds was a serious student of the earlier Italians, but it is as a portraitist that he is best remembered. He was the first president of the newly formed Royal academy, a colorist of rare charm and a man who caught the human side of his sitters with unusual fidelity. Gainsborough (1727-1788), was his great rival, one of the most original of the British school, painter of the landscape as well as the portrait, excelling in both directions and obtaining beautiful color. Others of the group; Rommey (1734-1802), Beechy (1753-1839), Raeburn (1756-1835), John Hoppner (1759-1810) and Lawrence (1769-1830), the last celebrated in his day, very popular, clever and effective, but less able than some of his school. Other names include, Etty (1787-1849), somewhat academic, but colorful; Moreland (1763-1804), a painter of farm life; Sir David Wilkie (1785-1841) painter of home life; Landseer

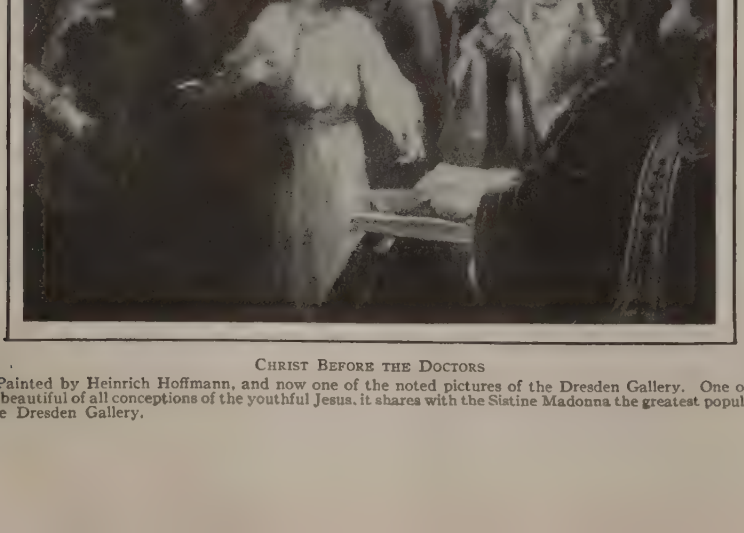
SHOEING THE BAY MARE

Painted by Landseer, and now in the National Gallery, London. A prime favorite of this noted animal painter. Though frequently accused of endowing his animals with too great a perfection, yet this thoroughbred evidently has a poetic right to give the farrier advice—as her attitude here so plainly implies.

(1802-1873), whose pictures of animals gave him great fame, and Mulready (1786-1863), painter of village children.

British Landscapes.—Here the English were strong. Richard Wilson (1713-1782) was the first of originality and importance though he did not attempt any realism and was more or less a reflection of the art of Claude Lorrain. Old Crome (1769-1821) was the leader of what was known as the Norwich school, of men painting in that section of England and he had a strong influence on his time. After Crome, was Cotman (1782-1842), but the best of all the Englishmen in landscape was John Constable (1776-1837), son of a miller of wealth and himself known as "the handsome miller." A student of the Academy schools, he shortly afterward went to nature and devoted himself to portraying scenes out of doors for the rest of his life. It was reserved for the French first to appreciate him, in 1824. His manner was broad, quite different from the then existing fashion in England, and he had a strong influence on the men who subsequently formed the Barbizon school in France. Callcott (1779-1844) was inclined to the manner of Claude, but Bonnington (1801-1828) was very original in color and manner and in his short life did many excellent pictures. Turner (1775-1851) a great name in British landscape painting, was a colorist of rare originality and force. He possessed an extraordinary imagination, unusual facility and was a fecund worker in both the mediums of oil and water color. Prout (1783-1852), Cox (1783-1859), and Dewint (1784-1849) were famous water colorists.

Pre-Raphaelites.—Holman Hunt (1827-1910) was associated with this school and Sir John Millais (1829-1896) and Rossetti (1828-1882) along with him, were the founders. Hunt painted religious pictures in great detail, more intellectual than



CHRIST BEFORE THE DOCTORS

Painted by Heinrich Hoffmann, and now one of the noted pictures of the Dresden Gallery. One of the most beautiful of all conceptions of the youthful Jesus, it shares with the Sistine Madonna the greatest popularity of the Dresden Gallery.

artistic, in dry, hard color, and much over-elaboration. Millais soon broke away from the school and gave himself to the painting of genre pictures and portraits with which he achieved enormous success, eventually becoming president of the Royal academy. Rossetti, more of a poet than a painter, took many of his themes from Dante, was neither an agreeable colorist, nor a well trained draughtsman, but he had a large following among whom may be mentioned Burne-Jones (1833-1898) painter of mystic themes and famous designer of stained glass, his color dry, though at times rich, and his drawing distinguished. Madox-Brown (1821-1893) had much dramatic power. Sir Frederick Leighton (1830-1896) who succeeded Millet as president of the Royal academy, was an accomplished draughtsman, but possessed little sense of color as such. He painted many classic themes and decorative works of great merit and charm. Albert Moore (1840-1893) was a graceful decorative painter of delightful originality and Watts (1818-1904) an original painter of portraits and allegorical pictures of deep thought and originality if at times of indifferent technical achievement. Other men: Orchardson (1835-1910), Erskine Nicol (1825-), Faed (1826-), Holl (1845-1890), Herkomer (1849-), Vicat Cole (1833-1893), Cecil Lawson (1833-1893), W. L. Wyllie, and Henry Moore (1831-1895). The younger modern men in England and Scotland have been strongly influenced by the art of Whistler and the modern Dutch painters.

A school known as the modern Scotch school includes such men as: James Guthrie, E. A. Walton, James Hamilton, George Henry, E. A. Hornell, John Lavery, Alexander Roche and others. An Irishman, William Orpen, has struck an original note in recent years in portraiture and figure work.

American Painting.—Early American art was in portraiture, largely borrowed from England, from which country came many itinerant portrait painters. Of these foreigners, the first were: Smibert (1684-1751), a Scotchman who settled in Boston, and a fellow countryman, Watson (1685-1768), who settled in New Jersey.

John S. Copley (1737-1815) and Benjamin West (1738-1820) were the first distinctively American painters though they learned their art in England and were under the domination of the then prevailing British fashions in art. Copley practiced in Boston and was the early pictorial historian of the New England families. West remained abroad where he enjoyed the favor of the English king and so succeeded to the presidency of the Royal academy. Many of these early men painted General Washington. Among them were C. W. Peale (1841-1827), Trumbull (1756-1843), Rembrandt Peale (1787-1860) and others. The best of the early American group, was Gilbert Stuart (1755-1828), a fine colorist and admirable draughtsman, and a man of intensely interesting personality whose portraits of Washington are quite the most famous. Other early men: Vanderlyn (1776-1852), Washington Allston (1779-1843), Jarvis (1780-1834), Sully (1783-1872) who painted a celebrated portrait of Queen Victoria, and Doughty (1793-1856), the first of the American landscapists. In this direction followed Thomas Cole (1801-1848) and A. B. Durand (1796-1886).

The Hudson River School.—Cole was the painter of a famous series known as *The Voyage of Life* and *The Course of Empire*, which were engraved and had a wide popularity. For the times both were excellent painters and they may be said to have founded what was known as the Hudson river school, of which Kensett (1818-1872) was a follower. Frederick E. Church (1826-1900) pupil of Cole, was famous for his pictures of mountain scenery, of natural phenomena, rendering great stretches of country with rare fidelity and skill. He enjoyed much material, as well as artistic success and was a prolific workman. Bierstadt (1830-1902) painted the western country, mainly the Rocky mountains. Other portrait and genre painters: Chester Harding (1792-1886), Inman (1801-1846), Page (1811-1885), Elliott (1812-1868), Baker (1821-1880), Healy (1808-1894), and Huntington (1816-1906), the last being one of the founders and a president of the National academy of design. Leutze (1816-1868), who came early to this country from Germany, painted many historical scenes, the most famous being *Washington Crossing the Delaware*.

William M. Hunt (1824-1879) was a pupil of Couture and a friend of Millet, at Barbizon. He introduced the work of Millet to this country and was himself an able painter as well as a popular teacher. Some of his portraits were rendered in a masterly manner, notably that of Judge Story, at Salem. Hunt had a strong influence on his followers. Uniquely American was George Fuller (1822-1884), lacking in his early art training but with an originality in his color and choice of theme that made him one of the interesting figures of his time.

A trio of landscape men that were strongly to influence the men of their time and the art that followed, consisted of George Inness (1825-1894) A. H. Wyant (1836-1892) and Homer D. Martin (1836-1897). Inness, influenced in turn by the Men of Thirty, at his best a powerful renderer of nature and a poet of the dramatic order; Wyant, more lyrical, was essentially of the soil, painting tender, dreamy bits of nature, while Martin was intensely personal.

Foreign Influences.—The foreign art that came to America at the time of the Centennial Exhibition in Philadelphia, in 1876, had much to do with stimulating the men and many students went to Europe to study, Munich and Paris being the most popular places. There still remained a group of strong men, most of them already having had the best of European influences. Among these were Eastman Johnson (1824-1896), a strong painter of portraits and genre; Elihu Vedder (1836-1922) a man with rare imagination; John LaFarge (1835-1910), distinguished for his decorations and designs for stained glass, and Winslow Homer (1836-1910) home trained, early in his career painting scenes from the American civil war, but later developing into a great marine painter, a man of large talent and virile artistic personality. John S. Sargent (1856-) though of American parentage, is European by birth and training, one of the most distinguished of living portraitists: he has decorative panels in the Boston public library. William M. Chase (1849-1916), pupil of Piloty and Munkacsy, is a painter of portraits, landscape and still life, excelling in all directions and Thomas W. Dewing (1851-) following along the lines of the little Dutch masters, holds a unique place among the moderns by reason of his skill and exquisite taste. Among landscape men, Willard L. Metcalf holds a commanding position because of his fidelity to nature's forms and his abiding skill in their representation. Other Americans include, J. Alden Weir, Abbott H. Thayer, E. C. Tarbell, Robert Reid, Charles H. Woodbury, Wyatt Eaton (1849-1896), Childe Hassam, Walter Shirlaw (1838-1909), E. L. Blashfield, Joseph DeCamp, H. S. Mowbray, George De F. Brush, I. R. Wiles, the brothers Harrison, Alexander and Birge, and Robert Blum (1857-1903).

CARMENCITA

Painted by Sargent, and now in the Luxembourg, Paris. One of his best delineations, portraying this dancing girl in all her insolent beauty and charming grace as the acme of the dancer's art. The original shows the sparkle and glitter of the deliciously colored gown in all the hues of a brilliantly lighted stage.

James MacNeill Whistler (1834-1903) American only by birth and preliminary education, a cadet at the U. S. Military academy at West Point for a while, but during all his art life a resident of Europe, was at his best a master, strongly influenced by the art of Japan. He painted as a rule in low tones and had an extensive following leaving a strong influence on the art of his time. As an etcher he was second only to Rembrandt. His portrait of his mother, in the Luxembourg, Paris, is a work of surpassing charm and excellence.

Edwin A. Abbey (1852-1911) made England his home for many years, being a Royal academician. He executed much work in historical and decorative compositions. His panels *The Quest of the Holy Grail* are at the Boston public library and he has done decoration for the State Capitol at Harrisburg, Pennsylvania. He also painted the official picture of the Coronation of the late King Edward VII. of England. Other Americans living, mainly, abroad are: Frederick A. Bridgman, Gari Melchers, Jules Stewart, W. T. Dannat, and Eugene Vail. John W. Alexander, P. N. A., is a painter of

portrait and decorations (in the Carnegie Institute, Pittsburg) of strong originality and distinction. Other men and women include John Francis Murphy, D. W. Tyron, Horatio Walker, Bruce Crane, John H. Twachtman, Henry W. Ranger, E. E. Simons, Childe Hassam, Arthur B. Davies, J. W. Freer, Frank Duveneck, John C. Johansen, Cecilia Beaux, Mary Cassatt, George Bellows, R. A. Blakelock, Emil Carlsen, Kenyon Cox, Thomas Eakins, C. W. Hawthorne, E. W. Redfield, H. O. Tanner, Douglas Volk, Edward C.Steichen, Albert Sterner, E. J. Waugh, Hugo Ballin, F. S. Church C. M. Dewey, Robert Henri, W. L. Lathrop, Carlton Wiggins, Frank Benson and H. H. Breckenridge.

Loomis; *National Gallery Pictures; Masters in Art;* Rinach's *Story of Art Throughout the Ages;* Coffin's *How to Study Pictures;* Frothingham's *History of Sculpture;* Sturgis' *Dictionary of Architecture.*

How to Look at Pictures.—It is a mistake to suppose that age is any indication of the value of a picture. This is an error into which many laymen fall, with the result that discouragement ensues because the work under consideration does not appeal. Indifferent work is by no means a monopoly of the modern painter. There have been poorly equipped craftsmen since the world began. But, because a picture is not immediately understood, is by no means to say that it is lacking. Art, like the study of literature or music, is a profound study, requiring the most serious application, investigation, research and experience. The average person prefers rag-time to the symphonies, nocturnes and grand compositions of musical masters, just as trashy reading appeals to the minds of the uncultivated. This is not, however, for a moment to admit that the works of the great composers and authors are not of higher importance than the meretricious tunes of the hurdy-gurdy, or the ephemeral novels of the day. But one, by a systematic course of study, can so train the ear and mind that only the best will satisfy in the end. And so it is with pictures. It is the story of all great collectors that their collections are gradually weeded out as their tastes improve and a higher standard is demanded.

Intuitively some minds are attracted to the best in art, as in music and literature. They are, however, the exceptions, not the rule. Even such minds are improved and strengthened by study and experience. The average man can only hope to achieve reasonable discretion in the matter of art by serious investigation and much sober reading. Some one has said that a work of art means a combination of two people—he who did it and he who looks at it. A picture is one man's conception of nature, and though twenty painters render the same subject, each according to his endowment and altogether differently from his fellow, each will be right, according to his convictions and power of transferring his thought to canvas. For it is a matter of seeing, no less in the layman than in the artist, and one may be taught to see, as one may be taught to do other things. A good picture must say something; not necessarily tell some trite anecdote, or record some trivial incident, but must strive to convey some truth, even it be but the truth of humanity, as for instance in Titian's *Man With the Glove*, in the Louvre, one of the grandest portraits ever painted, or in the *Mona Lisa*, the most successful single figure piece ever offered to the world. In both cases the artists gave an epitome of the man and the woman of their day, and did so in the last terms of craftsmanship. Veronese gave the glory of color and the sumptuousness of apparel in his *Marriage at Cana*, which, as a record of the biblical event, was utterly false; but his genius carried it beyond facts and made of it a superb composition. The extraordinary piety in many of the older men among the Primatives atoned for other shortcomings, while the absolute and convincing sincerity of the Little Dutchmen, and their technical skill, made up for many a stupid composition.

A masterpiece must be all things to all men. You may have it dark in key, like a Ribera; glorious in light and shade, like a Rembrandt; full of poetry and graceful beauty, like a Raphael; colorful, like a Titian; elegant, like a Van Dyke; faithful and analytical, like a Holbein; unctuous and rich, like a Rubens; a poem in tone, like a Turner; or full of the glories of light and air, as a Monet, for each of these men had a mission to convey and he conveyed it seriously, earnestly, and according to the best that was within him. So when you stand before a canvas, seek first to know what was the object of the creator. If his aim was color, try to analyze his accomplishments in that direction; if to portray the glory of out of doors, follow him there; or, if the human form attracted him most, endeavor to put yourself in touch with such an ambition on his part. And if at first there is no appeal, engage in a little introspection and possibly you may discover the fault is your own, not that of the artist. But above all, approach a work of art, one that has stood the test of time, with reverence and the genuine endeavor to get the good, not the bad out of it, to get the viewpoint of the painter, and so to try and enter with him into his general trend of thought.

They have an inscription above the doors of the picture gallery at the South Kensington museum, in London. It reads, "That which has pleased long and many must have some merit." It is advice to be remembered. Da Vinci, Botticelli, Rembrandt, Velasquez and the whole nobility of art are not where they are because of the critical opinions of the few, subject to changes of fashion, but because their art was founded on the eternal truths. They were great craftsmen as well, and they had something worth the world's listening ear, each in his own way, and each according to his own lights; but it was always truth, the truth of humanity, nature, beauty—always truth. The spectator may not understand them, but the fault is not theirs, and it is up to the spectator to reorganize his point of view, for no ignorance, no stupidity, no false arguments, can for one moment dislodge truth, which despite all efforts yet remains as firm as the rock of ages—as truth, eternal, unassailable, inviolate. So, read of art. Listen to what the best judges have said about pictures. Get from these writers their point of view, the point of view of men who by study and experience are better qualified than you to judge, and so, in a humble spirit, and with a child's openness of mind, approach the work of these great men whom heaven has endowed with beauty of thought, precision of hand, and splendor of imagination. Do this reverently, and with the genuine desire to learn, and the reward will be yours. It will repay a thousand fold, for if we may not all be creators, at least we may get an intelligent satisfaction from the creation of those more gifted, alas, than are we.

Terms in Fine Arts

Amphitheater.—A building for gladiatorial and other shows, generally elliptical in form.

Angels.—In mediæval art divided into nine degrees: Seraphim, Domination, Princedom, Cherubim Virtues, Archangels, Thrones, Powers, Angels. The Cupid-like angels were only introduced in the time of the Renascence.

Antae.—Rectangular pilasters forming the ends of the walls of the cella of a Greek temple, and supporting the extremities of the architrave. A temple of this form was called a temple "in antis."

Apse.—The extremity of a church, generally semicircular in form and surmounted by a semi-dome.

Aquatint.—A process of engraving by acid laid on in even washes with a brush, upon a broken surface formed by a crackled film of resin on the copper.

Arabesque.—An ornament composed of stems, foliage, leafage of plants, scrolls, and fantastic animals. Not, as its name implies, an Arab invention but found in Greek and Roman architecture.

Arch.—A curved structure, generally a segment or segments of the circle. Semicircular arches were used by the Romans; horseshoe arches by the Byzantines and Moors; pointed arches formed of two intersecting segments of circles by the Gothic builders.

Architrave.—The horizontal part of a structure resting immediately on the capital of column or pilaster.

Atlantes.—Human male figures, employed instead of columns to support the architrave.

Atrium.—A covered court in a Roman house, with an opening in the center (compluvium) and roof sloping inwards.

Baldachino.—A canopy over seats and other places of honor.

Baroque.—Rococco.

Base.—The lower division of a column on which the shaft is placed; absent in the Doric order.

Basilica.—A rectangular hall divided by rows of columns into three naves, and used by the Romans as a court of justice. Adopted as the typical form of early Christian churches.

Bas Relief.—(Basso relievo.) Figures sculptured on panel projecting less than half their proportions from the surface.

Body Color.—In water-color painting, color made opaque by intermixture with white.

Buttress.—A piece of wall built at right angles to the wall of a building to strengthen the structure, either immediately against the wall or connected by an arch called a flying buttress.

Byzantine.—The style of architecture and painting is use at Constantinople from the sixth to the twelfth century.

Capital.—The, usually ornamented, member which crowns the top of a column or pillar, and by the form of which the different orders are characterized.

Caryatides.—Female figure, employed instead of columns to support the architrave.

Cella.—The internal part inclosed by the walls of a Greek temple.

Chevron.—A zigzag molding used in Romanesque architecture.

Chevet.—A form of apse inclosed by an arcade with a series of chapels round it, common in Romanesque and Gothic churches in France.

Chiaroscuro.—The distribution of light and shade.

Cinquefoil.—An ornamental foliation, consisting of five projecting cusps.

Cloister.—A quadrangle covered walk, forming a portion of a monastic building.

Clustered Column.—A pier formed by a number of shafts clustered together, either united, or separate.

Column.—A column consists of three principal parts: base, shaft, and capital.

Cornice.—The horizontal molded projection terminating a building.

Corona.—A molding forming part of a conical, with lower part grooved to form a dripstone.

Crypt.—A subterranean chapel beneath a church.

Cusp.—Pointed foliations in architectural tracery.

Damascened.—Metal ornamented by inlaying another metal.

Decorated.—The second of the pointed or Gothic styles of architecture in England.

Dentils.— Ornaments in the form of small cubes of teeth.

Dormer.—A gable window in the sloping side of a roof.

Dry-Point.—Direct engraving upon copper with the etching needle.

Entablature.—The horizontal superstructure which lies upon the columns in classic architecture.

Etching.—Engraving by the action of acid on a copperplate covered with a wax ground on which lines have been scratched by the etching needle.

Fan Tracery.—Elaborate carved work spread over an arched surface.

Terms in Fine Arts.—Continued

Fillet.—A plain band used in architecture to separate ornaments and mouldings.
Finial.—An ornament of carved work representing foliage on a pinnacle or spire.
Flamboyant.—The style of French architecture peculiar to the fifteenth century, contemporary with perpendicular in England.
Flutes.—Small semicircular grooves or channels cut in the shafts of columns or pilasters.
Fresco.—Painting executed on a freshly laid ground of stucco.
Fret.—An angular, interlaced architectural ornament.
Frieze.—(1) The middle division of an entablature which lies between the architrave and cornice. (2) Any horizontal sculptured band.
Grisaille.—A style of painting in gray by which solid bodies are represented as if in relief.
Groin.—The angular curve formed at the intersections of a vaulted roof.
Gymnasium.—A large building used by the Greeks in which gymnastics were taught and practiced.
Hypostyle.—A roof supported by columns.
Impasto.—The thickness of the body of pigment laid on to a painting.
Intaglio.—A stone in which the design is sunk beneath the surface, and gives impression of a bas relief.
Klaft.—A royal Egyptian headdress forming a kind of hood and terminating in two flaps, which form over the breast.
Lancet.—A pointed arch, obtuse at the point, resembling a surgeon's lancet.
Lantern.—A small turret above the roof of a building having windows all round it.
Lintel.—The stone or beam placed across the top of a door or window.
Loggia.—The gallery or corridor of a place.
Lotus.—A water lily. In Egypt it is held very sacred.
Mansard.—A roof with two sets of rafters of which the upper part is less steep than the lower. Named after a French architect.
Marquetry.—Inlaid work of ornamental woods and stones of various colors.
Medallion.—A circular or oval tablet on the face of a building.
Metope.—A kind of panel between the triglyphs in the Doric frieze.
Mezzo Relievo.—Sculpture in relief in which half of the figure projects.
Mezzo Tinto.—A method of engraving by smoothing away the lights from a ground mechanically roughened.
Monolith.—An object formed of a single block of stone.
Mosaic.—An imitation of painting by joining together minute pieces of hard substances of different colors.
Nave.—The middle part or body of a church from the choir to principal entrance between the aisles.
Nimbus.—A halo or circular disk around the head of sacred personages.
Ogee.—An arch described with four centers so as to be concave in lower and convex in upper part.
Ogive.—A pointed arch.
Oriel.—A projecting angular window, generally triangular or pentagonal in shape.
Ovolo.—A convex molding much used in classical architecture.
Pagoda.—A religious building of the Hindoos.
Palaestra.—A place for wrestling, formerly part of the gymnasium.
Pediment.—A triangular crowning of a portico usually supported by a row of columns.
Pendentive.—The part of a vault between two arches supporting a dome.
Peristyle.—A building, the interior of which is surrounded with columns.
Perspective.—The art of representing on a flat surface the appearance of objects from one given point of view.
Pilaster.—Square pillar on a wall partly imbedded in it, less than one fourth of its thickness projecting.
Pinnacle.—A small spire.
Piscina.—A stone basin usually placed in a niche in the wall of the chancel at which the priest might wash his hands.
Plinth.—The lower projecting base of a column.
Pronaos.—The portico situated in front of a temple.
Propylaea.—Gateway or entrance to an Egyptian temple.
Quatrefoil.—An ornament in pointed architecture, consisting of four foils.
Rococo.—A style of decoration distinguished by a Superfluity of confused and discordant details.
Romanesque.—The debased style of architecture and ornament adopted in the later Roman empire, and the styles founded upon it.
Rose Window.—A large, circular window divided into compartments by curved mullions.
Rubble.—Rough stones and broken bricks, used to fill up between walls.
Rustication.—Hewn stone masonry, the joints of which are rendered conspicuous by grooves or channels.
Sarcophagus.—A stone coffin.
Scumbling.—The process of going over a painting with a brush, nearly dry, to soften and blend the tints.
Stylobate.—The common base of a row of columns.
Taenia.—A band which separates the Doric frieze from the architrave.
Tempera.—Painting with pigments mixed with chalk or clay, and diluted with size.
Torso.—The trunk of the statue of a human figure.
Tracery.—Geometrical ornament.
Transept.—A transverse nave, passing in front of the choir, and crossing the longitudinal nave of a church.
Trefoil.—An ornament of three foils.
Triforium.—The second or middle story of the nave wall of a Gothic church, consisting of a gallery over the ceiling of the side aisle and below its roof.
Triglyph.—An ornament, consisting of three flutings or upright groupings, separating the metopes in a Doric frieze.
Triptych.—A form of pictures in three panels.
Tympanum.—The triangular space between the horizontal and sloping cornices. The name is also given to the space included between the lintel of a door and the arch over it.
Vault.—An arched ceiling or roof of stone.
Volute.—A spiral scroll.
Voussoirs.—The wedge-shaped stones used in constructing an arch.
Zoophorus, Zophorus.—(Lit. bearing animals.) A continuous frieze, decorated with figures of animals, conventional and real.

WORLD'S FAMOUS PAINTINGS

I. In the Rijks Museum, Amsterdam

Title of Painting	Painter	School	Observations
The Night Watch.	Rembrandt (1607-1669).	Dutch.	Captain Banning Cock's company of musketeers coming out of the guard house. Wonderful arrangement of light and shade on figures.
Directors of the Cloth-Makers' Guild.	Rembrandt (1607-1669).	Dutch.	A masterpiece of portrait arrangement.
Banquet of the Guard.	Van der Helst (1612-1670).	Dutch.	On the occasion of the peace of Westphalia in 1648. Sir Joshua Reynolds called this canvas "the first picture of portraits in the world."
The Night School.	Gerard Dou (1613-1675).	Dutch.	Remarkable in the treatment of candle-light and exquisite in finish.
A Lady.	Netscher (1639-1684).	Dutch.	Marvelous rendering of textures and stuffs.

II. In the Antwerp Museum

Crucifixion.	Peter Paul Rubens (1577-1640).	Flemish.	Considered one of this master's chef d'œuvres. Sir Joshua Reynolds ranked it as one of the first pictures in the world.
The Entombment.	Quinten Matsys (1466-1531).	Flemish.	One of his celebrated works, containing ten figures, with the dead Christ in the center.
The Water Wheel.	Hobbema (1638-1709).	Dutch.	Excellent rendering of water in movement, by one of the great landscape painters of all times.
The Mandolin Player.	Terburg (1617-1681).	Dutch.	Exquisite treatment of surfaces and intimate surroundings of a Dutch interior.

III. In the Berlin Museum

Leda and the Swan.	Correggio (1494-1534).	Parmese.	A theme the artist painted many times, with great success.
Children of Charles First.	Van Dyke (1599-1641).	Flemish.	Justly considered one of the greatest of all the world's portraits of children.
The Wings of the Adoration.	The brothers Hubert and Jan Van Eyck (1390-1440).	Flemish.	One of the most elaborate altarpieces ever painted.
Boy Blowing Bubbles.	Vermeer (1632-1675).	Dutch.	Highly representative work of a most brilliant craftsman, one of the best of the coterie known as "the Little Dutchmen," and of recent years more fully appreciated at his true worth.
Saint Anthony and the Infant Christ.	Murillo (1618-1682).	Spanish.	One of the best of a long series of such pictures painted by this distinguished Spaniard.

IV. In the Borghese Gallery, Rome

Madonna.	Botticelli (1446-1510).	Florentine.	Botticelli was famous for his deep religious sentiment as expressed in his paintings and for exquisite finish.
Leda and the Swan.	Leonardo da Vinci (1452-1510).	Florentine.	It is fair to say that modern critics contest this attribution and in fact there are but few authentic works extant by Da Vinci.
Sacred and Profane Love.	Titian (1477-1576).	Venetian.	An undisputed masterpiece, full of glorious coloring and of splendid conception and execution.
Entombment.	Raphael (1483-1520).	Umbrian.	A highly important example containing eleven figures.
Danae.	Correggio (1494-1534).	Parmese.	Graceful arrangement of four nude figures.
Madonna.	Bellini (1428-1516).	Venetian.	Naively painted, and of deep religious feeling.

VII. In the Dresden Gallery

The Sistine Madonna.	Raphael (1483-1520).	Umbrian.	One of the most famous and popular of all the world's pictures.
La Notte.	Correggio (1494-1534).	Parmese.	This picture, *The Night*, is a representation of the Adoration of the Shepherds and was formerly known as *Madonna de Reggio*.

WORLD'S FAMOUS PAINTINGS—Continued

VII. In the Dresden Gallery—Continued

Title of Painting	Painter	School	Observations
Marriage at Cana.	Veronese (1528-1588).	Venetian.	Painted many times by Veronese, the most important canvas being at the Louvre, Paris.
Tribute Money.	Titian (1477-1576).	Venetian.	The last is a sumptuous work in rich, glowing color.
Cupid Crowning Venus.			
Sleeping Venus.	Sassoferrato (1605-1685).	Roman.	A fine canvas, for many years attributed to Titian.
Venus Reposing.	Palma Vecchio (1480-1528).	Venetian.	
Fortune Teller.	Caravaggio (1569-1609).	Roman.	This artist painted many pictures of this same theme.
Saint Mary of Egypt Kneeling at The Grave.	Ribera (1588-1656).	Spanish.	The artist, known as Lo Spagnoletto, painted much for churches and religious houses.
Saint Roderiguez.	Murillo (1618-1682).	Spanish.	
Virgin and Child.			
Charles I. of England.	Van Dyke (1599-1641).	Flemish.	Official portrait painter to the English court, Van Dyke limned all these people many times.
The Children of Charles I.			
Henrietta Maria, Wife of Charles I.			
The Artist's Wife.	Rembrandt (1607-1699).	Dutch.	This gallery contains a wonderful collection of Rembrandt's work.
The Artist and His Wife.			
Manoah's Sacrifice.			
Judgment of Paris.	Rubens (1577-1640).	Flemish.	
Madonna.	Holbein the Younger (1497-1543).	German.	One of the most important compositions by this master, containing no less than eight large figures.
Reading Magdalen.	Correggio (1494-1534).	Parmese.	One of the most popular and most reproduced religious pictures in the world, though of recent years its attribution has been questioned.
Crowned With Thorns.	Guido Reni (1575-1642).	Italian.	This work is familiar through many reproductions.
Lady in Satin.	Terburg (1617-1681).	Dutch.	Characterized by his usual detail and finish, a beautiful example.

VIII. In the Academy of Fine Arts, Florence

Allegory of Spring.	Botticelli (1446-1510).	Florentine.	World famous for its graceful arrangement of beautiful nudes.
Crucifixion.			This gallery is particularly rich in the pictures of its townsman, Botticelli.
Coronation.			
A Predella.			
Many Madonnas.			
An Angel.	Da Vinci (1452-1510).	Florentine.	This is in a painting by Verrocchio, and was painted when Da Vinci was his pupil.
The Nativity.	Ghirlandajo (1449-1494).	Italian.	

IX. In the Royal Museum, The Hague

The Young Mother.	Gerard Dou (1613-1675).	Dutch.	One of his very best examples.
The Anatomical Lecture.	Rembrandt (1607-1669).	Dutch.	One of the great paintings of all time, containing many figures showing seven students listening to a lecture by the famous Dr. Nicollas Tulp, who is dissecting a dead body. Rembrandt's fame dated from this picture. It was painted for the Guild of Surgeons, Amsterdam. Curiously enough, several famous painters have rendered the same theme, among them:—Aert Pietersen, Thomas de Keyser, Nicolas Elias, and Pieter van Mirevelt. There are several other important examples by Rembrandt in The Hague gallery, notably, *The Presentation in the Temple* and *The Flight Into Egypt.*
The Young Bull.	Paul Potter (1625-1654).	Dutch.	The most famous cattle picture in the world, painted when the artist was but twenty-seven. The animal is the size of life, another animal is lying near a tree by which are some sheep, and to one side is a peasant. Back of them there is a familiar Dutch landscape. Recent critics qualify the earlier profound admiration for this work.
Protrait of Paul Potter.	Van der Helst (1612-1670).	Dutch.	

X. In the Museum of Haarlem

Banquet of Officers of Arquebusiers of Saint George.	Frans Hals (1580-1666).	Dutch.	This large canvas contains twelve figures and is justly famous. The greatest claim this museum possesses is its superb collection of the work of its eminent townsman.
Banquet of Officers of Arquebusiers of St. Andrew.			All of these works may be considered as masterpieces.
Assembly of Officers of Arquebusiers of St. Andrew.			
Officers and Sergeants of Arquebusiers of St. George.			
Governors of the Elizabeth Hospital.			
Governors of the Hospital for Old Men.			
Lady Governors of the Hospital for Old Women.			

XI. In the Hermitage, St. Petersburg

Holy Family.	Raphael (1483-1520).	Umbrian.	
The Descent From the Cross.	Rembrandt (1607-1669).	Dutch.	This gallery is wonderfully rich in examples of Rembrandt's work.
Portrait of an Old Jew.			
Soldier			
His Mother.			
The Farm Yard.	Paul Potter (1625-1654).	Dutch.	A celebrated work ranking next to the artist's picture of *The Bull.*
	Van Dyke (1599-1641).	Flemish.	There are fourteen important canvases by this artist in the gallery.
	Rubens (1577-1640).	Flemish.	Represented by six notable canvases.
	Murillo (1618-1682).	Spanish.	Fourteen important canvases represent this painter here.

XII. In the Louvre, Paris

Madonna of the Cradle.	Raphael (1483-1520).	Umbrian.	
St. George and the Dragon.			
La Belle Jardiniere.			
Portrait of Himself.			
Portrait of Himself.	Rembrandt (1607-1669).	Dutch.	
Emmaus.			
Philosophers.			
The Samaritan.			

WORLD'S FAMOUS PAINTINGS—Continued

XII. In the Louvre, Paris—Continued

Title of Painting	Painter	School	Observations
Erasmus.	Holbein, the Younger (1497-1543).	German.	One of the world's famous portraits of deep human interest.
Soldier and Maiden.	Terburg (1617-1681).	Dutch.	A cabinet picture of great charm and delicacy of finish.
Officer Addressing a Lady.	Metsu (1630-1667).	Dutch.	A graceful composition by a master of genre work.
The Dropsical Woman.	Gerard Dou (1613-1675).	Dutch.	Very famous as being of a somewhat repulsive theme which the painter has by sheer force of craftsmanship made most interesting.
The Immaculate Conception.	Murillo (1618-1682).	Spanish.	This artist, as well as his contemporaries, painted this theme frequently, but this picture is the most famous of all and is a large canvas full of figures, exquisitely rendered.
The Birth of the Virgin.			
La Maitresse du Titian.	Titian (1477-1576).	Venetian.	
The Entombment.			A world-famous picture of deep religious significance.
The Man With the Glove.			Universally considered one of the greatest masterpieces of portraiture that the world has ever seen.
Crowned with Thorns.			
The Holy Family.			The collection is particularly rich in the work of this masterly Venetian.
Mona Lisa.	Leonardo da Vinci (1452-1510).	Florentine.	Perhaps the greatest single figure piece ever painted. It is a portrait of the wife of Zanobi del Giocondo, and the canvas is sometimes referred to as "La Gioconda." Da Vinci is said to have spent four entire years on the picture, which he sold to Francis I. for the then extravagant price of four thousand gold florins, a terrific amount for those days. It has been the shrine for art worshippers and students for many years. Many copies of this work, some by pupils of Da Vinci are in the various galleries of Europe. Stolen 1911. Found in Florence, 1913.
Saint Anne.			Among the few authentic pictures by this great artist.
Saint John, the Baptist			
The Marriage at Cana.	Paul Veronese (1528-1588).	Venetian.	The Louvre is full of masterpieces and this is one of its most famous, being an enormous canvas, of sumptuous coloring, containing portraits of Francis I. and his queen, Mary of England, the Emperor Charles V., and many painters, including the artist himself, Titian, Tintoretto and others.
Betrothal of Saint Catherine.	Correggio (1494-1534).	Parmese.	
Antiope and Jupiter Disguised as a Satyr.			
The Music Lesson.	Terburg (1617-1681).	Dutch	One of the famous gems of painting executed in great detail.
Shooting Match.	Van der Helst (1612-1670).	Dutch.	
Children of Charles I.	Van Dyke (1599-1641).	Flemish.	Van Dyke gave the greatest distinction to his portraits, of which, though he died at the early age of forty-two, he did many.
Charles I., at Full Length, With Horse and Suite.			
Isabella of Spain.			
The Duke of Richmond.			
Saint Sebastian.	Guido (1575-1642).	Italian.	A most representative collection of the work of this popular painter.
Mary Magdalen.			
The Holy Family.			
Portrait of the Infanta Margarita.	Velasquez (1599-1660).	Spanish.	A comprehensive representation of this great master's methods of work.
Maria.			
The Infanta Maria Theresa.			
Philip IV.			
Meeting of Gentlemen.			
Laughing Girl.	Frans Hals (1584-1666).	Dutch.	All are excellent examples, but this Dutch master is seen at his best in the gallery of his native place, Haarlem.
Portrait of a Lady.			
Portrait of the Beresteyn Family.			
The Embarkation for Cythera.	Antoine Watteau (1684-1721).	French.	Considered one of the most beautiful pictures in the world, of great charm, originality and poetic feeling.
Gilles of the Comedie Italienne.			
L'Indifferent.			
The Broken Pitcher.	Greuze (1725-1805).	French.	A very popular work, well known through reproduction.
The Raft of the Medusa.	Gericault (1791-1824).	French.	An epoch-making picture, being a great departure in realism and a protest against the prevailing academic manner. The work when first shown created a great sensation.
Portrait of Mme. Recamier.	David (1748-1825).	French.	Very distinguished canvases and both well known by reproduction.
Portrait of Himself.			
Oath of the Horatii.			These are hard, academic compositions, the figures rigid and unsympathetic, but drawn with distinction, though the manner of painting is of a curiously artificial period in French art.
Rape of Sabine Women.			
Œdipus Explaining the Riddle of the Sphynx.	Ingre (1780-1867).	French.	The picture *La Source* was painted when the artist was seventy-five and is one of the great works of his time, while some of his portraits are of most distinguished excellence.
Apotheosis of Homer.			
La Source.			
Portrait of Himself.			

XIII. In the National Gallery, London

Madonna and Child.	Cimabue (1240–1302).	Florentine.	Archaic and charmingly naive in its religious earnestness.
Madonna and Child.	Filippo Lippi (1457–1504).	Florentine.	Unusually fine landscape background to a well-balanced composition of deep religious feeling, characteristic of the times.
Saint Jerome and Saint Dominic.			
Madonna and Child.	Botticelli (1446–1510).	Florentine.	Of distinguished treatment and original composition arrangement, rendered in alluring detail and with conviction.
Reclining Venus.			
The Ansidei Madonna.	Raphael (1483–1520).	Umbrian.	Sometimes known as *The Blenheim Madonna* because it once belonged to the Duke of Marlborough. It is a noble composition, with the Virgin enthroned, St. John on one side and St. Nicholas of Bari on the other. There are other examples by Raphael in this gallery.
Our Lady of the Rocks.	Leonardo da Vinci (1452–1510).	Florentine.	This is a masterpiece pure and simple, one of the few authentic known works of Da Vinci, and there is a study for it at the Castle at Windsor. For finish, beauty of conception and profound skill of execution, it is unsurpassed in the world.
The Family of Darius at the Feet of Alexander.	Paul Veronese (1528–1588).	Venetian.	A grand, sumptuous composition, eminently characteristic of the master colorist.
Portrait of the Doge Leonardi Loredano.	Giovanni Bellini (1428–1516).	Venetian.	A most remarkable human document, full of deep sincerity.
A Tailor.	Giovanni Moroni (1525–1578).	Bergamese.	One of the world's famous portraits, full of character.
Mercury, Venus and Cupid.	Correggio (1494–1534).	Parmese.	Extraordinary painting of the nude forms of a man, woman and child.
Portrait of Jean Arnolfini and His Wife.	Jan van Eyck (1390–1440).	Flemish.	A remarkably painted portrait of two hideously ugly Dutch people, almost ludicrously naive in its selection of arrangement, but masterly in its rendering of light, shade and detail.
Portrait of an Old Lady.	Rembrandt (1607–1669).	Dutch.	A famous canvas, showing a seated woman in white cap and ruff.
La Chapeau de Paille.	Rubens (1577–1640).	Flemish.	The portrait of a beautiful young woman, thought to have been Mdlle. Lunden, wearing a black Spanish beaver hat. The picture was once known as *The Spanish Hat.* Rubens obviously admired this work, for he never parted with it, and when he died it went to his widow, who also retained it during her life.

WORLD'S FAMOUS PAINTINGS—Continued

XIII. In the National Gallery, London—Continued

Title of Painting	Painters	School	Observations
The Ambassadors.	Hans Holbein (1497-1543).	German.	One of the world's masterpieces, showing two gentlemen standing in handsome robes, by a table which is littered with various still-life, minutely painted. The floor is of intricate design, and cast diagonally thereon is the object that has been the subject of much speculation. It is apparently a human skull elongated, though for what reason no one seems able to determine. The work is of superlative greatness, however.
Charles the First.	Van Dyke (1599-1641).	Flemish.	A great portrait of the monarch on horseback, of rare excellence.
Portrait of Gevartius.			A man with a pointed beard, wearing a ruff about his neck, very famous and popular in reproduction.
The Peace of Munster.	Terburg (1617-1681).	Dutch.	Important composition, with many figures gathered about a table.
The Avenue-Middleharnais.	Hobbema (1638-1709).	Dutch.	One of the great landscapes of all time, by a man who received little appreciation during his life.
Interior of a Dutch House.	Pieter de Hoogh (1630-1684).	Dutch.	Interesting arrangement of light, shade and dexterous rendering of textures.
Philip IV. of Spain.	Velasquez (1599-1660).	Spanish.	One of the Spanish master's famous portraits of his king.
Marriage a la Mode.	William Hogarth (1697-1764).	English.	A series of six cartoons or pictures of the fashionable life of the artist's time, telling satires on the weakness, extravagance and dissipation of the nobility. These and other works here by Hogarth are world-famous.
Portrait of Mrs. Siddons.	Thomas Gainsborough (1727-1785).	English.	The famous actress seated in graceful pose, in large picture hat.
Portrait of Two Gentlemen.	Sir Joshua Reynolds (1723-1792).	English.	All of these portraits are human documents of the first order.
Doctor Johnson.			
Boswell.			
Admiral Keppel.			
Himself.			
George IV. as Prince of Wales.			
The Age of Innocence.			A very popular work of girlhood, known through reproduction.
Derby Day.	W. P. Frith (1819-1909).	English.	A popular picture full of infinite detail, representing England's famous race track on Epson Downs, on its fête day.
The Valley Farm.	John Constable (1776-1837).	English.	A famous landscape, which, with others by Constable, made a profound impression on the French artists who founded the Brabizon school, largely on the work of Constable.
The Fighting Temeraire.	J. W. M. Turner (1775-1831).	English.	An extraordinary colorful painting of the famous battleship being towed to her last berth; as a landscape allegory, not excelled.

XIV. In the Old Pinakothek, Munich

Saints John and Peter.	Albrecht Dürer (1471-1528).	German.	Wonderfully drawn and painted and full of engaging detail.
Saints Paul and Mark.			
Crucifixion.	Wohlgemuth (1434-1519).	German.	A marvelous composition, with many figures in the costumes of the artist's own time, with the dead Christ on the cross against a background of a mediæval city, all rendered in infinite detail.
Sacrifice of Isaac.	Rembrandt (1607-1669).	Dutch.	
Descent From the Cross.			
Mary and Saints.	Ghirlandajo (1449-1494).	Italian.	
Madonna Canigiani.	Raphael (1483-1520).	Umbrian.	A beautiful pyramidal composition that came originally as a part of the dowry of the Princess de Medici, to Elector Wilhelm, about 1507.
Street Boys.	Murillo (1618-1682).	Spanish.	There are in this gallery five other similar themes by Murillo.
The Physician.	Mieris (1635-1681).	Dutch.	This gallery contains fifteen other examples by this artist.
The Quack.	Gerard Dou (1613-1675).	Dutch.	This picture shows the artist at a window. In all there are twelve paintings in this gallery by Dou.
Dutch Interior.	Pieter de Hoogh (1632-1681).	Dutch.	
Battle of the Amazons.	Rubens (1577-1640).	Flemish.	
Abraham and Hagar.	Van der Werff (1659-1722).	Dutch.	
The Entombment.			
The Scourging.			
Ecce Homo.			
The Crucifixion.			

XV. In the Prado, Madrid

Las Lanzas (the Surrender of Breda).	Velasquez (1599-1660).	Spanish.	Unquestionably the finest historical military picture in the world. There is a group of soldiers to the right with lances (*las lanzas*) which give the picture its name. On the extreme right is a portrait of the artist with wide collar and hat with plumes.
The Spinners.			Known as *Las Hilanderas* or *Tapestry Weavers* a group of several women about a spinning wheel, and a great doorway in the center, in which are seen several more figures. A great and enduring masterpiece, showing the master at his best. There are over fifty pictures and portraits by Velasquez at the Prado, where his work is seen in its finest flower.
The Adoration of the Magi.	Rubens (1577-1640).	Flemish	
The Supper at Emmaus.			
Rape of Europe.			
Adam and Eve.			
Portrait of Marie de Medici.			
The Temptation of St. Anthony.	Teniers (1610-1694).	Flemish.	
A Village Festival.			
The Ninepin Player.			
A Surgical Operation.			
The Martyrdom of St. Bartholomew.	Ribera (1588-1656).	Spanish.	
Jacob's Ladder.			
St. Jerome Praying.			
St. Francis of Assisi in Ecstasy.			
Women Fighting in a Circus.			
The Adoration of the Shepherds.	Murillo (1618-1682).	Spanish.	
The Penitent Magdalen.			
Christ and St. John (Ninos de la Concha).			
Immaculate Conception (Four examples).			
Venus Listening to Music.	Titian (1477-1576).	Venetian.	
The Entombment.			
Venus and Adonis.			
The Fall of Man.			
Mater Doloroso.			
Portrait of Charles V. on Horseback.			
Portrait of Charles V. on Foot.			
King Philip II.			
Empress Isabel of Portugal.			
Charles V. at the Battle of Muhlberg.			

Title of Painting	Painter	School
The Chastity of Joseph.	Tintoretto (1518-1594).	Venetian.
Visit of the Queen of Sheba to Solomon.		
Susanna and the Elders		
Death of Holofernes.		
Tarquin and Lucretia.		
An Allegory of Venus.		
The Finding of Moses.		
Venus and Adonis.	Paul Veronese (1528-1588).	Venetian.
Christ at the House of the Centurion.		
Susanna and the Elders.		
The Marriage at Cana.		
A Youth Between Vice and Virtue.		
Cain Wandering With His Family.		
The Sacrifice of Abraham.		
The Vision of St. Peter Nolasco.	Zurbaran (1598-1662).	Spanish.
The Sleep of the Child Jesus.		
Saint Casilda.		
The Labors of Hercules.		
The Madonna del Pesce.	Raphael (1483-1520).	Umbrian.
Lo Spasimo de Sicilia.		
Portrait of a Cardinal		
Madonna la Perla.		
The Holy Family Under the Oak.		

WORLD'S FAMOUS PAINTINGS—Continued

XVI. In the Pitti Gallery, Florence

Title of Painting	Painter	School	Observations
Consequences of War.	Rubens (1577-1640).	Flemish.	
Two Landscapes.			
Portrait of Pope Leo X.	Raphael (1483-1520).	Umbrian.	The last is the *Madonna of the Chair* and has long enjoyed a great world-wide popularity, being perhaps the best known of the many Raphael madonnas. It has been reproduced in engraving and color, in every possible medium, and has had an enormous sale through Europe and America.
Portrait of Pope Julius II.			
Madonna Doni.			
Madonna dell' Impanata.			
Madonna del Granduca.			
Madonna della Segiola.			
Mary Magdalen.	Titian (1528-1588).	Venetian.	
Supper at Emmaus.	Palma Vecchio (1480-1528).	Venetian.	A theme that has always had a fascination for painters.
Charles I. of England and His Queen, Henrietta Maria.	Van Dyke (1599-1641).	Flemish.	
Three Ages of Man.	Lotto (1480-1556).	Venetian.	A very human composition, with age to the left and a handsome youth in the center, attending the reading of a man of middle age.
A Concert.	Giorgione (1476-1511).	Italian.	The three figures are said to be a portrait of Calvin, Luther and Melanchthon
Madonna and Saints.	Fra Angelico (1387-1455).	Italian.	
Eve.	Albrecht Dürer (1471-1528).	German.	Naive in both conception and rendering.
Adam.			

XVII. In the Uffizi Gallery, Florence

Holy Family.	Del Sarto (1486-1531).	Florentine.	The figures of St. Francis and St. John are contained within the composition. This is said to be Del Sarto's masterpiece.
La Fornarina.	Del Piombo (1485-1547).	Venetian.	This is a portrait of a very beautiful woman and for years was thought to have been by Raphael.
Portrait of Pope Julius II.	Raphael (1483-1520)	Umbrian.	A work most spiritual in its conception.
Virgin at the Well.			
Birth of Venus.	Botticelli (1446-1510).	Florentine.	
Venus and the Graces.			
Virgin and Child.			
Judith With the Head of Holofernes.			
Adoration of the Magi.			
The Annunciation.			
Portrait of Sir Robert Southwell.	Holbein (1497-1543).	German.	Both are world-famous portraits, of the first order.
Portrait of the Artist.			
Portrait of Elizabeth Brandt.	Rubens (1577-1640).	Flemish.	
Henry IV. at Ivry.			
Adoration.	Van der Werff (1659-1722).	Dutch.	
Entombment.	Van der Weyden (1400-1464).	Flemish	Very naive and full of great sincerity, in the manner of the Van Eycks.
Madonna Enthroned.	Memling (1430-1492).	German.	
Man Praying.			
Madonna.	Fra Angelico (1387-1455).	Italian.	In all a very comprehensive showing of the work of this interesting painter.
Coronation of Virgin.			
Naming of John the Baptist.			
Marriage of the Virgin.			
The Assumption.			
Virgin and Child.	Titian (1477-1576).	Venetian.	The Uffizi gallery contains portraits of artists painted by themselves at the request of the directors of the gallery, a distinguished honor that is not limited to men of Italian birth but includes the world's greatest artists, among them Rubens, Masaccio, Perugino, Raphael, Michel-Angelo, Leonardo da Vinci, Titian, Dürer, and other modern Europeans and Americans.
Venus.			

XVIII. In the Vatican Gallery, Rome

Communion of St. Jerome.	Domenichino (1581-1641).	Italian.	A famous work by a famous painter of altarpieces.
Dead Christ and Magdalen.	Raphael (1483-1520).	Umbrian.	
Faith, Hope and Charity.			
Transfiguration.			
Coronation of the Virgin.			
Adoration of the Shepherds.	Murillo (1618-1682).	Spanish.	A very effective rendering of the theme.
Coronation of the Virgin.	Pinturicchio (1454-1513).	Umbrian.	A fine painter who worked in "tempera," for he never mastered oils. His most famous work is a decoration for the library of the cathedral at Sienna.
Nativity.	La Spagna (——1530).	Umbrian.	
Madonna Enthroned With Saints.	Perugino (1446-1524).	Umbrian.	This artist was a pupil at the schools with Da Vinci, and was the master of Raphael, Lo Spagna and Pinturicchio.
Vision of St. Helena.	Paul Veronese (1528-1588).	Venetian.	
Madonna With St. Sebastian.	Titian (1477-1576).	Venetian.	
St. Jerome.	Da Vinci (1452-1510).	Florentine.	Cardinal Fesch had only the head of the saint, which had been cut out of the wood panel, but the rest was found at a dealer's shop in Rome and joined together with the original.

XIX. In the Venice Academy

Virgin in the Temple.	Titian (1477-1576).	Venetian.	An old woman in the picture, selling eggs, is said to be a portrait of the mother of the artist.
Assumption of the Virgin.			A grand work containing many figures.
The Entombment.			This was the last work of this great artist, begun in his ninety-ninth year and completed by Palma Vecchio.
Virgin and Child and Senators.	Tintoretto (1518-1594).	Venetian.	
Holy Family, With St. John.	Paul Veronese (1528-1588).	Venetian.	An astonishing piece of realistic flesh painting.
Procession in St. Mark's Square.	Bellini (1428-1516).	Venetian.	Highly interesting historically as showing the square as it existed in 1496.

XX. In the Vienna Academy

Portrait of Maximilian I.	Albrecht Dürer (1471-1528).	German.	Maximilian was a great patron of Dürer, though he did not invariably pay the artist's charges promptly.
Madonna and Saints.			
Himself at Forty-Five.	Rembrandt (1607-1669).	Dutch.	Rembrandt painted himself many times in various costumes.
Himself in Age.			
Young Man in Armor.	Van Dyke (1599-1641).	Flemish.	
Crucifixion.	Van der Weyden (1400-1464).	Flemish.	
Virgin and Saints.	Paul Veronese (1528-1585).	Venetian.	
Family of Velasquez.	Velasquez (1599-1660).	Spanish.	
A Venetian Lady.	Titian (1477-1576).	Venetian.	Very sumptuous in the color and remarkable treatment of stuffs.

FURNITURE.—It was not until the Gothic period, roughly spanned by the twelfth and fifteenth centuries, that furniture making was raised to an art, a crude art at first, heavy and clumsy as if the designers were awakening to new forms of beauty and in doubt as to how they should be expressed—but one of steady development until in the fourteenth century it reached a high degree of perfection.

Gothic.—The leading characteristics of this early style, as applied to furniture designing, were the pointed arch, the trefoil, the quatre-foil and simple tracery. Furniture was massive and Gothic motifs were confined to ornament. Construction was at first little affected by the style.

The leading characteristics of the later Gothic style as expressed in furniture were the divided Gothic arch, the quatre-foil, the cinque-foil, and an intricate scheme of tracery. The number of pieces in actual use at this period were chests of many varieties, cupboards, presses, dressoirs and armoires, stools, benches, chairs, bedstocks and bedsteads.

Peasant Cupboard of the Early Thirteenth Century

The Hall.—During the twelfth and thirteenth centuries, both in England and France, the hall was the main room in the house, in many cases the one room of the dwelling. In the homes of the nobility it was a lofty apartment which served the purpose of both kitchen and dining-room, and afforded the only living-room of the house. Meals were served on long trestle tables, the lord and lady of the manor sitting on a dias, which elevated them a few inches above their guests.

Below the dias the long and narrow table was set with viands less costly then those served to the master and the mistress. Here were gathered the baron and retainers. The placing of the salt divided the guests from the serving people. "Below salt" is an expression which has endured until today. On the dias were chairs with high backs and canopies. The latter were convenient in case of rain, for the raftered roof was not always proof against the weather. Benches without backs for the guests, and stools for the servants constituted the rest of the dining-room furniture. Between meals the tables were placed against the wall and the chairs were drawn to the fire. At night the serving-men slept on pallets of straw on the hearth.

Drawing-Room.—The next century added another room in the home of the affluent—a "withdrawing" room for the ladies—the beginning of our modern drawing-room. Here the mistress of the house with her ladies-in-waiting could retire when the music from the minstrels' gallery became too loud, or the jester's jokes too broad, or the drinking and fun too boisterous.

The Fifteenth Century was an important milestone in the march of progress. By this time the hall had lost its early character. It was large and often a meeting place for the owner and his friends, but as rooms multiplied, it ceased in turn to be parlor, kitchen and dining-room. It was gradually approaching the great entrance-hall of the seventeenth and eighteenth centuries. It retained its fine proportions, its lofty dimensions, but the raftered roof had given place to a beamed or vaulted ceiling. The big fire-place had grown more architectural, though still retaining its generous hearth. The rough walls were gone and in their place were oak panels and fine tapestries, the latter imported from Flanders, for the day of the French looms had not arrived.

During this period, furniture was of two general types— movable articles which could be transported with ease, and massive pieces which could be left behind with safety. It would be a bold thief who would try to escape with a heavily carved chair weighing several hundred pounds and made more unwieldy by a wooden canopy. In the same way the bedstead of the day was also quite immovable, for it, too, was well incased in wood and finished with a canopy. Both canopies had the same origin—namely, to protect the occupant from rain in case the roof should not be sufficient shelter. And while the wooden canopies in a milder form survived long after better building methods came into existance, they had their beginning in defective house building. When houses became water-tight and air-tight, furniture gradually assumed different aspects.

Origin of Modern Chair.—In the late fifteenth century, except in ecclesiastical chairs, the canopy was discarded. This straight back design was the ancester of our every-day chair—although three centuries of furniture making intervened between the two. Flemish designers in the sixteenth century had an active hand in its evolution. They remodeled or revised the chair on new lines and sent it to England where, in the seventeenth century, it underwent other changes. But the part the old Gothic designers had in making all this possible must not be forgotten. They took the crude pieces of the dark ages—the bench, the chest, the bedstock and transformed them into things of beauty. They made not only objects of beauty, but, in comparison with earlier efforts, articles of real comfort and convenience. Their constructive work was built for centuries rather than years, while the delicacy and charm of their carving, now almost as perfect as when it left their hands, still stand as models for the world.

St. Peter's Chair, St. Peter's Church, Costello, Italy. One of the earliest examples of wooden furniture.

Classic Renaissance.—With the sixteenth century came a transformation in living. The Renaissance, beginning in Italy, gradually spread throughout Europe. The house was no longer a stronghold; it had become a home.

Periods.—Broadly, the Renaissance had three distinct styles: The trecento, quatro-cento, and cinque-cento. The first was developed between the years 1300 and 1400 and its influence was confined to architecture and sculpture. The quatro-cento belonged to the fifteenth century and was a more classic style than its predecessors. The cinque-cento was the culmination of the art of the Renaissance. The former styles were but preparation for the architecture, sculpture, painting, and decorative arts of the sixteenth century.

It was not until the cinque-cento period that furniture showed traces of the classic revival. Wood-workers clung to Gothic designs long after stone-cutters had discarded them. Thus some of the tre-cento and quatro-cento motifs are exhibited in the furniture of the sixteenth century. It is well in studying the wood-work of this epoch to keep in mind the leading features of the three styles. The trecento consisted of interlacing lines combined with simple tracery and conventionalized foliage. The quatro-cento blended the festoon, the garland, the band, and the cartouche with naturalistic fruit and flowers. The cinque-cento was a restoration of classic details and included the fret, the arabesque, the anthemion, or honeysuckle, the scroll, and the acanthus.

The Renaissance raised furniture-making to an equality with the other industrial arts. Pupils were apprenticed to a master and studied with him until they had perfected their craft, when they opened work.

shops of their own. The pieces produced in these great studio-shops united beauty with utility. For the first time designs were made with reference to their setting. The furniture of the private dwelling was suggestive of neither cathedrals nor abbeys. It was made with a careful regard for the needs of the owner, his station and manner of living. Thus houses possessed a harmony which had hitherto been absent.

French Renaissance.—"The new birth" in France may be divided into the following epochs: First Transition, 1453-1515, including the reigns of Charles VIII. and Louis XII.; second, Francois I., 1515-1547; third, Henri II. and Henri IV., 1547-1610; fourth, Louis XIII., 1610-1643 Under Charles VIII. the great tide of the Renaissance extended northward.

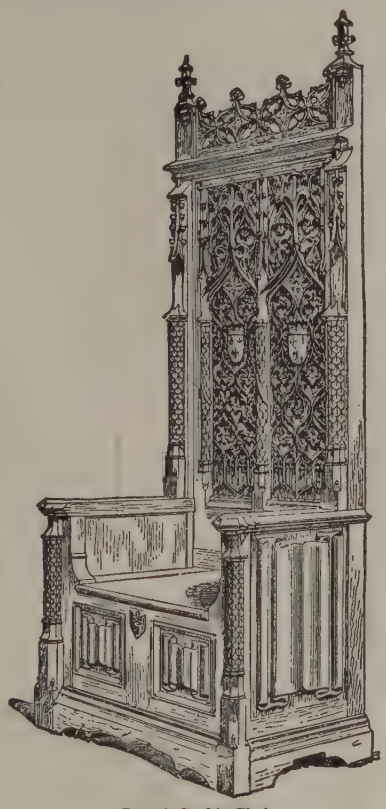
Francis I.—The reign of Francis I. was one of great activity in all lines of artistic achievement. This monarch, unwilling to be outdone by Henry VIII. of England and Charles V. of Germany, summoned to his court the greatest architects, painters, designers, and wood-carvers of Italy and Flanders. Under his patronage were erected many beautiful buildings, which in part, at least, give some hint of what the French Renaissance really was.

His Successors.—France has had but one other such royal patron, Louis XIV. Both sovereigns were nearly equal in power. Francis had the advantage of coming to the throne at a more interesting period of the world's history. His reign, a little more than a quarter of a century in length, 1515 to 1547, represented extraordinary achievement. The combined reigns of the five succeeding monarchs, Henri II., Francis II., Charles IX., Henri III. and Henri IV., completed the century and brought to a close the most important years of the French Renaissance. Of these sovereigns, so different in character, four of whom represented the many virtues and vices of the House of Valois, Henri II. and Henri IV. only were worthy successors of the great "Francois Premier." They exerted a helpful influence on the fine and industrial arts, and left much to testify to their taste and generosity. Both have been immortalized in a "Style," the "Henri Deux" being the more celebrated.

Renaissance Details, at first were combined with Gothic construction. It was not until the sixteenth century was well under way that the real force of the Renaissance was felt. France was the birthplace of Gothic art and the transitional period was of longer duration than in Italy.

Chairs. In the reign of Francis I., chairs became more varied in treatment. The cane design of Flanders was early adopted; the plain high Dutch chair was also a favorite, but it was somewhat reconstructed. The seat was lowered, and it was comfortably upholstered. The French seem at all times to have been very keen about comfort, far more so than the English, who until the seventeenth century were more or less indifferent to many of the refinements of life. And it was then by way of France that many minor comforts reached England.

Cabinets. As the 16th century advanced, French cabinets developed on high and narrow lines. Those of the Francis I. period show carved panels, moldings, and pilasters, but seldom anything ponderous—although at this time presses and armoires were built on heavy models. Distinctions between these pieces of furniture were always made in France where subtle dividing lines were recognized. French furniture-makers also made a distinction between designs for the *salon famille* and the *salon campagnie*, and this is the reason why so much French furniture which comes to this country is so unfitted for living-rooms. It was never intended for anything but gala apartments, and naturally looks out of place elsewhere.



French Gothic Chair

Henry II., in many ways did as much for France artistically speaking as Francis I. He did not build in the lavish way of his father, but two very clever women ruled his court, and each in different ways had a tremendous influence on the arts of the day. One was Catherine de Medici, whose tastes were naturally Italian, and the other was Diane de Poitiers, the most remarkable woman of her time. Diane's emblem, the crescent, is found combined with Henri's monogram in one of the most beautiful rooms in Fontainebleau. The chimney-piece has interlaced lines and shows the early stages of that beautiful Renaissance pattern known as "strapwork" so popular with workers in stone, wood, and silver in both France and England. It is found in woodwork, in furniture, in the Grolier book-bindings, and in the Oiron pottery, better known as "Henri Deux" ware.

Between the reigns of Henri II. and Henri IV., the latter better known as Henry of Navarre, no marked changes took place in handicraft. By the time the latter came to the throne a good deal of the beauty of early Renaissance ornament had disappeared. The simple arabesques, seen to such charming advantage in the Francois I. style, and the equally simple strapwork of the Henri II. style, lost favor with decorators and wood-carvers. Shell ornament, which was destined to play such an important part in the decorative arts of France for nearly two centuries, came into great prominence during the Henri IV. period, although known at an early date.

Upholstery. During the reign of Louis XIII. came many changes in domestic comfort. The upholstered chair in the modern meaning of the term came into existence. It was an arm-chair, and the seat was lower and broader, and the upholstery instead of being any rich and sumptuous material which the designer of the chair could command, or the owner happened to possess, was an especially selected covering so designed as to correspond with other chairs or to harmonize with the wall treatment. Window draperies were also selected with great care; they were more than a mere protection against air and sunlight. The age of upholstery had arrived.

Wall Treatment received especial attention, and was carried to a very elaborate point in France during Louis XIII's. reign. Simon Vouet, who bore the same relationship to Louis XIII. that his famous pupil, Le Brun, did to Louis XIV., was responsible for most of the florid decoration of the day. Furniture-makers were always a little behind the decorators, and while many of the wall schemes of the day are too ornate from the modern view-point, the beautiful chairs, tables, and cabinets are well worth studying. Flemish influence was strong in the early part of the seventeenth century, due indirectly, it is said, to Rubens' visit to the French Court.

The Characteristics of the French Renaissance are briefly as follows:

A transitional period similar to that of Italy but of longer duration, for Gothic art was more firmly rooted in France than in the south. The ornament of the French Renaissance was in a lighter vein than that of the Italian, and less dependent on antique models. Delicate arabesques and pierced shields were used by furniture-makers and decorators. Later in the sixteenth century wood-carvers combined an interlaced ribbon or strap ornament with the lozenge and the cartouche, which was followed by the introduction of the shell and the ornate scroll. From that date wood-carving lost much of its charm.

Flemish and Dutch Renaissance.—The Renaissance reached Flanders and Holland tardily. Gothic traditions lingered late in the north and the long transitional period lasted well into the sixteenth century. Holland was always more independent politically than Flanders and her work was less influenced by outside conditions. This fact makes Dutch work comparatively easy of identification, while that of the Flemish, being more mixed, sometimes raises a question. Spanish and French influences are ofter present in the early Flemish work. Charles, King of Spain, and Emperor of Germany, was also Count of Flanders, and Duke of Burgundy. The intercourse between these countries and provinces was decidedly intimate at this period. The Italian Renaissance was on the wane when the Flemish Renaissance was at its height

Holland and Flanders were far enough away from Italy to be quite independent of her influence. When Italian influence reached Flanders it was by way of France, with a strong mixture of French feeling added. When this complex influence was carried into England it had gained another element in addition to the Franco-Italian, and this is one reason why the English Renaissance swings so far from the classic. In the former the Flemish tincture is decidely marked. In the sixteenth century, particularly, English work showed far more Flemish influence than either French or Italian. In the seventeenth century it was more Dutch than Flemish in feeling and remained so until the pendulum swung once more toward French designs, this movement giving way to the classic revival of the late eighteenth century.

Dutch Chair of the Renaissance, Museum of Fine Arts, Boston.

Flemish Carvings.—Primarily the Flemings were great carvers. They had carved for centuries, and having carried Gothic ornament to a fine point it was quite natural that they should continue to carve, when a totally different style was in vogue. They were less bound by classic traditions than the Italians, and they maintained a simpler mode of living. The Flemings in their work has always used the human figure. Heads of men and women decorate many of their pieces, particularly cabinets, cupboards, sideboards, etc., and where there are large expanses of wood to be covered. Some of the pieces are too heavily carved to suit our present ideas, but we must, at least, pay tribute to their skill.

Paneling, ribbon-bandeaux, swags of fruit and flowers, strap work, and kindred things are more harmonious in a modern dining-room or living-room than masks, animal heads, or the human figure, clever as they may be in execution. The linen fold pattern, sometimes called the "parchment scroll," really a survival of Gothic ornament, is found in a good deal of Flemish furniture of the sixteenth century and is one of the simplest and best of the patterns of that day—so attractive that it is a wonder that it is not used more in modern furniture constructed on Flemish lines and in the paneling of rooms built in Flemish style.

Many Flemish ideas exist in our everyday furniture which we have long since accepted as entirely modern. They do not suggest to the casual observer anything bordering on period styles and are only "period" through long years of transforming and adapting. Flemish furniture makers did much in promoting the evolution of the chair. They rebuilt, as it were, the beautiful Gothic chair, lowering the seat as well as the back and substituting horizontal braces for the heavily carved arched braces of the fifteenth century. Flemish chairs were of several varieties, but two types were prominent—the upholstered chair with turned legs and braces, and the carved chair with a cane back and a cane seat.

The Dutch at this time were achieving fame in different lines. They were not a nation of carvers. They were great in a different way. Marquetry and inlay were favorite Dutch methods of ornamenting furniture during the seventeenth century.

The special value of the Flemish and the Dutch Renaissance from our viewpoint is the effect it had on the furniture-making of England, for by this time, late seventeenth century, we of America had our own furniture interests. If we date the colonial period from the time when it really began 1620, our own era had come into existence, and though no one knew it, least of all ourselves, we were making furniture history.

Characteristics.—In summing up the contributions of Holland and Flanders to furniture making, special emphasis should be laid on the cane work of the first country and the marquetry of the second. But Dutch marquetry, beautiful as it is, pertains to decoration rather than construction, and it is to Flemish designers that the greater glory belongs.

German and Spanish Renaissance.—Two phases of the Renaissance, German and Spanish, terminate the great Classic Revival on the Continent. In Germany there was a long transitional period during which the lingering traditions of Gothic art died slowly. The early phases of the Renaissance show the grafting of the new upon the old. This mixture of Gothic and Renaissance was less successful in that country than in France where a happier union prevailed.

The best examples of German wood-carving of the early sixteenth century were of ecclesiastical origin. Choir stalls and altar pieces were richly decorated in the manner of the day. In domestic furniture the combination of Gothic construction and Renaissance ornament was less successful.

The great presses of this century are the most characteristic pieces. Made of oak and walnut with carved panels and heavy doors they are as substantial today as when they came from the hands of their maker. The press illustrated among our pictures, is made of walnut with an unusually fine scheme of decoration. The plain surfaces are well distributed and the ornament, although elaborate, is neither heavy nor fantastic. The lock is concealed in the carving, while the key repeats the lines of the ornament. The ball-feet are worthy of note, as they indicate a new feature of furniture-making.

Carved Press of the German Renaissance

Spanish Contributions.—From her oriental colonies Spain imported ebony and ivory and other costly adjuncts to furniture making. The elaborate metal work which today is the most interesting part of a great deal of this furniture is Spain's most important contribution to furniture making.

The Moors. Damascening, *nielo*-work, and kindred crafts had long belonged to Spain, following closely on the Moorish invasion. In Granada, the city of the Moors, were fashioned many of the most elaborate chests and coffers, and long after the Moorish expulsion, Granada was still the center of fine cabinet work. Those who visit the Alhambra today can trace many similarities between the wall decorations of this famous palace and the embellishments of old Spanish furniture. The Gate of Justice and the Gate of Judgment recall in a grander, bigger way certain motifs in inlay and metal relief, and the whole architectural and decorative scheme brings to mind the comparison that it is all a grandiose kind of jewelry.

The cabinet elevated on high turned or carved columns was a characteristic piece and as one or more examples are usually found in every museum and in many private collections, it is as typical a specimen as could be selected. One type is quite plain apparently but the whole front lowers at the turn of a key and reveals an exquisite inlay of ivory and metals with ornamental bosses. And there are many variations of this beautiful style. Iron is used most attractively at times and the inlay includes bone, horn, shell, and occasionally painted decorations. Color is sometimes introduced beneath the horn.

The Leather Chair. The influence of the Flemish cane chair on the furniture-makers of Europe has been mentioned. The leather chair of Spain equaled it in importance. Both had high backs and carved legs and braces, but there the resemblance ended. The Spanish design consisted of a sturdy frame of oak, chestnut or walnut, a back completely encased in leather, turned stretchers, a carved underbrace and hoof feet. English furniture makers of the 17th century gained inspiration from both Flemish and Spanish models in their famous Jacobean designs of wood and cane.

English Renaissance.—By the middle of the seventeenth century, French and Italian furniture, like the wall treatments of that day, became heavy and ornate.

The vitality of the Renaissance in these countries was over. It was the age of beautiful surfaces; of elaborate ornamentation. Constructively neither the Italian nor the French had as much to their credit as in the previous century. Craftsmen were painting the lily and gilding refined gold.

English craftsmen never interpreted the Renaissance as did furniture-makers of the continent. When the classic wave reached England it had gained and lost much on the way. There were French and Flemish influences, and there were, moreover, English traditions too firmly planted to be uprooted.

The Characteristics of the 16th and 17th Centuries in designing were:

First, the English Renaissance or Tudor, which was a mingling of Flemish and Italian grafted upon Gothic; second, late Tudor or Elizabethan, showing greater unity (strapwork and paneling were features of this period); third, Jacobean, covering nearly a century, and including many types. Furniture was paneled and carved until walnut was introduced, when veneer and marquetry became popular. Among Jacobean characteristics were the spiral leg, the rising panel, and spindle ornaments. With the accession of William of Orange in 1688, Dutch influence became paramount, and English furniture was slowly developed on more graceful lines.

Historic Periods.—English Renaissance, Tudor, Elizabethan and Jacobean, are terms associated with the 16th and 17th centuries, a long period to sum up in a sentence, but one, which in spite of "mixed motifs," was remarkably homogeneous. Queen Elizabeth was, of course, very much a Tudor, but having been honored by a style all her own, the term "Tudor" is often applied to the reigns of Henry VII., Henry VIII., and Mary.

Tudor Cupboard of Oak

Henry VII.'s reign began in 1485 and was contemporaneous with the reigns of Charles VIII. and Louis XII. Elizabeth's long term ended in 1603, while Henri of Navarre was on the French throne. The early and late Tudor periods thus covered one hundred and eighteen years, the Virgin Queen appropriating nearly fifty. In company with Victoria, she is quite entitled to her own "style."

The Henri II. period is very closely allied to the Elizabethan, through the strap-work motif in wood carving which was popular in Flanders, England and France. It is seen in many English cupboards of the late sixteenth century and also in chimney breasts and wall treatments. It is one of the most valuable contributions of the Elizabethan period to design, and ranks with the linen fold motif of an earlier day and the "rising panel" of a later one.

Wainscot Chair of Elizabethan Design

Styles in English furniture were of slow growth, with much overlapping and intermingling. The Jacobean period was well under way before there were many changes in design, and it was not until Charles I. was on the throne that the popularity of certain Elizabethan patterns completely waned. Even then the outlines of furniture changed little. The court and livery cupboards were modified a trifle to suit a simpler scheme of carving, but oak was still the chief wood, and so long as it remained in use "massive" furniture continued to be made. The Protectorate caused a break in the crafts and by the time it was over, and Charles II. was safely placed on the throne, 1664, many new influences shaped and developed English handiwork.

Jacobean Furniture is roughly divided into two parts—"early" and "late." "Early Jacobean" preceded the Commonwealth, covering the reigns of James I. and Charles I. "Late Jacobean" followed the Commonwealth, including the reigns of Charles II. and James II. The Commonwealth or Protectorate with Oliver Cromwell at its head was too turbulent to be very productive of the arts.

After the Restoration, all English furniture became more graceful. Charles II. had been brought up at the court of Louis XIV. and returned to England with French ideas of comfort and refinement.

The furniture of Charles II.'s time is worthy of its present renaissance. Designers retained the best of the many motifs bequeathed from the earlier part of the century, combined with newer schemes. Paneling remained in favor, but it was diversified by nail-head and spindle ornaments, in the very late sixteenth century.

The introduction of walnut brought about a decided change in English furniture. It made possible a lighter, more graceful construction and an entirely different scheme of decoration. Carving was largely superseded by marquetry, which was well adapted to walnut and to the Dutch designs which William introduced.

The William and Mary period was brief, but it is an important link between seventeenth-century oak and eighteenth-century mahogany. During this reign the revocation of the Edict of Nantes caused many Huguenots to take refuge in England. A large portion were of the craftsman class and readily found employment. This added another element in furniture designing.

Walnut was used during Queen Anne's time and continued in favor until mahogany was well established, which was between 1720 and 1730. The cabriole leg is credited to William and Mary—to their reign, that is to say, and a most valuable accessory it proved to be. Inasmuch as William and Mary ruled jointly, a share-and-share-alike plan, unique, in English history, their brief period has an additional claim to consideration.

Louis XIV., Louis XV. and Louis XVI.—When Madame de Maintenon wrote to a friend, "The King will have us buried in symmetry," she expressed one of the most characteristic features of the Louis XIV. style. It was symmetrical, balanced, beautifully proportioned, cold, formal, lacking in imagination, and from modern viewpoints oppressively grand—like the monarch for whom it was named. Thirty

Charles II. Cabinet —Late Jacobean

years ago, there were probably fifty rooms in this country furnished in Louis XV. to one in Louis XVI. The latter had not been popularized by the professional decorator. It belonged to that remote century, the seventeenth, which for some strange reason has always seemed several hundred years away from the eighteenth.

Characteristics of Styles: French styles may be briefly characterized as follows:

Louis XIV: A formal rococo in which proportion and balance were salient features. Important details were the shell, the classic acanthus, the ram's head, the mask, and the satyr. In the early period furniture was massive and the designs of the Louis III. style were perpetuated. Carving was largely superseded by marquetry and by chiseled mounts of ormolu and bronze. Boulle furniture belongs to this reign and is now the most highly prized of Louis XVI. designs.

Regency. The rococo division of French designing is known as the Regency—the output of that brief period between the death of Louis XIV. and the coming of age of Louis XV., when the Duke of Orleans was regent. The Regency is an important period when viewed from the historic side of interior decoration. It forms an important link between the Louis XIV. style and the real Louis XV., which later in the century became once again extremely rococo. It is, however, the least worthy of admiration of any of the French epochs.

Ormolu Table of the Regency—1715-1723

Louis XV: Balance and symmetry were less important in the eyes of furniture-makers than richness of ornament and faultless execution. Angles gave place to curves, and the talents of the gold smith and the painter were utilized in designing furniture which, in point of workmanship, has never been surpassed.

Louis XVI: Simplicity of construction and severity of ornament. Rococo details disappeared and classic emblems replaced them. Important features were the fluted column, the bay leaf, the oak and acorn, the Bell Flower or "Corn Husk," the Greek band, and the plain acanthus. Straight lines superseded curves and ornament was a means, not an end.

Louis XVI. Table

The long reign of Louis XVI. witnessed many changes and developments in furniture designing. The reign of the next Louis was briefer, but quite long enough to make any one phase impossible, but with the final Louis—if we leave out Louis XVIII., who does not count when it comes to "periods"—the designing of the eighteenth century seems to have been crystallized. All the furniture of these three great epochs shows marvelous execution. Whether it be a Louis XIV. cabinet of boulle, a Louis XV. chair, or a Louis XVI. table, the workmanship is unsurpassed.

Metal played a very important part in many of the designs and added tremendously to their cost. Furniture decorated with insets of porcelain, usually of Sèvres, formed one class of Louis furniture; and fine upholstery of Beauvais and Aubusson were important accessories in both Louis XV. and Louis XVI. designing.

English Furniture of the Eighteenth Century.—The Early Eighteenth Century.—In our devotion to the late eighteenth century we are apt to overlook the rich legacy bequeathed to us by the early eighteenth, or to confuse it with other periods.

Yet the first half of this fascinating century was almost as important; a period of great variety of design, of many men working in many veins, of old ideas slowly giving way to new. If less unified than the latter half it was full of picturesque vigor and of sturdy simplicity, partly Dutch, and partly a survival of Jacobean traditions which lingered in spite of changed conditions.

The perpetuation of Dutch motives—such as the cabriole-leg and the web-foot continued until the fourth decade of the century. The web-foot or flat-foot we find in most of the furniture of Queen Anne's time, and a charming adjunct it is to the designing of the day. Chippendale preferred the ball-and-claw foot also at times in his later and elaborate "ribbon backs." He was one of the first English furniture makers to use the square leg, also one of the first to adopt the curving French leg of the Louis XV. period, but he clung to the cabriole or bandy leg in its various forms until about 1740.

Chippendale was the first important English furniture maker to have his name perpetuated by a style. Celebrated designers had preceded him but their identity is submerged in that of their sovereign. Chippendale raised his craft to such a point of excellence that his own name became associated with it.

What furniture of the eighteenth century would have been if mahogany had been unknown is a difficult question to answer. It is impossible to imagine Chippendale's designs in oak—just as it is impossible to conceive of the heavy furniture of the seventeenth century being executed in mahogany.

The Chairs and Settees from the Chippendale shop in Martin's Lane comprised at least six different styles—the early Dutch types with ball-and-claw feet and plain slats; the same with pierced slats. These two distinct backs were also combined with straight legs and later there were other variations. The curved leg of the Louis XV. style was a favorite with Chippendale, but was usually combined with an elaborate back. There were several distinct "ribbon" styles, a rather uncommon one having an intricate leaf pattern carved with the ribbons. After 1740 the "Gothic manner" and the "Chinese taste" fascinated Chippendale, and about 1750 he became extremely rococo. The English designer is not at his best in copying the Frenchman, and Chippendale pleases us least in his rococo furniture; nor do we like him nearly so well in his Gothic and Chinese absurdities as in his earlier and simpler things.

Chippendale's great point of excellence was his ability to take the designs he found at hand and so improve them that they took on new life and meaning. He was a past master at adapting; not so much an originator as a free and most successful translator of all that came to his hand. That he had more than his just reward is perhaps true. That he did not make or even design half the furniture bearing his name must also be conceded, but that he gave permanent fame to much that would have perished but for his indefatigable efforts must always be placed to the credit of "T. Chippendale of St. Martin's Lane."

The Later Eighteenth Century.—Thomas Sheraton, Thomas Shearer, George Hepplewhite, and Robert Adam are the names which stand out brightest in the roster of the late eighteenth century. Possibly Robert Adam should come first and Shearer fourth. Transpose them as you will, but place Sheraton near the top. It might be well to mark both Adam and Sheraton "one" for it is hard to divide the honors.

Robert Adam, fresh from his studies in Italy, returned to England at an opportune time. With him came Bartollozi, the engraver, and the painters, Pergolesi and Cipriani, both designed to play an important part in English furniture making.

We recognize the urn and the oval pateræ as Adam; also certain motifs like the acanthus, the ribbon band, the arabesque and the garland, as both Adam and Louis XVI. There is a good deal of similarity between the two styles. We find in the English style a greater slenderness and a totally different treatment of the wood. The Adams used carving very sparingly; many of their finest pieces have not a trace of it. They also brought

to great perfection painted furniture, employing Pergolesi and Cipriani for the finer work; also that gifted and erratic woman, Angelica Kauffman.

In Adam furniture a charming light green is often seen; there is also a burnished gold which almost equals Vernis-Martin. Cipriani had many Italian secrets of mixing colors and a good deal of this work is from his hand.

Cane Furniture was designed by Adam and is today the type most frequently reproduced by American furniture makers. The chair backs are usually oval and the cane webbing usually follows the lines of the frames. By this time the square leg has been to a large measure discarded. Hepplewhite, however, preferred the square to the round one; Shearer did likewise; Sheraton used both the plain round leg and the square leg; he also had a strong preference for the fluted leg of the Louis XVI. style In most of the Sheraton furniture in this country the fluted leg is found. In the sideboards especially it is a characteristic feature.

Inlaid Work.—By the last decade of the century, the fancy was no longer for carved mahogany; in many instances it was no longer for mahogany of any kind. Inlaid furniture of satin-wood and painted furniture of satin-wood represented the taste of the hour. Many writers have credited to Sheraton the introduction of satin-wood. If this be true he gave almost as much to the Adam Brothers as they gave to him.

Sheraton's furniture creations may be divided into three classes—carved, inlaid and painted. His sideboards and chairs come usually under the first head; his cabinets and tables, the latter found in great variety in England, to the second; and to the third, belongs a large portion of the work he did for the Adam Brothers, which is extremely scarce in this country. Some of his inlay has as much color as if executed with the brush. Sycamore was a favorite wood with him and under the name of "harewood" was given a beautiful golden brown. Combined with satin-wood or white mahogany, it was extremely effective. Whitewood was stained apple green, that lovely tone which Kauffman and Cipriani were so successful in securing. Other woods Sheraton used with consummate skill. He was thus able to give to his simplest designs a real color value.

Hepplewhite's greatest contribution to furniture-making of the late eighteenth century was his masterly use of heart and shield shaped motifs. Most of his chairs have shield-backs, but it was in his dress-tables and kindred things that this motif is seen in its most charming guise. Charm is the word to give his work. The strength of Chippendale; the proportions of Sheraton we do not find. His range is limited. He repeats one theme over and over. His knowledge of woods did not equal Sheraton's—he had none of Chippendale's mastery of construction—but he had a fine intuitive feeling for beauty and he expressed it in his work. He was not a carver of note, like Chippendale, not a master inlayer like Sheraton, yet so great was his popularity that he employed many men to help him fill his commissions and his reputation was so well established that after his death in 1875 his widow was able to carry on his business for years.

Their Comparative Merits. — Neither Sheraton nor Hepplewhite could rob Chippendale of his supremacy as a chair maker. Sheraton's designs with straight legs and rectangular backs are not his most attractive work. In Hepplewhite's chairs his famous shield seems to lack constructive force. Chippendale still held his field. Sheraton's sideboards, cabinets, tables and bedsteads reach high water mark. Hepplewhite's sideboards and tables are also greatly to his credit. To Sheraton we accord a grasp of proportion, a feeling for restraint which were not equaled in his generation. If we place him at the head of the furniture makers of his century it is because he expresses the ideals of our own day—simplicity, proportion and reserve. Chippendale produced a far greater variety of designs, not alone because variety of design appealed to him, but because he lived at a time when fashions in furniture were extremely diversified. The last quarter of the eighteenth century was a remarkably unified period and here tribute must again be paid Robert Adam, for he was largely responsible for producing it.

Thomas Shearer must be mentioned as a designer of mark—particularly successful with sideboards and book-cases. The serpentine sideboard is supposed to have been originated by him. Hepplewhite gave this type distinction and it is his name that we associate with it.

The French Empire.—The Empire style marked the last of the great historic epochs in furniture and decoration. It was cold and formal, reflecting the personality of the man — Napoleon — so closely identified with it. The Revolution brought chaos to the industries of France which had so flourished under the old regimé. Furniture-makers and metal-workers were thrown out of employment. Many suffered imprisonment or death by the guillotine. With few exceptions the artist-artisans of the Louis XVI. period had little part in the handicraft of the Empire. The Directory and the Consulate were periods of construction. In the arts the process of rebuilding is slow. David's name is associated with this transition from old forms to the new, and with him must be mentioned Charles Percier and Pierre Fontaine. Percier was architect to Napoleon during the Consulate and ranks with Fontaine as a celebrated craftsman of the period. Napoleon was not a patron of the arts, yet no monarch of the old regimé had so dominated a style. The letter "N" is stamped over the entire decorative scheme of the Empire.

Designers of Louis XVI's day lauded the classics, but seldom to the extent of the Empire artists and never to the glory of one man. The laurel leaves of the preceding style were rearranged and twisted into a victor's wreath. The fluted column upheld a torch. Roman and Grecian emblems were used lavishly. "Paris was to become a new Athens, Napoleon a Cæsar, and France a second Roman empire." The craze for the antique transformed the dress of the day. Statesmen wore togas and court ladies donned the gowns of Grecian goddesses. Architects, decorators, and furniture-makers were imbued with the spirit of the hour. The classic lived again and, if somewhat inconsistent, the enthusiasm of the day overlooked all shortcomings.

The Chief Characteristics of the Empire Style were the wreath and the torch, the Roman eagle, the Athenian bees, the Greek fret, and the honeysuckle. After the campaign in Egypt the sphinx was added to the medley and became a conspicuous feature in both furniture and decoration. Distinctive qualities of the furniture of the period are few and easily mastered. Constructively the plain column and the claw-foot are the most salient features; decoratively the wreath and torch are most prominent. Marquetry was discarded and plain surfaces were covered with ornamental mounts of chiseled brass and ormolu. Chairs showed a square frame with a plain round leg, ornamented with mounts of characteristic patterns.

In the plainer form the Empire style was full of dignity. If it lacked the charm of the graceful Louis XVI. style it had, on the other hand, qualities of repose and stability which placed it far above some of its predecessors. One of the most interesting phases was the strong influence which it exerted upon American furniture-making of the early nineteenth century.

American Empire Table

American Empire and Colonial.—After pioneer days the colonists modeled their homes on those of their native land. Early furniture was the heavy oak of the old country or pine and hickory made in the colonies. Toward the end of the seventeenth century the transition from massive to more graceful forms took place. The introduction of mahogany in England soon influenced furniture-making on this side of the water, and for fifty years Chippendale, Hepplewhite, and Sheraton were the guiding stars of American designers. Early in the nineteenth century English patterns declined in favor and French influence became paramount. The Empire style marked the end of colonial furniture-making.

Colonial Furniture.—The term used in its literal sense, includes the household effects of the colonists from the time of the settlement at Jamestown until the war of the Revolution. This restricted definition excludes the work of the great English cabinet-makers of the late eighteenth century, and all pieces which owe their origin to the style known as the Empire. Thus the furniture of Sheraton and Hepplewhite, and the later designs of Chippendale, are debarred from the category, together with those massive mahogany shapes having carved columns and claw-feet which have long been the stronghold of colonial connections. Correctly speaking, these pieces should be classed as late Georgian and American Empire. To limit the adjective "colonial" to the furniture imported or made by the colonists prior to 1776 would disqualify

more than half of the old mahogany in this country. The word has been used so long in a wider sense and has been applied so continually to everything in furniture, from the earliest possessions of the Pilgrims to the designs in vogue as late as 1820, that it is doubtful if the literal meaning is ever accepted. From one point of view the broader use of the term is the right one. It was not until 1830 that American furniture-makers ceased to be governed by the standards of the Old World. English taste in house-furnishing prevailed long after English supremacy was at an end. The colonial period in furniture outlived the colonial period in history fifty years.

In the accepted definition two centuries of furniture-making are covered. 1620-1820. The first hundred years may be called the age of oak, and the second the age of mahogany. During the earlier period the history of all handicraft in this country was closely allied to that of England and Holland. In the later epoch Dutch influence lessened, and England shared with France the honor of molding taste in America.

After the War of 1812 English patterns declined in favor and furniture-makers turned to France for inspiration. The American development of the Empire style is a lasting credit to the designers of this country, and forms a fitting close to the second century of colonial furniture-making.

While the Empire style in America followed in a general way the trend of the movement in France, it was free from the incongruities which marred many of the foreign pieces. Carved columns, claw-feet, pine-apple finials, and ornamental brasses were the hall-marks of the American empire. Realistic heads of lions and griffins, and the many Egyptian details to which French furniture-makers resorted, were happily absent from the work of the day on this side of the water.

By 1830 the Empire style in this country had run its course. Designs lost their vitality and became heavy and ponderous. When black walnut superseded mahogany the characteristics which had made furniture-making an art for more than a hundred years ceased to exist. Varied as were colonial types there were certain features common to all. Whatever extravagances marked English and continental styles, designs in this country leaned toward simplicity. It is this quality that renders colonial furniture as satisfactory to-day as when it came from the hands of its makers.

Modern Furniture.—In the past there has been a survival of the fittest in furniture. The transitional Gothic and traditional Renaissance pieces are not nearly so numerous as pure specimens, and so it is with Elizabethan furniture, with Charles II. pieces, with Queen Anne designs, with examples of Chippendale and his contemporaries. The experimental pieces —the failures have apparently disappeared. Modern furniture makers have rendered marked assistance in reproducing the best, the most typical specimens and thus perpetuating the good. The value of a correct reproduction both as an example of style, and as a well made piece of work must be conceded.

Reproductions are usually more successful than adaptations—faithful copies rather than free translations. This is particularly true of mahogany designs. The oak furniture of the seventeenth century can sometimes be more freely interpreted, if there be skill of hand, and taste and discrimination back of the skill. But with the furniture of the succeeding century, he is wisest and most successful who does not alter a line but reproduces as truthfully as is possible.

Variety versus Harmony.—We have so much to choose from that we do not always choose wisely. The matter is not so simple as it was in the old days. Again in the tremendous gain we have made in certain lines we have lost in others. Allowing a good deal for the glamour that time gives, it is doubtful if in the twenty-second century, our own age will present that harmony and grace, that perfection of detail which we find in the eighteenth century. Even the costumes of the period fit into the background and it seems to us like a gigantic stage setting, in which white paneled walls and mahogany furniture, powdered hair, brocades, and lace ruffles all make a consistent picture.

It is this harmony of wall treatment, furniture, and costumes that charms us in all historic styles. In the seventeenth century the dark oak paneling seems to be just the needed background for sturdy oak furniture and for the brighter, more picturesque costumes. This is a more vigorous period of the world's history. It lacks the repose, the refinement, of the eighteenth century but it charms us with its own harmony. Turning the years of the calendar back to the sixteenth century we find cruder furniture, cruder walls, the furniture massive, the walls partially paneled, and finished with tapestries or molded plaster—all brave and strong in color—just the setting we immediately see for the heavily carved oak and for the brave apparel of the period. We shudder to think what conflict would arise if the backgrounds were shifted; if the white paneled walls formed the setting for the dark oak, or if the refined mahogany were placed against the paneled oak. In the same way the transposing of the costumes would mar the harmony. The gorgeous apparel of Elizabeth's day would be out of focus against the background of the Georgian period. The delicate brocades and laces of the latter would be lost without a dark oak setting. The Jacobean costumes fit best their own century, and so in each case the right relation is maintained.

Claims of Colonial Style.—Colonial styles more than any others seem to fit the long popular American house. The expensive carved pieces in "Flemish" or "old English" were too elaborate for the average room and had little meaning except in rooms especially designed for them. It was not until "Mission" furniture became popular that oak really held its own with mahogany. The "Mission" fad had a great deal to do with the present revival of seventeenth century oak, although, like other furniture happenings, it was of slow growth.

Mission.—The simplicity of Mission or "craft" designs won instant approval and to a certain extent revolutionized living-room and library furniture. It suited certain backgrounds far better than mahogany being particularly in line with severe trims and plastered walls. That a great deal of it was unnecessarily heavy and awkward was at first overlooked. A little later many people realized that it was impossible to have simplicity without going to such extremes. Several craftsmen modified the earlier designs, while several furniture makers turned their attention to the seventeenth century, reproducing the plainest of Jacobean patterns in the way of tables, cabinets, and chairs.

It would be folly to hint that mission furniture, or its adaptations, will fit all places. But it can be claimed that it fits many places exceedingly well and that it has been a real factor in making many homes more comfortable, more attractive, and far more livable. It emphasizes the structural idea in cabinet-making and gives point to the theory that the less the grain and texture of the wood are treated, the better. Oak is especially adapted to its use, and the present interest in that wood is largely due to the mission movement.

Period Furniture.—The seventeenth century opened up a mine of material for our furniture makers and as the demand for such furniture increased other types were added. It is now possible to furnish entire rooms in Jacobean and Elizabethan, and with the right settings these new-old styles are wonderfully interesting. There was a time when the interest in the Chippendale designs was greater than that in the Jacobean, but that can hardly be said to be the case to-day. William and Mary patterns are also in demand and are now receiving greater attention in this country.

When our own furniture makers undertook the reproducing of period designs in earnest a new era was possible. It brought well made furniture of correct pattern within reach of moderate incomes. The price limitation worked for good, for it made impossible the most elaborate designs. The plainer phases of the French styles were carefully studied and faithfully reproduced. Naturally, the pieces were not cheap, but relatively speaking—and such comparisons must be relative—they were not more costly than well-made colonial reproductions, or, coming to more modern designs, finely executed pieces in oak. Skilled labor and the best of materials were a necessity and these factors make cheapness impossible. But the word "cheap" is also relative, and the phrase "more economical in the end" as true as it is trite.

What the furniture of the future will be it is impossible to say. Perhaps it will combine the strength of mission the grace of colonial, the beauty of the old French styles with the enduring qualities of Gothic.

CERAMICS.—In the broadest sense the term ceramics includes the whole field of the compounds and mixtures of which the foundation is silica and to which solidity and permanence are given by the action of fire, or briefly, the field of the igneous silicates. In this term, therefore are included not only pottery and porcelain but bricks, tiles, terra-cotta, stoneware, glass, the hydraulic cements and enamels for steel ware and for use in jewelry. The principles of composition and the technical treatment of these are similar in character though differing widely in detail.

The study of ceramics may be approached from many points. The historical view concerns itself with the gradual development of the nations as expressed in fictile wares; the artistic is founded upon the historical and deals with clay, glaze and color as means of art expression; the technical and scientific considers the methods by which results are produced

and the industrial or utilitarian view deals with the production of wares upon a large scale and as a commercial proposition.

Materials.—Certain rocks and minerals are the foundation of all ceramic work. Clays of all kinds, feldspars, quartz, limestone, steatite, cryolite, and fluorspar are used more or less, together with, for glazing, the compounds of lead, zinc, boron, potash and soda. Some of these substances are easily fusible, others resist the action of very high temperatures and the remarkable variety of ceramic products is due to the possibility of wide variation in the nature of the compounds. Two things are, in the main, necessary, a sufficient resistance to the action of fire and a sufficient yielding to produce the solidity due to partial fusion. Some clays, such as those used for brick or terra-cotta, possess both these properties naturally balanced, others, such as the white clays used for porcelain and fine earthenware, possess only the refractory nature, the yielding to heat must be supplied by an admixture. Thus all porcelains are more or less artificial in that the material is not found in nature ready for use. Hard porcelain is a mixture of natural substances, soft porcelain is a mixture of substances which have, for the most part, been prepared artificially.

Evolution.—The progress of clay-working among the nations has been through similar phases in all parts of the world although in some cases the beginning has been with the brick, in others with the pot. Broadly speaking the brick was evolved from adobe and was manufactured only under climatic conditions such as make sun-dried clay a possibility. The pot was evolved from the basket or bark vessel and was made by such peoples as the British and the North American. Possibly sun-dried pots were made at the first but no specimens remain. The origin of burning or baking the clay is unknown. The British placed pots in the funeral pyre and afterwards collected the bones and buried them in one of the vessels, using others to contain food and water. The Red-man made large numbers of earthen vessels and baked them in the open fire. All these wares were built by hand and shaped finally when nearly dry.

The potter's wheel, whereby symmetrical form is given to plastic clay, was used by Egyptians, Greeks and Romans but does not belong to the Bronze age in which the hand-built ware is placed.

The Greeks.—As producers of pottery from natural clays the Greeks stood first. Many thousands of their vases are now to be seen in museums. The work is classified under certain well marked styles. The earliest wares were plain or simply decorated with black bands; then came the Geometric style in which, as the name implies, the prices were covered, more or less completely, with lines arranged in angular patterns. This was succeeded by the black figured ware in which animals, birds and human figures were painted in black silhouette upon the brown or red clay. The finest period was that of the red figured ware in which the black pigment was used as a background the figures being reserved in the natural red. All these wares are once fired the pigment being laid upon the unburned clay.

Romans.—The Roman potters carried their art into many lands using often local clay. The black ware commonly known as Upchurch from the locality in England where much of it has been found was made of a common red clay and was turned black in the burning by the action of smoke. Castor ware is a variety which is characterized by painting in white clay upon a black or brown body. Samian or Aretine ware was molded from a bright red clay, the source of which is unknown.

Chinese Influence.—None of these ancient wares has been perpetuated with the possible exception of the Castor ware which may have been the remote ancestor of the early English slip decorated wares. The treatment is similar though there does not seem to have been any continuity of production. The whole trend of the pottery idea was changed by the influence of Chinese porcelain upon the Western world. Up to this time dark colored wares from natural clays had been made exclusively but as soon as the porcelains of the Chinese became known through the channels of trade the whole ceramic world strove for the production of white pottery. In the near East the expedient was adopted of coating the dark clay with a white veneer of ground quartz mixed with a little pipe-clay. The knowledge of this process was confined to the Persian, Arabs and Moors but upon the invasion of Spain by the last named people the ware known as Majolica was originated. The characteristic feature of this is a glaze rendered opaque by the use of tin oxide which serves, as did the earlier white veneer, to conceal the dark colored clay of the body. Nearly every country in Europe participated in this development. The Majolica of Italy, the Delft of Holland, and the different styles of faience made at Nevers, Rouen, Moustiers and other places in France are technically almost identical. Wide differences are, of course, apparent in design and form but the essential technique is the opaque tin enamel.

Majolica derives its name from the island of Majorca in the Mediterranean whence these wares were first exported. The term was first applied only to the lustered pottery which originated in Spain and was afterward made with such great success in Italy, but it is now generally used for all wares with the stanniferous enamel. Whether the knowledge of this was carried from Spain to Italy or was communicated to the Italian potters by Oriental workmen is a debatable point. In any case it was in Italy that the art reached its fullest perfection. The names of Luca della Robbia, Giorgio Andreoli and even Michelangelo himself are connected with this product while it is from the town of Faenza that the word faience is derived. The world is fortunate in possessing a manual of the potter's art in Italy during the sixteenth century by Piccolpasso, a contemporary writer. In this most exhaustive work detailed information is given as to the production of the wares of the time and every modern writer has drawn liberally upon this source.

Soft Porcelain may be said to have grown naturally from Majolica, first in Italy where the rare Medici porcelain was made about the year 1580, and afterward in France at St. Cloud in 1695, at Chantilly in 1725 and at Vincennes the forerunner of Sevres. The aim of the early porcelain makers was to produce a translucent white ware which should approach the Chinese masterpieces in appearance. No pure white clay had then been discovered in Europe so that the result had to be accomplished by artificial means. A mixture was made of sand, gypsum, salt, alum and niter and was fused in crucibles to a solid slag known as "fritt." This was then ground to a fine powder and to it was added a small portion of a plastic calcareous clay. This clay tended to darken the color so that it was not possible to use enough to impart a working plasticity to the mass. Hence the porcelain makers were driven to use such emollients as soap and mucilage before the paste could be shaped. So tender was this ware in its resistance to fire that heavy losses were experienced in the kilns and it was eventually superseded by the hard porcelain which now constitutes the staple European product. No more beautiful ware than the French "pate tendre" has ever been made. The glaze was a very fusible glass composed largely of lead oxide and, consequently, the paintings, which were executed with consummate skill by artists of repute, sank into the glaze in the burning and acquired their lustrous beauty. To this fact is also to be attributed the superb quality of the ground colors, the inimitable turquoise, the apple green, the rose du Barri and the blue du Roi.

Development in France.—France gave birth, in the sixteenth century, to two notable departures from the established methods. These were the faience known as Henri II. and the ware of Bernard Palissy. The former has been the subject of much discussion as to its place of origin. It was first attributed to Hekene de Hangest who was a woman of refined taste, the chatelaine of the Chateau of Oiron. It was said that she and her librarian together made this pottery as a labor of love. Only about sixty pieces are now known to exist. The characteristic feature of the ware is that a light, yellowish clay is inlaid, somewhat after the method of a bookbinder, with clays of darker color, the whole being covered with a transparent glaze. Other locations have been given to this ware but the name Henri Deux is accepted as the most satisfactory.

Bernard Palissy was born in 1510 and his life has inspired many a theme. His aim was to make a perfect white enameled pottery and though he struggled for fifteen years he never realized his purpose. He made, however, the beautiful colored glazes which will always be associated with his name. Being a devoted student of nature he modeled reptiles and fishes on his platters and covered the clay with glazes in the natural colors.

Neither of these two wares had any appreciable effect upon the ceramic industry nor is either of them made at the present time.

Continental Development. — Chinese porcelain is generally conceded to be the criterion, as it is the prototype of this class of ware. The ingredients are the pure clay known as kaolin, feldspar and quartz. The glaze is composed of lime, feldspar and quartz. Both body and glaze are burned together at a very high temperature. The highest perfection of the work of the Chinese potters was reached between the fourteenth and the seventeenth centuries to which period most of the finest pieces are referred. It was this porcelain which inspired the European connoisseurs as already stated. France led the way at St. Cloud with a purely artificial ware but the first hard porcelain made in Europe must be accredited to Saxony. In the year 1709 one Johann Friedrich Böttger, being employed as chemist by the Elector of Saxony, was shown some infusible, white earth. He had become interested in porcelain

through the fine collection of Chinese and Japanese wares in the possession of the Elector and at once essayed its production. The result was the famous porcelain of Meissen, also known as Dresden. The production of porcelain now became the passion of princes. One after another the rulers of the German states established studios or small factories in which the fashionable art could be pursued. Vienna, Höchst, Berlin, Nymphenburg and many other places became centers of production but in the majority of cases the work ceased upon the death of the patron. Meissen, Vienna, and Berlin still flourish together with a large number of modern manufactories which are successfully producing commercial wares.

English Porcelains.—England soon became involved in the passion for porcelain, three manufactories being established within a very brief period. These were Bow, 1744, Chelsea, 1748 and Worcester, 1751. The work of each was in almost close imitation of the French in technical treatment but influenced by the Chinese as to motif. The china made at Bow contained as one of the ingredients a white earth which was imported from America, from the "back of Virginia" a locality whence china-clays are now procured. There was a factory in Derby which was flourishing in 1756 though the exact date of its origin is unknown. Worcester, now known as "Royal Worcester" is the only one of these old establishments which survives, though a new factory has been set up at Derby.

Hard porcelain in England has had but two exponents. When, in 1756, William Cookworthy discovered china-clay in the county of Cornwall he set up a factory at Plymouth, the nearest important town, for the purpose of using the clay. He made a kaolinic porcelain after the manner of the Chinese but so imperfect were his methods that a piece of Plymouth poreclain without a flaw is almost unknown. The venture did not succeed and in 1770 was removed to Bristol where Richard Champion was already engaged in making a similar porcelain. The works at Bristol are now engaged in the manufacture of earthenware only.

About this time the characteristic English china was perfected. This is known as "bone china" from the fact that the paste contains about forty per cent calcined bone. This differs from both soft and hard porcelains and may be regarded as a compromise. It is not as tender as the French soft paste and is glazed with a compound which is much softer than that necessary for hard porcelain. Much of the success of English table wares may be attributed to this china for there is nothing better for the finest services.

English Types.—While the manufacture of porcelain came to England as an alien the production of pottery is indigenous to the soil. From the days of the ancient Britons there were potters in the land. They wrought the native clays and evolved the slip painted wares, the combed and marbled wares, the tortoise shell the agate and the mottled of modern museums. They also made a beautiful white stoneware, glazed with salt after the German fashion and decorated with transparent colors. From the ranks of these men arose Dwight and Toft and Astbury and Wheildon to be topped in turn by Josiah Wedgwood. The potters foregathered in North Staffordshire where clays and coal were abundant and thus were founded the Staffordshire potteries, a federation of small towns which have separate entities but one interest. Here are the famous Minton, Copeland, Wedgwood, Doulton, Meakin, Johnson and a hundred other flourishing factories whose wares are on every table. Nearly all of the English potters make both china and earthenware. The latter is a white ware, light and porous, which is much cheaper than china. Native clays are almost exclusively employed but feldspar is imported from Sweden.

The types of ware known as "Gros de Flandres" originated in Germany and was exported from the low countries, hence the name. It was also, from its hardness, known as stoneware and was the forerunner of the recent wares of this type. The first glazing was by a unique and hitherto unknown process. When the pottery was in the kiln and at a glowing heat a quantity of common salt was thrown upon the fire. This was vaporized by the heat and the fumes attacked the hot clay forming a glassy coating over the surface. This process, while still in demand for decorative wares has been superseded in the manufacture of common jars by a cheaper method.

Kaolin or porcelain clay was discovered in France in the year 1768 and after some experiments the manufacture of hard porcelain was begun. For some years both wares were produced at Sevres but in 1804 the soft paste was finally abandoned.

Pottery in America.—The aboriginal pottery of the United States constitutes a rich field of study to those who are specially interested but it has no connection whatever with the product of the present day. American pottery apart from the work of the Indian began with the industries of the early settlers in Virginia and Pennsylvania. Brick and roofing tile were probably the first to be made for there is evidence that in Virginia brick were burned in the year 1612 and Prof. Morse states that the German immigrants to Pennsylvania introduced the manufacture of roofing tile after the German pattern. Very early in the settlement of the country white or light colored wares were made by those who brought with them a knowledge of the potter's art. Native clays were used but at that time the country had been so little explored that the finer clays were unknown. Naturally the potters settled where the clays were found and so the pottery centers were established. As a foil to the importation of American clays by English potters it is related that Joseph Wedgwood was greatly exercised in mind over the fact that an English workman named Bartlem emigrated to South Carolina in 1766 and attempted to establish a pottery there. Wedgwood, in a private letter, deplored this, stating that "an amazing quantity of white stoneware" was being exported to the "continent of North America" and expressing the fear that if English potters should begin to practice their art in the "colonies" the trade of the mother country would suffer. Recent developments have shown that his fears were without foundation.

Eighteenth Century.—During the eighteenth century a number of small potteries were established in the Eastern counties of Pennsylvania, mainly by the German settlers. Dr. E. A. Barber has made a special study of the wares produced in this district and has written a good deal upon the subject. He thus describes the process of 'sgraffiato' as practised by the Pennsylvania potters—"The decorative process consisted in covering the red clay with a thin layer of lighter colored slip, through which the designs were scratched with a style to expose the darker color below. A coating of transparent glaze, slightly clouded with green and yellow oxides, was then applied to the surface, and, after the final firing, the ware presented the appearance of a rich red intaglio beneath a greenish or mottled-yellow ground."

The slip decoration which was a contemporary of this consisted in using a fluid clay as a pigment. It was usually a light clay painted upon a darker surface but the reverse was also used. Many interesting pieces of these wares are to be found in most museums.

Nineteenth Century.—During the opening years of the nineteenth century attempts were made in many parts of the Eastern states to establish the industry of pottery manufacture. At first the potters paid but little heed to the location of the clays, thus departing from the practice of their predecessors. Stoneware was attempted in more than one place in New York state where no stoneware clays are to be found. Gradually, however, the matter of the raw material prevailed and segregation began. The first pottery in East Liverpool, Ohio, now one of the most important seats of the industry, was built in 1839 by James Bennett who selected this location on account of the superior quality of the clay for the manufacture of yellow ware. It is interesting to note, as an evidence of the progress of the art, that while this clay is still used, the bulk of East Liverpool wares are now made from clays found elsewhere. Mr. Bennett was joined by his three brothers one of whom the late Edwin Bennett of Baltimore was in 1851, the originator of the well known teapot with the bas-relief of Rebeckah at the well, a design which has been copied by teapot makers all over the world. The next few years saw some important developments. Men bearing the now well-known names of Harker, Taylor, Goodwin, Knowles, Vodrey and Lee settled on the Ohio river and built their kilns until there are now in East Liverpool nearly fifty establishments engaged in the manufacture of clay products.

The first kiln in Trenton, New Jersey, was set up in the year 1852 by Taylor and Speeler, according to Barber. As in the Ohio field the first product was yellow ware made from local clay. In order to improve the quality of the wares extensive search was made for better material with the result that kaolin deposits were found in Delaware and Pennsylvania. Feldspar was also found in Pennsylvania and quartz in Maryland. The potters, coming for the most part from England, were able only with difficulty to adjust themselves to the new materials and heavy losses resulted. Gradually, however, the obstacles were overcome and distinctive wares developed. One of these, known as "Hotel China" is a fine earthenware which closely approaches hard porcelain in character, being white and translucent This ware is in constant demand whereve

severe usage is expected and under such conditions has no superior. The body is composed of kaolin or porcelain clay, a plastic clay known as ball-clay, feldspar and quartz. The glaze is a compound of lead oxide, lime, potash, soda, boron sesquioxide, alumina and silica. These ingredients, when melted, form a hard glass which protects the body and offers great resistance to wear. The decoration is usually printed beneath the glaze and therefore lasts as long as the china itself.

Belleek.—Another development was the soft porcelain known as "Belleek." The name refers to a village in Ireland where a porcelain of similar character was formerly made. Not finding any natural substance which would fuse at a sufficiently low temperature the experimenters, Messrs. Brewer and Bromley, constructed an artificial feldspar or "fritt" to which they added a sufficient amount of plastic clay, thus following the plan of the early workers in France. Belleek ware is of a soft yellow color and is made extremely thin. It is much in demand for decorative pieces but is too tender for severe use on the table. Two or three factories are now making this ware in Trenton. The demands of recent years have given rise to the manufacture of sanitary goods in large quantities, some important concerns being exclusively engaged in their production. A strong earthenware which goes by the name of "granite" is extensively made for general trade, constituting, in fact, the bulk of the household pottery used in the country.

American Decorative Pottery.—In pottery which claims to be decorative and ornamental America has achieved some notable results. The general type of wares made is best defined as faience, that is, glazed earthenware produced at a low or moderate temperature. The glazes are both brilliant and matt and the decorations are either beneath the glaze or consist in colors added to the glaze itself. The pioneer in this field has been the Rookwood Pottery Company of Cincinnati, Ohio.

Rookwood has become, by reason of the variety and technical excellence of its products, a household word among ceramists and a study of the career of the concern will prove to be very instructive. In addition to the production of rare and beautiful vases in the standard brilliant glaze, Iris, Matt glaze and the inimitable vellum, Rookwood has embarked in the manufacture of tiles and architectural faience. Some very important works in interior decoration have been carried out in the cities of the middle West and it is evident that there are unlimited opportunities for development.

The Grueby Faience Co. of Boston, Mass., has devoted itself chiefly to the production of vases, wheel made and modeled, in a sober Matt green. Some other colors have been attempted but the green is the most successful. The glaze possesses an interesting reticulated surface which is peculiar to itself. Tile are also made in the same glaze. The Newcomb pottery as a department of Tulane University, New Orleans, has established a reputation for a decoration in blues and greens, under the glaze, which is now well recognized.

Commerical and Structural Pottery. On commercial lines large numbers of pieces are being made at Zanesville, Ohio, and elsewhere. This so called "art pottery" has a large sale but can scarcely be classed with the above named as both shapes and decorations are repeated again and again according to the demand.

In structural pottery, brick, roofing tile and terra cotta, great progress has been made in America in recent years. Common brick, made from soft clay in wooden molds, stands first as to quantity for all structural work needs it in the concealed parts. Many alluvial clays are used in the manufacture.

Refractory wares such as fire-brick, tuyeres, locomotive blocks, gas retorts and furnace linings in general form an important section of the ceramic field.

Architectural Terra Cotta is now recognized as the most satisfactory fire-proof building material. Red clay or shale is sometimes used but for the most part the same coal-measure clays are the best because of the demand for light colors. These clays are buff colored when burned and therefore do not destroy the light surface tints as red clays would. All terra cotta, except the red, is either glazed with a dull face or coated with a thin film of prepared clay which both secures uniformity of tint and also the desired color effect. The surface is impervious to water and is self cleansing. The weight of the pieces makes it impossible to dip them in the liquid so that the coating is sprayed on by means of compressed air.

Recent advances in the use of electric power have made it necessary to transmit high tension currents for long distances. This has created a large demand for insulators capable of resisting the strain. Glass, while suitable for currents of low voltage will not, on account of the irregularities of structure caused by rapid cooling, stand the heating which is inseparable from the transmission of currents at high pressure and recourse has been had to porcelain. The body structure is the same as that used for all porcelain wares except that color is not of great importance. It is found, however, that the white porcelains are the best because they can be burned at a higher temperature than those of impure color, in fact the color of the ware is an indication of the purity of the clay. The wares are generally burned at a low heat at first to insure safety in handling, the pieces are then glazed with the lime-feldspar compound already mentioned and are burned at an intense heat, approximating 1400 C., and are tested under an enormous voltage for the detection of flaws.

TABLE I—POTTERY AND EARTHENWARE

Country	Date	Nature of Product	Remarks
Egypt	B. C circa 300	Unglazed pottery.	Household vessels, mostly wheel made.
Egypt	1900	Glazed stoneware.	Rich blue glaze. Figures and charms molded.
Assyria	800	Unglazed pottery	Utensils both hand and wheel made.
Assyria	700	Inscribed tablets.	Cylinders and slabs with impressed letters.
Babylonia	700	Unglazed pottery.	Utensils.
Greece	800	Pottery both rough and polished.	Primitive style. Simple bands of dark color. Wheel made.
Greece	700	Polished pottery, also called Mycenæan.	Geometric style. Interlaced lines in dark color. Wheel made.
Greece	600	Polished pottery, also called Mycenæan.	Wheel made. Archaic style. Birds and animals in black silhouettes, the tails scratched in.
Greece	600	Polished pottery, black figured ware.	Wheel made. Human figures in black, faces in profile, eyes fronting.
Greece	500	Polished pottery. Red figured ware. Finest period.	Wheel made. Background in black, figures in natural color of clay. Faces and eyes in profile; drapery in detail.
Greece	400	Polished and ornamental ware. Decadent period.	Figures and embossments in color.
Rome	100 to A. D. 40	Black and gray ware, called "Upchurch" from the English locality where much is found. Found also in France and Germany.	Wheel made. Lines polished. Black color produced by smoke in burning.
Rome	B. C. 50	Dark ware with white decoration. Called Castor from the English locality.	The beginning of "slip" painting. Hunting scenes and scrolls.
Rome	400	Samian ware from the island of Samos; also called Aretine.	Bright red glazed pottery. Molded with decorative scenes and scrolls.
India	900 et seq.	Pottery of natural clay with colored glazes.	Wheel made. Decorated with floral arabesques under the glaze.
Japan	A. D. 200	Common pottery glazed and unglazed.	The art introduced by Korean potters.
Persia	1300	Eryobe or slip coated pottery.	A natural dark clay covered or veneered with a white coating, colored and glazed.
Persia	1200	So-called "Gombroon ware," attributed by some to the Chinese.	A porcelanous earthenware of fine quality. Perforated and filled in with semitransparent glaze. Sometimes decorated in blue.
Syria and Arabia	1400	Eryobe ware of the same general type as the Persians.	Decorated under the glaze with fine arabesques in color.
Rhodes and Asia Minor	1500	Eryobe ware of the same general type as the Persians.	Characterized by the use of a red earth as a pigment.
Spain	1320	Tin enameled ware, known as Majolica.	A dark natural clay covered with an enamel opacified by tin oxide. Lustered and decorated in color.

TABLE I. POTTERY AND EARTHENWARE,—Continued

Country	Date	Nature of Product	Remarks
Italy	1350	Tin enameled ware, known as Majolica. A most extensive and important product which emanated from many centers.	Elaborately decorated in color and embellished with rich paintings. Lustered and sometimes with a brilliant overglaze.
Italy (Luca della Robbia)	1450	Architectural modeled work coated with the characteristic tin enamel.	Luca della Robbia is believed to have greatly improved the quality of the enamel.
Italy (Giorgis Andreoli)	1520	Ruby pots, dishes and platters.	The Maestro Giorgis worked at Gubbie and his ruby lusters are unique.
France (Nevers)	1580	Tin enameled wares in Italian style.	The maker of these wares came from Faenza, hence the term "faience."
France (Rouen)	1540	Tin enameled wares of superior quality.	The style is entirely French. Figures and conventional ornament.
France (Moustiers)	1680	Tin enameled wares of superior quality.	Painted with hunting and domestic scenes on a very pure enamel.
France (Henri Deux)	1520	Glazed cream-colored pottery, inlaid with dark clays.	Also called Faience d' Oiron from the supposed place of origin. A very rare and valuable ware; only 53 pieces are known.
France (Palissy)	1560	Light colored earthenware with richly toned glazes.	Modeled embossments of natural objects glazed in proper colors. Also some modeled figures.
Germany	1540	Salt glazed stoneware.	Brown, gray or cream clays, embossed and sometimes decorated in blue.
Holland	1600	Tin enameled pottery decorated in blue.	The well-known Delft ware.
England	B.C.400	Primitive hand-formed pottery.	Found in burial mounds used in funeral ceremonies.
England	A.D. 490	Anglo-Saxon pottery.	Crude and unglazed.
England (Malvern and other places)	1250	Encaustic tiles. Parti-colored clays.	Made for church use, by the monks.
England (Tulham, Mortlake and Staffordshire)	1550	Salt glazed ware.	The knowledge derived from Germany.
England (Staffordshire)	1610	Lead glazed pottery on colored clays.	Primitive in character. Either wheel made or shaped by hand.
England (Wrotham and Staffordshire)	1620	Slip decorated wares.	A characteristic English product. Dark clay with ornamentation in light-colored slips.
England (Lambeth, Staffordshire, Liverpool)	1635	Tin enameled wares.	Introduced from Holland.
England (Staffordshire)	1680	Combed and marbled wares in parti-colored clays.	A domestic pottery largely made in cottage homes.
England (Etruria)	1762-1776	Wedgwood wares, queensware and jasper.	The beginnings of modern manufacture.
England (Leeds)	1770	White earthenware.	Perforated and glazed.
England (Staffordshire)	1784	Willow pattern, introduced by Spode.	Spode was the forerunner of the house of Copeland.
England (Lambeth (Doulton)	1818 (still working)	Stoneware.	A salt glazed ware, decorated in Sgraffiato and otherwise commonly known as "Doulton-ware."
England Staffordshire (Furnivals)	The date of origin of these factories is unknown. They developed from the domestic industry of the seventh century		A fine quality of earthenware for table use.
England Staffordshire (Meakin's)			An excellent earthenware, largely in demand for table services.
England Staffordshire (Johnson's)			One of the best of the English earthenwares.
China	Circa B.C. 185	The first hard porcelain.	It is quite uncertain when porcelain was invented; the Chinese themselves assign a much earlier date.
China	A. D. 583	Hard porcelain, decorated under the glaze in blue.	The blue of cobalt is quite indestructible by fire and has been universally employed as a pigment.
China	618–907	Pure white hard porcelain (Ihang dynasty).	The early porcelains were rather dark in color.
China	954	The first "celadon" porcelain.	This tint was called "the sky after rain" and was produced from iron.
China	1368	Minz dynasty. The finest period.	The works of this time constitute the crowning glory of Chinese porcelain.
China	1661	"Famille vert." (Jacquemart).	The porcelain was finished and glazed in the usual way, then decorated in black and covered with a fusible green enamel.
China	1723	"Famille rose" (Jacquemart).	Overglaze decoration in which a rose color made from gold is the characteristic feature.
Italy (Florence)	1580	A semihard porcelain with blue decoration.	The famous and rare Medici porcelain. Only 26 pieces are known.
Italy (Capo di Monte near Naples)	1743	Soft porcelain.	Modeled figures colored over the glaze.
Spain (Buen Retiro)	1760	Soft porcelain.	Removed from Capo di Monte when king Charles of Naples became King Charles III. of Spain.
France (St. Cloud)	1695 to 1773	Soft porcelain.	The first French porcelain and the first distinctive soft porcelain.
France (Vincennes)	1745	Soft porcelain.	Vincennes was the forerunner of Sèvres. In 1753 the king of France purchased one-third of the stock and gave the title "Royal" to the factory.
France (Sèvres)	1756	Soft porcelain (pâte tendre).	Removed from Vincennes. In 1759 Louis XV. became sole proprietor.
France	1769	Hard porcelain (pâte dure)	Kaolin or porcelain clay was discovered at St. Yrieix in 1768 and the production of hard porcelain followed. The pâte tendre was finally discontinued in 1804. The factory still exists as the most important national porcelain works in the world.
France (Limoges)	1779 et seq.	Hard porcelain	The famous works of Haviland, Guerin, Pouyat and others now manufacture very large quantities of the well known French china.
Germany (Mussen or Dresden)	1709	Hard porcelain.	No porcelain was made in Germany until the discovery of kaolin. Böttger was the first man to make hard porcelain in Europe.
Germany (Vienna, Anspach, Bayreuth, Höchst, Fürstenberg, Berlin, Frankenthal, Nymphenburg, Ludwigsbury, etc.)	1718 to 1758	Hard porcelain	Nearly every German prince desired a porcelain works during this period. There is not much to choose between the wares as regards quality, but the decorations, largely over the glaze, bore different characteristics. Few of these factories are now in existence.
Denmark (Copenhagen)	1760	Soft porcelain.	This factory was closed in 1768. The paste is good and the painting of excellent quality.
Denmark	1772	Hard porcelain.	Became a royal manufactory in 1779. Is now noted as one of the first in the world.
England (Bow)	1744	Soft porcelain.	Bow was at one time called "New Canton." It is believed that bone ash was here first used in English china. The factory was closed in 1776 when Duesbury removed the equipment to Derby.
England (Chelsea)	1745	Soft porcelain.	Patronized by the king and the duke of Cumberland. The style of treatment was French. Purchased in 1769 by Duesbury and the equipment removed to Derby.

TABLE I. POTTERY AND EARTHENWARE—Continued

Country	Date	Nature of Product	Remarks
England (Derby)	1750 (uncertain)	Soft porcelain.	Derby was concerned in the making of china probably as early as 1745. In 1769 Duesbury combined with the Derby works the resources of Bow and Chelsea. Hence the term Chelsea-Derby.
England (Derby)	1877	Bone porcelain and other wares.	Mr. Edward Phillips of the Worcester factory built the new Derby works and began the manufacture of "Royal Crown Derby" porcelain. The factory now stands among the foremost in England.
England (Worcester)	1751	Soft porcelain. Ivory porcelain. Bone porcelain.	Founded by Dr. Wall and for a time occupied chiefly in producing Chinese patterns. Consolidated with Chamberlains in 1840. The present company formed in 1862 and now manufactures the famous Royal Worcester wares.
England (Coalport)	1814	Soft porcelain. Bone porcelain.	The successor of Jackfield and Caughley. This factory is still in existence and produces fine wares.
England (Plymouth)	1768	Hard porcelain.	This, the first factory in England for the manufacture of hard porcelain, was established by Cookworthy as a consequence of the discovery of porcelain clay in Cornwall. Removed to Bristol in 1771.
England (Bristol)	1768	Hard porcelain.	Champion began to make porcelain in Bristol and in 1771 purchased the Plymouth patent. The works still exist, but for the production of earthenware only.
England Burslem (Doulton)	1880 (still working)	Bone porcelain, and other wares.	The factory of Pindar, Bourne, etc., was purchased by the firm of Doultons, Lambeth, and the work produced now ranks with the first of English wares.
England Stoke-on-Trent (Mintons)	1793 (still working)	Bone porcelain, earthenware and pottery.	Begun as a manufactory of earthenware, the house of Minton, under the leadership of Campbell and Arnoux, took the lead in the well known Staffordshire potteries. The wares are of the finest.
England Stoke-on-Trent (Copeland)	1779 (still working)	Bone porcelain, ironstone china and other wares.	Copeland was the successor to Spode. Considerable success has been achieved in all kinds of table services. Ornamental wares have been made also.
England Cauldon Place (Brown-Westhead, Moore, etc.)	1794 (still working)	Bone porcelain and earthenware.	The present house is the successor of Ridgway & Sons. They are noted for china dinner ware.
England Etruria (Wedgwood)	1762 (still working)	Bone porcelain and earthenware.	The original house of Wedgwood has taken up and developed all the modern styles with much success.

TABLE II. GLASS

Locality or Country	Date	Nature of Product	Remarks
Egypt	Circa B.C. 2400	Dark blue glass. Semi-opaque.	The earliest dated specimen is a small lion's head in the British Museum.
Egypt	1450	Transparent green glass.	A bead found at Thebes.
Nineveh	712	Pale green transparent.	A small vase in the British Museum bears the name of Layon, king of Assyria.
Greece	Circa 400	Colored glass. Waved, striated and sometimes carved.	Numerous small bottles. Beads and ornaments.
or Phenicia			
Rome	Circa 30 B. C. to 309 A. D.	Common green glass. Colored and ornamental glass, carved, cut and woven glass.	Enormous quantities of glass of every description, even including window glass, were produced.
China	Circa B. C. 140	Small vessels ornamented and embossed.	The statements regarding early glass in China are very uncertain. But few specimens remain.
Constantinople (Byzantium)	A. D. 800 to 1200	Heavy molded glass in dark colors. Some window glass.	Classic models were followed, but the wars of the period caused much interchange of plunder, and the origin of many specimens is doubtful.
Damascus and the East	1200 to 1400	Vessels of clear glass often richly ornamented.	Many lamps and vessels for religious use are found in mosques.
Italy (Venice and (Urviano)	1090	Every description of fancy glass.	Glass mosaics preceded the general manufacture of glass in Venice. The furnaces were removed to Murano probably about 1300. Venetian glass is the model for the world.
Italy (Murano)	1490	Mille fiore glass.	This had been made by the Romans. Canes of colored glass were cut into short lengths and these, with the cut ends showing, were fused into the body of the vessel.
Italy (Murano)	1500	Vitro di Trina (lace glass)	Threads of opaque white glass were fused in a geometric pattern into the clear glass of the vessel.
France	A. D. Circa 500 to 800	Glass vessels.	Scarcely any specimens remain. The work was probably of Roman origin.
France	1400 to 1600	Utensils of various sorts colored and decorated. Window glass.	Small manufactories of glass existed in many parts of France but most of the product was unimportant.
Spain	Circa 500 to 800	Cups, vials and bottles.	As in the case of France, the Roman influence was felt in Spain.
Spain	1400 to 1600	Utensils and drinking cups.	Some Spanish glass bears evidence of Venetian influence. Colored and reticulated forms are found.
Germany	Circa 700	Drinking cups.	The influence of Rome is apparent here also.
Germany	1400 et seq.	Steins and goblets. Window glass.	The stein was even then a feature in Germany. A great variety of form and treatment is found. Some highly ornate pieces are preserved.
Great Britain	Circa 600	Beads, crude cups, window glass.	Both Roman and Saxon specimens are found. The original "tumbler" was a glass drinking horn which could not be set down until empty.
Great Britain	1300 to 1600	Cathedral glass. Vessels of many sorts.	English stained glass for church windows is of the finest. The vessels were generally plain and useful.

Modern Productions

Venice and Murano	The glass made is much on the old style. Every description of colored, blown, woven and reticulated glass is produced. The material is still of the lime-soda mixture.
France	A great deal of modern French glass is crystal of the lead-potash compound. The molded glass is very fine. Some French craftsmen have produced wonderful effects in colors.
Bohemia	This glass is well known in the small and inexpensive bric-a-brac of the stores. A good deal of it is decorated in color and gold.
Germany (Jena)	In optical and chemical glass the Jena works lead the world.
England	The English glassmakers are surpassed by none. Table glass of pure crystal, cut glass and ornamental pieces are made in great variety. The Stourbridge district is the most famous.
America	Much of the American glass is molded in the form of tumblers and household vessels. Fine cut glass is made at Corning, Toledo and other places. Plate glass is an important part of the industry.

NOTED ARTISTS

MUSIC AND MUSICIANS

MUSIC.—No definition of music has ever been found that would satisfy musicians, to say nothing of explaining the art to the laity. Emotionally, it is based upon the outcry, the audible expression of grief, joy, love, and infinite varieties of agitation or contemplation. To make an art of these noises some sense of form and design is necessary. For its record, some form of writing is necessary. For its reproduction, numberless mechanical devices are required.

Music, therefore, includes dramatic expression, structural form, mathematical measurement, machinery, its construction and repair, and visual writing. Though it is founded upon an appeal to the ear, it has other elements and one of the greatest of composers, Beethoven, wrote some of his best work after he became deaf; while a trained musician can be almost as deeply stirred by merely casting his eye over a score, as an ordinary reader is moved by reading a book.

Music is familiarly called "the universal language" and it has flourished in some form in every age among every people. But music, as we understand it today, is the newest and youngest of the high arts. It is perhaps the only art in which the modern European and American civilization does not pay homage to Grecian ideals and achievements.

There is not a single truly great name in music until we come down to the Belgian Orland di Lassus and the Italian Palestrina, in the sixteenth century. The compositions of these men were of such simplicity and grandeur that many of them are still in occasional use after nearly four centuries.

Forms of Music.—There were three careers open to an ambitious composer at that time, the church, the opera, and the salons of nobility and royalty. From these sources rose the chief of the larger forms of music; the mass, the opera, the symphony, the overture, the oratorio, suite, sonata and the song.

The **Mass** is the most ponderous and elaborate form of religious music. It accompanies the consecration of the Host, and derives its name from the dismissal of those not permitted to assist in this service: "Depart, the congregation is dismissed," or in Latin, "*Ite, missa est ecclesia*)." The Latin word for mass is "*missa*" and our word is a corruption from it.

Divisions.—The mass is divided into four or more portions of the liturgy. They take their names from the first words of the text: first, the *Kyrie*, which is subdivided into the *Kyrie Eleison*, the *Christe Eleison*, and the *Kyrie Eleison;* second, the *Gloria*, or Doxology, which is subdivided into the *Gratias agimus*, the *Qui tollis*, the *Quoniam*, and the *Cum sancto spiritus;* third, the *Credo*, which is subdivided into the *Et incarnatus*, the *Crucifixus*, and the *Et resurrexit;* fourth, the *Sanctus*, subdivided into the *Benedictus* and the *Hosanna;* fifth, the *Agnus dei*, and the *Dona Nobis.*

At its best, the mass is a peculiarly sublime expression of human emotion, performed as it is in the resounding vault of a cathedral with the awe of adoration.

When the Mass is for the dead it is known as a Requiem Mass from the opening words, *Requiem aeternam dona eis, domine.*

Composers of Masses. Nearly every ambitious composer has written one or more masses. Dufay (1400-1474) is said to have invented white notes. His pupil was Okeghem (1430-1495) founder of the second Netherland School. His great pupil was Josquin Deprès (1450-1521) whom Burney called "the father of modern harmony" and of whom Ambros says, "he was the first musician who impresses us as being a genius." He was one of the many eminent Flemish composers who carried their gifts into Italy. Orland di Lassus (1520-1594) was another and he was the most notable composer of his time except Palestrina. Palestrina's own teacher was Claude Goudimel (1505-1572) a Frenchman, who went into Italy and became the "Father of the Roman School," before he went back to France to perish in the Saint Bartholomew massacre.

Palestrina.—It was in 1564 that the Council of Trent and a committee of eight cardinals determined to purify church music of its ribaldry and its frippery and commissioned Palestrina (1514-1594) to write a mass which should serve as a model. He wrote three, all of them wonderful, and won the name "the savior of music." The best of his masses is known as the "*Missa papae Mercelli.*" He would generally be accounted the greatest of all composers for the church.

Later Composers. There followed the great J. S. Bach who wrote four small masses and his Grand Mass in B. minor. Haydn wrote fourteen masses including The Seven Words on the Cross. Mozart wrote fifteen and was engaged at his death on his wonderful *Requiem* which he left unfinished, but which is rated among the immortal works. Beethoven composed two masses, including the famous *Missa Solennis.* Schubert left six including the *Deutsche Messe.* Schumann a *Missa sacra* and a *Requiem Mass* with orchestra. Even Liszt wrote his *Graner* festival mass, and a requiem. Cherubini wrote a famous mass for the Prince of Chimay. Verdi wrote a noble *Requiem.* Among the French contributions are the masses of Gounod, Saint-Saëns, Widor and others. In America John Knowles Paine composed a fine mass. Doubtless the greatest of modern attainments in this field is Brahms' tremendous *German Requiem* (1867).

Oratorio.—Between the mass and the opera exists a third great form, which serves as a bridge between them. This is the oratorio, dramatic in its story, but meant for performance in a church, or at least without theatrical effects.

The oratorio gained its name from the chapel or "oratory," because St. Philip of Neri (1515-1595) seeing the inroads of the Reformation upon the populace by the use of simple hymn-tunes, resolved to interest the common people in Catholic music. He commissioned the composition of short songs and gradually of short sacred legends, often enacted in costume. These were performed in the oratorio.

Early Composers. Dramatic recitative was just gaining favor and it fell in with his purposes. Cavaliere's allegory *The Soul and the Body* was the first oratorio along modern lines. Other Italians, Carissimi, Cesti, and Alessandro Scarlatti (1659-1725) carried it on toward perfection.

Simultaneously the Protestants in Germany found it of immense power. Heinrich Schütz, called "the father of German music," studied in Italy and brought inspiration back to Germany. He composed *The Seven Words of Christ on the Cross* and a *Passion* for use in Passion Week.

Under the name of Passion-Music, J. S. Bach (1685-1750) wrote his immortal *Passion according to St. Matthew* and *according to St. John.* His *Christmas Oratorio* and many cantatas both sacred and secular, are also the masterpieces of a master.

Handel. The Passion form, however, lost its vogue with composers, and music followed rather the outlines established by the greatest of oratorio composers, George Frederick Handel (1685-1759) who became a national institution in England. He anglicised his name from Händel to Handel, but he managed to Handelize English music forever after.

With Handel, who was born in the same year as Bach, oratorio became more epic and dramatic, for he took it up after a glorious career in opera, which ended in a sudden disfavor and bankruptcy. His *Messiah*, first produced in Dublin in 1742, made him a new fortune, and to this day it is still one of the most popular of all musical compositions. His powers of declamatory vigor, and of choral thrill have hardly been approached. His *Judas Maccabæus, Israel in Egypt* and *Samson* are among his other famous works in this form.

His Great Successors. The next great oratorios were Haydn's *The Creation* (1795) and *The Seasons* (1801). They are still beautiful. Beethoven's *Mount of Olives* does not rank among his best works, but Mendelssohn's *St. Paul* (1836) and his *Elijah* (1846), attained the heights of achievement. *Elijah* has at times a fire and an exaltation quite equal to Handel at his best, and it has also the infinitely human and homely pathos of the widow whose son has died, and of the prophet in his dejection.

Gounod wrote successful oratorios and the *Samson and Delilah* of Saint-Saëns has been sung both as an opera and as an oratorio. Berlioz' *The Damnation of Faust* a great and greatly popular work wears the rather ill-fitting title of oratorio, yet includes a burlesque of Handel's *Amen* fugue. Liszt's *St. Elizabeth* and Rubinstein's *Moses* are also nearer the theatre than the church.

Recent Oratorios. In Italy a young priest Lorenzo Perosi made a sensation in 1897 by a number of works which promised to restore oratorio to a more religious frame of mind; but his vogue was brief.

England has been more successful in oratorio than in any other musical form, among the most important of the composers being Benedict, Bennet, Sullivan, Parry, Stanford. Most successful of all is perhaps Sir Edward Elgar's *The Dream of Gerontius* (1900).

America has contributed a splendid achievement in Horatio Parker's *Hora Novissima* (1893).

The Cantata is a smaller oratorio, usually far less ambitious, and frequently entirely secular. Thus, J. S. Bach wrote a coffee-cantata (a humorous protest against drinking too much) as well as many religious cantatas. Haydn set a Greek subject *Ariadne at Naxos*, while Mozart composed a Masonic cantata (as well as a Masonic opera).

The mere list of genuinely delightful or deeply impressive works in this easy and elastic form would fill pages.

Opera.—In the field of opera the composer must be song-writer, symphonist, choir-master, and dramatist. Opera is the most popular of all forms of music, and has been from earliest times. The classic Greek tragedies were always sung; and when opera had its renaissance in 1594, the composers Peri and Caccini definitely announced that their intention was to revive the Greek tragic art. The first opera was called *Dafne*. It was followed in 1600 by *Eurydice*.

Early Impulses. The once popular and historically important operas of Monteverde, Scarlatti, Pergolesi, Sacchini, Piccinni and others carried Italian influence all over Europe. Practically all the singers were Italians and the librettos in Italian.

Even the staunch Germanic-British Handel was trained in Italy, and wrote in the Italian manner, however greatly his personality tinged everything. All the capitals were battle grounds of rival Italian operas. In London Handel and Buononcini almost provoked civil war. The exquisite influence of England's one native genius in opera, Henry Purcell (1658-1695), who wrote to English text in an English manner, was smothered forever by the Italian tidal wave.

Opera in France. The Italian composer Lulli, who, after Handel's fashion, naturalized himself as a Frenchman and became Lully (1633-1687) is looked upon as the founder of French opera, under the patronage of Louis XIV. Later, Rameau (1683-1764) Lesueur (1764-1837) Méhul (1763-1817) Boieldieu (1775-1834) Grétry (1741-1813) Auber (1782-1871) Hérold (1791-1833) Halévy (1799-1862) and others established, developed and sustained a natural French opera with French texts and spirit.

But Paris was still a center of Italian influence and when the Austrian Glück (who had Marie Antoinette for pupil and protectress) essayed to purge opera of its insincerities and artificial vocalization, he was opposed by the Italian devotees of Piccinni.

History has awarded Glück the victory and dealt rather unfairly by Piccinni, who was a good man, a sincere artist and an unwilling opponent. But his work is in oblivion while Glück's *Orfeo* is still beautiful, and still heard about the world.

Living opera, however, begins for us really in what Rockstro calls its "thirteenth period."

Mozart. While Paris was shaken with the Glück-Piccinni war, another Austrian, young Mozart, was in the city, suffering from complete neglect. He had travelled in Italy and his first operas were in the Italian style. His greatest successes, indeed, were his settings of the librettos of an Italian, Da Ponte; but Mozart wrote also German operas.

He was a wonderful being. In his thirty-five years of life (1756-1791) were crowded supreme triumphs as an infant prodigy, a piano virtuoso, a composer of sonatas, symphonies, suites, songs, church-music and operas. He faced poverty and his art with a certain boyish ingenuousness of joy and of sorrow, of bravado and of superstitious dread, that gives all his work an eternal youthfulness. His greatest operas *Don Giovanni* and *Le Nozze di Figaro*, one of them epic, the other high comedy bordering on farce, are fascinating in the highest degree, to this day. Both of these works are Italian in text, but his *Magic Flute*, a Masonic opera, of uneven merits, is German in book and spirit.

Famous Failures. Haydn, Schubert, Schumann, and Mendelssohn, could not succeed in opera, and Beethoven found only one libretto, *Fidelio*, that interested him, and this failed twice before it succeeded. It has a German libretto but its scenes are Spanish.

Strictly German opera found its world-wide success first in the *Der Freischutz* of Weber (1786-1826), which is Teutonic in every idea, and has had enormous vitality. In Germany, Marschner, Lortzing, and others gained national success, but had little hearing abroad. It remained for Wagner to place German opera on the general height of German music.

Meanwhile came another tidal wave of Italian opera—a wave that has not yet ceased to penetrate the farthest reaches of music. Wagner's success overtopped it, but never set it back, and since his death it still sweeps on.

Great Italian Operas. There are few corners of our civilization that have not resounded with Rossini's *Barber of Seville* and his *William Tell;* with Donizetti's *Elixir of Love, Lucia di Lammermoor, Daughter of the Regiment* and *La Favorita;* with Bellini's *I Puritani, La Sonnambula,* and *Norma;* and with Verdi's *Ernani, Rigoletto, Il Trovatore, La Traviata, Aida, Otello* and *Falstaff.*

The most world-wide successes in opera today are again written by Italians. Mascagni's *Cavalleria Rusticana*, Leoncavallo's *I Pagliacci*, Puccini's *La Boheme, Madame Butterfly*, and the like. Neither England nor America has ever contributed to world-literature a really great opera, though both countries have made excellent audiences.

French School. During the last century French composers also have managed to create several world-conquering operas in addition to the numberless works, successful only to native audiences.

Meyerbeer (1791-1864), though of German birth, failed in Germany as a composer, and established himself at Paris, writing French works for the French. His *Robert le Diable* founded the wealth of the Opera, and was heard throughout the world. His *Les Huguenots, Le Prophète*, and *L'Africaine* have been among the most successful of operas. Wagner owed much to their influence, and had personal help from Meyerbeer in his earlier struggles.

Meyerbeer belongs to French opera, and so does Gounod (1818-1893) whose setting of the German legend *Faust* has been sung innumerable times and is still almost the staff of life of an opera troupe. His *Romeo and Juliet* has also had great success, though not so much as the *Carmen* of Bizet (1838-1875) which has rivalled the greatest successes in the entire operatic field. Among contemporaries Massenet (1842-1912) has enjoyed most cosmopolitan vogue, though a new note has been struck by Charpentier's *Louise*, a realistic story of the Paris of today, and by Claude Debussy, whose extraordinarily original music found its opportunity in Maeterlinck's *Pelléas and Mélisande.*

Wagner. Of all operatic names, however, the greatest remains that of Richard Wagner (1813-1833). He wrote his own librettos and revolutionized the art in nearly every detail, including scenic effect, and orchestral management and development.

In opera, Wagner is as supreme as Beethoven in the symphony. He met an inconceivably bitter opposition, which provoked riots in Paris and threatened revolution in Bavaria. The chief hostility to Wagner was aroused by his theory of harmonic flow and continuous melody. Though it seems natural enough to us now, it was completely bewildering to his early hearers who found his continuous melody continuously non-melodic.

It is difficult to single out any of Wagner's operas, where all are so great. His earlier works, *The Flying Dutchman, Tannhauser*, and *Lohengrin*, seem today so melodious that they are played at popular concerts and ground out by the very barrel organs. To the critics of their own day they were chaos and poison. His *Tristan and Isolde* is perhaps the most intensely passionate expression of love ever given voice. His comic opera, *Die Meistersinger* is unsurpassed in its field, and his *Parsifal* is the loftiest of efforts at religious opera. His monument is the cycle summing up German myth, the so-called *Ring of the Nibelungen*, divided into four evenings: *The Rheingold, The Valkyrs* (or *Die Walküre*) *Siegfried* and *The Twilight of the Gods*, (or *Götterdammerung*).

Wagner's great figure typifies German operatic ambitions and has overshadowed subsequent composers; almost the only personality emerging into foreign notice being Humperdinck, with his delicious children's opera, *Hänsel and Gretel.*

Strauss. More recently, however, Richard Strauss (born 1864), who stirred the world with his daring symphonic music has provoked an almost Wagnerian war with his opera *Salome*, and his *Elektra.* Curiously enough the Wagnerians are his chief enemies and they fling at him the very same taunts of non-melodic cacophony and immoral sensationalism that were formerly hurled at Wagner. The end of this war is not yet, but the victory will probably rest with Strauss, since the innovator, and the darer usually overwhelm the conservative and the cynic.

Lesser Forms. There remain untouched the fields of the chorale, the hymn, the part-song, and the solo song, not to mention the entire realm of comic opera. It seems inadvisable to include comic opera here, though many of its masterpieces are not inferior in ingenuity or in ultimate value, to more solemn works.

As for attempting to describe the composers of short songs, it were as easy to catalogue the sounds of the sea. Some of the most perfect have been written by unknown composers, and there is hardly a respectable musician who has not been moved to write at least one fine lyric. Even America has contributed splendid songs. The foremost important place would be given probably to Schubert, always a melodist, yet intensely dramatic and true to his text. Robert Schumann and Robert Franz (1815-1892) would come next in importance.

But, admitting, as one should, that a perfect song is as much better than a slovenly opera, as a perfect sonnet or a perfect short story is better than a limping epic or a loose-jointed novel, let us leave the infinite field to itself. The best songs have a way of promulgating their own virtues.

Instrumental Music. In turning to instrumental music, we might first take the piano. Though believed to be less expressive than the violin and other instruments, because less like the voice, it is more nearly universal, and, above all, is the only home instrument that is self-supporting. The violin, 'cello, flute and even the voice sound thin when they are alone. The piano is sufficient unto itself. The number of perfect works for the piano would rival the stars, many of the most exquisite being written by minor composers. We, however, cannot deal with the Milky Way. The planets are more than enough.

John Sebastian Bach wrote vastly for the piano and had immense influence on all subsequent music. His monumental work is *The Well-Tempered Clavier*, made up of four compositions, preludes and fugues for each of the twelve keys, both in major and minor. It has immense historical and technical value to the professional musician, and includes many single compositions and numberless passages which will appeal to the laity by their tenderness, solemnity, grace and wit, or by that peculiar and indescribable felicity of expression that keeps Bach hale and hearty to this day. In his *Chromatic Fantasia and Fugue* he wrote a composition that is more modern and pianistic in its treatment and nobility of expression.

A fugue, it may be well to say, is a composition in which a melody is chosen that may be accompanied by a perfect imitation of itself. It is hard to explain it without using terms that must themselves be explained; but everybody has sung *Three Blind Mice* or some other "round," in which different voices strike in with the same tune at different points. On such a principle of "imitation" is built up what is called a "canon." A fugue is a freer and more elaborate canonic structure.

For the orchestra, as in Mozart's *Jupiter* symphony, and for the organ with its different instrumental colors, as in many of Bach's great organ fugues, there are cumulative and variegated effects which render the fugue a noble form.

Sonata. The popularity of the fugue gave way to the vogue of the sonata, which is itself going out of use. The word "sonata" originally meant merely something "played," as contrasted with something "sung," or "cantata." But gradually the term crystallized, just as the poetic term "sonnet" assumed a definite and restricted meaning.

A sonata, as it is now understood, is a group of three or four somewhat related pieces. The first and the last are built on a certain formula; the other two are for contrast's sake and may be, first, a sad little elegy or a funeral march, or something sombre: second, a lighter piece, as a minuet, a rondo or a waltz.

The formula which is strictly called the "sonata form" is easily explained. It is simply a close welding of two melodies with an effort at variety of key and treatment. Thus, a melody is selected and played through; then a second melody in a contrasting rhythm and another key is played through; then follows a so-called "development" of these two melodies in as many keys and as many moods and with as many embellishments or dissections as one pleases; then, to bind all together, the first melody is played over again in its original key; the second melody is repeated in this same key; there are a few bars of conclusion and that is all. It is as logical and natural as anything could well be.

But this is only the first movement. There usually follow, to repeat, two different compositions—one sad, one usually more brilliant. This group of four (sometimes three) movements is the completed sonata. It is a form of great elasticity and great scope.

Adaptations and Variations. Sonatas have been written not only for the piano but for almost every other instrument in combination with it. A String Quartet is a sonata for two violins, a viola and a 'cello. An *Overture* is only an orchestral work based on the same form as the first movement of a sonata. A *Concerto* is a brilliant sonata for some instrument, as piano or violin, with orchestral accompaniment. A *Symphony* is simply a sonata for the full orchestra with the enlargements natural to the enlarged resources.

Composers of Sonatas. "The father of the sonata" was Carl Philip Emmanuel Bach (1714-1788). He was the son of J. S. Bach, "the father of modern music." His compositions are more lyrical, therefore more modern, than those of his father, though not so deep. Joseph Haydn (1732-1809) developed the sonata-form more completely and made such further use of it that he is called "the father of the string quartet and the symphony." If Haydn was lyrical, Mozart was more so. He had a singularly gracious spirit and it is shown in his fascinating melodies, though he added nothing to the form.

Beethoven's Sonatas. It was Beethoven who reached the highest point in this field, and his sonatas are far more dramatic, passionate and resourceful than any before him. He substituted the scherzo ("joke") for the minuet, and some of the wittiest things ever said were said by him in the scherzos he put into his sonatas and symphonies. He took great liberties with both the sonata and symphonic forms and in both stands supreme. His so-called *Moonlight* and *Appassionata* sonatas for the piano are perhaps best known.

Since his time, many composers have written sonatas. Even Chopin wrote one, in which he included his famous funeral march, as Beethoven had included in one of his own *A funeral march on the death of Hero.* Schumann, Brahms and others wrote sonatas of the highest importance and among the few real contributions made by America to really important piano music are the *Tragic, Heroic* and *Celtic* sonatas of Edward MacDowell (1861-1907).

The sonata, however, has suffered some obsolescence because its formality became somewhat oppressive to the freer flights of the modern spirit.

Chopin. About 1810 were born several composers who developed intensely romantic tendencies and let the mood shape the form rather than compress the mood into a rigid mold. Among these was Frédéric Chopin (1809-1849) son of a Frenchman, but born in Poland of a Polish mother. Chopin's music is so beautiful that it is hard to think of him as one of the most radical innovators in musical history. But he was none the less a revolutionist for being a gorgeous one; no less an earthquake for not wrecking buildings. He certainly altered the landscape and the very harmonic materials of music. He transformed all future piano music by his harmonic and melodic richnesses. It would be impossible to say which of his works are best where almost all are best: nocturnes, ballades, valses, preludes, polonaises. He gave his dances passionate meaning, and even his finger exercises, or études, are more important than the iceberg symphonies of most composers.

Robert Schumann (1810-1856) also wrote with absolute novelty and individuality a multitude of piano works, hardly two of them alike in shape or spirit. Mendelssohn (1809-1847) conceived his *Songs without Words.* Liszt (1811-1886) developed unheard-of skill as a pianist and wrote his tremendous *Hungarian Rhapsodies* for the piano, as well as great program symphonies and symphonic poems. Rubinstein (1830-1894) who was inferior only to Liszt as executant, composed much that caught the world's ear. Paderewski, equally brilliant as a pianist, has also written splendid music for the instrument.

The Norwegian, Edvard Grieg (born 1843) has been among the most individual of piano composers since Chopin, and has written superbly in nearly every form. Edward MacDowell, the American, also developed a distinct and distinguished personality in writing lyrics and poems for the piano.

Of recent years, the piano seems rather to have suffered the neglect of the most ambitious composers. While there is the usual rain of compositions, no personality is commanding wide attention.

Other Instruments. Every instrument has a literature of its own, but the pipe-organ, while its resources are greater far than the piano's, is too unwieldy to have its popularity. The violin has perhaps the richest library, next to the piano. It includes a bewildering series of compositions, from the time of Corelli (1653-1713) "the father of violin music," through such work as Tartini's *Devil's Trill Sonata* (which was inspired by a dream in which the devil played for him with black magic), and on through such of Beethoven's as the *Kreutzer Sonata*, to the uncanny works of Paganini (1782-1840) and the inspired fabrics of Mendelssohn, Spohr, Vieuxtemps, De Bériot, Sarasate, and Brahms.

Chamber Music. One of the most delightful fields is that of so-called "chamber music," written for a small string orchestra, usually a quartet, or, with some other instrument, a quintet. Human ingenuity has never been more gracious than in this form, which Haydn developed, Mozart improved, and Beethoven, Schubert and Brahms reveled in. But as these pieces are usually labelled with uncouth titles such as "C sharp minor," "B flat major" and the like, it would be unprofitable to name them here.

The Orchestra is employed to its fullest capabilities in opera and oratorio and often in church music, but it has also a field of its own, and here it finds one of the sublimest realms of human art and invention.

The difficulties of expressing one's self at all through the medium of sixty or a hundred instruments are great enough. To wield these as a painter wields his brushes, but without seeing how the canvases will look, or hearing them sound; and to retain a unity of idea and a dramatic thrill and progress to climax—these things place orchestral music on a plane with cathedral architecture.

Orchestral Works are chiefly *overtures, symphonic poems* or *symphonies*. Haydn is called the father of the modern symphony and the overture. He composed one hundred and twenty-five works in these forms, some of them very simple and even humorous, such as the *Toy Symphony* for toy drums, trumpets and the like, and the *Surprise Symphony*, which was written "to keep the King awake and make the ladies jump." He removed the piano from the orchestra and added the minuet to the four movements, but it is a long walk from his *Surprise* to the *Fate* symphony of Beethoven.

Mozart gave his symphonies further depth and breadth. He composed no less than forty-one of them, including the superb *Jupiter*. But it remained for Beethoven (1770-1827) to set the high-tide mark, beyond which nobody has gone. He took such liberties with the hallowed form that he was called a madman, but time has justified and dignified his every explosion of the great emotional frenzy that made him Beethoven.

Beethoven's Symphonies. Like Shakespeare, Beethoven sounded the depths of tragedy, reached the heights of joy and travelled the sunny levels of contentment. His third symphony, the *Eroica* was written "to celebrate the memory of a great man," meaning Napoleon, whom Beethoven thought of as already dead in 1804 because he had by then betrayed the great cause of freedom. His fifth symphony opens with the tremendous idea of "Fate knocking at the door," and typifies the individual in deadly combat with that destiny which visited Beethoven with deafness and despair. His sixth is the open-air *Pastorale* in which he set "all outdoors" to music. His seventh is the most romantic. The most massive is his ninth or *Choral Symphony* in which he reinforced the orchestra with an army of voices to chant Schiller's *Hymn to Joy*, with which the symphony concludes.

Schubert. Of the symphonies of Schubert there are two which are of heavenly beauty, the *Unfinished* and that in *C Major* in both of which melody of most popular appeal is joined with majestic profundity of thought.

Schumann wrote four important symphonies; Mendelssohn three (named the *Scotch, Italian,* and *Reformation*, this last ending with Luther's sonorous hymn). The brilliant French composer, Berlioz, (1803-1869) wrote two famous symphonies, the *Fantastic* and *Harold in Italy*. Raff is celebrated for his *Forest* and his *Lenore*, and Brahms reached the highest of recent levels with his four works, the last the best.

Tschaikowsky. From Russia came the *Pathetique Symphony*, perhaps the most emotionally appealing of all works in this form. It was the work of the most eminent of Russians, Tschaikowsky (1841-1893) who composed five other symphonies; seven famous symphonic poems on such subjects as *The Tempest, Manfred* and *Hamlet;* also various overtures, suites songs, and operas.

The Bohemians Smetana and Dvorak (1841-1904) achieved important symphonies, the latter after a sojourn in America, composing his *New World Symphony*, based on negro melodies.

The best of Italian symphonies is that of Pietro Floridia, also one of the foremost of Italian operatic composers, now domiciled in America.

Richard Strauss is undoubtedly first of living composers, and his *Domestic Symphony*, portraying a day of family life, has opened a new field for "program" music. In the symphonic poem he has also written marvelous works, such as his *Death and Transfiguration*, his *Heldenlebe*, *Don Quixote* and *Thus Spake Zarathustra*, in which he has enormously enlarged orchestral resources, as Haydn, Beethoven and Wagner did before him.

An American symphonist is Edgar Stillman Kelley (born 1857) who has created a humorous masterpiece in his *Gulliver*. Edward MacDowell never wrote a symphony, but in the kindred form of the symphonic poem his *Hamlet and Ophelia* and his *Launcelot and Elaine* are notable, while his *Indian Suite* magnificently employed themes drawn from the American Indians.

Musical Instruments have had long and elaborate evolutions, but a glance at the instruments in use today will suffice to acquaint us with the media of interpretation.

Pianoforte. Most popular is the pianoforte, an almost ubiquitous instrument, developed from the one-stringed monochord, and the harp, through different stages when the strings were plucked with quills, down to Cristofori's invention of the *forte-piano* with a hammer-mechanism, in 1711.

The piano has a compass of about seven octaves. A new value has been given to it by the recent invention of various forms of piano-player, by whose aid the difficulties of performance are overcome while leaving the control of expression in the hands of the veriest tyro.

The educational value of this is incalculable, and it is possible now to enjoy the most complicated forms of music without the years of finger-training previously required.

The Organ originated in some form of Pan's pipes. Two centuries before Christ, it already had a keyboard and bellows supplying the pipes with air. Pedals were invented about 1325, and in the fifteenth century the reed-pipe was invented. This made possible the cheap melodeons and "American organs" which preceded the piano in the home of the more modest sort.

The Pipe-Organ exists in almost every form, extending to huge mechanism run by electricity and compressed air, with from one to five keyboards and almost unlimited combination-effects known as "stops," imitating almost every other instrument and permitting effects that rival a full orchestra.

Other Wind Instruments are usually classified according to their material, as "woodwind" and "brasswind."

The *windwood* are subdivided into those sounded by a reed and those sounded through a side-hole. Of the latter are the *flute* and the *small flute*, or *piccolo*. It was to the invention of the system of keys by Theobald Boehm (1794-1881) that the flute owes its modern facility and range.

Of the instruments sounded by a single reed, are the various *clarinets* and the *saxophones* (made of brass, but classified with the woodwind) invented by Adolphe Sax (1814-1894), who may be called the Christopher Columbus of metallic instruments. The saxophone combines the tone qualties of the 'cello, the English horn and the clarinet.

The double-reeded wood instruments are the *oboe*, an instrument of quaintly pastoral tone capable of exceeding pathos; the *alto oboe* (or English Horn, or Cor-anglais); the *bass oboe* (or fagot, or bassoon) a nine-foot conical tube doubled on itself and played with a long mouthpiece; the *double bassoon* (or contrafagot); and the *sarrusophone*, which was invented by Sarrus in 1863; it looks like a bassoon, while sounding like a trombone.

Brasswind. The brass instruments originally could play only in one key, the length of the tube determining the key. Later the plan was evolved of inserting extra portions or crooks to lengthen or shorten the tube. This required a pause, and immediately altered the key. In 1790 and 1813 Claggett and Bluhmel developed the valve idea. By this means, stationary crooks are so arranged on the instrument that the pressure of a valve cuts off one crook and opens another. By the use of three valves the horn can play in any key. Valve instruments are practically universal now.

The *cornet* is the high tenor of the brass-wind, and one of the most familiar of instruments. The *trumpet, horn,* and *trombone* are equally well known. The *tuba*, a huge instrument invented by Sax, and the *bass tuba* (Saxhorn or Bombardon) carry the lowest notes. The term *Saxhorn* usually includes a series of instruments much used in street-bands.

Stringed Instruments. These are the *piano* played with hammers, and the *harp* in which the fingers pluck the strings. Sebastian Erard in 1820 perfected the double-action harp of seven pedals enabling quick shifts to all the keys.

Of stringed instruments played with a bow, the modern orchestra uses great numbers of *violins, violas, violincellos,* and *double-basses*, each supplementing the other. The *violin* holds perhaps the first place in the affections, because of its singing qualities. These are influenced by minute details of construction and the qualities of the wood. There has risen an almost religious reverence for the work of certain violin-makers, particularly those flourishing at Cremona in the sixteenth, seventeenth and eighteenth centuries. First came the famous family of Amati, of whom Niccolo trained Andrea Guarneri and Antonio Stradivari, each of whom founded an equally famous family. The violins of these makers are cherished as treasures of fabulous value, and they are constantly forged.

The *human voice* may be called a wind instrument with a double reed. It is the original musical instrument, and the more nearly other instruments suggest the human speech or outcry, the more immediate is their appeal. As the human voice can express almost every mood of interest of the soul, so music can hardly be denied any subject. It was for centuries hampered by restrictions and rules and imaginary laws. Its chief need now is for enlarged resources. As the youngest of the arts, perhaps it has the greatest future.

Imitative music suggests something external to the mere melody and harmony, as *motion, noises,* and objects of sight. By ascending and descending strains and cadences modern composers express soaring, sinking, etc. The varied sounds of battle, funeral processions, domestic sounds, tempests, notes of birds, etc., are produced by variations of tone.

Manual of Classified Questions for Examinations, Reading, and Study Courses

ALGEBRA

What is Algebra?....838a
A dealer sold his stock of used Fords at $430.00 each and Buicks at $920.00 each. There were three times as many Fords as Buicks. He received in all $15,470.00 How many cars of each kind did he sell?....839c
Sixteen coins, quarters and dimes, amount to $2.95. How many of each?....841c
Six horses and eleven cows cost $810.00. Thirteen horses and five cows at the same price cost $1,190.00. Find the cost of each animal?....845a
A farmer pays six men and eight boys $32.00 for a day's work, the next day paying the same wages, he pays ten men and two boys, $42.00 for the day's work. How much does he pay a man? A boy?....847a
A rectangle is fifteen feet long and its area is 36 square feet more than a square of the same width. How wide is it?....854c
A farmer sets out apple trees so that the number of trees in a row is two more than the number of rows. If there are 624 trees, how many rows and how many trees in a row?....854b
To pay $245.00 use twenty dollars and five dollar bills only. Three times as many fives as twenties. How many of each?....839b
There are twice as many lights on the first floor of a house as on the second floor. There are 48 lights on both floors. How many on each?....838b
A man rows five miles per hour in still water. It takes five hours to row upstream a certain distance, and only four hours to return. How fast does the current flow?....844b
Six men and three boys earn $39.00 per day. Eleven men and one boy earn $38.00 per day. How much does a man earn in a day? A boy?....847c
Multiply (x minus 5) by (x minus 6)? 852b
A fraction having 70 for its numerator is inverted and muliplied by 6. Its new value is one more than its original value. What is the fraction?....854c
One line is three times another and half the shorter lines is 20 inches less than the longer line. Find the length of each line....842a
John is twice as old as Will. Eighteen years ago John was five times as old as Will. How old are they?....840c
Apples cost 15c a dozen less than oranges. If two dozen apples and three dozen oranges cost $1.65. What is the cost of a dozen of each?....841a
One angle of a stripe is 7 less than twice the other. Find the number of degrees in each?....841b
I sold canned corn at 11c a can and five times as many cans of tomatoes at 14c each, and one can of peas at 12c. If the total receipts were $4.98, how many cans of corn and tomatoes did I sell?....840a
In paying $68.00, I used only $5.00 and $2.00 bills. The number of five dollar bills was three times the number of two dollar bills. How many of each?....839b
One angle exceeds half another by 15 degrees and exceeds the complement of their sum by twenty degrees. Find the angle?....842c
A boy can ride on his wheel ten miles per hour and walk four miles per hour. How long will it take him to go 126 miles if he rides half the time and walks half the time?....843b

GEOMETRY

How is Geometry useful?....856c
What relation has Geometry to sciences?....856c
When did people first start to use Geometry?....856a
What is a point?....857a
What is a line?....857a
What is an axiom?....857a
What is a postulate?....857a
What equipment is necessary for Geometry?....857b
What is a segment?....857c
State five geometrical axioms....858c
What are adjacent angles?....858b
What is an angle?....858a
What is a straight angle?....858a
What is a polygon? A triangle?....858b
What is a complementary angle?....858c
A supplementary angle?....858c
What is magnitude?....858c
What is a solid? A geometrical solid? A surface? A line?....859a
Define a broken line. A curve. A plane....859a
Prove—If one side of a triangle is greater than a second side, the angle opposite the first side is greater than the angle opposite the second side....861a
Prove the theorem—If two straight lines intersect each other the vertical angles are equal....862a
Prove that through three points not lying in a straight line, one circle and only one circle can be drawn....867a
What is a chord? A sector? A tangent?....866c
Prove this theorem—If in the same circle or in equal circles two angles at the center are equal, the arcs which they intersect are equal....867b
Show that the area of a trapezoid is equal to one-half the product of its altitude and the sum of its base....874b
How may a perpendicular be accurately drawn from a given point in a straight line?....877c
How may a triangle be constructed when two sides and the included angle are given?....878a
What is a scalene triangle?....880c
Prove that the medians of a triangle meet in a point two-thirds of the distance from each vertex to the mid point of the opposite side?....880c
What is a corollary?....881b
Show that regular polygons of the same number must have similar sides....876a
Prove that the square of the hypothenuse of a right triangle is equal to the sum of the squares of the other two sides....874c
Why must the area of a rectangle be equal to the product of its base and its altitude?....874a
Prove—If a straight line divides two sides of a triangle proportionately is parallel to the third side....871c
Prove that a straight line tangent to a circle is perpendicular to the radius drawn to the point of contact....869a
Prove—The diameter of a circle is greater than any other chord....867a
What is a secant?....866c
What is a lemma?....881b

How Many Speakers Have There Been to the House of Representatives? 952b

AGRICULTURE

Name a Disease of the Following: Cherry Tree, Currant Bush, Grape Vine? 382
What Would You Do for Your Horse If It Had Colic? 387
To What Climate Is Celery Culture Best Suited? 382
What Soil Is the Most Suitable For Growing Onions? 382
In What Time Will the Cherry Tree Bear Fruit? 382
What Are the Chief Products of Porto Rico? 367
Where Can You Get Free Bulletins on the Diseases and Remedies of Vegetables? 383
In What Seasons May Lettuce Be Planted? 382
What Garden Vegetable Is Free From Insect Pests? 382
What Are the Best Foods For a Dairy Bull? 388d
When Is the Planting Time For Lettuce? 382
What Is the Average Yield of Beans Per Acre? 382
What Northern Berry Bush Does Orange Rust Affect? 382
How Does the Average Yield of Wheat in Germany and England Compare With That of the United States? 375a
What Are Some of the Means Used to Upbuild the Land? 375b
Do Commercial Fertilizers Improve the Soil For More Than One Year? 375c
What Makes Soil Dark? 375c
What Are Some of the Fertilizing Materials? 375
When Did the Mormons Begin Irrigation in Utah? 376a
How Many Acres of Land Were Under Irrigation in 1860? 376a
Indicate the Training That School Children Are Now Getting In Agriculture 23-24
What Are Some of the Most Effective Means of Drainage? 376b
Whom Would You Address to Get a Free Farmer's Library? 376c
What Are Some of the Things That Determine Yields? 376b
What Is Meant by "Extension Education"? 376c
What Is the Work of the United States Department of Agriculture? 377a
Give the Origin and Brief History of Tobacco? 380
What Do You Understand by Dry Farming? 376c
What Are the Various Courses Offered in an Agricultural College? 377
What Is the Life of the Dahlia Plant, Bleeding Heart, Aster? 396
What State Has the Oldest Agricultural College? 377a
In What Form Are the Results of Experiment Stations to Be Had? 377a
What Do You Know About Plant Breeding? 377b
What Is the Color of the California Poppy? 396
Of What Value Is the Testing Box? 377c
What Is the Value of Farm Products Exported From the United States In a Single Year? 377c
How Does It Rank With Other Nations? 377c
When Is the Planting Time For the Chrysanthemum? 396c
When Was the First Society For the Advancement of Agriculture Founded in America? 376c
Is Red Clover a Native of America? 378f
How Does Agriculture Rank Among American Industries? 377c
What Distance Apart Should Lilac Bushes Be Planted? 396e
What Are Some of the Varieties of Roses? 397a
What Canadian Bulletin Will Explain the Use of Alfalfa, Its Diseases and Remedies, and Fertilizers? 378
Name a Disease of Barley; Corn; Oats? 378
Give a Brief History of Alfalfa. To What Soil Is It Best Adapted? 378
Name a Cool Season Berry Plant 384b
What Orchard Fruits Are Affected by the San Jose Scale? 385a
What Is the Normal Yield of Alfalfa; What Is the Planting Time in the North? 378
What Is the Normal Yield of Rice Per Acre? 378
Is the Watermelon Free From Disease? 384
To What Climate Is Asparagus Best Suited? 380b
How Old Is a Raspberry Bush When It Bears Fruit? 384
How Deep Should the Sweet Pea Seed Be Planted? 397
How Many Strawberry Plants Should Be Planted Per Acre? 384
What Is the Best Way to Get Rid of the Hessian Fly in Wheat? 381c
Where Can I Get Bulletins on Agriculture, Horticulture and Animal Husbandry? 379d
What Are the Best Breeds of Turkeys, Ducks, Geese? 394a
What Is the Treatment for the Following Diseases of Cattle: Mange? Ringworm? Indigestion? 389b
Give Some Brief Breeding Rules for Sheep 391a
What Are the Symptoms of Hog Cholera? 393b
How Treat Case of Founder in a Horse? 387
Tell How to Carry On An Experiment Showing the Effect of Air On the Soil 23c
How Is Soil Formed? 23c
Do Plants Give Off Moisture? 24b
How Can We Test Seed Corn or Garden Seeds For Their Vitality? 377c
What Do You Do to Relieve a Horse of Worms? 387c
What Kind of Soil Is Best Adapted For Tree and Fruit Growing? 376a
How May Crops Be Improved in Yield and Quality? 377b
What Kind of Soil Is Best For Clover? 378
What Time of the Year Should Mangels Be Planted? 378
For What Is Millet Used? 378
What Is the Normal Yield Per Acre of Rye? 380
What Are the Characteristics of the Clydesdale Horses? 386
Give Some Characteristics of the Guernsey Cow 388
What Is the Best Food for a Dairy Cow, in Winter? 388

What Is the Solar System? 894
What Is the Diameter of the Sun? 894
Give a Description of a Comet? 896
Who Was Messier? 896
In What Year Did the Largest and Brightest Comet Ever Seen Appear? 895-896
What Do We Mean by Double Stars? 896
What Is Cosmogony? 898
What Nine Kinds of Astronomy Are There? 893
What Is the Magnetic Pole? 359a
Who Was the Most Eminent Ancient Astronomer? 894
What Causes Sun Spots and Do They Have Any Effect Upon the Weather? 894c
Is the Cause of Gravitation Known? 894b
From What Science Was Astronomy Evolved? 893
Distinguish Between a Meteor and a Comet 896a
How Many Days Does It Take for the Sun to Turn on Its Axis? 894
What Are the Dimensions of the Moon? 895
Describe What is Meant by Inferior and Superior Planets 895
What Is Meant by "Harvest" and "Hunters'" Moon? 895a
Is Gold Present in the Sun? 894c
Is There Any Danger of a Comet Destroying the Earth? 896a
Of What Use Is Chronological Astronomy? 893
Give Sir Issac Newton's Law of Gravitation 894
To What Is the Eclipse of the Moon Due? 895

PHYSICS

What Are the Chief Branches of Physics? 927c
What Is the Theory of Dynamics? 929
What Are the Primary Colors? 930c
What Is Heat? 829
What Is a "Conductor" and "Non-Conductor" of Electricity? 928a
What Are the Best Insulators? 928c
Why Does Alcohol Feel Cold? 930a
What Is the Normal Temperature of the Body? 930a
Do Some Substances Absorb Heat More Readily Than Others? 930a
What Colors Are Generally Used in Heraldry? 930c
What Is the Most Economical Way of Heating a House? 930a
Are There Any Good Conductors of Heat? 930a
What Causes One Thing to Appear Red and the Other Violet? 930b
When a Piece of Iron Is Said to be "Red Hot" What is Meant? 930b
Can Yellow be Produced by a Combination of Other Colors? 930b
What Is an Electric Current? 929a
What Are Known as the Simple Mechanical Powers? 929
Why Is the New York Subway Hot? 930a
Could You Freeze Cream in a Freezer With Ice Without Salt? 930a

CHEMISTRY AND CHEMISTRY OF FOODS

What Per Cent Vanadium in Vanadium Steel? 916d
Chrome Added to Steel Adds What Property? 417d
What Is Iodine Made From? 913b
From What Does the Tungsten Light Get Its Name? 916d
What Is the Property of Iridium? 913c
What Per Cent Silver in Sterling Silver? 915d
Name Some of the Chemical Elements of the Sun? 168a
What Is the Second Hardest Known Substance? 418ab
Which Foods Are Best to Eat in Winter? Which in Summer? 918
What Food Contains the Greatest Fuel Value per 10c Worth? 918ab
Which Melts the Quicker, Aluminum or Silver? 911-915
What Shining Metal Does Not Tarnish and Can be Burned in Air? 911c
What Use Is Made of Arsenic? 911d
What Carat Is Pure Gold? 913d
What Metal Is Used by Dentists as a Substitute for Gold? 913d
What Is Food? 917
How Much Food Does an Average Man Eat per Day? 918c
What Are the Most Important Mineral Foods in the Nutrition of Man? 917b
What Kind of Sugar Is Most Important for Human Nourishment? 917a
The Bulk of Human Foods Consist of What? 917a
What Is the Melting Point of Copper? 912a
What Tissues of the Body Are Largely Composed of Proteid? 917a
What Causes Natural Decadence as We Grow Old? 917c
What Metal Is Used for Gold Pen Points? 913d
How Is Iron Galvanized? 916d
What Is the Difference Between Corundum and Carborundum? 414b-418
Where Do Amythysts Come From? 826c
Why Would an Average Man Weigh Only 25 Pounds in the Moon? 895b
Strictly Speaking, What Are the Only Four Precious Stones? 926c

ANALYTICAL INDEX

EXPLANATIONS: Reference numbers and letters give page and column, as 25a indicates page 25, first column; references to the Dictionary of Biography are indicated by the abbreviation, biog.

ABBREVIATIONS: Biography (biog.); Illustration (illus.); Table (tab.); Opposite (opp.)

"A" as distributive, 87c
——As numeral, 87c
——With plural groups, 88a
Aard-vark, 937a
Aard-wolf, 937a
Abacus, 794a, 795a, (illus.) 795b
Abbas I, biog. 489a
Abbe, Cleveland, biog. 489a
Abbey, Edwin A., 1081c, biog. 489a
Abbot, Ezra, biog. 489a
Abbot, Sir John, 29ad
Abbot, Jacob, 138b, biog. 489a
Abbot, John S. C., 138b; biog. 489a
Abbott, Lyman, biog. 489a
Abbreviations, 68c
——Dictionary of, 113
——Used in geometry, 859b
Abel, Niels H., biog. 489a
Abelard, Peter, biog. 489a
Abelone, 413b
Abercrombie, James, biog. 489a
Abercromby, Sir Ralph, biog. 489a
Aberdeen, Earl of, 293d
Aberdeen, Scotland, 996a
Aberdeen-Angus, 338a
Abolition Movement, 240, 242a. See also Garrison, William Lloyd; Lovejoy, Elias P.
Abou-hannes, 937a
About, Edmond F. V., biog. 489a
About, 88a
——In future sense, 88a
Above, below, adjective or adverb, 88a
Abraham, 213c, 250b, biog. 489a
Abraham Lincoln, play, 152c
Abruzzi, Duke of, 360b, biog. 489b
Absorption, 929c
——Of food, 1027c
——In plant life, 901b
Abu Hanifah, 125d
Abu Ubaidah, 125d
Abyssinia, 180a
——Government and ruler of, 361
——Statistics and industries of, 361
Academy of Fine Arts, Florence, famous paintings in, (tab.) 1084
Acanthurus, 937a
Acapulco, 347a
Acceptance, form, 829a
Accidents, laws about, 976b
Account Purchase, 825a
Account Sales, 824c
Accounting, 10c
Acephala, 935a
Acerata, 935b
Achates, 165a
Achelous, 165a
Acheron, 165a
Achilles, 165a
Aconite, 402a
Acreage Yields, 375a
Act of Settlement, 202b
Acteon, 165a
Acton, Lord, see Dalberg, Acton
Adam, Robert, furniture of, 1092c
Adam Bede, 149a, 153a
Adams, (Parson), 149a
Adams, Brooks, biog. 489b
Adams, Charles Francis, biog. 489b
Adams, Charles Francis, Jr., biog. 489b
Adams, Charles K., biog. 489b
Adams, George B., biog. 489b
Adams, Henry, biog. 489b
Adams, Henry C., biog. 489b
Adams, Herbert, 1072b
Adams, John, 632a
——Administration, 180a-180c, (illus.) 191, 239b, 284c
——Biog. 489b
——Cabinet, 284b
——Death, 181a
——Election and inauguration, (tab.) 954
——Personal facts about, (tab.) 956
——Portrait, 199
Adams, Maude, biog. 489c
Adams, Samuel, 162b, biog. 489c
Adams, William T., see Optic, Oliver
Adams Act, 377b
Addams, Jane, biog. 489c
Adder, 937a
Addison, Joseph, 131a, 149a, 159b, 162a, biog. 489c
Addition,
——Algebraic, 848a
——Applied, 807a
——Banker's method, 802b
——Civil service method, 802b
——Drills in, (diag.) 802a
——Of fractions, 811a
